## FEATURES

The MODEL ELEVEN is a stereo receiver incorporating a switchable 2-channel DOLBY system to reduce noise, inherent in recording music from records, tape and FM broadcasts.

### 1. Built-in Dolby Unit

Switching over the Mode switch allows the sound characteristics for recording and playback to be selected. Also the incorporated Dolby Unit can be used for the reception of Dolbyized FM broadcasts; by pressing the push-button, time constants of  $75\mu\text{sec}$  and  $25\mu\text{sec}$  can be selected, corresponding to the broadcast to be received, thus improving the S/N ratio and increasing the area in which reception is possible.

### 2. Timer on Front Panel (Up to about 2 hours)

The Model ELEVEN is equipped with a TIMER control which enables turning off the set automatically at any pre-determining time within two hours from the time of setting.

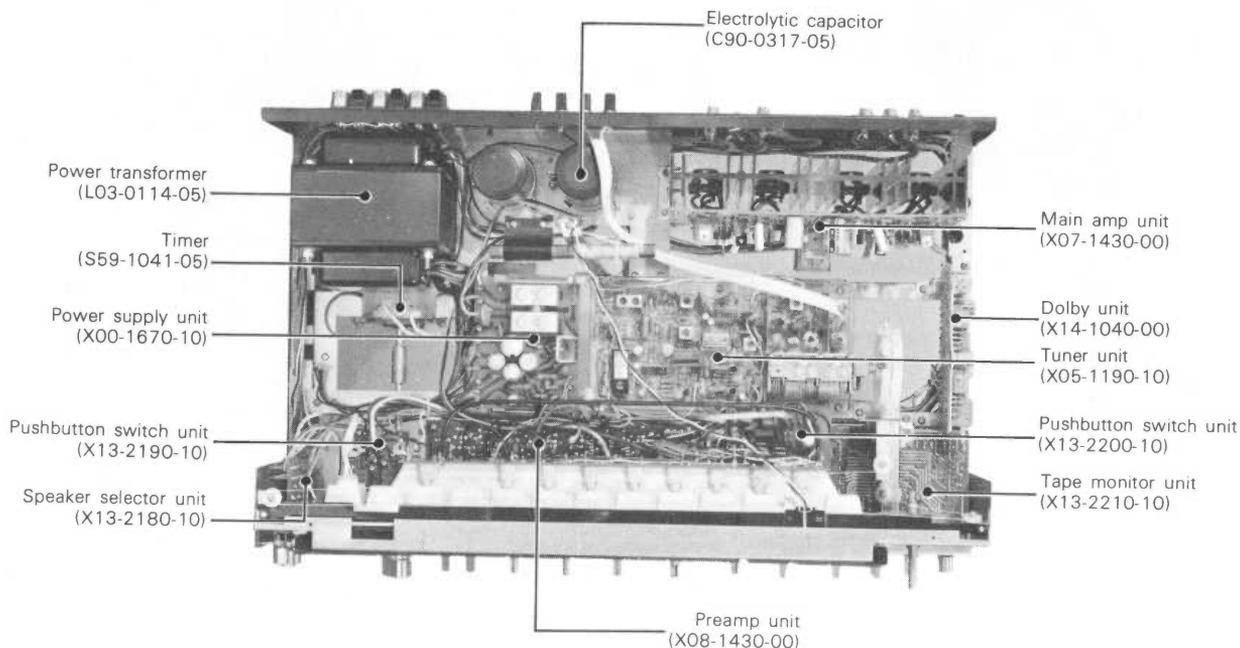

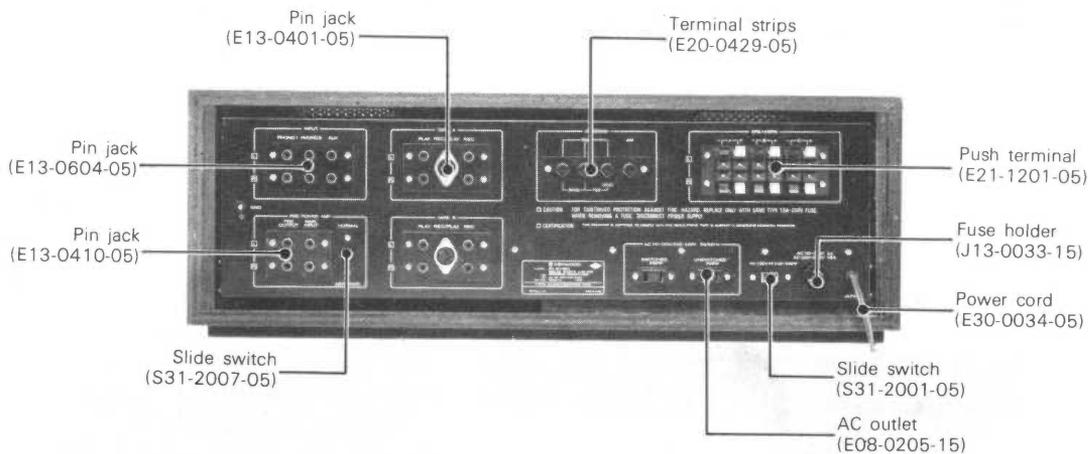

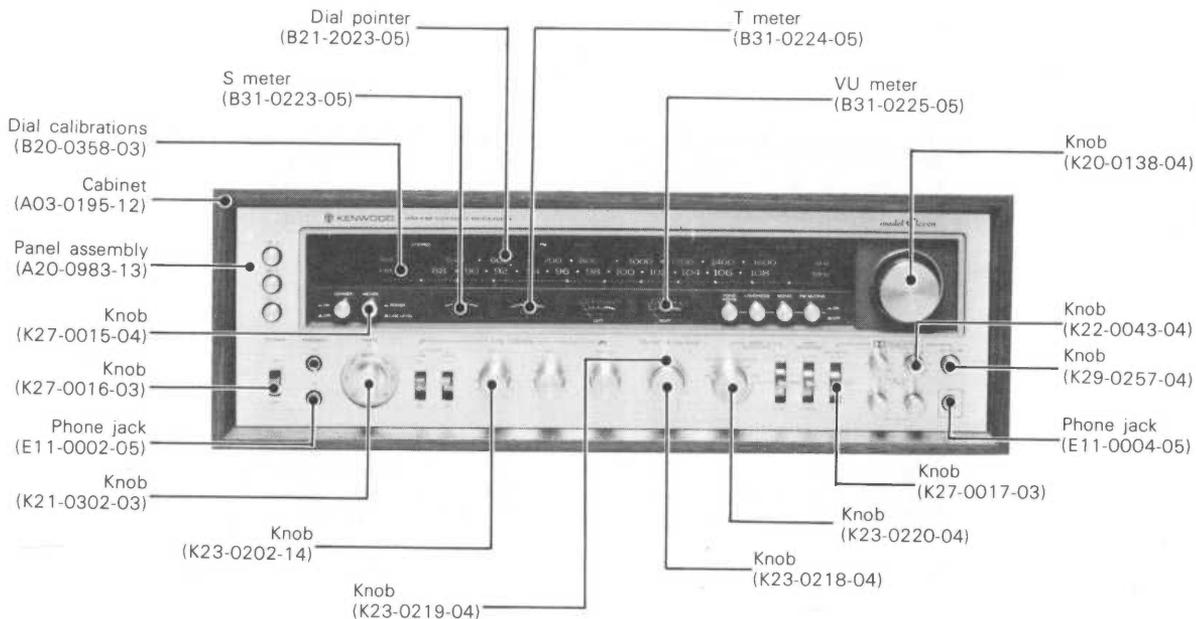

### 3. Convenient and Versatile Meter

This receiver is equipped with a 3-way meter. By switching over the meter switch, it can be used as:

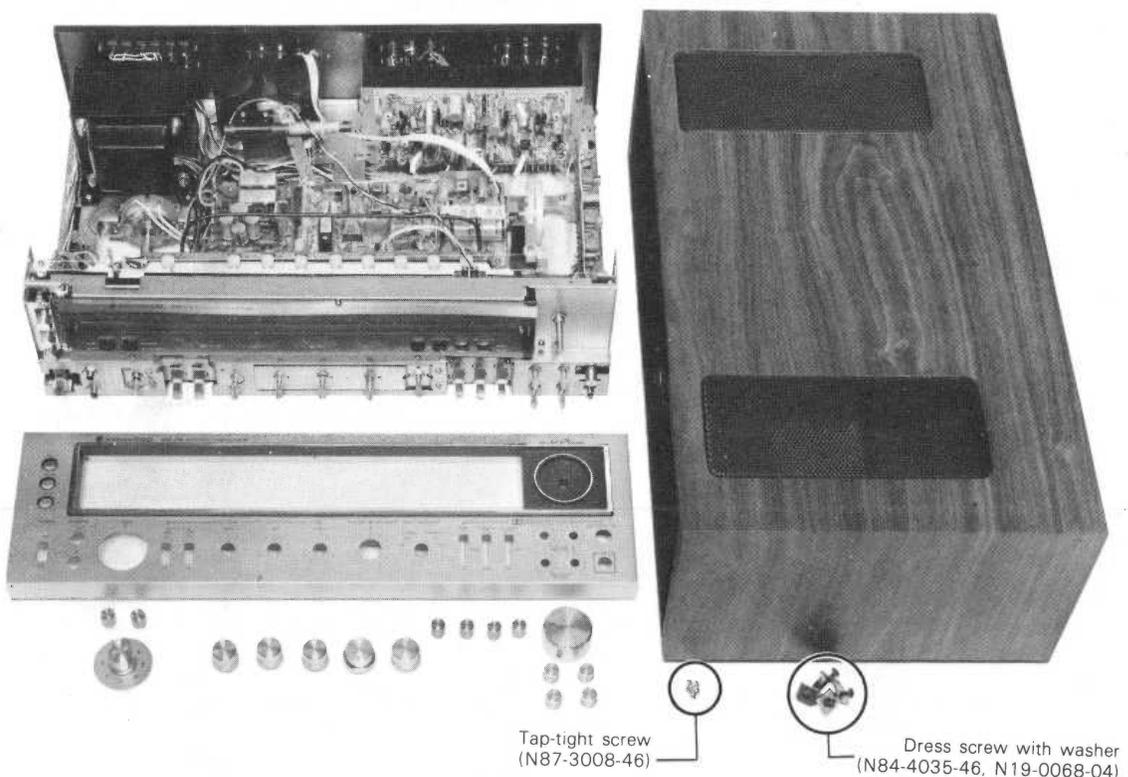

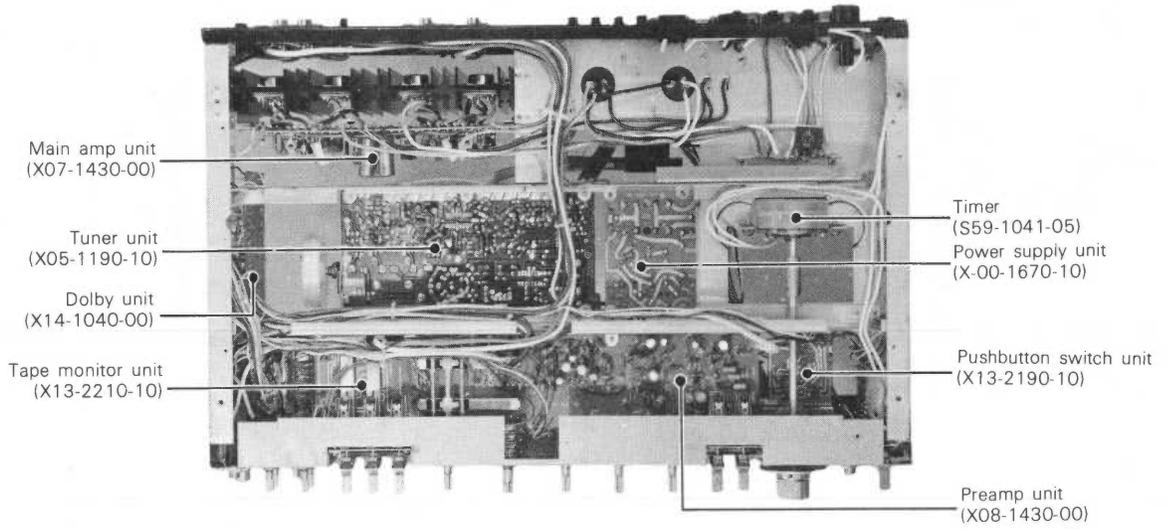

- 1) Output Power Meter
- 2) Line Level Meter
- 3) 400Hz Tone Calibration Meter

**NOTE:** The MODEL ELEVEN is shipped to PX (U type) and other area (M type).  
DOLBY is a trade mark of DOLBY Laboratories, Inc.

# EXTERNAL & TOP VIEW

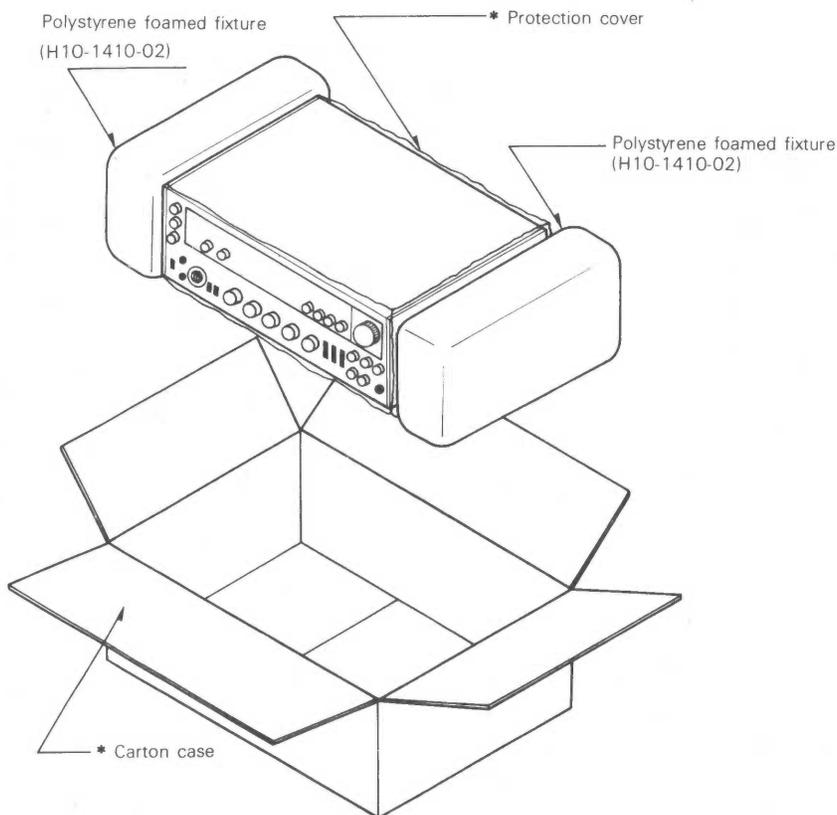

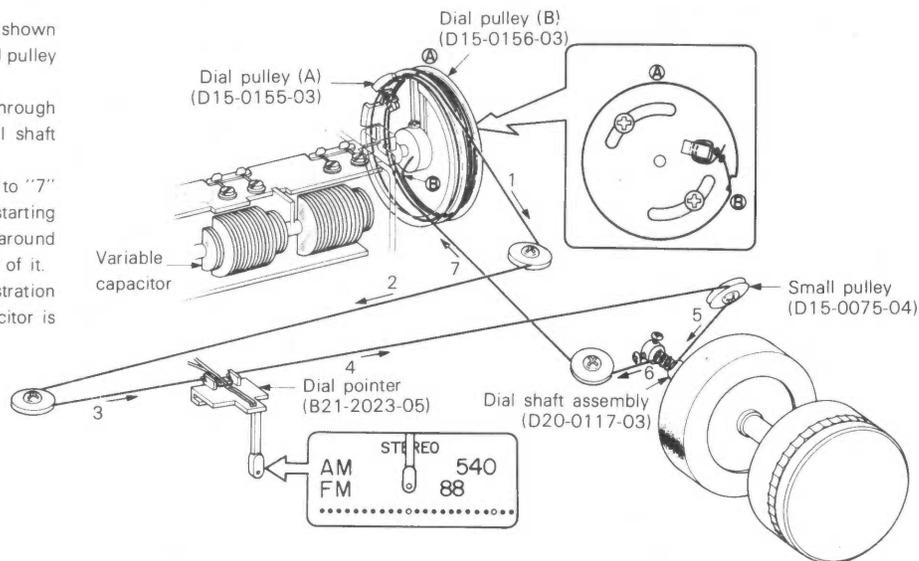

# BOTTOM VIEW / DISASSEMBLY

# DIAL CORD STRINGING/PACKING

1. Fully open the variable capacitor.
2. Assemble the dial pulley (A) with the pulley (B) and fix them on the shaft of the variable capacitor using 2 screws.
3. Tie the end of the dial cord to the boss as shown and wind the cord one turn around the dial pulley (A).
4. Dress the dial cord in the direction of "1" through "5" and wind it 3 turns around the dial shaft starting from its lower side.
5. Dress the dial cord in the direction of "6" to "7" and wind it 2 turns around the pulley (B) starting from its lower side. Then, wind it 2 turns around the boss at the rear side and tie the end of it.
6. Mount the dial pointer as shown in the illustration while making sure that the variable capacitor is fully closed.

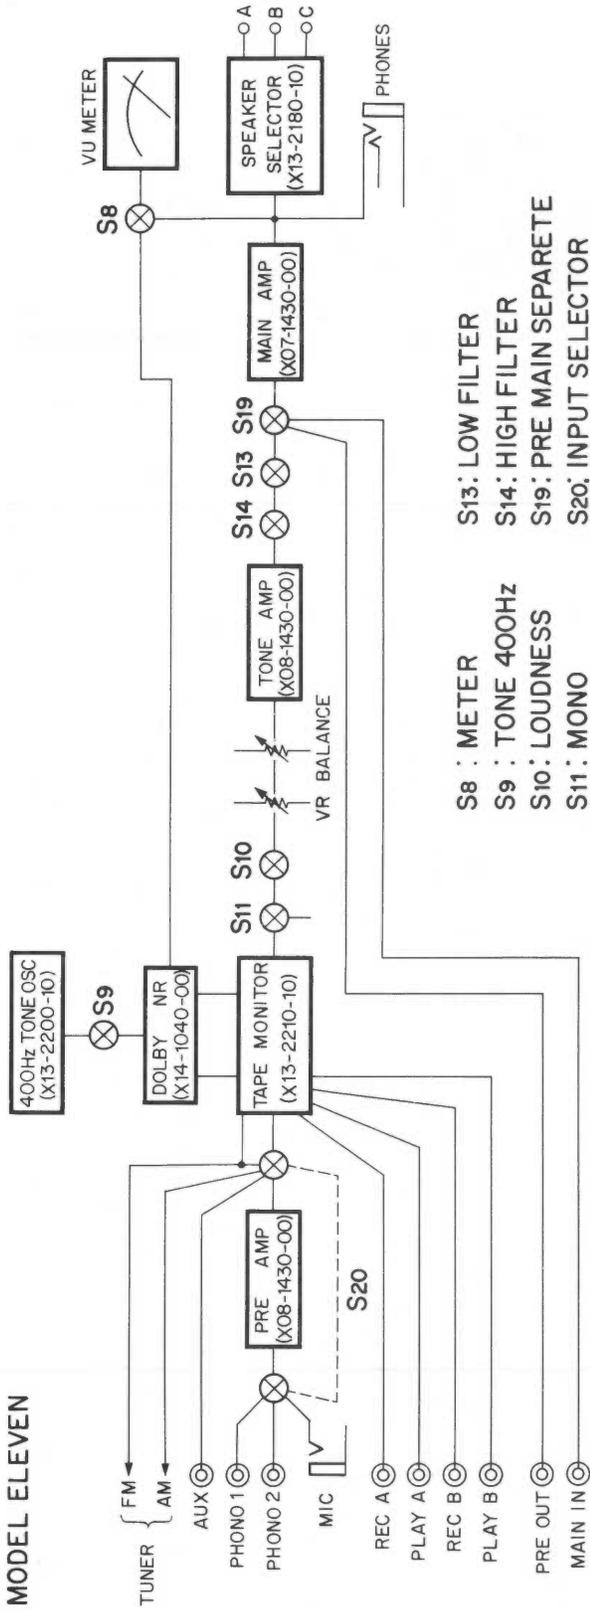

Dial Cord: 220 cm, 0.5φ

## TUNER

# BLOCK DIAGRAM

## TAPE MONITOR & DOLBY NR CIRCUIT

# CIRCUIT DESCRIPTION

## 1. DOLBY NOISE REDUCTION SYSTEM

The purpose of Dolby NR (noise reduction) system is to reduce the background noise not contained in recording signal, such as hiss, cross talk and print-through noise which occur after the recording process.

The Dolby NR System boosts the low level signal at the recording and, at the playback, it reduces the previously boosted parts of signal together with the level of the background noise. In this manner, the ratio of the signal level to the background noise level becomes larger by the amount boosted, thus improving the S/N ratio.

The Kenwood's Cassette Tape Deck, Model KX-700, KX-710 or KX-910, is equipped with the Dolby NR System.

The Model ELEVEN is also equipped with Dolby NR circuit having the same feature so that Dolbyized recording and playback can be readily made when connected to a tape deck not equipped with a Dolby NR System.

For the detailed information on the Dolby NR System, refer to the Service Manual of KX-700.

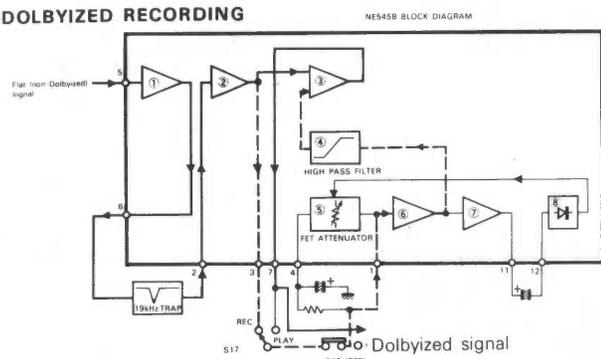

## 2. DOLBY NR CIRCUIT USING MONOLITHIC IC

This model uses a monolithic IC NE545B in the Dolby NR circuit to improve the stability and reliability.

### (1) DOLBYIZED RECORDING

The incoming flat signal is applied to No. 5 pin of IC and is amplified by Amp ②. A part of signal is directly fed to the input of Amp ③ while the rest of the signal (addition signal) is fed to the input of Amp ③ through the high pass filter ④. These two signals are added together in Amp ③ and delivered from No. 7 pin as a recording output (Dolbyized signal). In this case, the rectified voltage of Amp ⑦'s output signal controls the FET attenuator, thus the amount of addition is increased as the signal level becomes lower.

### DOLBYIZED RECORDING

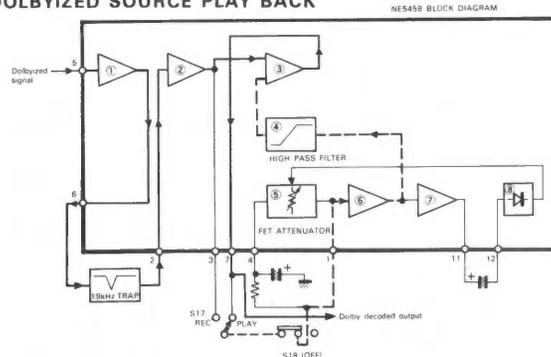

### (2) DOLBYIZED SOURCE PLAYBACK

The Dolbyized incoming signal is applied to No. 5 pin of IC and is amplified by Amp ②. This signal is directly fed to the input of Amp ③ while the signal (subtraction signal) passing through the high pass filter ④ is fed to the other input of Amp ③.

The addition and subtraction signals are in opposite phase to each other. In this case, these two signals are subtracted in Amp ③ and a normal output signal is delivered up from No. 7 pin.

### DOLBYIZED SOURCE PLAY BACK

## 3. DOLBYIZED FM BROADCASTS

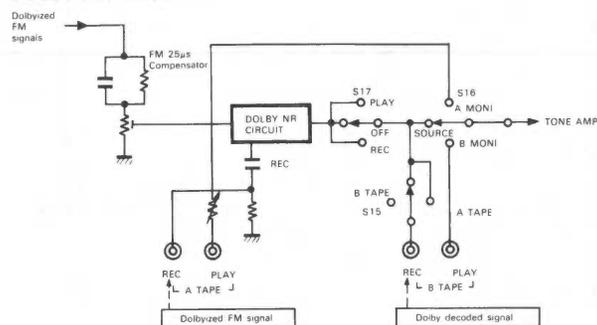

The Dolbyized FM broadcasts signal is transmitted at 25 $\mu$ sec time constant through an encoder of Dolby "B" type Noise Reduction System. The Dolby NR System, when used in FM broadcast, provides various features such as enlargement of broadcast service area, reduction of interference noise during transmission, simplification of antenna system, etc. In the U.S.A. there are more than 70 FM stations using the Dolby NR System at present, though some of them are under the stage of preparation. The Dolbyized FM broadcasts from these stations can be received by the Model ELEVEN.

## 4. FUNCTIONS OF TAPE MONITOR CIRCUIT (X13-2210-10)

### (1) FUNCTION AT DOLBY FM SWITCH ON

When the Dolby FM switch is turned to ON, the circuit is used for playback of Dolbyized FM broadcasts regardless of the position of the INPUT SELECTOR. In this case, Dolbyized FM signal appears at the "A" TAPE REC terminal and a flat (Dolby decoded) signal at the "B" TAPE REC terminal. The output signal to the tone amplifier is a flat signal.

### DOLBY FM RECEPTION

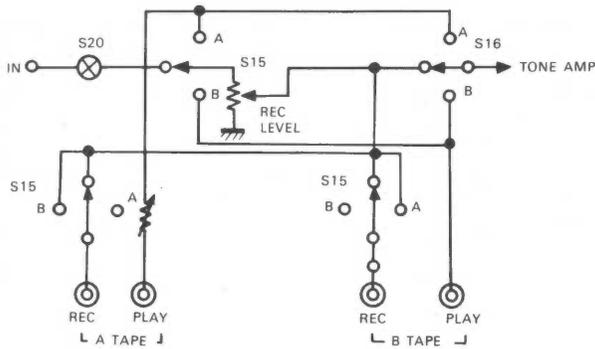

# CIRCUIT DESCRIPTION

## (2) FUNCTION AT DOLBY FM SWITCH OFF AND NR MODE SWITCH OFF

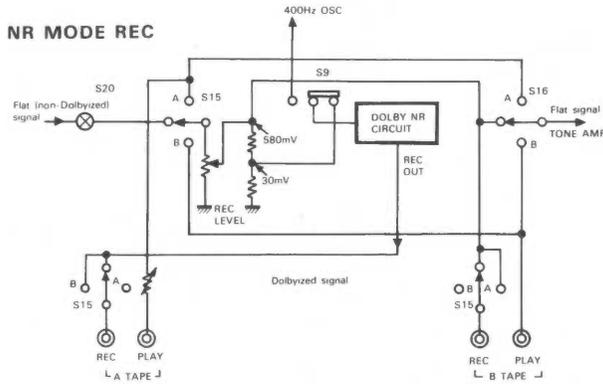

The circuit is released from the Dolby NR mode and acts as a normal tape monitor circuit. There are no output at the "A" REC terminal for "A" TAPE PLAY and the "B" REC terminal for "B" TAPE PLAY.

### NR MODE OFF

## (3) FUNCTION AT NR MODE SWITCH REC

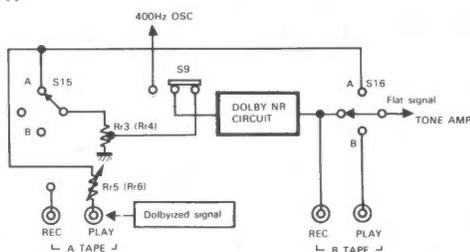

Either the input selected by S20 or the input at the "B" PLAY terminal is Dolbyized and appears at the "A" REC terminal, while the non-Dolbyized signal appears at the "B" REC terminal. (When the input is selected by S20)

## (4) FUNCTION AT NR MODE SWITCH PLAY

The circuit is used for "A" PLAY only. If a Dolbyized signal is applied to the "A" PLAY terminal, the output becomes a flat signal.

### NR MODE PLAY

# ADJUSTMENTS

- \* Tuning dial is set to the proper point corresponding to no radio stations.
- \* The sweep and the r.f. generator are set to the lowest response possible on oscilloscope.
- \* When connecting the r.f. generator to the antenna terminal use the dummy antenna ..... refer to Fig. 2.
- \* Use the insulated screwdriver adjusting the i.f.t.
- \* FM MUTING is OFF position unless it is required.
- \* Test points are shown in the schematic diagram, and PC board.
- \* For TRACKING adjustment, repeat several times and confirm the reception of broadcasting.

# SCHEMATIC DIAGRAM (1)

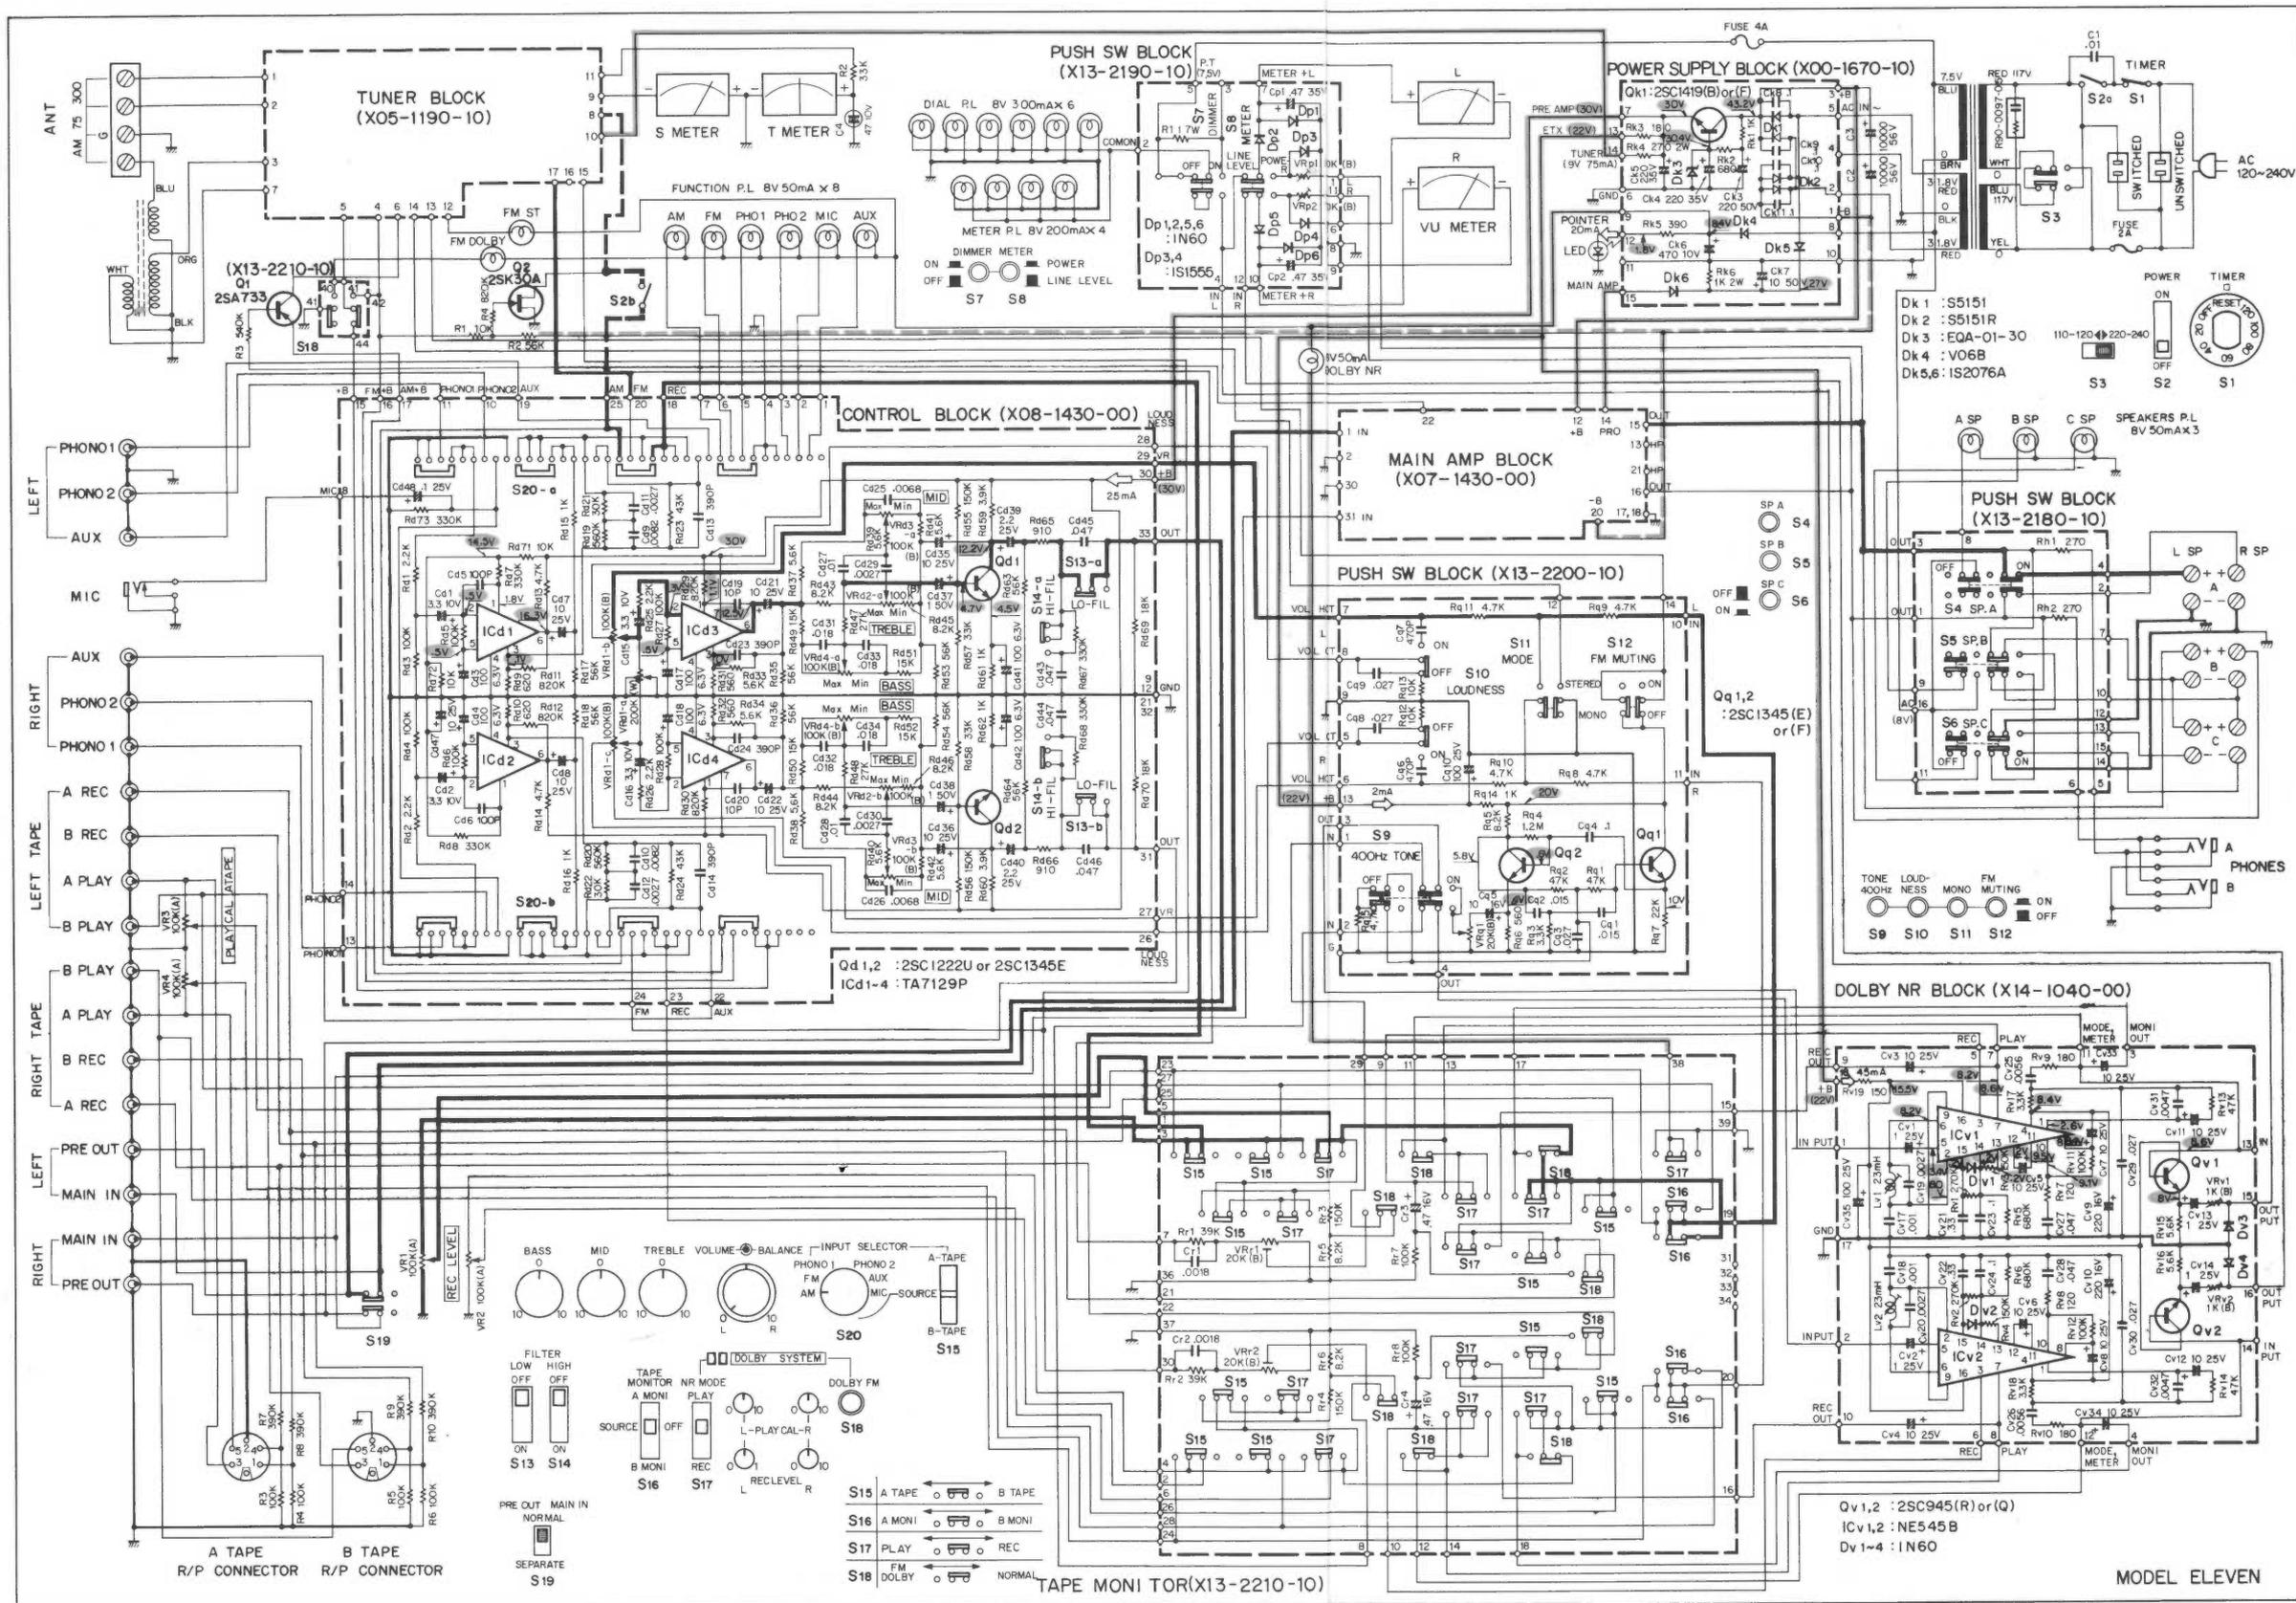

DC voltage is at FM stereo reception.  
( ) is at AM reception.

MODEL ELEVEN

# SCHEMATIC DIAGRAM (2)

DC voltage is measured by Tester (DC2541/V)

## SPECIFICATIONS

### FM TUNER SECTION

**Frequency Range:** 88 MHz to 108 MHz  
87.5 MHz to 108 MHz  
(FTZ approved)

**Usable Sensitivity (IHF):** 1.8 $\mu$ V

**50 dB Quieting:** 4.0 $\mu$ V

**Signal to Noise Ratio:** 70 dB (at 1mV input)

**Harmonic Distortion:** 0.2% (MONO)  
(at 400 Hz 100% mod) 0.5% (STEREO)

**Image Rejection:** 70 dB

**Selectivity (IHF ALT channel):** 70 dB

**IF Rejection:** 100 dB

**Capture Ratio:** 1.5 dB

**Stereo Separation:** 38 dB (at 1,000 Hz)

**Antenna Impedance:** 300 ohms Balanced and  
75 ohms Unbalanced

### AM TUNER SECTION

**Usable Sensitivity:** 20 $\mu$ V

**Signal to Noise Ratio:** 50 dB (at 1mV input)

**Image Rejection:** 60 dB

**Selectivity (IHF):** 30 dB

**Antenna:** Built-in ferrite bar antenna, External antenna terminal

### POWER AMPLIFIER SECTION

**Power Output:** 60 watts per channel minimum, RMS at 8 ohms from 20 Hz to 20,000 Hz with no more than 0.3% total harmonic distortion

**Both Channel Driven:** 63 watts per channel into 8 ohms at 1,000 Hz  
80 watts per channel into 4 ohms at 1,000 Hz

**Dynamic Power Output:** 270 watts into 4 ohms

**Total Harmonic Distortion:** 0.3% at rated power into 8 ohms  
0.1% at 1/2 rated power into 8 ohms at 1,000 Hz

**Inter Modulation Distortion:** (60Hz : 7,000Hz = 4 : 1) 0.3% at rated power into 8 ohms  
0.1% at 1/2 rated power into 8 ohms

**Power Bandwidth:** 10 Hz — 60,000 Hz

**Damping Factor:** 50 at 8 ohms

**Speaker Impedance:** Accept 4 ohms to 16 ohms

### PRE-AMPLIFIER SECTION

#### Input Sensitivity, Impedance and S/N (IHF A curve)

**Phono 1:** 2.5mV, 50 kohms, 77 dB

**Phono 2:** 2.5mV, 50 kohms, 77 dB

**AUX:** 150mV, 50 kohms, 95 dB

**Tape Play A,B:** 150mV, 50 kohms, 95 dB

**MIC:** 2.5mV, 50 kohms, 70 dB

#### Output Voltage and Impedance

**Tape Rec (pin):** A: 150mV, 80 ohms.  
B: 580mV, 80 ohms

**(DIN):** A: 30mV, 80 kohms.  
B: 120mV, 80 kohms

**Pre Out:** 1V, 1 kohms

#### Frequency Response

**Phono 1, 2:** RIAA Standard curve  $\pm 0.5$  dB

**AUX, Tape Play:** 10 Hz — 40,000 Hz  $\pm 1.0$  dB

#### Tone Controls

**Bass:**  $\pm 10$  dB at 100 Hz

**MID:**  $\pm 10$  dB at 800 Hz

**Treble:**  $\pm 10$  dB at 10 kHz

**Loudness (—30 dB):** +10 dB at 100 Hz  
+5 dB at 10 kHz

**Low Filter:** —9 dB at 10 Hz

**High Filter:** —9 dB at 10 kHz

### GENERAL

#### Switches

**Speaker Selector:** A, B, C

**Input Selector:** AM—FM—PHONO 1  
—PHONO 2—MIC—AUX  
—A TAPE—B TAPE

**Mode:** MONO—STEREO

**Meter:** Power—Line Level (Dolby NR Cal.)

**Tape Monitor:** A—Source—B

**Dolby NR Mode:** PLAY—OFF—REC

**Other Switches:** Dolby FM, 400 Hz Tone, FM Muting, Loudness, High Filter, Low Filter, Dimmer, Power

#### Special Functions:

2 Hour Shut-off Timer, Dolby NR System, 2 Power Meter, Triple Tone Control, 2 Head Phones, Selector Indicator

#### AC Outlet:

Switched 1, Unswitched 1

**Power Consumption:** 250 watts at full power  
45 watts at no signal

**Dimensions:** W 22-19/32" (574 mm),  
H 7-3/4" (198 mm),  
D 13-25/32" (350 mm)

#### Weight (Net):

35.3 lbs (16 kg)
