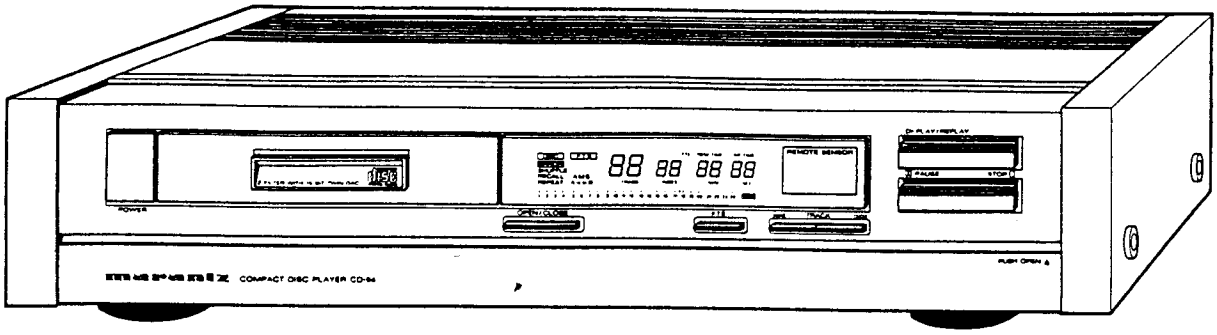
SERVICE MANUAL CD-94

marantz®

model CD-94

Compact Disc Player

MODEL CD-94 COMPACT DISC PLAYER



INTRODUCTION

This service manual was prepared for use by Authorized Warranty Stations and contains service information for the Marantz Model CD-94 Compact Disc Player.

Servicing information and voltage data included in this manual are intended for use by knowledgeable and experienced personnel only. All instructions should be read carefully. No attempt should be made to proceed without a good understanding of circuitry operation.

The parts list furnishes complete ordering information. Most replacement parts should be ordered from the Marantz Company. However, a simple description is included for parts which can be obtained locally.

How to use this service manual

- The "Common parts" which Marantz Japan, Inc. has established are eliminated from this service manual.
- These "Common parts" are applied to all models in the service manuals arranged and issued by MJI.
- To indicate clearly the common parts in the schematic diagram, a line is drawn above or under the Ref. Desig. No. of applicable parts.
- "Common parts" can be supplied from the Marantz service center as ever.
  In case of ordering, please establish the parts number of 10 figures following the procedure mentioned in this service manual "How to establish the parts number for common parts".

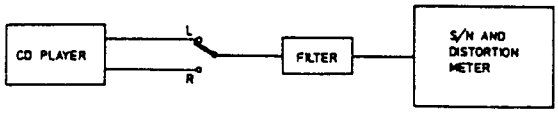
(NOTE)
When you order parts to the Marantz parts center, please take notice of the following points.

1) Please correctly write the parts number of 10 figures following the rule.
2) Since ordering parts by the Ref. Desig. No. or ratings indicated in the schematic diagram does not satisfy the above conditions, the Marantz parts supply system does not work properly.
   As this case is apt to cause a trouble, please pay attention to it.

M 7.73

ELECTRICAL MEASUREMENTS AND ADJUSTMENTS

Specification measurement



To measure the specification use can be made of audio test disc 4822 397 30085.
Use a 7th order filter, e.g. 4822 395 30204 (see Figure), to measure:
— Total harmonic distortion (THD).
— Intermodulation distortion.
— Signal-to-noise (S/N).

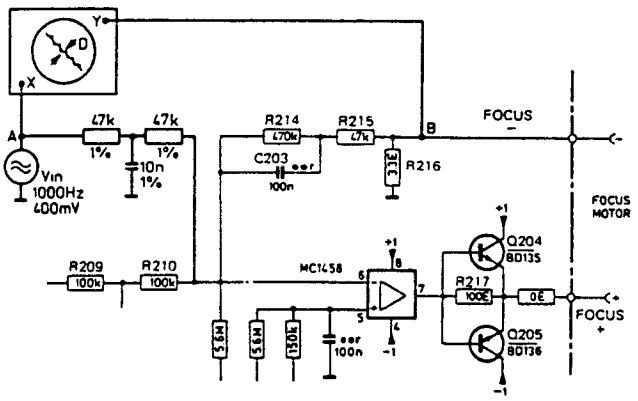
Laser power supply (POS. VOLT. SH.)

For check and preliminary adjustment of the laser supply see service manual C.D.M.-1.

Adjusting the laser supply

Play track 1 of test disc 4822 397 300096 (disc without defects).
Connect a DC voltmeter across resistor R309 on the servo PCB (= on emitter of transistor Q315 and ground).
Adjust the laser power supply with resistor 3180 until the voltage across resistor R309 is 575 ± 75 mV.

Adjusting the focus bandwidth



Make a measuring arrangement according to the figure.
Play track 1 of test disc 4822 397 30096 (disc without defects).
Adjust trimming resistor 3158 on PRE. AMPL. + LASER PCB for a 180° phase difference between signals A and B. This corresponds with a minimum distance D in the Lissajous pattern.

R=47 kΩ - 1% 5322 116 54671
C=10 nF -1% 5322 121 54154

Check of the AGC and offset circuits

(See SERVO PCB)
Play track 1 of test disc 4822 397 80096 (Disc without defects).
The voltage between pin 7 of IC Q303 (4/4) and ⊥ should be -4 V ± 2 V.
The voltage between pin 8 of IC Q302 (2/4) and ⊥ should be 0 V ± 2 V.

INITIATION OF THE SERVICING PROGRAMME OF THE μP

— **Servicing position "0"**

Simultaneously depress the STOP, PLAY and SEARCH ▷▷ buttons. Keep these three buttons depressed while the mains voltage is switched on.

This is the STAND-BY mode, "0" appears on the display.

In this state it is possible to move the arm by means of the SEARCH FORW and SEARCH REV keys with a minimum torque to the outside and the inside resp.
This enables a check of the free motion of the arm across the disc.

— **Servicing position "1"**

From servicing position "0" the player can be brought in servicing position "1" by depressing the NEXT key.

In this state the laser emits light and the objective starts to focus. When the focal point has been reached, "1" appears on the display.

When **no** disc has been inserted the objective goes 16 x to and fro. Then the player reassumes servicing position "0".

As in servicing position "0" the arm can be moved across the diameter of the disc by means of the SEARCH FORW and SEARCH REV keys.

— **Servicing position "2"**

To be reached by depressing the NEXT key after servicing position "1" has been reached.

The turntable motor starts to run

On the display appears "2".

In preparation of the transition to servicing position "3" the arm is sent to the centre of the disc.

— **Servicing position "3"**

To be reached by depressing the NEXT key after servicing position "2" has been reached.

The radial control is switched on. The subcode information is ignored. $\overline{\text{MUSB}}$ is high so that the music information **is released.**

On the display appears "3".

M 7174

(Dependent on the length of the lead-in track music will be reproduced after approx 1 min.)

In this state it is possible to move the arm by means of the SEARCH FORW and the SEARCH REV keys to the outside and to the inside resp. Now the motion is controlled by the μ and the arm moves by steps of 64 tracks as long as the key is depressed.

If one of the servicing positions 1, 2 or 3 is disturbed (e.g. braking or removing the disc) the player reassumes servicing position "0".

The servicing programme can be left by switching the mains switch (POWER ON/OFF) off and on. (Hardware reset).

FAULTFINDING METHOD

Preface

In course of the development of the troubleshooting guide for the Compact Disc it has become clear that a different approach from the one applied so far was required.
For, it is no longer possible to use the classic strategy, i.e. basing the troubleshooting method on a number of possible faults in the unit.
Practice has shown that a certain fault, with the associated symptom, can have a wide variety of causes.
The reason is that this player incorporates a number of feedback loop configurations—which, moreover, might affect each other—and this impedes the obvious measurements.

The method below divides the player from diagram point of view into nine clearly distinguishable subgroups and by performing some measurements, the sub-group being in failure can be isolated. Later the defective circuit can be further examined according to the method given.

PRACTICAL HINTS

Test discs

It is important to handle the test discs with great care.
For, the troubles (black dots, fingerprints, etc.) are exclusively and unambiguously positioned.
Damage can cause additional drop-outs etc. and as a result the conscious fault on this disc is no longer exclusive.
In that case it is no longer possible to check e.g. whether the track detector is working correctly.

Measurements on op-amps

In the electronic circuits of the servo systems op-amps are frequently being applied. These op-amps can be used as amplifiers, as filters, as investors, as buffers, etc.

In those cases where feedback is applied in one way or the other, the voltage difference at the differential inputs inclines to zero. This applies both to DC and to AC.
The cause can be traced back to the properties of an ideal op-amp ($Z_I=\infty$; $G=\infty$; $Z_o=0$).
In practice this means that it is nearly impossible to perform measurements on the inverting and non-inverting inputs of op-amps if one input is directly connected to ground.
In those cases only the output signal will be measurable.

That is why in most cases no AC voltages can be given to the inputs.
The DC voltages at the inputs are equal.

Stimulating with "0" and "1"

In the troubleshooting method certain pins should in a number of cases be connected to ground or be connected to the power supply voltage.
This way of acting offers the possibility to overrule certain circuits and to stimulate others.
In this way the diagnose time can be reduced.

In a number of cases the relevant pins appear to be **op-amp outputs**.

In this respect it should be mentioned that the outputs of the used op-amps are short-circuit protected.
This implies that the output of an op-amp can be made low (= usually ground potential) without consequences.
On the other hand should be pointed out that it is **not allowed** to connect the output of an op-amp directly to the **power supply voltage**.

I/Os of microprocessors should not be connected directly to power supply voltage.
These I/Os are allowed to be brought to "0" in case this is mentioned explicitly.

Selection of ground point

It is very important to select a ground point as close as possible to the test point.

Conditions for injecting

- It is should be pointed out that injection of levels or signals from a strange source is **never** allowed to occur when the power supply voltage is lacking in the circuit in question.
- Naturally, the injected level is never allowed to exceed the power supply voltage of the circuit in question.

Continuous burning of the laser

- Disconnect plug J203 on the servo PCB and connect pin J203-9 (laser) of the cable connector to ground.
  Now the focus loop and the radial loop are interrupted as well:
  J203-7 (RE1 = Radial Error 1), J203-8 (RE2 = Radial Error 2) and J203-10 (FE = Focus Error).
  The laser also burns continuously when the set is in service loop 2.

M7.75

Irregular working of the display

Irregular working of the display when the set is opened and playing, might have been caused by incidental body effect in the region of the crystal oscillators.
Switching "off" and "on" of the mains voltage will eliminate this effect.

Indication of checkpoint

In the circuit diagram the checkpoints have been given a serial number (e.g. ◇12◇), to which the troubleshooting method will refer.
For oscillograms, amplitudes, time bases and position of set, see tables of checkpoints.

GENERAL CHECKPOINTS

In the detailed troubleshooting method following below a number of general conditions, required for proper functioning of the player, will **not** be repeated. Before starting the detailed troubleshooting method these general points should be checked.

a. Ensure that disc and objective are clean (remove dust, fingerprints, etc.) and use undamaged discs.
b. Convince yourself of the presence of the clock frequencies, viz.:
   - 12 MHz for μP servo (pin 18)
   - 11.2896 MHz for FILTER-B IC (pin 19)
   - 2.82–5.64 MHz for free-running PLL circuit on the DECODER-A IC (pin 27)
   - 3 MHz for control and display μP (pin 33).
c. Check whether all power supply voltages are present and have the correct level.
   See PCB drawings.
d. Check whether the two mutes (KILL and $\overline{\text{MUSB}}$ are inactive so that data are nowhere interrupted.
   This should go high about 2 seconds after the mains voltage is switched on.
   $\overline{\text{MUSB}}$=pin 23 of the FILTER-B IC on the decoder PCB.
   Normally this pin is high during play and low during search.

DETAILED TROUBLESHOOTING METHOD

A number of quick and efficient checks immediately give a definite answer on poorly functioning sections of the player.
To check the servo systems four service loops have been built in μP Q271.
Before calling in service loops, it should be checked (position power on) whether the bus (clock, data: pin 17 and 10 or 11 of μP Q271 resp.) is free. In other words, checking whether these lines do not have a short circuit to ground or supply voltage (level low or "high"). In such a case the buttons cannot be operated.
For troubleshooting the step-by-step method below is followed.

First step (with disc on turntable)

Bring the player in service loop 1 or 2

If one of the conditions for service loop 1 or 2 is not met, the questions below should be answered positively **in the sequence given.**

In practice this means that when one question has been answered positively, all the preceding circuits, to which the questions refer, are functioning well.

Example: if the eye pattern is present, we may conclude that the laser is working, the laser is in focus and that the turntable motor is running.

Note:
In some situations, certain faults in the radial servo circuit affect the focus servo circuit (e.g. if supply voltage + 1 of IC Q301 in the radial circuit fails, the focus coil starts oscillating).
To determine if this situation exists, connect point ◇36◇ on the servo PCB to ground.
In this way, the influence of the radial servo circuit on the focus servo circuit can be eliminated.

A. Is the laser giving light?
   (Test method: see sub A)

B. Is the angle disc-light pin within the tolerance, i.e 90°± 0.5°?
   (Test method: see description mentioned in chapter "Mechanical measurements and adjustments" of the C.D.M. manual).

C. Is the laser giving sufficient light?
   (Test method: see sub C).

D. Does the objective come in focus?
   (Test method: see sub D).

E. Is the turntable motor running and, if so, is it running at the correct speed?
   (Test method: see sub E).

If the answers to questions 1 or 2 through E are positive, it should be possible to bring the player in service loop 1 or 2.

Second step (with disc on turntable)

Bring the player in service loop 3.

This means that the eye pattern on point ◇65◇ (on the decoder PCB has to be stable, while MSC on point ◇17◇ on the servo PCB has to be more stable too).
(Test method: see DECODER-A IC)

Note that the set is not only tracking a song in loop 3, but also playing the song, provided the digital circuit is working (however music cannot be hard).

If this does not work, return to service loop 2 and answer the questions below positively in the sequence given.

F. Are $\overline{\text{DO}}$ and HFL detectors functioning?
   (test method: see sub F)

G. Is track detector functioning?
   (test method: see sub G)

M7.76

H. Is the radial control functioning properly?
(test method: see sub H)

If the answers to questions F, G and H are positive, it should be possible to bring the player in service loop 3.

Third step (with disc on turntable)

Note that the set is not only tracking a song in loop 3, but also playing the song, provided the digital circuit is working (music cannot be heard).

If this does not work, return to service loop 3 and answer the question below positively.

I. Is $\overline{TL}$ functioning, i.e. polarity of RE?
(test method: see sub I)

J. Is information transmission subcode functioning?
(test method: see DECODER-AIC)

Check the Q-channel signals.

If the answers to questions I and J are positive, it should be possible to bring the player in the Play mode.

Fourth step (with disc on turntable)

If no music is heard in position "play" or service loop 3 answer the last question.

K. Is digital decoder circuit functioning according to specification (test method: see II. FILTER-B IC and V. KILL CIRCUIT)

Sub. A. IS THE LASER GIVING LIGHT?

Test method

Bring the player in service loop 1 without placing a disc on the turntable. Now the laser is giving light for an unlimited period of time.

Another method for which the laser gives light during an unlimited period of time and the objective is standing still, is disconnecting plug J203 on the servo PCB and connecting point J203-9 of the cable connector to ground.
In case of power-on the laser should burn. This is checked with the aid of a light-sensitive component which is slightly screened from ambient light.

Hereafter follow some examples:

a. Connect photosensitive diode type BPW4, code number 4822 12032108, with correct polarity to an analogue multimeter (e.g. PM2412) at range 10 kΩ.
If the laser is burning, the meter will give virtually full scale deflection.

b. Connect LDR, code number 4822 116 10002, to digital multimeter PM2517E.
If the laser is burning, the resistance will drop to approx. 8 kΩ.

If the laser is not giving any light, proceed to Annex 1.

Sub. C. IS THE LASER GIVING SUFFICIENT LIGHT?

Test method (Test points on Pre-amp PCB)

— Interrupt the collector of Q203 on the servo PCB or ground-the-side of electrolytic capacitor C201. Disconnect plug J203 on the servo PCB and connect pin **J203-9 (laser)** of the cable connector to ground.
Now the laser should continue to give light while FE, RE1 and RE2 are interrupted.
— Place disc on turntable and switch power on.
— Directly inject with AF generator ($Z_i \leq 600$ Ohms) to test point ◇1 FE a sine-wave signal between 25 and 60 Hz (exact frequency is player-dependent) and $2V_{pp}$.
— Select such a frequency that the monitor diodes of the light pin give output signals as indicated on test points ◇5, ◇6, ◇7 and ◇8. Amplitude 40–80 mV.
— If the amplitude is not sufficient, proceed to Annex 1.

Sub. D. IS THE OBJECTIVE COMING INTO FOCUS?

Test method

- **No disc on turntable**

Switch power on and actuate Play button.
Now the arm should move inwards. Immediately after that the objective should move two times up-and downwards (this happens during searching of the focusing point).
After this the action will stop.
These actions are software-controlled from the servo μP. If this is not working, check μP servo, end stage focus circuit or focus coil.

- **With disc on turntable**

Quick test procedure:

For a rough check on the working of the focus circuit, proceed as follows:
— place disc on turntable.
— set player in service loop 1.
— remove disc from turntable.
— now examinate if the objective focuses by bringing a reflective object (e.g. mirror) above it.

Detailed test procedure

— Check **Q203** (on servo PCB) as follows:
Check whether FN becomes, with each passage of the nominal focusing **low for a short period of time**. Only when focusing point FN has been found, FE will be released via Q203 (base will become negative).
Check whether base of Q202 is driven low from servo μP (= $\overline{FCO}$). If not, check servo μP.
If so, proceed.

— Test focusing circuit as follows:
Interrupt the collector of Q203 on the servo PCB and disconnect **plug J203** on the servo PCB. Con-

M 7'88

nect pin **J203-9 (laser)** of the cable connector to ground.
Now the laser is burning continuously, FE has been released and the focus loop has been interrupted at test point ◇1 (=FE) on servo PCB.

Testing of circuit, between test point ◇1 and focusing coil
(Test points on servo PCB)

- Directly inject a sine-wave signal of 10 Hz, $2V_{pp}$, to test point ◇1 by means of an AF generator ($Z_i \leq 600\ \Omega$).
- Check visually whether focusing coil "--" and thus objective too "--" responds.
- Check whether this voltage is 0.6 V_{pp} on test point ◇2.
- Check whether this voltage is 6 V_{pp} on test point ◇3.
- Check whether this voltage is 5 V_{pp} on test point ◇4.

Testing the subchassis (Test points on Pre Amp PCB, injection point on servo PCB)

- Place a disc on the turntable.
- Directly inject to test point ◇1 a sine-wave signal between 25 Hz and 60 Hz at 2 V_{pp} by means of an AF generator ($Z_i \leq 600\ \Omega$). The exact frequency is player-dependent.
- Select such a frequency that the monitor diodes of the light pin give output signals as indicated on test points ◇5, ◇6, ◇7 and ◇8.
- Check test points ◇9, ◇10, ◇11 and ◇12.
- Check test point ◇13.
- Check test point ◇14.

  Is the same as signal on test point ◇13 but amplitude is dependent on position of potentiometer 3138.

If all the checks are positive, close focus loop (insert plug J203). Now the focusing circuit should be able to operate. Reconnect transistor Q203.
It should be noted here that the amplitudes on test points ◇5 through ◇13 are slightly dependent on the characteristic of the monitor diodes.

Sub. E. IS TURNTABLE MOTOR RUNNING AND, IF SO, IS IT RUNNING AT THE CORRECT SPEED?

Test method (Test points on servo PCB)

- Place disc on turntable and bring set in service loop 2.
- If focusing point is found, check whether $\overline{FCO}$ is low on point ◇15.
  If not, check focus circuit sub D.
  If so, proceed.
- Now only power on, disconnect plug J201 on the servo PCB and check MSC=point ◇12 of cable connector J201 or point ◇81 on the decoder PCB.
  If not, check Decoder-A IC (Q501) circuit.
  If so, proceed.
- Reconnect plug J201, disconnect plug 15 on the preamplifier PCB and inject a DC signal to the cable connector of the motor or directly to the turntable motor.
  The turntable motor should be running now.
  (A DC voltage of 2,5 V approximately corresponds with the rpm during scanning of the innermost tracks).
  In this condition the player should be brought in service loop 2 (depress Stop button while mains voltage is switched on).
  If DC < 2.5 V Figure G should be visible on test point ◇17 (servo PCB).
  If DC > 2.5 V Figure H should be visible on test point ◇17.

If so, check turntable control circuit (circuit from point ◇17 to turntable motor).
If not, check whether MSC is released by means of $\overline{SSM}$ at pin 16 of IC Q271.
This connecting plug J201 on the servo PCB and measure on pin 12 of cable connector J201.
If MSC is working now, check circuit around IC Q271.

- Take player out of service loop 2, depress Power-on button and then Play button and check eye pattern on point ◇65 (on decoder PCB).
  To stabilize the eye pattern, bring light pin above tracks by hand, or by briefly (5 s) depressing Fast Forward button.
  If eye pattern not point ◇65 is not present or unstable, check RF pre amplifier (see Annex IV).
- If eye pattern is correct, proceed.
- Check whether point ◇55 (=$\overline{HFLS}$) on the servo PCB is correct in service loop 2 (see Figure Y). If not, check $\overline{HFLS}$ detector circuit (is circuit between point ◇65 and ◇55). If so, proceed.
  Take player out of service loop 2 by depressing the power button.
- Check locking-in of PLL circuit of Decoder-A IC.
  (See CEFM signal pin 27: point ◇58)
  If PLL is locking-in, proceed.
- Check timing signals on output of Decoder-A IC as indicated in "DECODER-A IC".
  Is the digital decoder circuit functioning according to specification? If timing signals are correct, proceed.
- If MSC is still not functioning properly, replace the relevant specific digital IC according to the trial and error method with the aid of service IC box.
- MSC has to be present now.

M7178

Sub. F. ARE THE $\overline{DO}$ and $\overline{HFLS}$ DETECTORS FUNCTIONING?

Test method (Test points on servo PCB)

— Starting point is:
$\overline{HFLS}$ = 1 when spot is exactly on track
$\overline{HFLS}$ = 0 between tracks (e.g. during track jumping)
$\overline{DO}$ = 0, or DO = 1 in case of drop-out
$\overline{DO}$ = 1, or DO = 0 when there is no drop-out.

Approximative method
(applicable in service loop 2)

— Place disc on turntable.
— Bring player in service loop 2.
— Check whether DO (test point ◇57) is not continuously "high". Normally test point ◇57 is "low", however small spikes of approximately 100mV are present in case of scratches on the disc.
— Check $\overline{HFLS}$ (test point ◇55).

Precise method
(can be checked in playing set only)

— Place test disc 5A on turntable. Switch power on and depress Play button.
— Select track no. 10: Check point ◇55.
$\overline{HFLS}$ pulses should be present.
— Select track no. 15: Check point ◇56.
$\overline{DO}$ pulses should be present. With this track the $\overline{HFLS}$ pulses on point ◇55 should also be present.
— In case of track jumping $\overline{HFLS}$ pulses are always present on point ◇55.

Sub. G. IS TRACK DETECTOR FUNCTIONING WELL?

Test method (Test points on servo PCB)

Switch off the offset circuit:
Loosen resistor 3315 (at the side where it is in contact with pin 8 of IC Q302).
Mount a 47 kΩ trimming potentiometer between +1 and −1 supply voltage (for example between pins 4 and 11 of IC Q302). Connect the wiper of the trimming potentiometer to the loose side of resistor 3315.

— Place a disc on the turntable.
— Bring the set in service loop 2.
— Adjust the signal on test point ◇21 symmetrically round 0V by means of the external 47 kΩ trimming potentiometer. The amplitude of the signal may change during this adjustment.
— Measure F.S on point ◇36.
Here too the frequency variation depends on the eccentricity of the disc.
— Check point ◇60.
— Check point ◇61. Signal cannot be triggered.
— Check point ◇62.
— Switch the offset circuit on again.

Sub. H. IS THE RADIAL CONTROL FUNCTIONING PROPERLY?

Attention: The offset circuit (d-multipuller) and the AGC circuit (k-multiplier) are correction circuits. This means that under optimal conditions (new disc, minimum tolerances of components) the set may be working properly even if a fault is preset in offset or AGC circuit.

Test method (Testpoints on servo PCB)

a. Place disc on turntable.
b. Switch off AGC circuit (k-multiplier) and switch off offset circuit (d-multiplier).

Method:
Switching off AGC circuit: interconnect points ◇5 and ◇6 of IC Q309.

— Place a disc on the turntable.
— Bring the set in service loop 2.
— Adjust the signal on test point ◇21 symmetrically round 0V by means of the external 47 kΩ trimming pot. The amplitude of the signal may change during this adjustment.

c. Bring set in service loop 3.
At this moment there is a high probability that the set is working.
If so, check d and k factor (see Annexes II and III).

If not, proceed.

d. Bring set in service loop 2 and check signal on point ◇21.
The AC-component has to be 12-14 V symmetrically, around a DC level of zero volt.
If this is correct, proceed to e).
If this is not correct check following testpoints
◇22, ◇23: value should be 0.7 V_{pp}
◇24: value should be 0.2 V_{pp}
◇25: value should be 0.25 V_{pp}
◇26: value should be 20 mV_{pp}
◇27, ◇28: value should be 800 mV_{pp}

Note:
The frequency variation strongly depends on the eccentricity of the disc.
If points ◇22 ÷ ◇28 are OK, check point ◇21 again.
If ◇21 is OK, proceed.

e. Check point ◇29 (is RE + 650 Hz).
Value should be Vpp If so, proceed.
When the set is in the normal stand-by position 650 Hz at 300 mV is present on point ◇29.

f. To check radial output stage, do not use a disc, only power on. Inject on points ◇30 and ◇31 respectively a sine-wave signal of 8 to 10 Hz 3 Vpp.
Then the radial motor will go back and forth.

At this moment radial tracking must be possible in service loop 3..
— Switch the AGC circuit on again.
If the original fault symptom is still present proceed

M7.79

to Annex III:
Check of the k-factor.
— Switch the offset circuit on again.
If the original fault symptom is still present, proceed to Annex II:
Check of the d-factor.

Sub. I. IS $\overline{INT}$ FUNCTIONING. O.E. POLARIOTY OF RE? (Measure points on servo PCB)

Test method

Bring player in service loop 3 and measure $\overline{INT}$ on pin 12 of μP servo IC Q271.
A square-wave voltage (0-5V) should be measured on th is pin. As a result of the frequency variation th is square-wave is hard to trigger.

I DECODER-A IC

- **Check the MC signal (pin 17; test point ◈)**

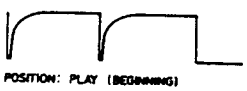
— In stand-by mode, the MC signal (Motor Control) corresponds to the figure below.

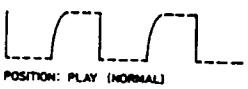
Note:
The repetition time of the MC signals is 11.3 μsec.

— Place a disc on the turntable.
— In position PLAY or SERVICE POSITION 3, the MC signal corresponds to the figure below.

Note:
During start-up the duty cycle is 98%, then the duty cycle of the signal becomes about 50%.

See also Service Manual CDM-1: "Check of the motor control".



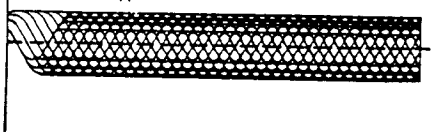


- **Check the HF signal on test point ◈ (eye pattern)**

— Place a disc on the turntable.
— The HF signal should be present and be stable in the PLAY mode and in:
SERVICING POSITION 3 after the run-in track has been read.
— In SERVICING POSITION 2 and during reading of the lead-in track the HF signal is not stable.

Position of oscilloscope 0.5 μs/DIV.

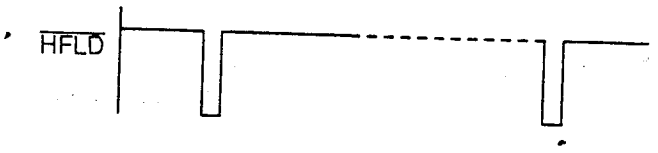
Amplitude ≈ 1.5 V_{pp}



- **Check the $\overline{HFLD}$ signal on test point ◈**

— Place a disc on the turntable.
— In the PLAY mode and in SERVICING POSITION 3 the $\overline{HFLD}$ signal is "high"; however, minor pulses may be present and in cause of disorders on the disc.
— In SERVICING POSITION 2 and during playback of track no. 15 of test disc 5A $\overline{HFLD}$ pulses are visible.

Position of the oscilloscope 5 ms/DIV



- **Check if the $\overline{MUTE}$ signal (pin 11; test point ◈) is "high"**

When Filter-B IC is applied, the $\overline{MUTE}$ input will nct be used.

- **Check the CEFM signal (pin 27; test point ◈)**

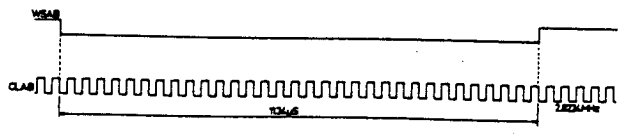
— Place a disc on thr turntable.
— In stand-by mode (only the main s switch is depressed), the frequency lies between 2.82 MHz and 5.64 MHz.
— In the position PLAY and SERVICE POSITIONS 2 and 3, the frequency is 4.32 MHz.

- **Check the Xin signal (pin 19; test point ◈)**

— The Xin frequency is 11.2896 MHz.
— If this frequency deviates, check test point 70; Xout signal, on Filter-B IC.
This frequency should also be 11.2896 MHz.

- **Check the timing signals meant for Filter-B IC**

— Place a disc on the turntable.
— Select one of the following positions:
SERVICE POSITION 2 or 3, or position PLAY.
— Trigger the oscilloscope with the WSAB signal (test point ◈, pin 39).
— Check signals:
WSAB at test point ◈ (pin 39)
(Word Select from Decoder-A to Filter-B)
CLAB at test point ◈ (pin 38)
(Clock from Decoder-A to Filter-B)
and their interrelation.
— There must be activity at test point ◈ (pin 37), DAAB signal (DATA from Decoder-A to Filter-B).

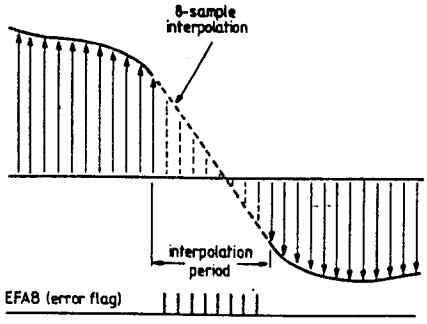


M7180

- **Check the EFAB signal (Error Flag from Decoder-A to Filter-B) at test point ◇74 (pin 36)**

— Place test disc 5A on the turntable.
— During playback, EFAB fulses should be present at test point ◇74 for soft braking of the disc and during fast search (F.Forward, F.Reverse).

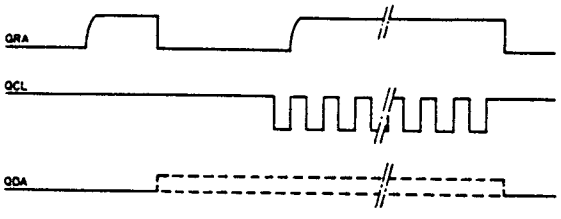
Note:
Filter-B IC is capable of interpolating linearly 8 successive EFAB pulses.



- **Check the Q-channel signals**

— Place a disc on the turntable.
— Select one of the following positions:
SERVICE POSITION 3 or position PLAY.
— Trigger on the QRA signal (Q-channel Request Acknowledge) test point ◇75; pin 30.
— Check signals QRA at test point ◇75 (pin 30).
QCL at test point ◇76 (pin 31).
(Q-channel-clock)
and their interrelation.
— There should then be activity at test point ◇77 (pin 29) QDA (Q-channel Data).

Note:
The QRA request is initiated by decoder μP (QRA "high"). Then Decoder-A answers this request (QRA goes "low"). With the next leading clock pulse (QCL) the QRA signal is rendered "high" again by the decoder μP.
As soon as the decoder μP has taken in enough information via QDA, QRA will go low again. That is why the QRA times vary each time.



- **Check the $\overline{SSM}$ signal (test point ◇78; pin 33) = Start-Stop turntable motor**

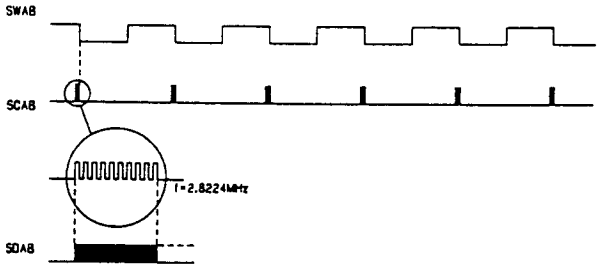
— Motor start pulse when test point ◇78 is "high" for ≥ 0.2 sec.
— Motor start pulse when test point ◇78 is "low" for ≥ 0.2 sec.

Note:
After the motor start pulse, SWAB information (Subcoding Word clock) will become visible at this point. The period time of that signals is 136 μsec.

- **Check the subcode clock signals**

— Place a disc on the turntable.
— Select one of the following positions: SERVICE POSITION 3 or position PLAY.
— Trigger the oscilloscope with the SWAB signal at test point ◇78.
— Check the following signals:
SWAB at test point ◇78; pin 33
SCAB at test point ◇79; pin 35 (Subcode Clock from Decoder-A to Filter B)
SDAB at test point ◇80; pin 34 (Subcode Data from Decoder-A to Filter B)I
and their interrelations.

Note:
While the burst of 10 clock pulses, appear on SCAB the Q-channel information is transferred on SDAB. Hereafter the P-bit indication follows.
The P-bit "high" between two bursts of 10 clock pulses in case of pause indication and "low" in case of music indication.



- **Check the $\overline{CRI}$ signal**

The $\overline{CRI}$ is "low" in case of track jumping.
Player in position SEARCH.

- **Check the $\overline{DEEM}$ signal (test point ◇84; pin 32)**

— Place test disc 5 on the turntable.
— During playback of track no. 14 (recorded without PRE-EMPHASIS), the $\overline{DEEM}$ signal should be "low".
— During playback of track no. 15 (recorded with PRE-EMPHASIS), the $\overline{DEEM}$ signal should be "high".

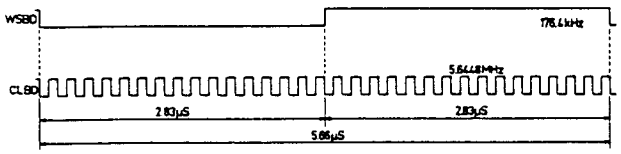
II FILTER-B IC

- **Check the signals between Decoder-A IC and Filter-B IC**

See sub. "I Decoder-A IC".
— Check the X IN signal (test points ◇69 and ◇70)
— Check the timing signals meant for Filter B (WSAB, CLAB, DAAB signals; test points ◇71, ◇72 and ◇73).
— Check the EFAB signal (test point ◇74)
— Check the subcode clock signals (SWAB, SCAB, SDAB signals; test points ◇78, ◇79 and ◇80).

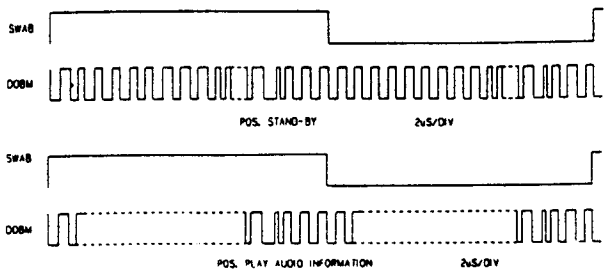
- **Check the timing signals between Filter-B IC and DAC IC**

— Place disc on the turntable.
— Select one of the following positions:
SERVICE POSITION 3 or position PLAY.
— Trigger the oscilloscope with the WSBD signal (Word Select from Filter B to DAC) test point ◇85 (pin 18).
Check the following signals:
WSBD at test point ◇85; pin 18
CLBD at test point ◇87; pin 16 (Clock signal from Filter B to DAC) and their interrelation.
If an Audio disc is used, there should be activity at test point ◇86 (pin 15) DABD signal (DATA from Filter B to DAC). If a disc with Digital Data (CD-ROM) is used, this point is continuously switched "low" by transistor Q537. In that case the word "data" appears on the display.



- **Check the DOBM signal (Digital Output)**

— Place a disc on the turntable.
— Select the stand-by mode (only mains switch depressed).
— Trigger the oscilloscope with the SWAB signal (test point ◇78).
— Check the DOBM signal (test point ◇88; pin 14).
An empty audio signal has a fixed pattern.
See drawing, "Stand-by".
— Select the PLAY mode.
Check the DOBM signal. See drawing "PLAY".



- **In position SEARCH the $\overline{\text{ATSB}}$ signal is "low" test point ◇89; pin 22 (Attenuation Audio Signal)**

— When the "µP panel" is applied, (a sub-printed circuit board) that houses IC Q271, test point ◇89 is not connected.

- **Check the $\overline{\text{MUSB}}$ signal test point ◇90; pin 23 (Soft Mute)**
This signal is "low" in positions:
PAUSE
NEXT or PREVIOUS when jumping form one track to another.
Fast SEARCH when the Search button is kept depressed for some time.

III DAC IC (Dual Digital Analog Converter)

- **Check the signals between Filter-B IC and DAC IC**

See sub. "II Filter-B IC":
— Check the timing signals between Filter-B IC and DAC IC.

- **Check the output of the OP-AMP after the DAC IC**

— Place a disc on the turntable.
— In position PLAY or in SERVICE POSITION 3, the analog (music) signal should be present at the output of the OP-AMP, after the lead-in track has been read.

IV $\overline{\text{DEEM}}$ CIRCUIT

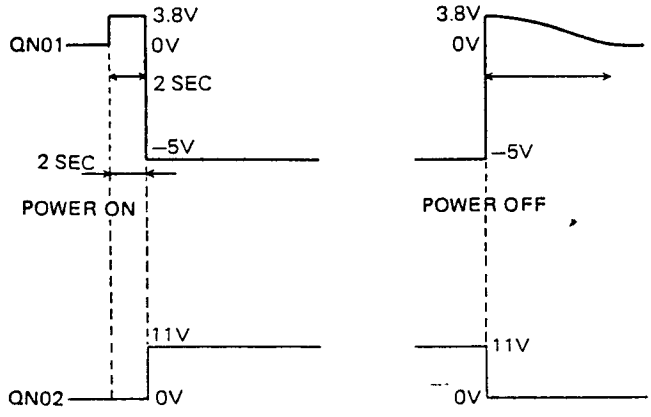
- **Check $\overline{\text{DEEM}}$ circuit**

— Place test disc 5 on the turntable.
— During playback of track no. 14 (recorded without PRE-EMPHASIS) the $\overline{\text{DEEM}}$ signal at test point ◇84 should be "low".
— During playback of track no. 15 (recorded with PRE-EMPHASIS), the $\overline{\text{DEEM}}$ signal at test point ◇84 should be "high".
— During playback of track no. 14 the analogue signal should be present at the source of R564 (test point ◇91) and R565 (test point ◇92).
— During playback of track no. 15 the analog signal at the source of R564 (test point ◇91 and R565 (test point ◇92) should be 0 V..

M7182

V KILL CIRCUITL

— During switching on and off the mains voltage the signal on the collector of QN01 and QN02 should be as indicated in the figure below.



VI FAVOURITE TRACK SELECT (FTS)

Attention:
When repairing a CD player it is important that the cxontents of the FTS memory (EEPROM) should not unnecessarily be damaged.
If no complaints are reported about the functioning of the FTS, a check of the functions of the EEPROM should be left undone.
The EEPROM IC is in the Stand-by mode when $\overline{CE}$ and RDY are both high.

Selftest of the FTS μP

During the self-test of the FTS μP, I/O Gate will not be tested.
Therefore this self-test can be executed without damage to the memory as indicated in General Test Points.

Annex I: LASER IS GIVING NO OR INSUFFICIENT LIGHT

Together with laser supply and the monitor diode the laser forms a feedback system.
A defect in the laser supply might thus result in destruction of the laser. Replacement of th laser (=new light pin) will not solve anything. The new laser will also be destroyed since the original fault in the laser supply is still present.

On the other hand it is impossible to check and repair a feedback system when one link is missing.

For this reason the so-called laser simulator 3 is supplied. Code number 4822 395 30229.
This laser simulator consists of a PCB which contains the laser and monitor simulation, a switch to test the On/Off position and a number of sockets.

This PCB can be connected to the laser supply instead of the light pin so that the feedback system is closed.

Repair procedure:

Since the light pin is very sensitive to static charges, care should be taken that during measurements and adjustments of the laser power supply the potential of the aids and yourself equal the potential of the CD mechanism.

Detach light pin an connect laser simulator as follows: (connections on pre-amp PCB).
Take the flex PCB out of socket 11 and connect the simulator PCB with the socket.
Remove plug 16 and insert it in the socket on the simulator PCB.
Connect the plug with 4 wires to socket 16. Take out plug 17 and insert the plug with 1 wire in socket 17.

— Switch on the mains switch and ensure that the drawer is closed or else that the tray-end-in switch on the tray PCB (S004) is depressed.
Now press the play key and check if the L-line of the servo μP, pin 21-2 on the pre-amplifier PCB, goes "low".
— In rest position the current through the laser diode should be ≤ 1 mA. For NEG. VOLT. lasers this can be checked as follows:
Set the switch on the simulator PCB in the OFF position and the mains switch in the ON position.
Turn trimming resistor 3180 counterclockwise (min. R) and measure the voltage across resistor 3194 on the pre-amp. PCB.
On pre-amplifier PCBs with discrete components turn resistor 3180 clockwise (min. R) and measure the voltage across resistor 3194.
The voltage should be ≤ 15 V.

Check of laser supply control

Set the switch on the simulator PCB in the ON position and measure the voltages between points +V and=V on the simulator PCB.
Resistor 3180 clockwise (max. R): U_{+v-v}=225 mV ±45 mV. On pre-amplifier PCBs with discrete components resistor 3180 counterclockwise (max. R): U_{+v-v}=225 mV ±45 mV.

R3180 counterclockwise (min. R): U_{+v-v}=750 mV ± 150 mV.
On preamplifier PCBs with discrete components resistor 3180 clockwise (min. R): U_{+v-v}=750 mV ±150 mV.

Set resistor 3180 in the mid-position.
This is a preliminary adjustment. After the simulator PCB has been removed the laser current must be adjusted.

Fine adjustment of laser current

— Playback track 1 of test disc 4822 397 30096 (Disc without defects). Connect a DC voltmeter across resistor 3308 on the SERVO PCB circuit

M-723

diagram D. Adjust the laser power supply with resistor 3308 is 575 mV ± 50 mV.

Annex II: **CHECKING d-FACTOR**
(Test points on servo PCB)

— Switch off AGC circuit (k-multiplier) and switch off offset circuit (d-multiplier). See sub G and H.

Place disc on turntable and set player in service loop 2.

— Check points ◇22◇ and ◇23◇.
Value should be o.7 V_{pp}.
Frequency variation strongly depends on the eccentricity of the disc.
— Check points ◇25◇.
Value should be 250 mV_{pp}.
— Check point ◇35◇.
Value should be 200 mV_{pp}.
— Check point ◇36◇.
Value should be 2 V_{pp}.
— Check points ◇37◇ and ◇38◇.
Value should be 10 V_{pp}.
The signals is more sine-shaped now due to filtering out of 650 Hz.
— Point ◇39◇ is hard to measure since switch is in position Yoc and thus connected with input of op-amp Q302 (pin 9).
However, a signal of 200 mVpp is present.
— Check point ◇40◇.
Value should be 9 V_{pp}.

Bring the player in service loop 3. With a disc on turntable and the AGC and offset-circuits are still switched off.

— Check point ◇41◇.
— Check point ◇40◇ on beam A of oscilloscope and check point ◇39◇ on beam B of oscilloscope while oscilloscope is triggered with point ◇41◇.
— Switch on the AGC-circuit and offset circuit.

Annex III: **CHECKING k-FACTOR**
(Test points on Servo PCB)

a. Static

Switch power on **without** depressing the Play button. I.e. RC0=high; $\overline{RC0}$=low so switch Ya is in position 0 and switch Yc is in position 0.

— Check point ◇45◇.
Value should be 9 V_{pp}.
— Check point ◇46◇.
— On point ◇29◇ now appears a sine-wave signal of 650 Hz, 300 mV, and 180-45=360°shifted in phase relative to signal on point ◇45◇.
— Check point ◇47◇.
Value should be 1.5 V_{pp}.
— Check point ◇48◇.
Value should be 1 V_{pp}.
— Check points ◇49◇, ◇50◇, ◇51◇ and ◇46◇ relative to each other.
Amplitudes are 5V.
— Check integrator IC Q303 (4/4)

b. Dynamic

Insert disc, select service loop 2 and check if the signal on point ◇21◇ equals to 7 V_{pp}.

— Select service loop 3.
Now $\overline{RC0}$=high and RC0=low.
So switch Y_a is in position1.
Switch Y_c switches at f=650 Hz.
Point ◇52◇ is low; so point ◇51◇ is in phase point ◇50◇.
Now fig. U should be present on point ◇51◇ with duly cycle jittering round 50%.

Annex IV: **CHECKING RF PRE-AMPLIFIER**
(measure points on pre-amp. PCB)

a. Check DC-voltages on transistor 6103, 6104, 6105, 6109, 6110, 6111.

b. For checking sensitivity, frequency and delay characteristic, proceed as follows:
— Take flex PCBs of sockets 10 and 11.
— Take plugs 18, 17, 12, 13, 14 and 15 out of sockets.

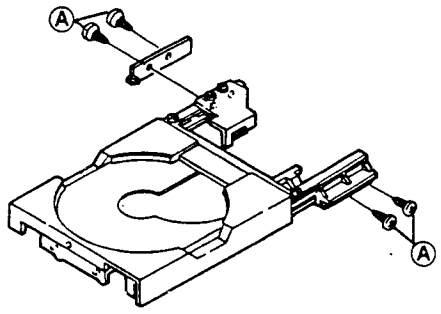
Loading Tray Mechanism

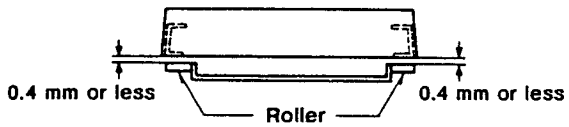
Cautions When Servicing

1. Installation of Tray and Tray Case
(Upon replacement of the tray case due to breakage, etc.)

(1) If the position with respect to the tray's front panel window is incorrect, lossen screws (A) and move the tray within the range of play of the hole to adjust. For the inclination of the tray, refer to diagram below.

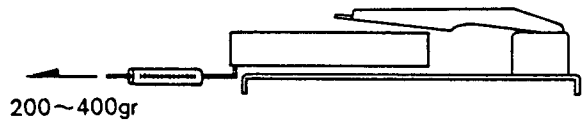


The tray should not be more than 0.4 mm above the rollers on the bottom side.

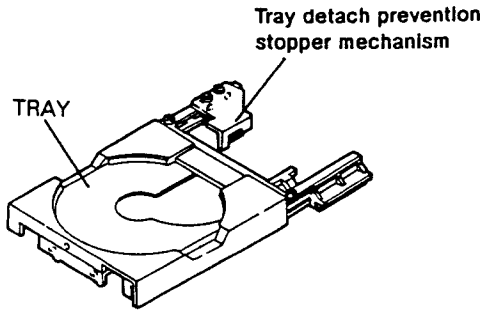


Adjust the inclination as well with screws (A).

(2) The tray's working force should be set to between 200 and 400 gr (when power is off).



2. If Tray has become detached downward

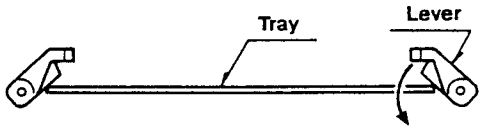


Take care in the following instances as the tray will become detached downward.

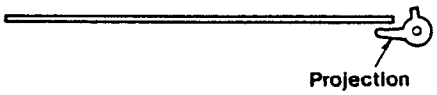
- The tray will become detaced if pressed downward with the stopper mechanism removed while the drawer is open.
- The tray will become detaced if pressed downward when there is no subchassis (CDM-1).
  (The same is true when the tray is closed with nc subchassis.)

Use the following procedure to reinstall.

(1) Lower the lever and place the tray on the projection.



(2) Next, with the tray pressed down, lower the other lever and place the tray on its projectin.



NOTE:
Be sure to lower only one lever at a time as the tray cannot be lifted if they are both lowered.

NOTE:
If the tray is forced back to its original position, the two pins in the tray case may bend.

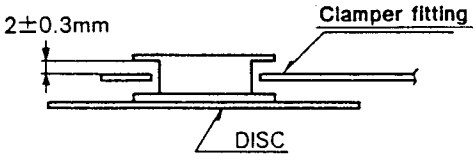
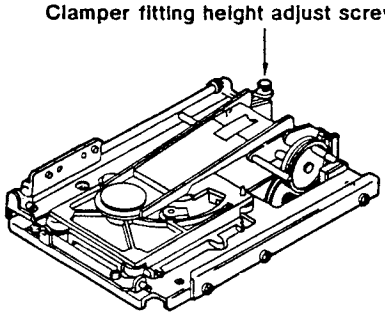
M788

3. If Subchassis (CDM-1) has been replaced

(1) The height of the subchassis turntable differs from one unit to the next, so it is necessary to adjust according to the height of the turntable so that the magnet clamper is not in contact with the clamper fitting. (Standard 2±0.3 mm)



Clamper fitting height adjust screw

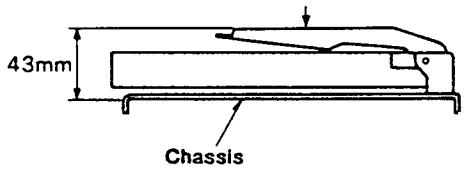


(2) When the height of the clamper fitting is adjusted, the position when the clamper is up must be readjusted. Use the following procedure.

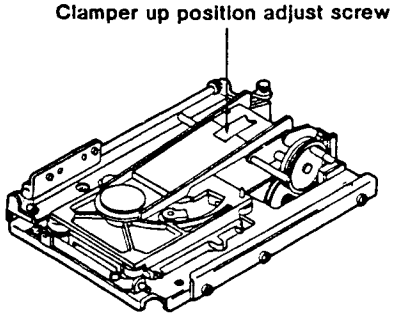
Disc clamper position

When up Max. 43 mm
(Tray and clamper should not come into contact when try is opened and closed.)

To the eye, this fitting appears parallel to the chassis.

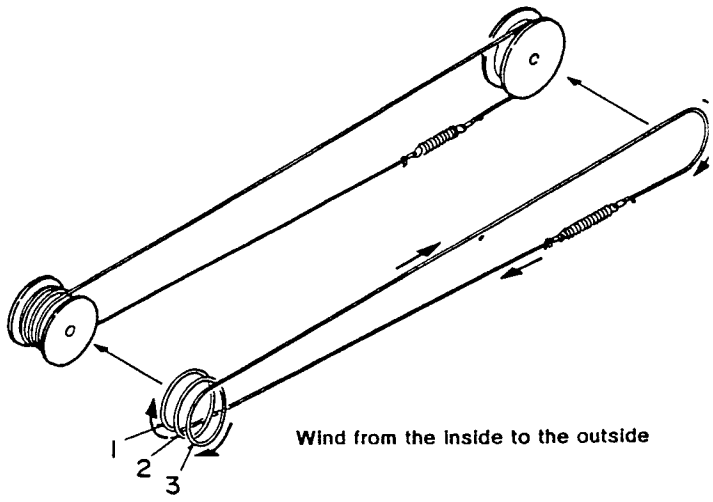


Clamper up position adjust screw



4. Others

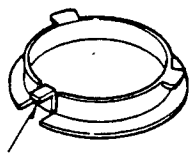
(1) Refer to the diagram below to install the loading wire.



Wind from the inside to the outside

(2) All switches on the mechanism are of the socket type. If a switch breaks, remove the socket to replace.

(3) Use to the structure of the hooks of the magnet clamper (094M), incline as indicated below to remove and install the magnet clamper when replacing it.



The narrowest hook inclines

TECHNICAL SPECIFICATIONS

Audio Characteristics

Number of channels	2
Frequency response	2 – 20,000 Hz ±0.1 dB
Digital to analogue convarsion	16 bit 4 times oversamping
Dynamic range	Better than 96 dB
Signal-to-noise ratio	101 dB
Channel separation	Better than 100 dB (1000 Hz)
Total harmonic distortion	0.0015% (1000 Hz)
Wow & flutter	Unmeasurable (quartz accuracy)
Error correction system	Cross Interleave Reed Solomon code (CIRC)
Audio output level	2 Vrms

Optical Data Read System

Laser	AlGaAs semiconductor laser
Wave length	780 nm

Signal Format

Sampling frequency	44.1 kHz
Quantization	16-bit linear/channel

Power Supply Section

Power requirements	220/240V AC, 50/60 Hz
Power consumption	Approx. 30 W
Fuse capacitance	0.2A

Cabinet and Others

Dimensions (W x H x D)	462 x 86 x 333 mm
Weight	Approx. 10 kg
Allowable operating temperature	+5°C – +35°C
Allowable operating humidity	5 – 90% (No condensation)

Provided Accessories

Remote control unit (RMC-94)	1
Dimensions (W x D x H)	63 x 18 x 149 mm
Weight (without batteries)	100 g
Battery (AA/R06)	2
Audio connection (RCA pin-jack) cord	1 pair

Compact Discs

Diameter of disc	120 mm
Thickness	1.2 mm
Rotating direction	Counterclockwise (viewed from the laser pickup side)
Scanning velocity	1.2 – 1.4 m/sec
Revolution (spindle) speed	500 – 200 rpm
Playing time (theoretical)	74 minutes max. (stereo)
Track pitch	1.6 μm
Material	Plastic (polycarbonate)

* Improvement may result in changes in specifications and design without notice.

ASSIGNMENT OF COMMON PARTS CODES.

RESISTOR

R***: (1) GD05 --- 140, Carbon film fixed resistor, ±5%, 1/4W
R***: (2) GD05 --- 160, Carbon film fixed resistor, ±5%, 1/6W

① — Resistance value

Examples

① Resistance value

0.1Ω...001	10Ω...100	1kΩ...102	100kΩ...104
0.5Ω...005	18Ω...180	2.7kΩ...272	680kΩ...684
1Ω...010	100Ω...101	10kΩ...103	1MkΩ...105
6.8Ω...068	390Ω...391	22kΩ...223	4.7MkΩ...475

(Note) Please distinguish 1/4W from 1/6W by the shape of parts used actually.

C***: CERAMIC CAP.
(1) DD1 --- 370, Ceramic condenser
Disc type
①② Temp. coeff. P350 ~ N1000, 50V
② — Capacity value
① — Tolerance

Examples

① Tolerance (Capacity deviation)
±0.25pF...0
±0.5pF...1
±5%...5

* Tolerance of COMMON PARTS handled here are as follows:
0.5pF ~ 5pF...±0.25pF
6pF ~ 10pF...±0.5pF
12pF ~ 560pF...±5%

② Capacity value

0.5pF...005	3pF...030	100pF...101
1pF...010	10pF...100	220pF...221
1.5pF...015	47pF...470	560pF...561

C***: CERAMIC CAP.
(1) DK16 --- 300, High dielectric constant ceramic condenser
Disc type
① Temp. chara. 2B4, 50V
② — Capacity value

Example

② Capacity value

100pF...101	1000pF...102	10000pF...103
470pF...471	2200pF...222	

C***: ELECTROLY CAP. (⫩), FILM CAP. (⫫)
(1) EA ------ 10, Electrolytic condenser
One-way lead type. Tolerance ±20%
①② Dielectric strength
② — Capacity value

Examples

① Capacity value

0.1μF...104	4.7μF...475	100μF...107
0.33μF...334	10μF...106	330μF...337
1μF...105	22μF...226	1100μF...108
		2200μF...228

② Working voltage

6.3V...006	25V...025
10V...010	35V...035
16V...016	50V...050

(2) DF15 --- 350, Plastic film condenser
One-way type, Mylar ±5% 50V
① — Capacity value

Examples

① Capacity value

0.001μF (1000pF)...102	0.1μF...104
0.0018μF.....182	0.56μF...564
0.01μF.....103	1μF...105
0.015μF.....153

Kind of Common Parts

RESISTOR

R*** (1) GD05 · · · 140, Carbon film fixed resistor, ±5% 1/4W
R*** (2) GD05 · · · 160, Carbon film fixed resistor, ±5% 1/6W

C*** : **CERAMIC CAP.**
(1) DD1 · · · · 370, Ceramic condenser, disc type (titan condenser) Temp. coeff. P350 ~ N1000 50V

C*** : **CERAMIC CAP.**
(1) DK16 · · · 300, High dielectric constant ceramic condenser, disc type (titan variable) Temp. chara. 2B4 50V

C*** : **ELECTROLY CAP. (±) / FILM CAP. (±)**
(1) EA · · · · · · 10, Electrolytic condenser, one-way lead type, tolerance ±20%
(2) DF15 · · · 350, Plastic film condenser, one-way type, Mylar, ±5% 50V

* In case of ordering the common parts, please establish the correct parts number of 10 figures by the procedure "ASSIGNMENT OF COMMON PARTS CODES"

id wiring are subject to change for modification without notice.
