DIAL STRINGING PROCEDURE

- 1—Rotate drum to maximum counterclockwise position.
- 2—Fasten string and spring to drum as shown, winding dial cord counterclockwise around drum. Keep string taut while stringing, or slippage may result when stringing is completed.
- 3—After completing stringing, set pointer to zero (0) on the dial logging scale, and glue pointer to dial cord.

If replacement parts are out of stock, locally, they may be obtained directly from the Parts Department of FISHER Radio Corporation. They will be shipped "best way", either prepaid or C.O.D. unless otherwise specified.

For instrument-operation information and technical assistance write Richard Hamilton, Customer Relations Department, FISHER Radio Corporation, Long Island City, New York 11101.

NOTE: The above procedure is based on the use of the FISHER Model 300 Multiplex Generator.

1 — In steps 2 through 11, the audio output of the Multiplex Generator should be connected to lug 1 of the multiplex sub-chassis through a 12,000 ohm, 1/2-watt, carbon resistor, and a 180 uuf capacitor should be connected between lug 1 and ground. The wiring from the MPX TEST jack on the main chassis to lug 1 must be disconnected during Steps 2 through 11.

2 — The vertical amplitude of the Lissajous pattern will increase slightly

as the generator output is increased. This is a normal occurrence.

3 — If DC VTVM reading falls below -9 volts when maximum reading is obtained on the AC VTVM, readjust bottom of Z100, then repeat Step 5. Repeat this procedure until maximum AC VTVM reading is obtained with DC VTVM reading greater than -9 volts.

4 — Tune the FISHER to the RF output frequency of the Multiplex Generator.

ALIGNMENT INSTRUCTIONS

- Set the SELECTOR switch to the MONO position for the entire alignment procedure.
- Rotate the TUNING knob to its maximum counterclockwise position. (Dial pointer must line up with the zero (0) calibration mark at the left-hand end of the logging scale without forcing—reset dial pointer if necessary.)
- Warm up the receiver and the test equipment for at least 15 minutes before beginning alignment.
- Adjust the line voltage for 117-volts, 50- to 60-Hz (cps) AC.

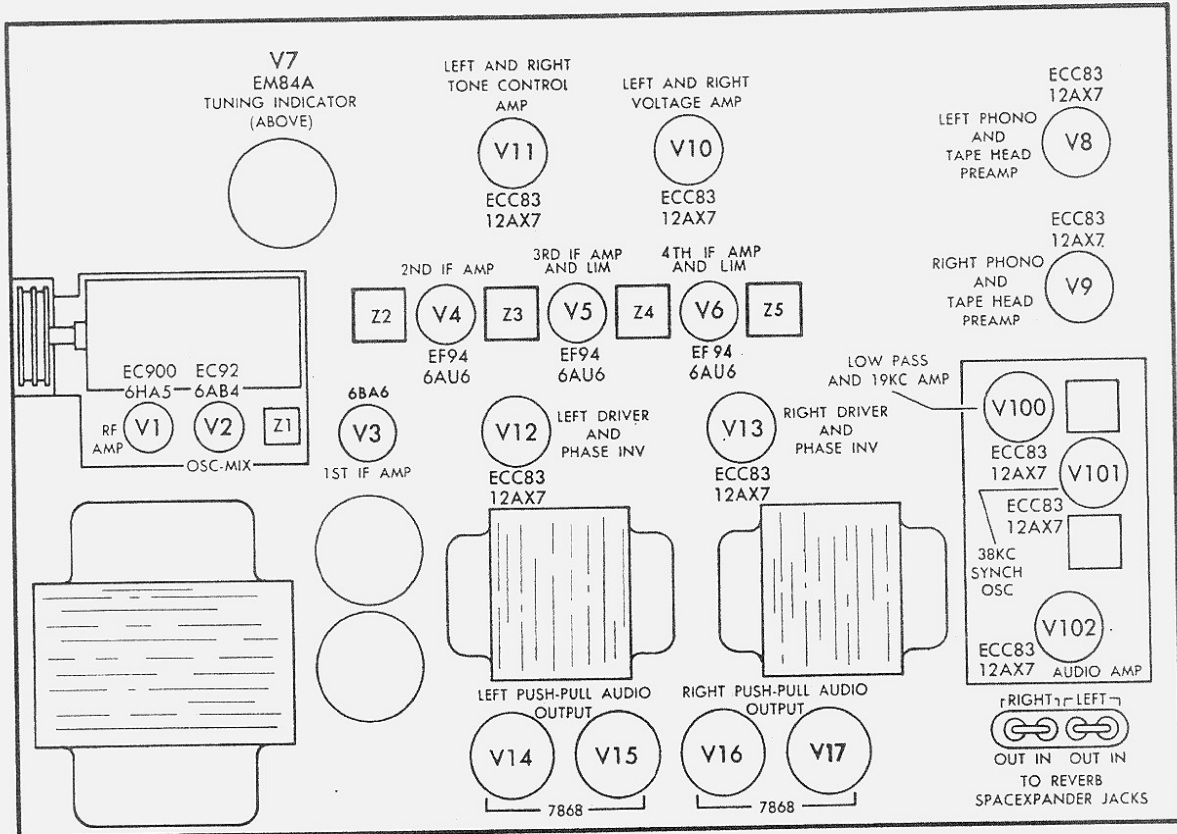

WARNING: Only use the proper, fully insulated, alignment tools to prevent breakage or damage to the adjustable circuit components.

NOTE: Reduce signal-generator output during alignment to keep VTVM readings below the specified voltages.

STEP	DIAL	SIGNAL GENERATOR			DC VTVM	ADJUST	INDICATION
		GENERATOR COUPLING	FREQ.	MOD.			
1	Set dial pointer for extreme C.C.W. position.	Ungrounded tube shield of V2	10.7 MHz (MC)	None	TEST POINT 3	Z1, Z2, Z3 top and bottom; Z4 bottom	Maximum negative voltage (below -5 volts)
2					---	Z4 top	Maximum indication on TUNING INDICATOR
3					Across C41	Z5 bottom	Maximum indication (below -20 volts)
4					Hot lead of DC VTVM to TEST POINT 4; Common lead to ground	Z5 top	Zero indication on zero-center dial.
5	90 MHz (MC)	Two 120-ohm carbon resistors in series with generator leads to the Normal antenna terminals.	90 MHz (MC)	± 22.5 kHz (KC) deviation at 400 cps	Through 100K resistor to TEST POINT 2	L4, L3 and L2	Adjust for maximum negative voltages and check for sine wave-form, with scope at Left or Right RCRDR output.
6	106 MHz (MC)		106 MHz (MC)	± 22.5 kHz (KC) deviation at 400 cps	Through 100K resistor to TEST POINT 2	C10, C8 and C3	
7	98 MHz (MC)		98 MHz (MC)	± 22.5 kHz (KC) deviation at 400 cps	Through 100K resistor to TEST POINT 2	L1	
8	Repeat steps 6 and 7 for proper dial calibration and maximum output.
