

ONKYO SERVICE MANUAL

STEREO CASSETTE TAPE DECK MODEL TA-2058

Black and silver model

UDN, UDC, UD	120V AC, 60Hz
UG	220V AC, 50Hz
UW	120 or 220V AC, 50/60Hz
UQA, UQB	240V AC, 50Hz

SAFTY-RELATED COMPONETN WARNING!!

COMPONENTS IDENTIFIED BY MARK Δ ON THE SCHEMATIC DIAGRAM AND IN THE PARTS LIST ARE CRITICAL FOR RISK OF FIRE AND ELECTRIC SHOCK. REPLACE THESE COMPONENTS WITH ONKYO PARTS WHOSE PARTS NUMBERS APPEAR AS SHOWN IN THIS MANUAL.

MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

SPECIFICATIONS

Track Format:	4 tracks, 2 channels
Erasing System:	AC erase
Tape Speed:	4.8 cm/sec. (1-7/8 i.p.s.)
Wow & Flutter:	0.045% (WRMS)
Frequency Response:	20-17,000Hz (30-16,000Hz \pm 3dB) (normal position tape) 20-18,000Hz (30-17,000Hz \pm 3dB) (high position tape) 20-19,000Hz (30-18,000Hz \pm 3dB) (metal position tape)
Signal-to-Noise Ratio:	60dB (metal position tape, Dolby NR out) A noise reduction of 10dB above 5kHz and 5dB at 1kHz is possible with Dolby B NR. A noise reduction of 20dB at 5kHz is possible with Dolby C NR.
Input Jacks:	Mic jacks: 2 Input sensitivity: 0.6mV/600 ohms Input impedance 5.6 kohms Line IN: 2 Input sensitivity: 60mV Input impedance: 50 kohms
Outputs:	Line OUT: 2 Std output level: 500mV (0dB) Optimum load impedance: over 50 kohms Headphone Jack: 1

ONKYO[®]
AUDIO COMPONENTS

	Optimum load impedance: 8-200 ohms
Motors:	DC servo motor: 1 DC motor: 2
Heads:	REC/PB heads: Special Hard Permalloy Erase head: Ferrite
Power Supply:	AC 120V/60Hz
Power Consumption:	34 watts
Dimensions:	435(W) × 112(H) × 360 (D)mm (17-1/8" × 4-3/8" × 14-1/8")
Weight:	6.1 kg. (13.4 lbs.)

Specifications and external appearance are subject to change without notice because of product improvements.

SERVICE PROCEDURES

1. Replacement of power supply cord

There are two power supply cord outlets on the strainrelief. Insert them in prescribed direction to ensure safety. AS-UC-3 (UD<120V> model) should be inserted lengthwise and other types of cords should be inserted horizontally.

2. Instruction resistance measurement

Connect the insulating-resistance tester between the plug of power supply cord and chassis.

Specifications: 500V more than 10MΩ

3. Replacing the lamps

This unit used the lamps listed below.

Circuit No.	Parts No.	Description
Mechanism 184b	24606173	50mA, 14V. Lamp
PL901	210090	150mA, 14V. Lamp
PL902	210190	60mA, 14V. Lamp

CAUTION: Before replacing the lamps, be sure to unplug the power supply cable.

FEATURES

Three Heads with Special Hard Permalloy For Superior Metal Tape Performance

Having three heads means you can monitor the actual recorded signal as you record instead of rewinding the tape to check your recording afterward. The 3-head system also

has the advantage of making possible the use of separate record and playback gaps, each optimized for its own task. The special hard permalloy head formulation boasts the high saturation flux density and abrasion resistance needed for true metal tape compatibility.

Preset Automatic Accubias

Different brands of cassette tape can exhibit slight variations in playback frequency response even when recorded at exactly the same bias level. Automatic Accubias tailors the recording bias to the magnetic characteristics of any cassette tape. The Auto Accubias preset knob allows you to choose from five different frequency response positions (-2, -1, 0, +1, +2) before the adjustment takes place. The 0 setting results in flat playback response. If you wish to boost high frequencies (when recording electronic music, for example) choose +1 or +2; choose -1 or -2 to attenuate them. This system combines maximum flexibility with ease of operation.

Dual Sensor Real Time Tape Counter

The tape counter circuit measures the speed of both tape reels and compares them by microcomputer to provide precise readings of remaining time. This dual sensor technique eliminates small errors in time calculations caused by slight variations in tape thickness between different manufacturers to give the most accurate time indications possible.

2-Motor Tape Transport with Separate Head Assembly Motor

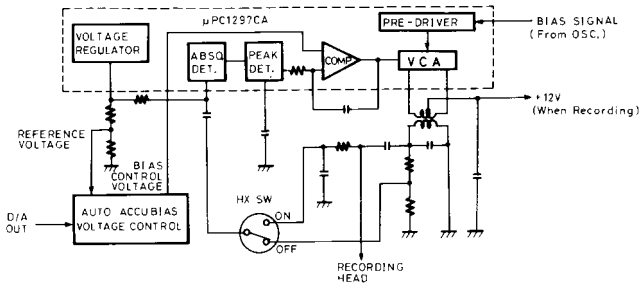

The tape transport system, along with the heads, is the most important factor affecting the basic performance of a cassette deck. To assure extremely stable and accurate transport, this unit uses a DC servo-controlled capstan motor. This motor is unaffected by fluctuations in the power supply voltage and frequency and instantaneous changes in load. A highly reliable simple drive transmission system and precision vertical cassette holder further enhance overall accuracy and stability. As a result, wow and flutter is under 0.045%. In addition, separate DC motors drive the reel tables and head base and the head assembly is constructed to move silently with no annoying clicks.

Dolby B and C Noise Reduction, and Dolby HX PRO

Along with standard Dolby B NR, this unit also has the even more effective Dolby C NR system. Dolby C NR reduces tape background noise by 20dB at 5kHz, about 3 times more than Dolby B NR. In addition to its wide band noise reduction, Dolby C NR uses a sliding band technique that varies the band width of noise reduction according to the input level, thereby avoiding noise "pumping." Dolby C NR also has an anti-saturation effect to reduce the chance of tape saturation in the high range. All these features combine to eliminate the adverse effects on tape sound that other noise reduction systems can cause. This deck also features Dolby HX PRO which helps prevent tape saturation and thereby allows you to record tapes containing a wider dynamic range.

CIRCUIT DESCRIPTIONS

1. DOLBY HX PRO CIRCUIT

In this circuit, the bias oscillates only when recording. The size of the bias current is controlled by the bias control voltage. When the HX PRO is OFF, by means of the recording signal, a non-modulating oscillator voltage is applied to the absolute value detection circuit. When the HX PRO is ON, by means of the recording signal coming from the recording head, a modulating oscillator voltage is applied to the absolute value detection circuit, and by means of the recording signal level peak detection value, the bias current is instantaneously controlled. At such time, by means of the CR integrated circuit, the frequency characteristic is maintained. (Approx. 8 KHz)

2. PRESET ACCU BIAS OPERATION

Fig. 1 Block diagram

With the LEVEL SELECT, the 12KHz level is set in 5 stages. With regard to 400Hz, the 12KHz level is set in 5 stages.

When the ACCU BIAS operation is started, a 400Hz/12kHz mixed signal is recorded, the bias current in this case being controlled by a signal from the microcomputer. The playback signal is separated by filter into the original 400Hz and 12kHz signals, and after being rectified these signals are passed to a comparator where a comparison check is made to see if one of the signals is greater than the other. A HIGH comparator output indicates that the 12kHz signal is greater than the 400Hz signal, and a LOW output indicates that the 400Hz is lower than the 12kHz.

Fig. 2 Bias adjustment method

First the bias is set to step 16 which is in the center of the bias range shown in Figure 2. Then the 400Hz/12kHz mixed signal is subjected to a comparison operation to see which component is larger. If the 12kHz signal is larger, then the bias level is too small. If the 400Hz signal is larger, on the other hand, the bias level is too large. In the example shown in Figure 2, the bias level at step 16 is too large, so the bias is reduced by 1/4 of the total range (8 steps) to position (2) where the 400Hz and 12kHz components are again compared. If the 400Hz signal is still larger than the 12kHz signal, the bias level is further reduced by 1/4 of the total (4 steps) (3) and the components then compared again. This procedure is used for rough adjustment of the optimum bias. If at this stage, the 12kHz signal is now found to be greater than the 400Hz signal, the optimum bias is known to exist between steps 24 and 28. The operation is now switched to fine adjustment – the bias is increased by 1/4 and then reduced one step at a time from step 24. The step where the component signal size relationship is switched from $400 > 12k$ to $12k > 400$ is taken as the optimum bias (5), and the bias is set at this level. This fine adjustment operation proceeds only from greater to lower bias levels in order to avoid misoperation due to possible drop outs. The effects of a drop out on the bias adjustment when the bias is changed from a smaller to a larger level is indicated in Figure 3, while the reverse case is indicated in Figure 4.

Fig. 3 Example of misoperation caused by drop out

Fig. 4 Example where effect of drop out is avoided

3. DA Converter and Data Setting Method

The D/A converter circuitry is outlined in Figure 5, and the logic diagram of the 4024BP 7-stage binary counter in Figure 6. The 4024BP counter is counted up each time a negative input pulse is applied to the clock pin, the output data being obtained from Q1 thru Q7 (although only Q1 thru Q5 are actually used). This output is converted to an analog quantity when passed through the R-2R rudder resistance circuit.

If the power supply voltage is 5V, the voltage per step is approximately 0.156V with a total of about 4.84V. Since this 4024BP is only involved in up counting, setting to a value lower than the current value (that is, greater bias) results in an initial clearing and output of pulses until the set value is reached.

Fig. 5 DA converter circuitry

Fig.6 4024BP logic circuit

4. Input Port Expander IC

The equivalent circuit of the LC7800 used to expand input ports is shown in Figure 7. This IC includes four 4-bit input ports, one 4-bit output port, and one 4-bit selector input port. When BA of the selector input is set to LOW and the other bits to HIGH, the A0" A1" A2" A3 input port is connected to the D0" D1" D2" D3 output port. And if only the BB bit is set to LOW, the B0" B1" B2" B3 input is selected. Hence, a LOW level signal is applied to the selector port bits in cyclic order, and the operation indicator LEDs are switched on and off dynamically in combination with the #13, #14, and #15 LED output ports while input port data is being read out.

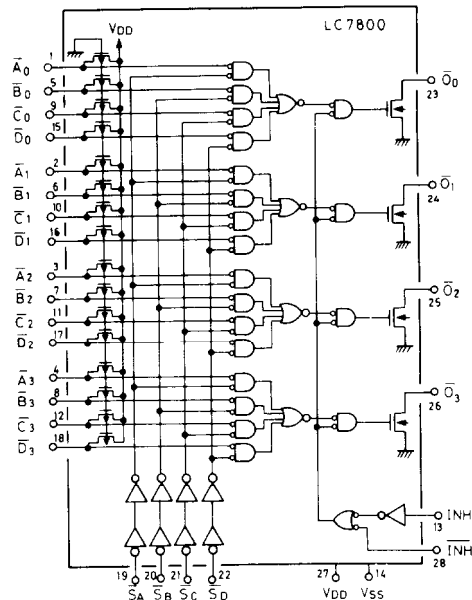

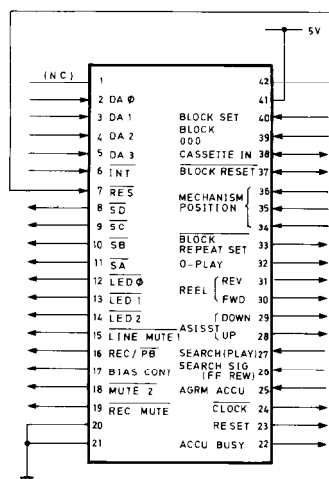

Fig. 7 LC7800 equivalent circuit

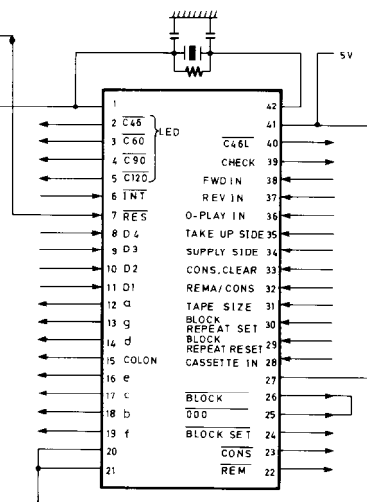

MICROCOMPUTER(LM6402H-425)

Pin no.	Name	Function	Classification

4	Bias current	Fig. 2	1kHz, -20dB and 12kHz, -20dB	NEW XL-II90	REC/PB	AC voltmeter	R-569 (Ch.L) R-570 (Ch.R)	Same level at REC/PB	Input VR maximum
5	Record level	Fig. 2	1KHz	REC PAUSE	AC voltmeter	Attenuator or AF OSC output	350mV	accu VR center position	
				REC/PB	AC voltmeter	R-401 (Ch.L) R-402 (Ch.R)	Same level at REC/PB		

ACCU BIAS oscillator adjustment

1. Connect the oscilloscope and AC voltmeter to the terminal TP-3.
2. Pull P605 socket out of P605 plug on NACOC-2673.
3. Connect +5V terminal to the cathode of D-618 with short-crip.
4. Adjust the semi-fixed resistor R-531 so that the 400Hz and 12kHz mixing signals become same level (a=b) as shown below.
5. Adjust R-532 so that the AC voltmeter indicator becomes 20mV.

Confirming phase relationship

fig-1

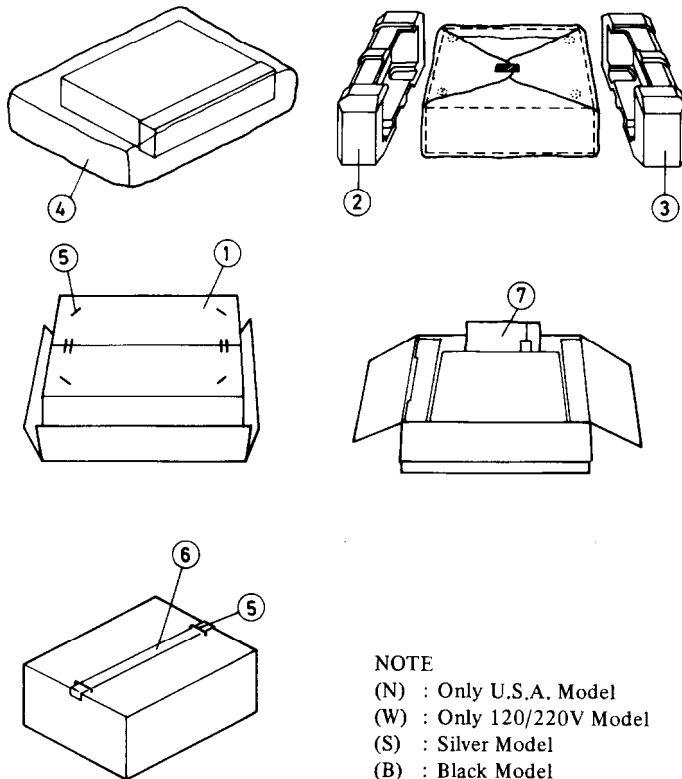

fig-2

PLAY torque 30 ~ 60 g/cm
 FF. REW torque 70 ~ 140 g/cm

Back tention 4 ~ 7 g/cm

Peak meter and volum pc board (NAVR-2635-1)

CIRCUIT NO.	PART NO.	DESCRIPTION
	IC	
Q305	222507	TA7612AP
	LEDS	
D311, D312	225160	SEL9520BG
D313, D314	225161	SEL9520MB01
	Lamp	
PL901	210090	14V, 150mA
	Resistors	
R197, R198	6172001	N60LGL50KA5Z
	27225076	Shield plate

Headphone Terminal pc board (NAHP-2636-1)

CIRCUIT NO.	PART NO.	DESCRIPTION
P301	25045139	HLJ0540-01-010

NOTE

- (D) : Only 120V model
- (G) : Only 220V model
- (W) : Only Universal model
- (S) : Silver model
- (B) : Black model

- NOTES
- ALL RESISTORS ARE IN OHMS 1/4WATT OR 1/2WATTS UNLESS OTHERWISE NOTED.
 - RESISTORS ARE IN OHMS UNLESS OTHERWISE NOTED.
 - ALL CAPACITORS ARE IN P.F. UNLESS OTHERWISE NOTED.
 - ALL DIODES ARE 1N540 UNLESS OTHERWISE NOTED.
 - VOLTAJE MEASURED WITH V.T.V. PIVOTING AT DC INTERNAL FOR SAFETY. REPLACE ONLY WITH PART NUMBER SPECIFIED.
