SPECIFICATIONS

NOTE: Measurements referenced to 8 ohms are taken with the Speaker Impedance Selector set to "8 ohm (High)". Measurements for 4 and 2 ohms are taken with the impedance selector at "4 ohm (Normal)". Specifications are measured in accordance with EIA Standard RS-490 (IHF A-202) for amplifiers and ANSI-IEEE Standard 185 (1975) (IHF T-200) for tuners. Tuner sensitivity is measured via 75 ohm coaxial input and converted to equivalent 300 ohm values.

Keep leads as shortas possible, to minimize stray signal pickup.

FM ALIGNMENTS

NECESSARY INSTRUMENTATION

FM GENERATOR (less than 0.05% THD)
STEREO GENERATOR (less than 0.05% THD, more than 50 dB sep.)
AUDIO GENERATOR (not necessary if FM generator has built in sweep; i.e., SOUND TECHNOLOGY ST 1000A and ST 1020A)
AC VTVM's (or one with a left/right switch)
THD ANALYZER (resolution less than 0.1%)
OSCILLOSCOPE (5mV or better sensitivity, X input capability)
FREQUENCY COUNTER
VOM or DMM (high impedance, must read in mV)
DETECTOR PROBE

IMPORTANT — While all FM generator output levels hereafter are referred to the 300 ohm input, 75 ohm input can be used, but be aware of possible equipment groundloops and divide the RF output levels by 2.
Before alignments commence set input selector and record selector to tuner and release mono dyn sep defeat switches (out).

FRONTEND — Alignment of frontend should only be necessary after repair to frontend or crystal oscillator circuits (pin 2 and 3 on IC 110).

A TUNING VOLTAGE (OSCILLATOR)

It is essential to check tuning voltage before aligning the rest of the frontend.

1 Connect DMM between ground and TP 102.

2 Tune to 108 MHz and adjust C 20 if voltage is incorrect.

SPECIFICATION 24.7V ± 0.5V

3 Tune to 88 MHz and read voltage. Adjust L 6 if voltage is incorrect.

SPECIFICATION 3.6V ± 0.5V

4 Repeat step 2 and 3 until readings are within tolerances.

B RF ADJUSTMENT (TRACKING)

1 Connect RF generator to 300 ohm antenna input and detectorprobe to pin 1 IC 102 with ground to tunershield. Adjust sensitivity of oscilloscope to maximum (5mV or better) and modulate FM generator sweep ± 300 kHz or more.

2 Set tuner to 105 MHz, enter into preset 5, and tune generator so that curve appears on oscilloscope. Turn down RF input level so that curve covers approximately 1/2 of oscilloscope display.

3 Adjust C 3, C 9, C 11 and C 15 to maximum curve height while reducing RF input to keep entire curve on display.

4 Set tuner to 90 MHz, enter into preset 1, and tune generator so that curve appears on oscilloscope display.

5 Adjust L 1, L 2, L 3 and L 4 to maximum curve height.

6 Repeat steps 2, 3, 4 and 5 (use preset 1 and 5) until both frequencies are at maximum curve height.

NOTE: 105 MHz curveheight is typically slightly stronger than 90 MHz.

C IF ADJUSTMENT

1 Set tuner to approximately 98 MHz (the tuner must be tuned to an unoccupied frequency) enter into preset 3, and tune FM generator to display a curve on oscilloscope.

2 Adjust L 5 and L 101 to maximum and symmetrical curve on the display, using as little input as possible.

NOTE: Maximum input 500 μV, typical curveheight 4 mV at 150 μV and 15 mV at 300 μV.

D DETECTOR COARSE ADJUSTMENT (OPTIONAL, NEEDED ONLY IF DETECTOR WAS REPAIRED)

1 Reduce sweep modulation level to ± 75 kHz and set input level to 300 μV.

2 Adjust FM generator frequency so that both legs of the inverted U-shaped curve are equally high on the display. The curve should be almost perfectly symmetrical.

3 Disconnect detectorprobe from tuner and oscilloscope. Connect either of the tape 1 rec. outputs to the oscilloscope.

4 The oscilloscope should now display a diagonal line. Adjust L 102 primary (closest to IC 102) to maximum curveheight and L 102 secondary to minimum curve height and straightest possible line. Go back and forth between primary and secondary till both are peaked.

NOTE: Both the cores should be within 1.5mm from the top of the form.

E DETECTOR ALIGNMENT (FINAL)

1 Disconnect detectorprobe and connect tape 1 rec. output to VTVM's, oscilloscope and distortion analyzer.

2 Switch stereo generator to 1 kHz 100% (± 75 kHz) mono modulation and oscilloscope to normal internal sweep 0.2 mS and 0.5 V/cm sensitivity.

3 Detector reference frequency.

Reduce FM generator output level while monitoring THD from left channel. When THD increases to 3%, fine tune the FM generator frequency to minimum THD. Reduce FM generator output level and fine tune till no reduction in the 3% THD can be achieved by fine tuning. Use this frequency for all the following detector, MPX and DYN SEP adjustments.

NOTE: The typical input level for this 3% THD should be 1.6 μV to 2.3 μV. This is done only to "line up" the frequency from the generator to the tuner's frequency.

If IHF usable sensitivity (–30 dB THD + N = 3.16%) is to be verified, a proper IHF bandpass-filter must be used.

4 Connect DMM across TP 104 (negative) and TP 105 (positive). Set FM generator output to 1000 μV

5 Adjust L 102 primary (closest to IC 102) for 0 V on DMM.

TOLERANCE ± 50 mV

6 Adjust L 102 secondary for lowest THD.

SPECIFICATION less than 0.1%

7 Repeat steps 3, 5 and 6 till no further improvements. Record the DMM's final reading for use later in the adjustments. (I – 3)

F AUTOSEARCH LEVEL

1 Connect DMM between ground and TP 107.

2 Increase FM generator level upwards from 0 and adjust R 107 "MUTE" so that DMM reading goes from 0 V to approximately 4.8 V at 10 μV input.

TOLERANCE ± 2 μV

G STEREO DECODER, MPX FILTERS.

1 VCO

Connect a frequency counter and a 200 k ohm resistor in parallel between ground and TP 108.

2 Set FM generator to 1000 μV output and no modulation.

3 Adjust R 164 "MPX VCO" for a 19000 Hz reading on the counter.

TOLERANCE ± 100 Hz

4 Disconnect frequency counter and resistor and depress DYN SEP defeat switch (in).

5 Stereo switch threshold.

Modulate FM generator 1 kHz 100% left only plus 19 kHz pilot 8 - 10%.

6 Increase FM generator level upwards from 0 and adjust R 167 "ST SW" so that stereo light turns on and audio outputs, as watched on VTVM's and oscilloscope, switches to one channel only at 10 μV input level.

TOLERANCE + 5 μV

NOTE: When turning input level down the unit will switch into mono at a lower level, typically 7 μV.

7 Stereo separation.

Set FM generator output to 1000 μV, modulate left channel only.

8 Adjust R 158 for minimum on right channel VTVM.

9 Modulate FM generator right channel only and adjust R 158 for minimum on left channel VTVM.

10 If the minimum in step 8 and 9 are different, adjust R 158 so that the readings are the same in both channels.

SPECIFICATION better than 50 dB separation

11 MPX filter

Turn off audiomodulation, leaving pilot tone only. Disable IHF filter, or external 19 kHz filter.

12 Check 19/38 kHz suppression.

SPECIFICATION more than 60 dB

13 If unit does not meet specification adjust FL 102 "MPX FILTER" on left channel and FL 103 "MPX FILTER" on right channel to minimum output.

NOTE: DO NOT ADJUST THE MPX FILTERS UNLESS NECESSARY, the cores are brittle and break easily.

14 Release the DYN SEP DEFEAT switch (out).

H DYN SEP ADJUSTMENTS.

1 Turn R 256 "DYN SEP OFF", R 249 and 250 "DYN SEP" fully clockwise.

2 DYN SEP separation effect.

Observe output from left channel with FM generator output level 1000 μV and modulated 1 kHz left channel only.

Reduce audiomodulation only from stereo generator so that left channel output is reduced by 6 dB (50% stereo modulation).

The 19 kHz pilot signal MUST REMAIN modulated 8 - 10%.

3 Set FM generator output to 50 μV and adjust R 249 "DYN SEP" for –30 dB separation left to right channel.

TOLERANCE ± 2 dB

4 Switch modulation to right channel only while maintaining the same modulation levels.

Adjust R 250 "DYN SEP" for –30 dB separation right to left channel.

TOLERANCE ± 2 dB

5 DYN SEP auto defeat level.

Set generator output to 200 μV and adjust R 256 "DYN SEP OFF" so that separation starts increasing when watching left channel VTVM. Adjust FM generator output up and down around 200 μV and make sure switching occurs around 200 μV.

TOLERANCE + 100 μV – 30 μV

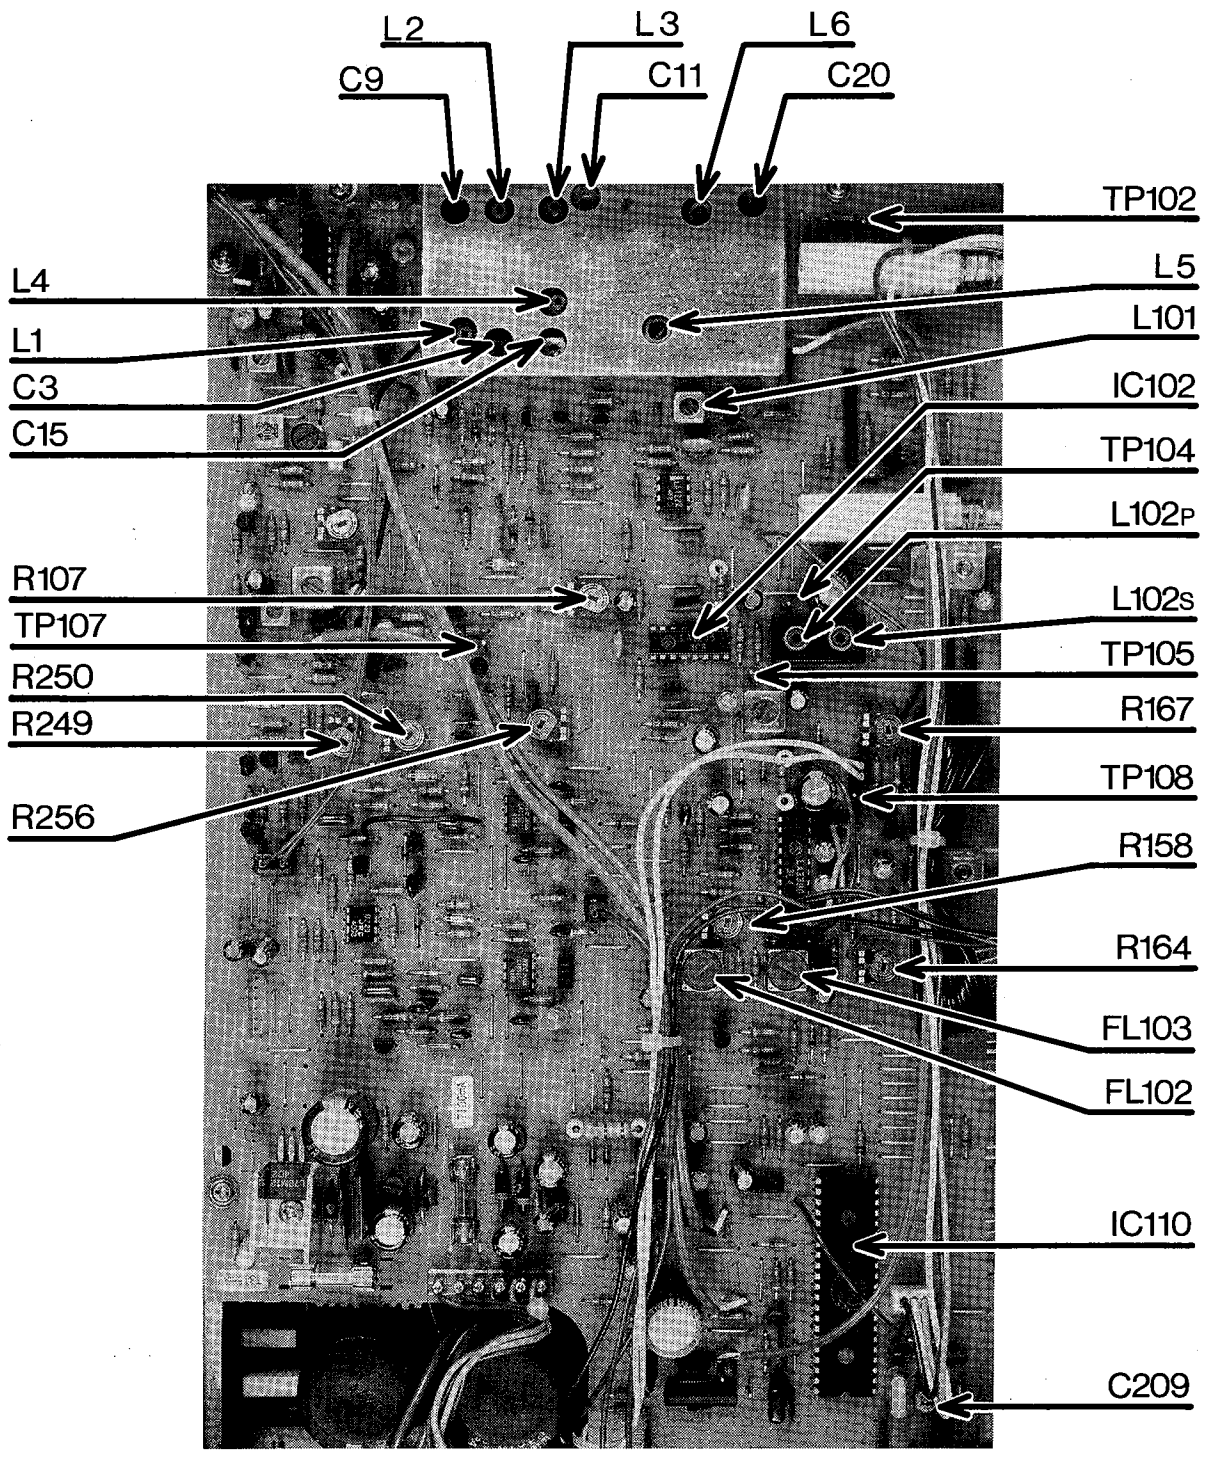
I SYNTHESIZER FREQUENCY

1 Tune to a known accurate frequency source, i.e., broadcasting station or synthesized/digital display FM generator preferably in the midband 95 - 100 MHz.

2 Connect DMM across TP 104 (negative) and TP 105 (positive).

3 Adjust C 209 "FQ" so that DMM reads the same as recorded in E – 7.

TOLERANCE ± 10 mV



AM ALIGNMENTS

A OSCILLATOR.

1. Connect DMM to TP 101 and gnd.
2. Tune to 1710 kHz. Enter into preset 1. Adjust C 148 for reading of 31 ± 0.5VDC.
3. Tune to 520 kHz. Enter into preset 2. Adjust L 103 for reading of 1.8 ± 0.1 VDC.
4. Repeat steps 2 and 3 until within tolerances.

B ANTENNA, IF

1. Swing antenna away from chassis and peel back label (if present) to expose adjustment tab.
2. Connect DC voltmeter to centertap, R 208 and gnd.
3. Tune to station of moderate strength, near 600 kHz. Enter into preset 3. Adjust L 951 (move tab under label on antenna) for maximum reading on meter. (Use non-ineractive tool, such as plastic or wooden stick.)
4. Adjust L 104 and L 106 for maximum reading on meter.
5. Tune station of moderate strength near 1400 kHz. Enter into preset 4. Adjust C 147 for maximum reading on meter.
6. Repeat steps 3 and 5 until no further improvement is seen.

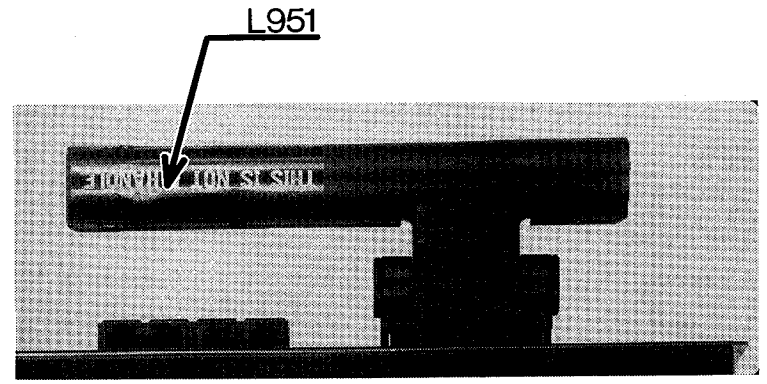
C 9 kHz, 10 kHz WHISTLE FILTERS

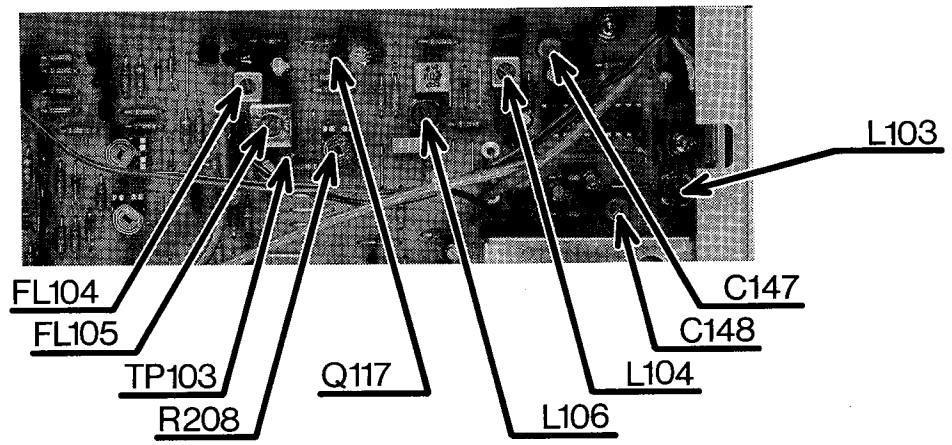
1. Tune to quiet spot on the dial (a clear frequency)
2. Connect audio osc. to base, Q 117 (isolate with 0.1 - 1.0 μF capa.)
3. Connect AC VTVM (or scope) to TP 103.
4. Set audio osc. to 10 kHz (± 50 Hz) 1 V. Adjust FL 104 for minimum meter reading.
5. Set audio osc. to 9 kHz (± 50 Hz) 1 V. Adjust FL 105 for minimum meter reading.

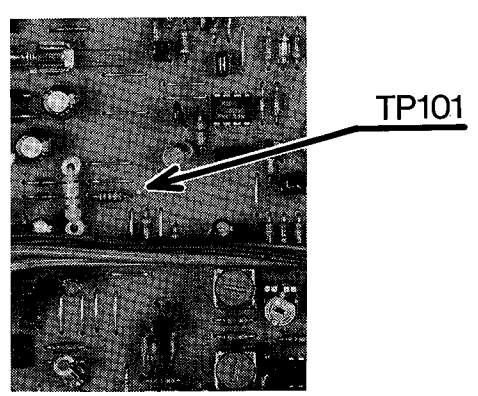
D SIGNAL METER, AUTO STOP

R 208 controls signal strength indication and auto stop level, adjust only if necessary, to correct for scan stopping on excessively weak signals, or failure to stop on moderately strong ones.

NOTE: When finished, lock antenna bar adjustment with laquer (nail polish), re-install label.







AMPLIFIER ALIGNMENTS

A IDLE (QUIESCENT) CURRENT

1 Connect mV meter (DVM) from TP 701 to TP 702, left chan. (from TP 751 to TP 752, right chan.)

2 Adjust R 721, left chan. (R 771, right chan.) so that meter reading is 20 - 25 mVDC.

NOTE: Reading may take a few minutes to stabilize; re-check after offset adjustment (next step.)

B OFFSET (CENTERING) VOLTAGE:

Adjust R 708. left (R 758, right) so that voltage at spkr. terminals is 0 ± 50 mVDC.

NOTE: Perform these adjustments with no load, volume minimum.
