INTRODUCTION

This service manual is intended to assist trained and qualified technical personnel in verifying the performance of, adjusting, and repairing the ADCOM GFA-535II power amplifier. The procedures described here are not intended for persons unfamiliar with the appropriate safety and test procedures.

WARNING

THERE ARE POTENTIALLY LETHAL VOLTAGES WITHIN THE GFA-535II AMPLIFIER WHICH WILL BE ACCESSIBLE ONCE ITS TOP COVER IS REMOVED. **DO NOT ATTEMPT FAMILIARIZATION, INSPECTION OR ANY PROCEDURE WHATSOEVER UNLESS YOU HAVE DISCONNECTED THE GFA-535II FROM THE WALL AC OUTLET OR OTHER SOURCE OF AC POWER AND THE POWER-SUPPLY CAPACITORS ARE COMPLETELY DISCHARGED.** PLEASE TAKE NOTE THAT THE POWER-SUPPLY CAPACITORS TAKE AS LONG AS **5 MINUTES** TO DISCHARGE. THESE INSTRUCTIONS ARE PROVIDED FOR USE ONLY BY COMPETENT TECHNICAL PERSONNEL. **DO NOT UNDERTAKE ANY SERVICE PROCEDURES IN THE GFA-535II UNLESS YOU ARE TECHNICALLY QUALIFIED TO DO SO.**

CIRCUIT DESCRIPTION

The ADCOM GFA-535II is a stereo power amplifier rated at less than 0.04% THD from 20Hz to 20kHz with 60 watts into 8 ohms and 100 watts into 4 ohms. The output stage is capable of greater than 25 amps into low impedance loads. The amplifier employs a discrete differential Class-A front-end followed by a Class-A voltage-gain stage which amplify the input signal to the voltage required at the output of the amplifier. This high-voltage signal drives the high-current triple-Darlington-follower output stage which amplifies the current by a factor of about 50,000.

Referring to the accompanying schematic, describing the Left Channel only, the input signal passes through network C601, C603, R603, and R607 which provide a 3dB bandwidth of 1.7Hz to 500kHz to the input of the amplifier. C601 is an extremely high quality capacitor and serves to protect the amplifier and the speakers connected to it from DC faults at the output of the preamplifier. **WE DO NOT RECOMMEND THAT C601 BE SHORTED OUT.** Q601 and Q603 form the differential input stage.

Open-loop gain is defined by R615 and the bias current through Q601 and Q603. The small-signal gain is approximately $825/(2 \times 25) = 16$. The next voltage gain stage consists of Q613 with Q615 as a current-source load. DC bias is set by R635, D605 and D607. Its open loop-gain is defined by R639 and R641, with R651, R653, C609, C613, and C615 providing high-frequency compensation.

Feedback is provided from the output to the base of Q603 by the network R611, R613 and C607. C607 provides a high-frequency roll-off above 150kHz, improving stability by taking high-frequency feedback before the triple Darlington.

The input stage is biased by R619, R623, R625, R627, R629, R631, R633, R635, Q605, Q609, Q615, D601, D603, D605, D607, D609 and the overtemperature LED, D004. Q609 is turned on when the B+ supply is on. A current of about 4mA flows through the thermal breaker on the heatsink and into D605 and D607. If the heatsink overheats, the breaker opens and the current flows through D609 and the THERMAL PROTECTION LED instead. When the breaker carries the current, D605 and D607 are biased at 1.4V. This creates about 0.7V across R619; Q605 then sources about 2mA to Q601 and Q603, the differential input stage. If the negative supply fails or its fuse opens, Q605 saturates, Q601 turns off, turning off Q613, D613 turns on and Q615 saturates. This holds the input to the Triple Darlington to near ground. If the positive supply fails or its fuse opens, Q609 turns off and the bias circuitry is disabled.

Any DC imbalance in the amplifier is corrected by R687, R689, C623, C625, and IC601. Any DC error at the amplifier output is servoed back through IC601 to adjust the DC current through the input transistors. DC-bias is nominally 1.0mA through Q601 and Q603. IC601 provides the DC-bias current to Q601 and can swing from ground to +10V to bring the amplifier into balance.

The bias network of VR601, R643, R645, and Q617 form a temperature- compensated DC-bias voltage to the input of the triple-Darlington-follower output stage. Mid- and high-frequency bypassing is provided by C611.

R693 and C617 provide a load for the amplifier at high frequencies, stabilizing the amplifier under varying load conditions. D611 and D613 provide a high-current return to the power supply for backlash current from the load.

The output stage consists of two sets of 2 parallel transistors operated as emitter followers, driven by another pair of emitter followers. This configuration minimizes distortion caused by varying load impedances. The output transistors have 0.22-ohm ballast resistors to ensure current sharing and bias stability.

TEST PROCEDURES

All tests are performed with a 120V, low-distortion (less than 2%), AC-power source, 8-ohm resistive load, (except slew rate), and a signal source of not more than 600 ohms.

Tests are performed after warming up the amplifier at 20 watts into an 8-ohm load for at least 10 minutes.

All grounds during testing are referred to the ground of the black output terminal, **EXCEPT FOR RCA INPUT-JACK GROUNDS AND ANY SIGNAL-GENERATOR GROUND. DO NOT CONNECT RCA INPUT-JACK GROUNDS TO BLACK OUTPUT-TERMINAL BINDING POSTS, OR DAMAGE TO THE GROUNDING SYSTEM OF THE AMPLIFIER MAY RESULT.**

80kHz low-pass filter is employed during THD distortion measurements.

Signal-to-noise measurements are "A" weighted.

Damping factor is measured by comparing the 20-watt-output voltage with and without an 8-ohm load.

Slew rate is measured with an inductive load, and is derived with a dual-time-based oscilloscope reading the slope of a full-power (70V peak-to-peak) 5kHz square wave. To avoid damaging output networks R693/C617 AND R694/ C618 **DO NOT OPERATE THE AMPLIFIER AT FULL-POWER, SINE-WAVE ABOVE 22kHz OR FULL-POWER (70V PEAK-TO-PEAK) SQUARE WAVE ABOVE 5kHz.**

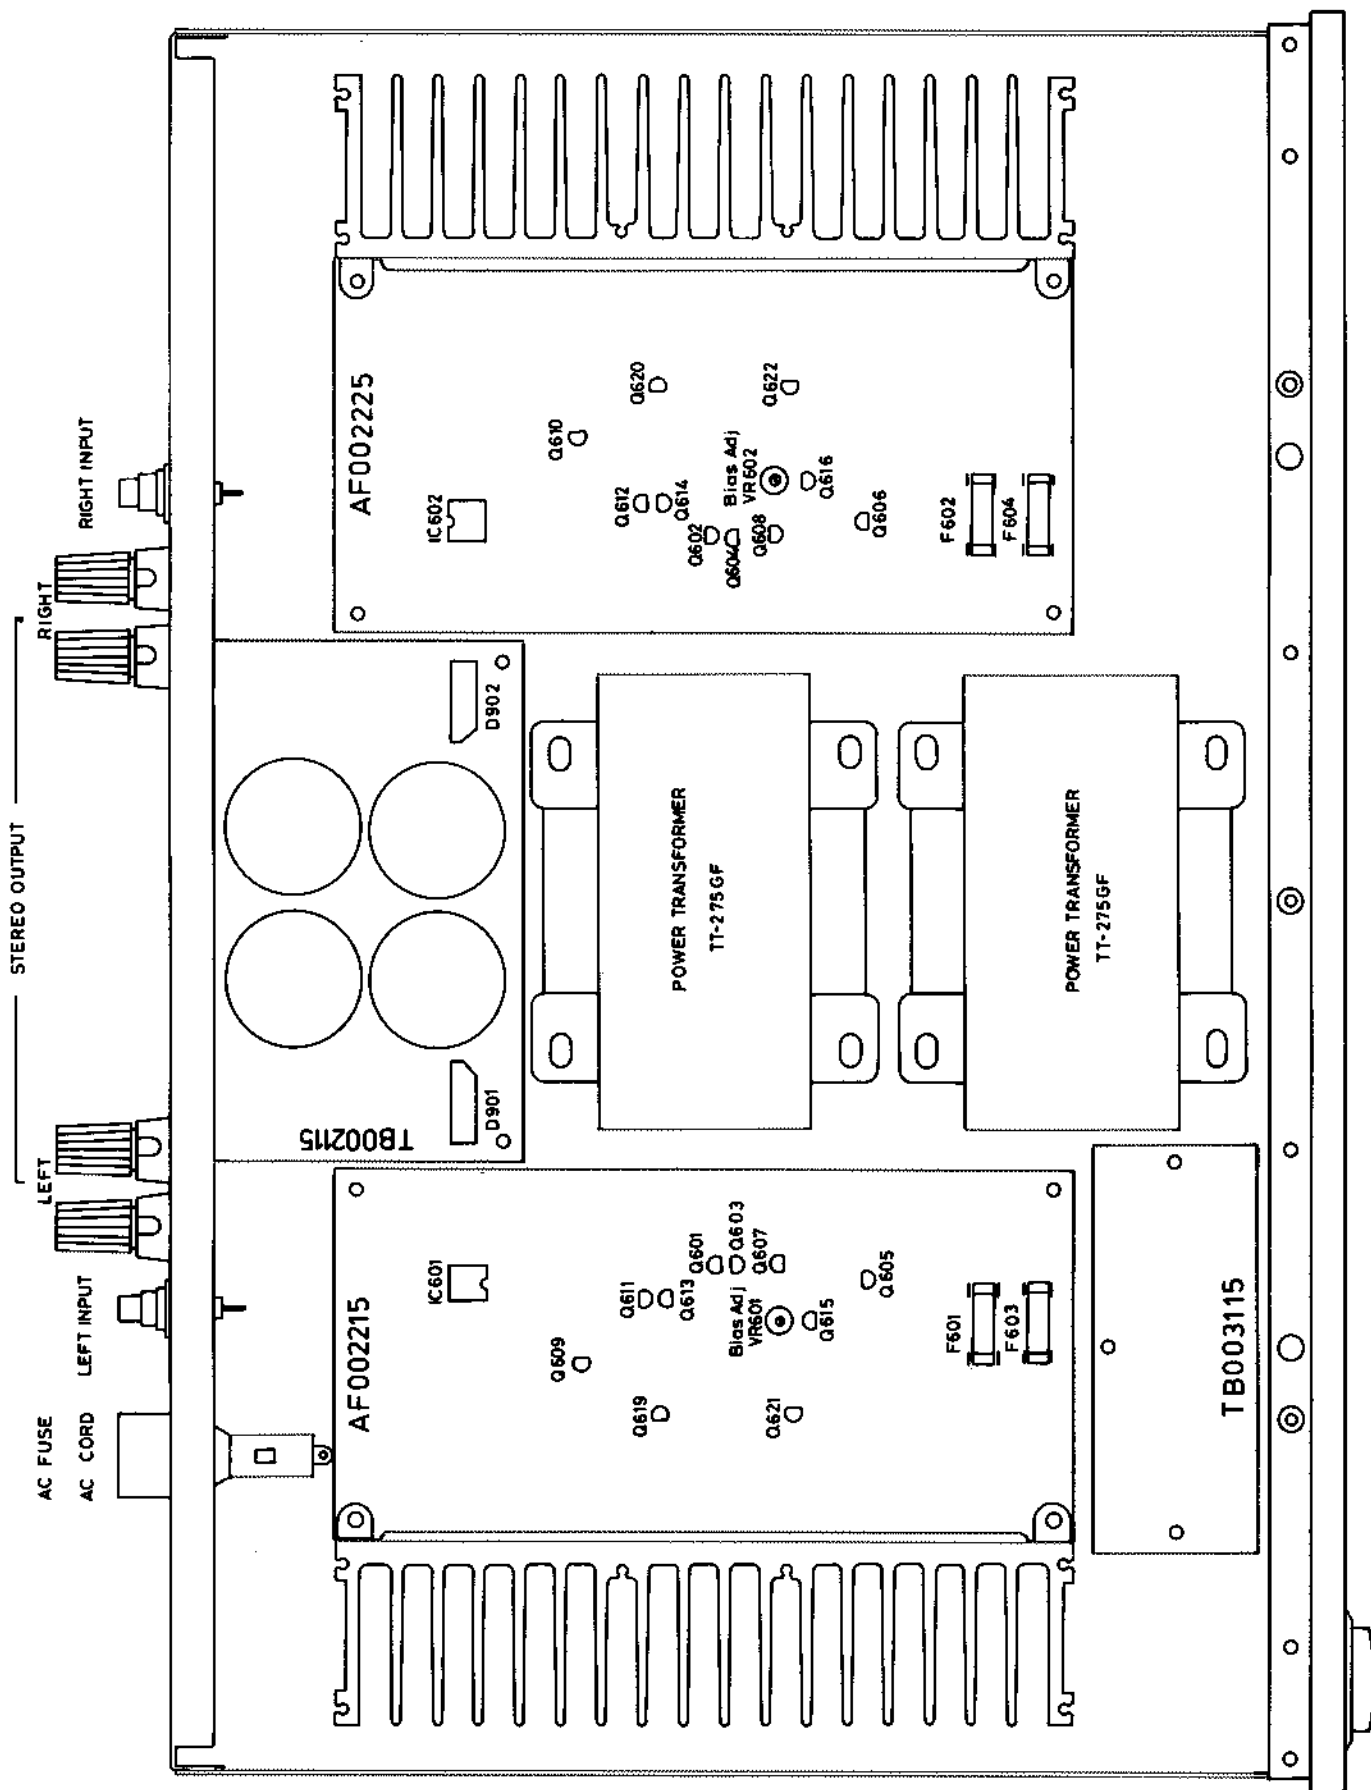

IMPORTANT

BEFORE PROCEEDING WITH ADJUSTMENTS, MAKE SURE AMPLIFIER IS AT ROOM TEMPERATURE.

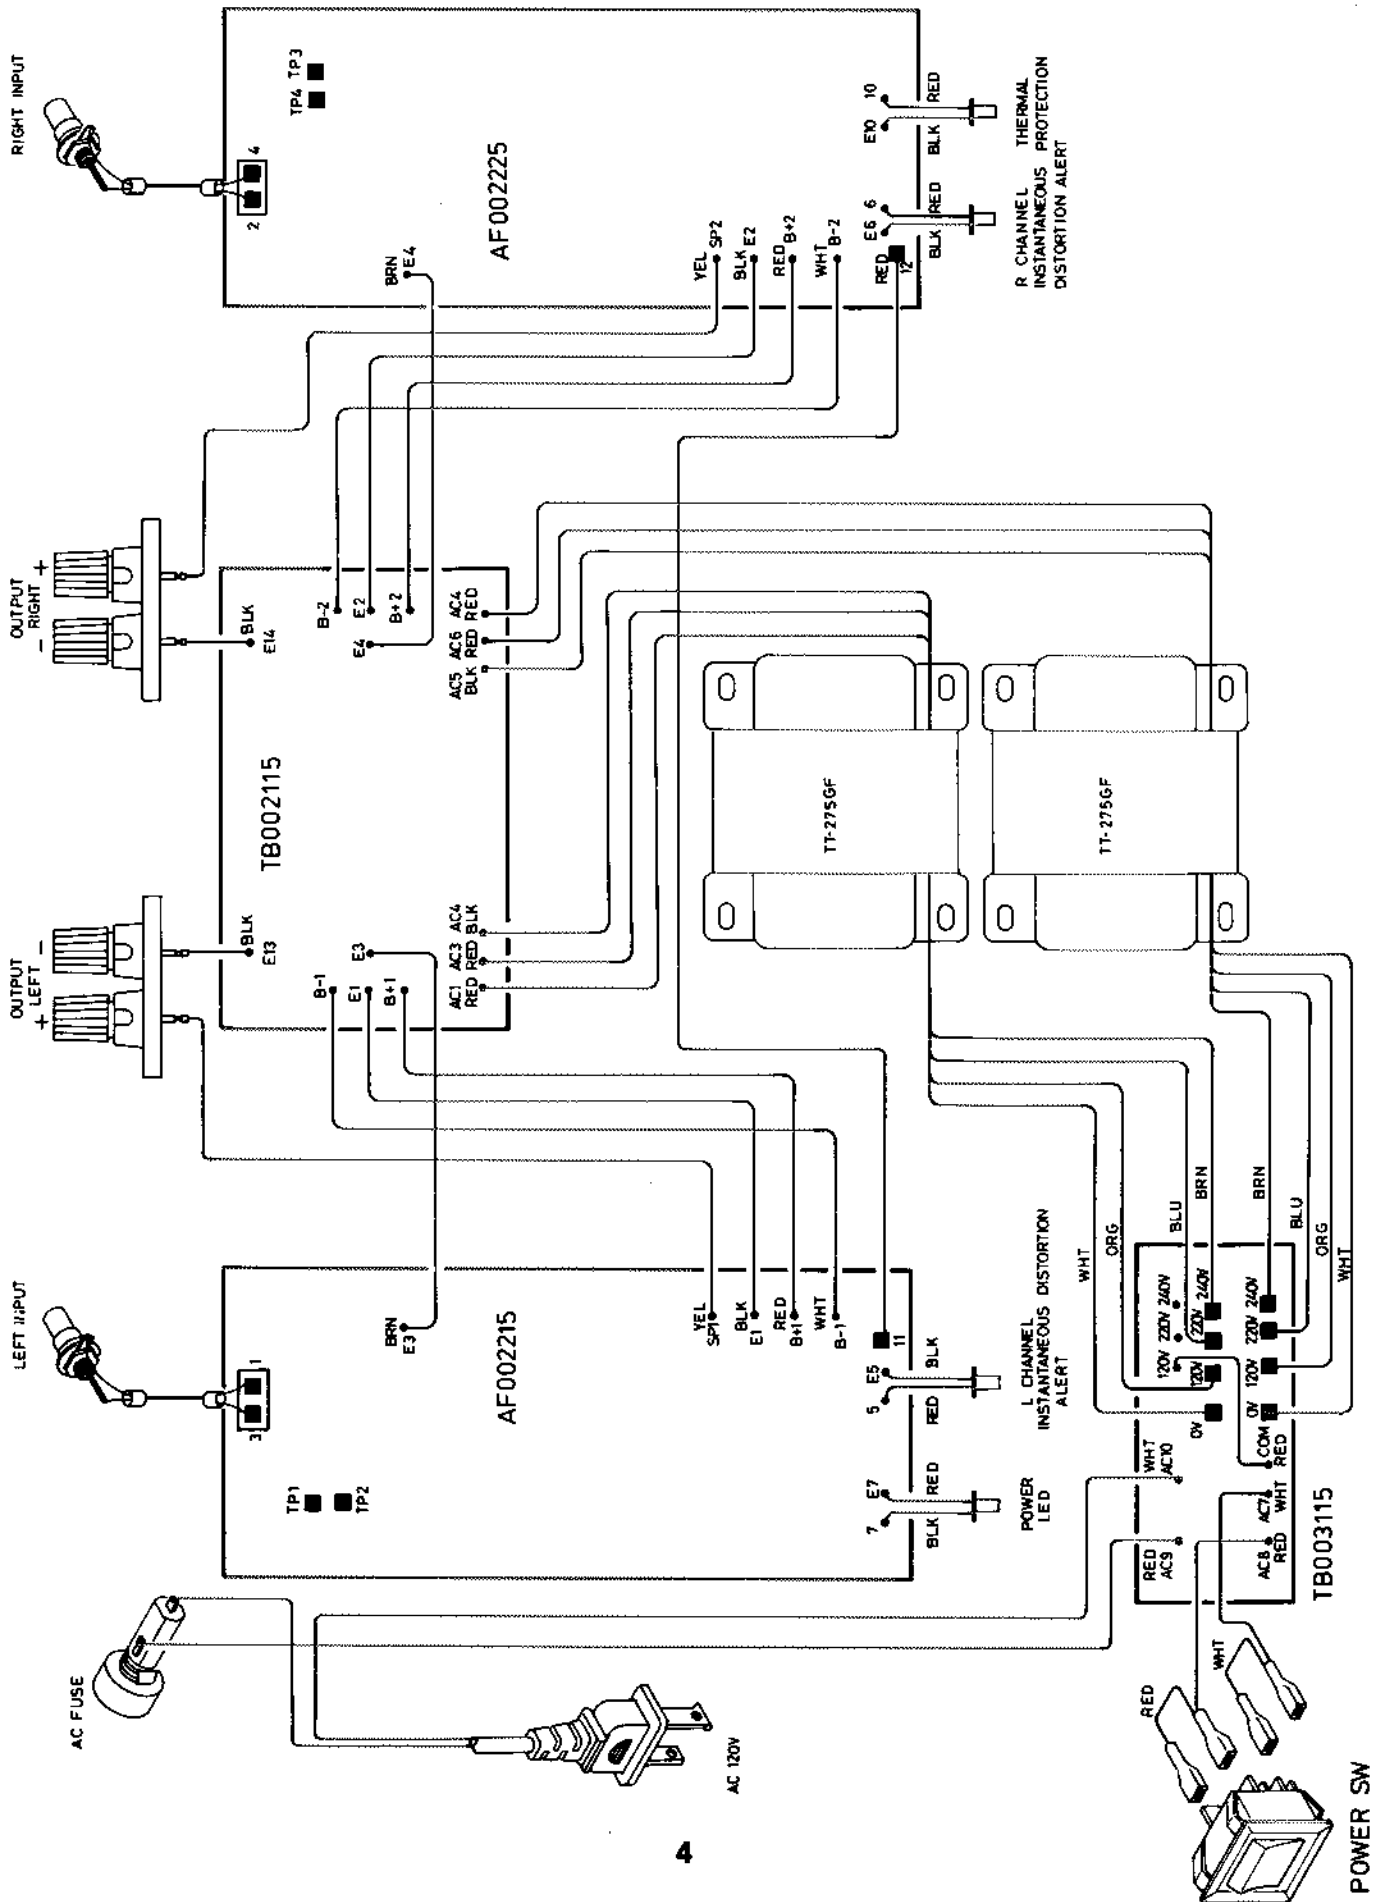

BIAS ALIGNMENT

1. With set-up as per the first paragraph of TEST PROCEDURES and with **NO SIGNAL IN**, set bias controls (VR601 and VR602) to midpoint.
2. Connect a millivolt meter across TP1 and TP2.
3. Turn amplifier on and allow a 3 to 5 minute settling period.
4. Adjust **BIAS** control VR601 to obtain either a + or - 7mV ($\pm 1\text{mV}$) indication on the millivolt meter.
5. Connect a millivolt meter across TP3 and TP4.
6. Adjust **BIAS** control VR602 to obtain either a + or - 7mV ($\pm 1\text{mV}$) indication on the millivolt meter.
7. To check for proper bias setting, remove millivolt meter and apply input signal to obtain 20 watts into 8 ohms for 10 minutes with cover on.
8. Remove input signal and connect the millivolt meter as in Step 2 and Step 5. Let amplifier idle until bias stabilizes and readjust to 7mV ($\pm 1\text{mV}$).

§ The fuses listed, and their time-current blowing points, have been carefully selected and thoroughly tested to deliver optimal performance while still accomplishing their protective functions. Replace these fuses, individually, only with the specific types listed. **DO NOT USE ANY SUBSTITUTE FUSES WITH DIFFERENT RATINGS, TIME-CURRENT CURVES OR VALUES.** Failure to observe this precaution may cause serious damage to the amplifier circuits, **MAY CREATE A FIRE HAZARD, AND MAY VOID THE WARRANTY**

△ Because of fire, shock and/or other hazards, parts identified by and listed with this sign **MUST** be replaced with the **IDENTICAL FACTORY PART** listed in the **SERVICE PARTS LIST**. No substitutions with other "equivalent" parts can be made.

 20kHz 0.03%

Frequency Response @ 1 Watt into 8 Ohms

10Hz to 20kHz +0, -0.25dB

Power Bandwidth (-3dB) 1.7Hz to 100kHz

Dynamic Headroom into 4 Ohms 3dB

Signal-to-Noise Ratio, "A" Weighted

60 Watts into 8 ohms $\geq 110\text{dB}$

Gain 27dB

Input Impedance 100,000 ohms

Input Sensitivity

60 watts into 8 ohms 0.97V rms
 1 watt into 8 ohms 130mV rms

Damping Factor

20Hz to 20kHz ≥ 180

Rise Time

5kHz, 70V peak-to-peak square wave, 20% to 80% 2.2us

Semiconductor Complement 34 transistors, 2 zener diodes,
 14 diodes, 2 ICs, 2 diode bridges

Power Consumption (Continuous, Both Channels Driven)

Quiescent	55VA
Maximum	600VA
60 watts into 8 ohms	240VA
100 watts into 4 ohms	410VA

GENERAL

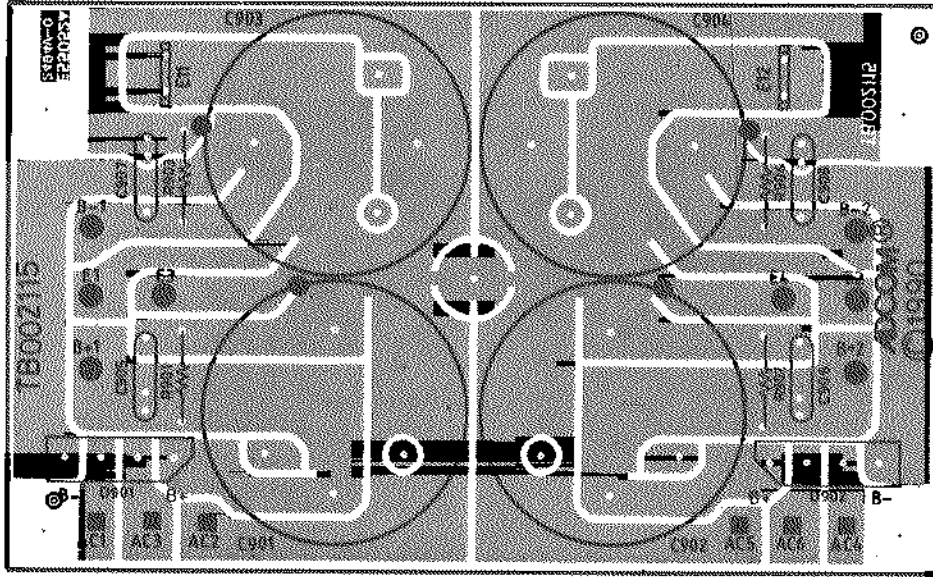

Power (available in 220V or 240V on special order)	120VAC/50-60Hz
Chassis Dimensions	3"(76mm) x 17"(432mm) x 11-1/4"(286mm)
Maximum Dimensions	3-3/8"(86mm) x 17"(432mm) x 12-1/2"(317mm)
Weight	19.5 lbs.(8.9kg)
Weight,Packed	23 lbs.(10.5kg)

SPECIFICATIONS SUBJECT TO CHANGE WITHOUT PRIOR NOTICE

FILTER CAPACITOR/RECTIFIER PCB ASSEMBLY

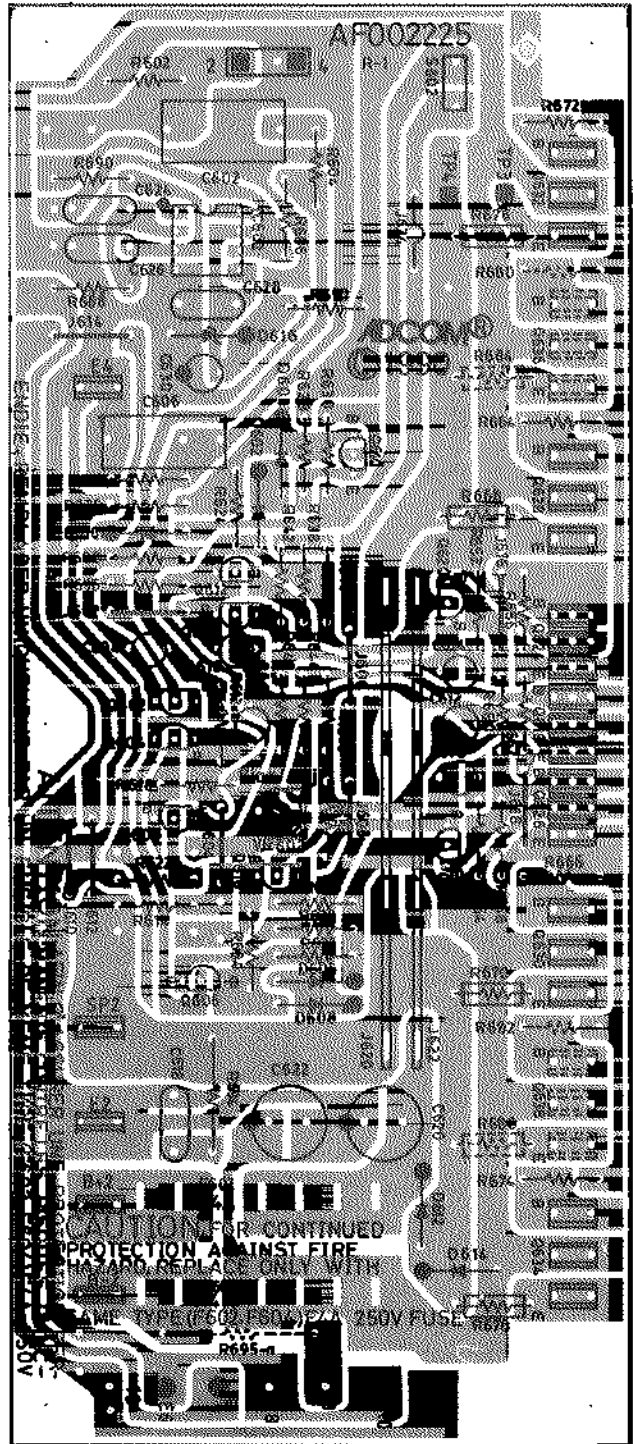

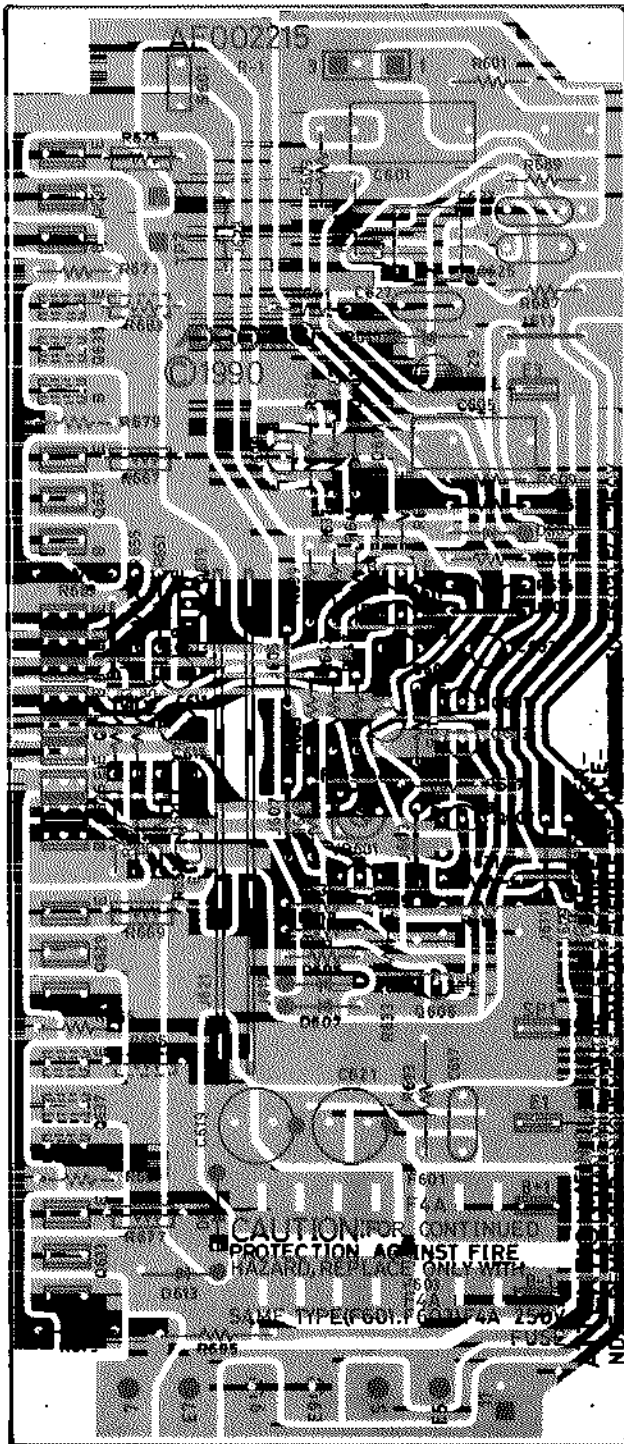

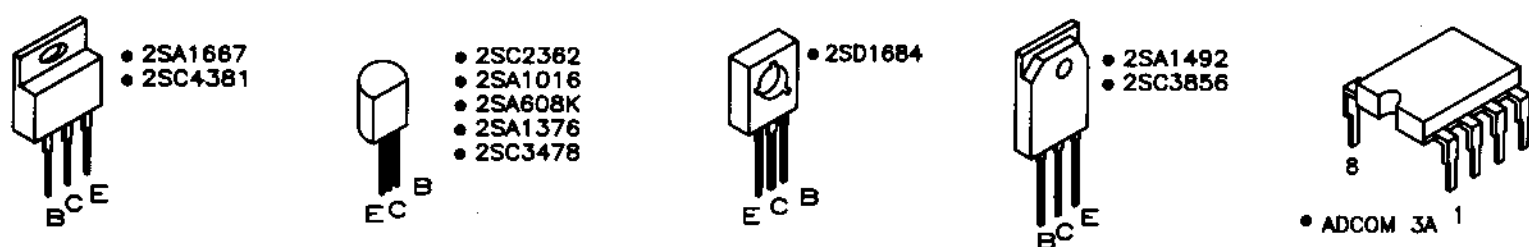

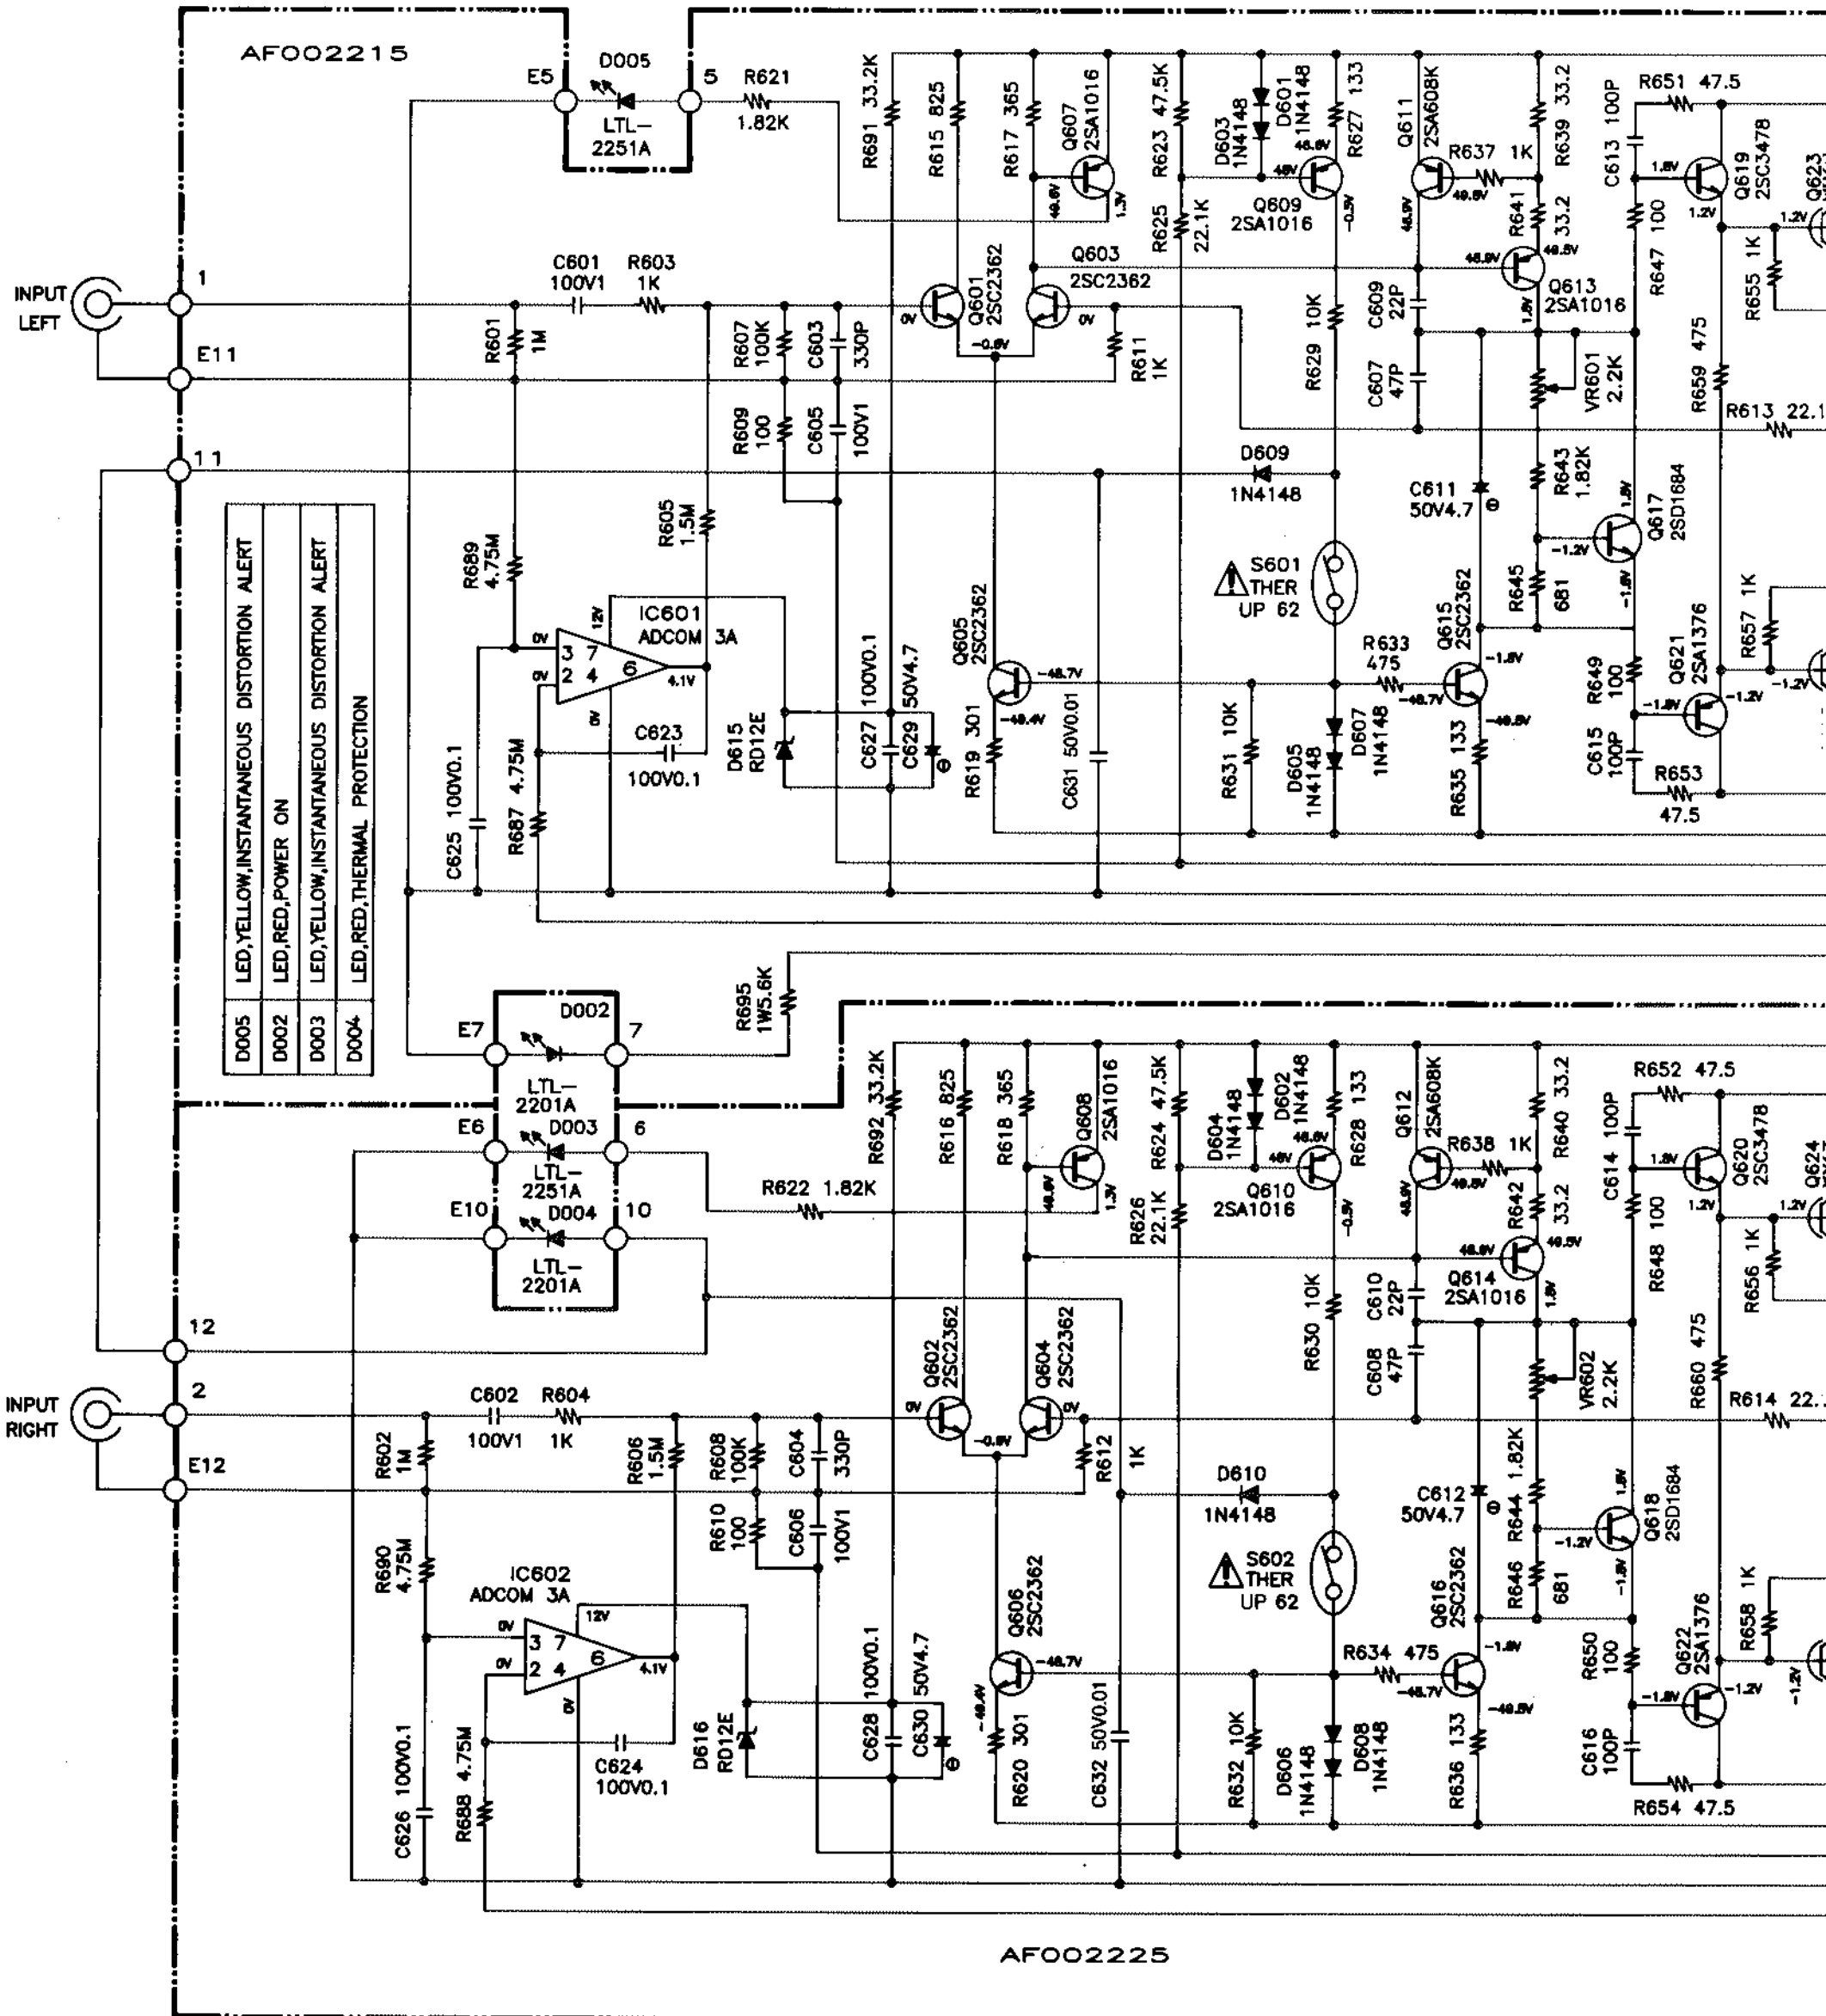

AC INPUT PCB

RIGHT AMPLIFIER PCB

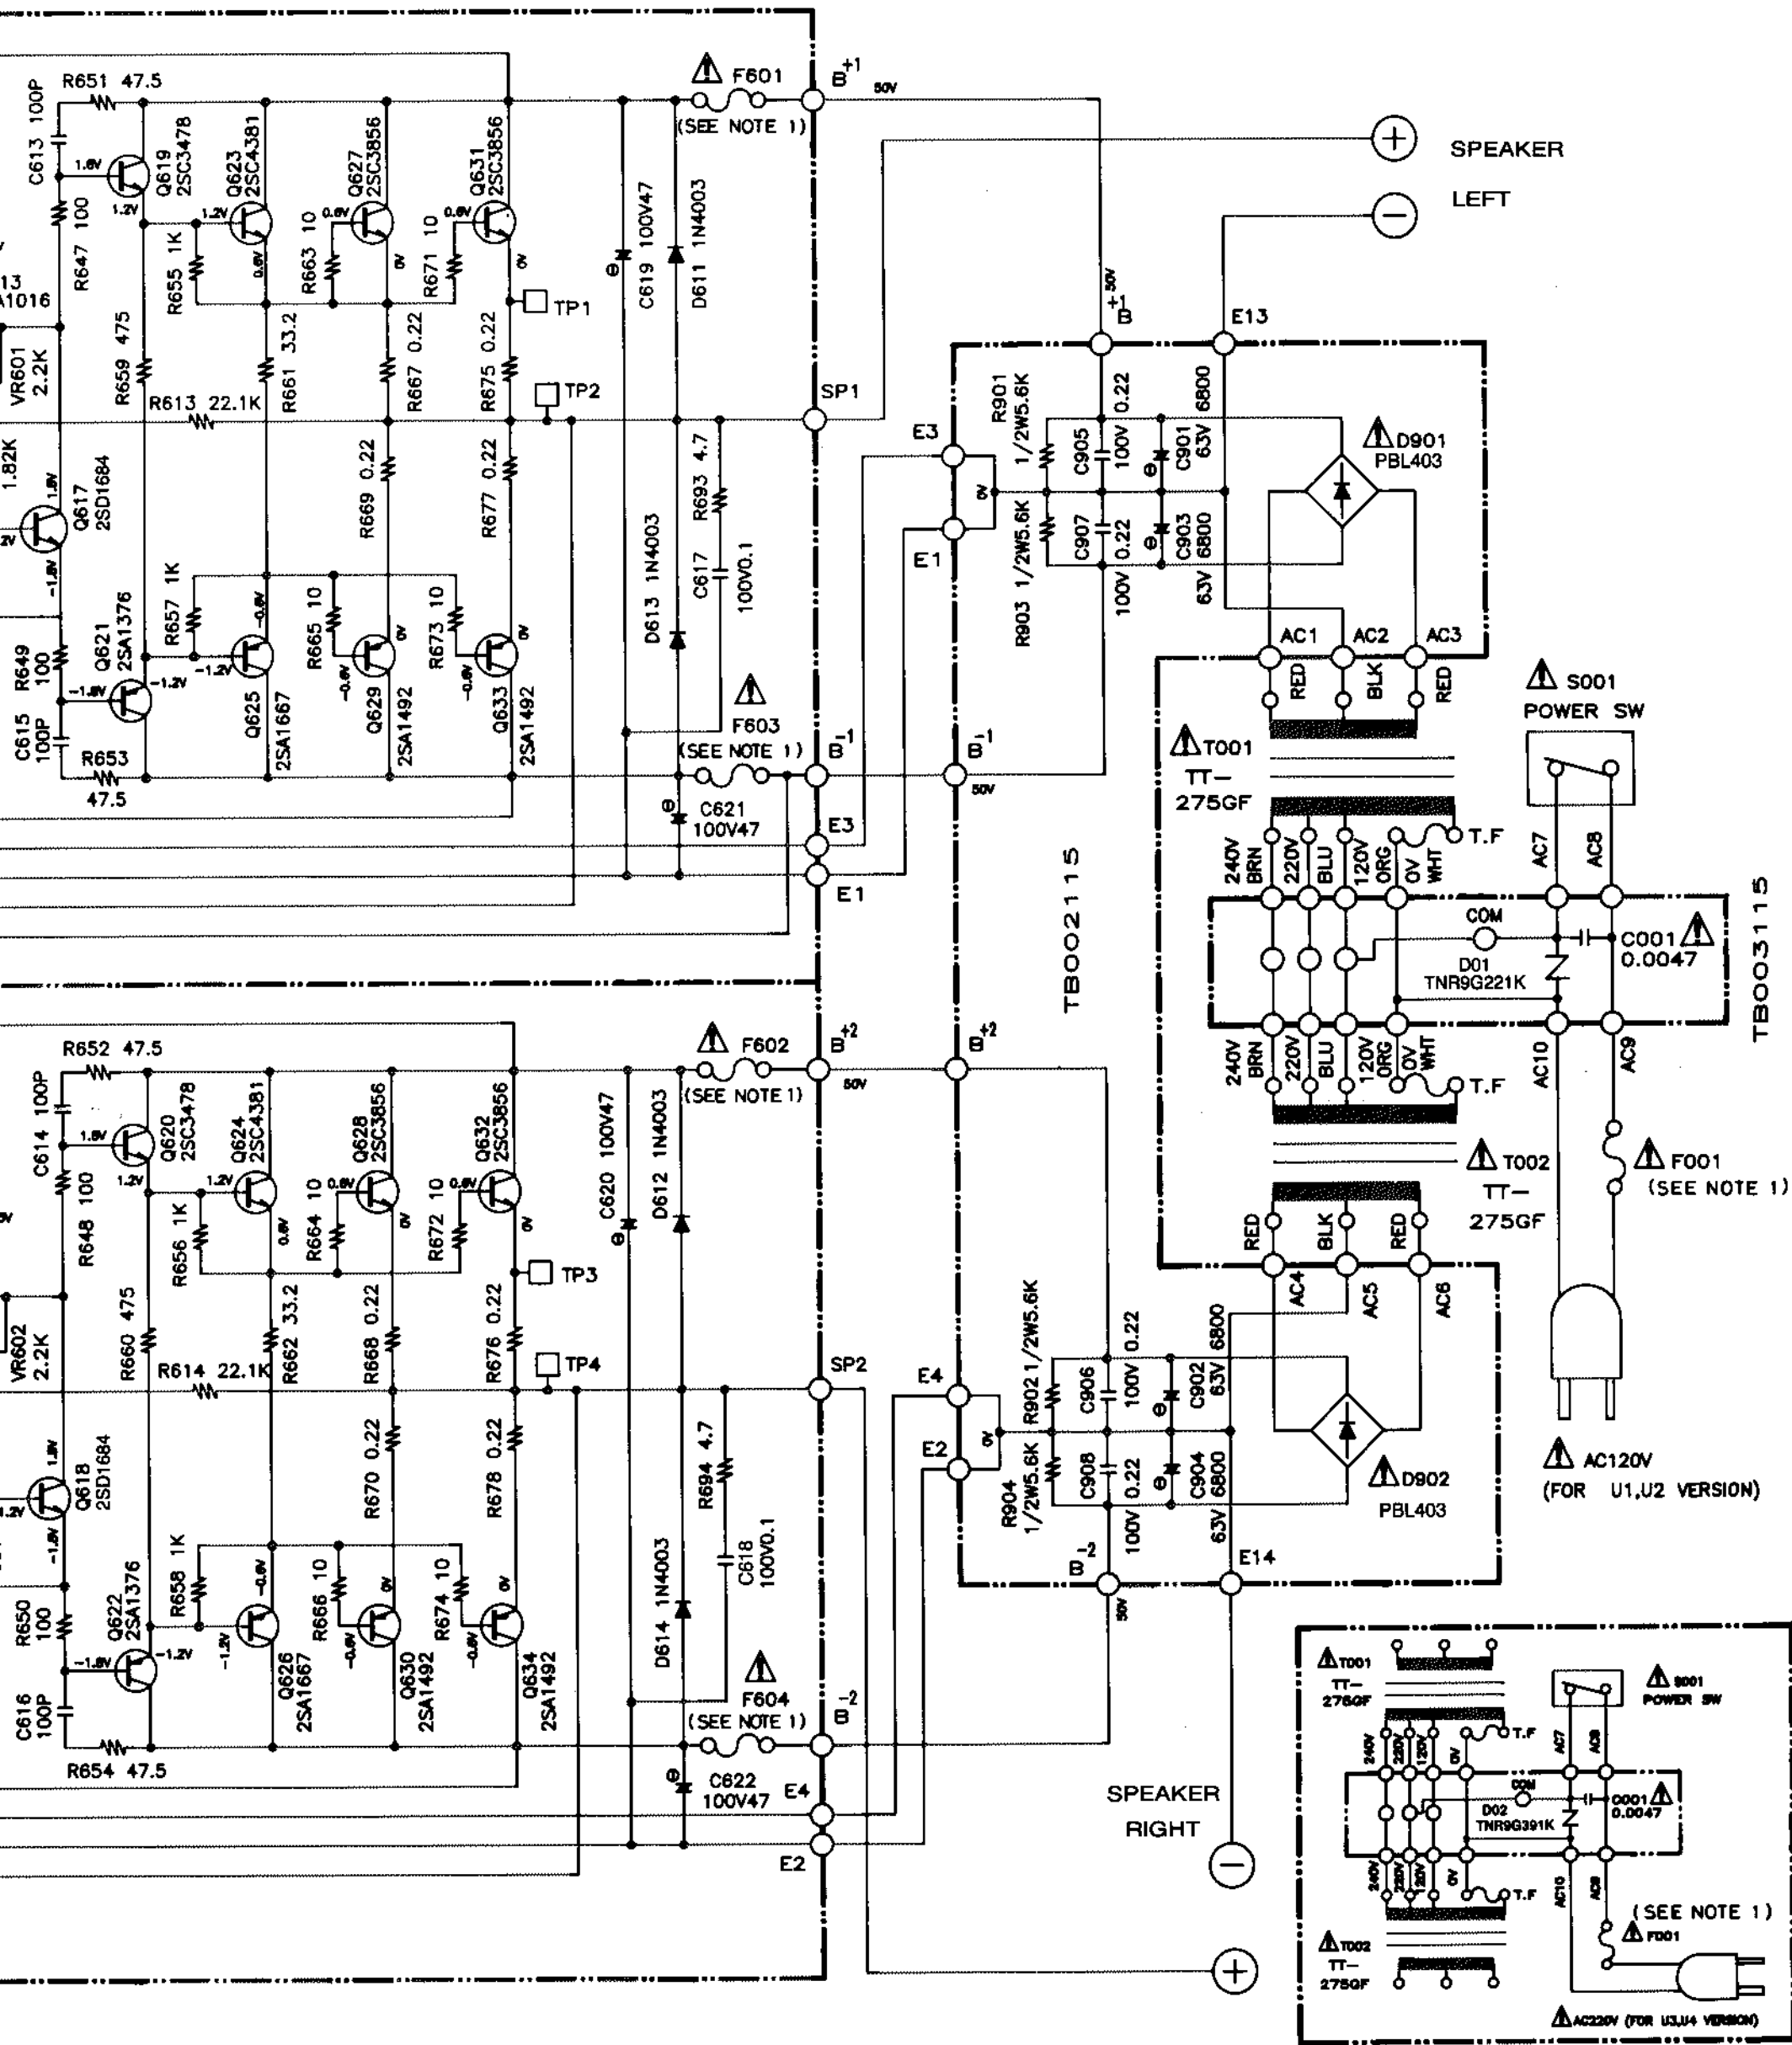

LEFT AMPLIFIER PCB

INSTRUCTION TO SERVICE:
 1). USE ONLY REPLACEMENT COMPONENTS WITH IDENTICAL CHARACTERISTICS.
 2). MAKE LEAKAGE-CURRENT TESTS TO DETERMINE THAT COMPONENTS ARE PROPERLY INSULATED FROM THE CHASSIS OF THE UNIT TO THE CU

INSTRUCTION TO MODIFY CIRCUITRY AND/OR CHANGE COMPONENTS
PRIOR NOTICE OR INCURRING ANY LIABILITY.

INSTRUCTION TO SERVICING PERSONNEL:
 1). USE ONLY REPLACEMENT PARTS THAT HAVE THE CRITICAL CHARACTERISTICS RECOMMENDED BY MANUFACTURER.
 2). MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE AC SUPPLY CIRCUIT BEFORE RETURNING THE UNIT TO THE CUSTOMER.
