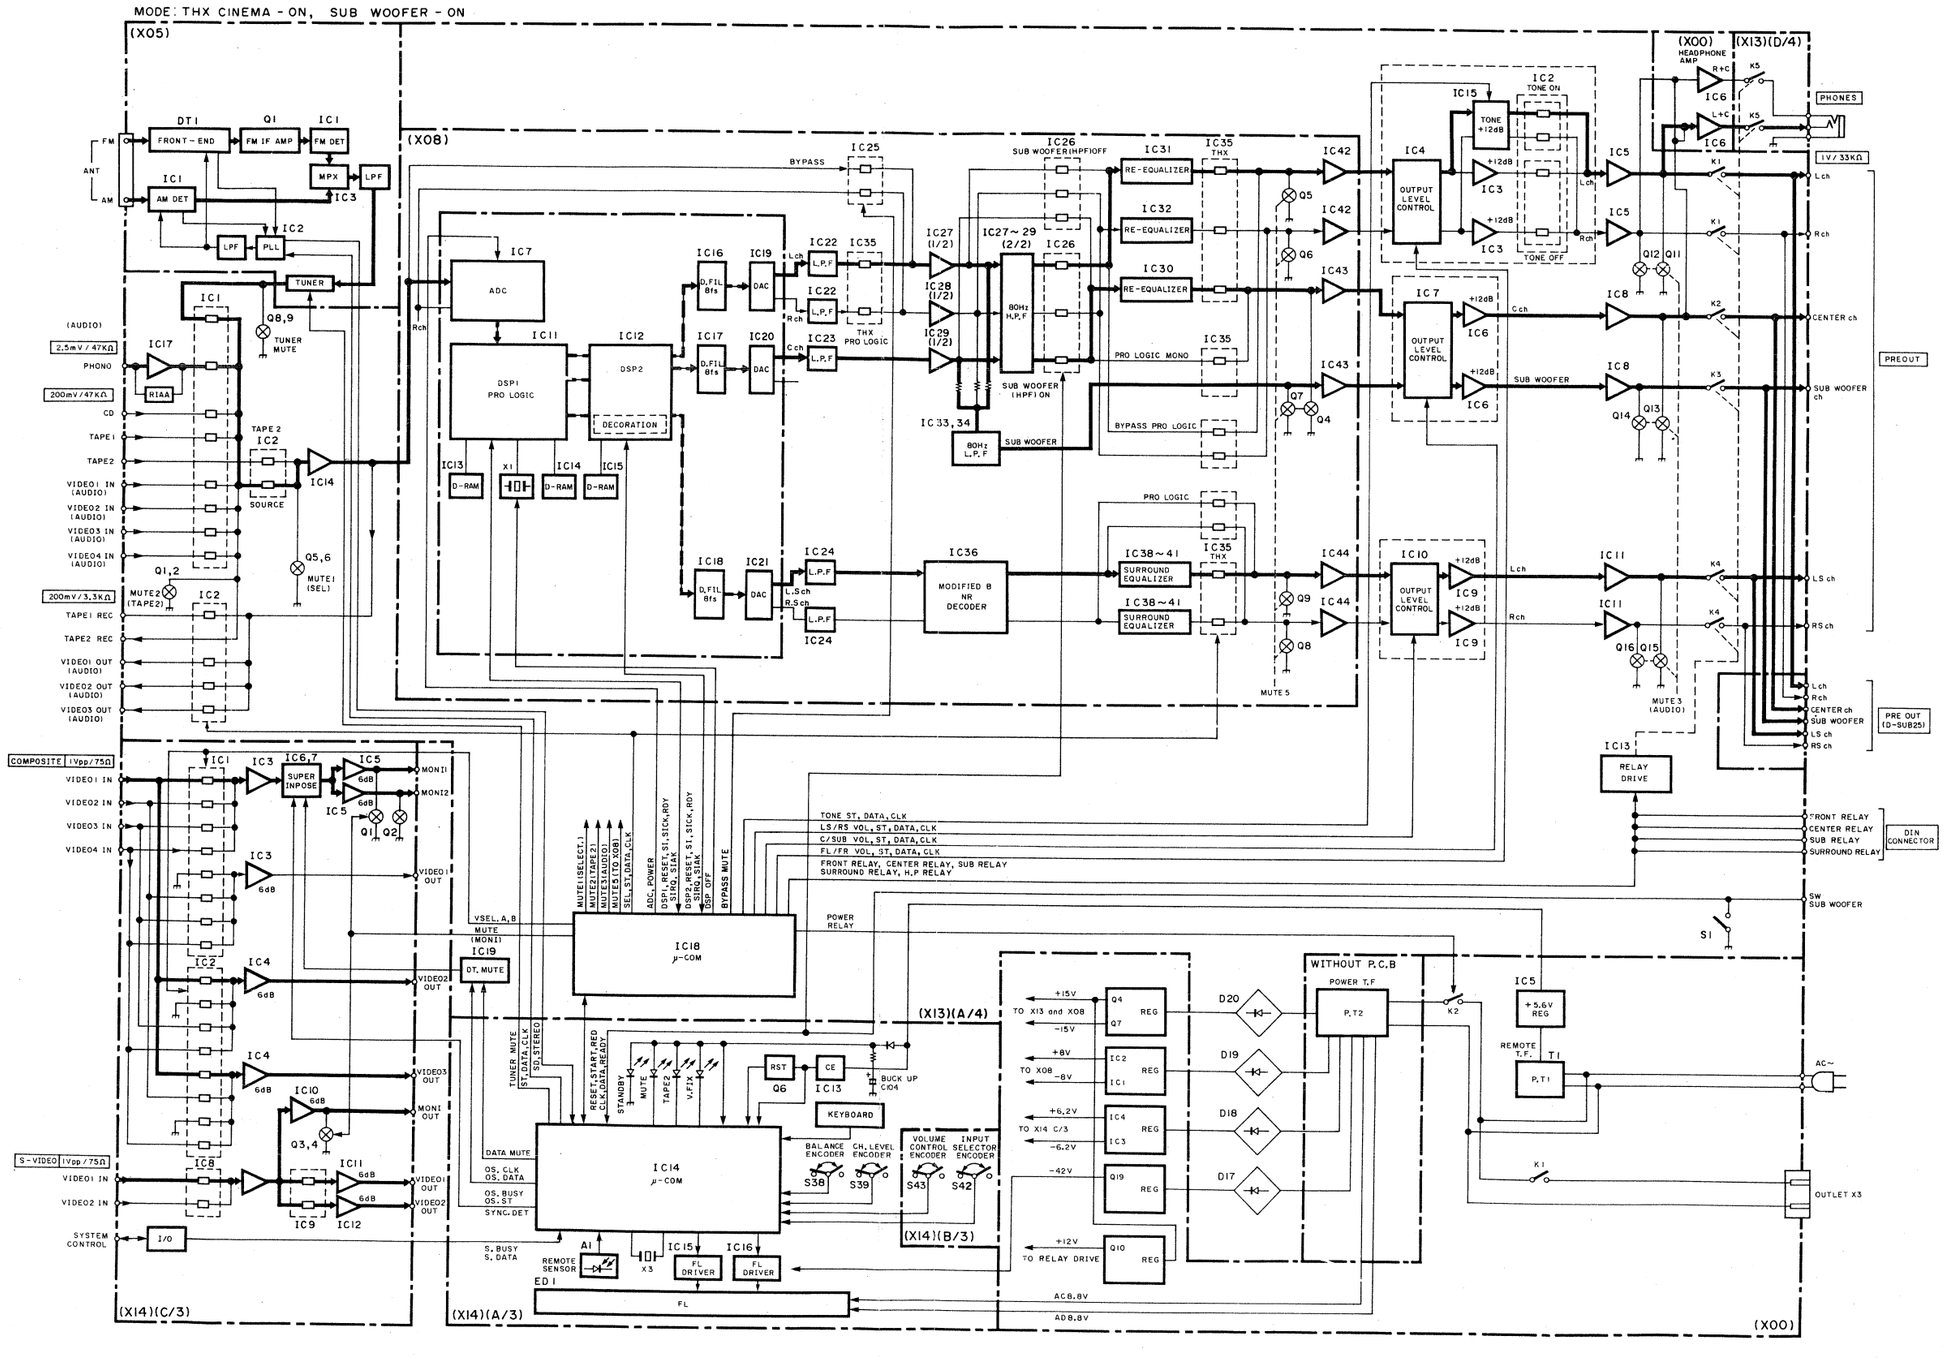
BLOCK DIAGRAM



CIRCUIT DESCRIPTION

1. Outline of THX system

The THX system reproduces a similar Dolby Surround acoustic effect to movie theaters from a video software program carrying the DOLBY SURROUND mark.
The differences between the THX and the Dolby Surround function are as follows:

(1) In the video software carrying the DOLBY SURROUND mark, the high frequencies are enhanced assuming reproduction in a large place such as movie theaters (because high frequencies tend to be attenuated in a large place due to the distance between the speakers and audience).
In consequence, the THX applies re-equalization to the signal to prevent excessive high frequencies when the program is played in home.

(2) The rear component of the Dolby Surround signal is monaural but, to obtain more feeling of presence, the THX reproduces the rear component in simulated stereo by decelerating the rear left and right pitches by 1/100.

(3) To obtain an equivalent feeling of presence to movie theaters, the THX uses the same quality of speakers for the front and center channels. The rear (surround) speakers are located directly to the left and right of the listeners and their sounds are radiated so that the listener does not sense the source of surround sound.

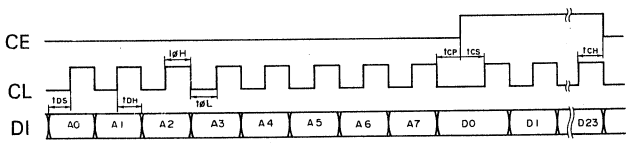
4-5. Data input ADDRESS

- The serial control data consists of 8 address bits and 24 bits of instruction code. The address code is used as the chip select data when the device is connected to the common bus line, and the code configuration is as shown below.

Address							
A0	A1	A2	A3	A4	A5	A6	A7
1	1	1	0	0	1	1	0

Note) Instruction ''CGRAM data write'' requires 56 bits.

- DI, CL and CE timing



The data is input internally at the positive-going edge of CL, and latched at the negative-going edge of CE. When an instruction is sent from the microprocessor, the period after having sent an instruction until the start of the next instruction shall be longer than the instruction execution time.

DC voltages are as measured with a high-impedance voltmeter during reception of the FM broadcast signal (with a signal strength of 60 dB at the ANT terminal).
Values may vary slightly due to variations between individual instruments or/and units. Values in parentheses are as measured during reception of the AM broadcast signal (with a signal strength of 60 dB at the ANT terminal).

CAUTION: For continued safety, replace safety critical components only with manufacturer's recommended parts (refer to parts list). ⚠ Indicates safety critical components. To reduce the risk of electric shock, leakage-current or resistance measurements shall be carried out (exposed parts are acceptably insulated from the supply circuit) before the appliance is returned to the customer.
