COMPACT DISC PLAYER

# PD-7050

## PD-7050-S

MODEL PD-7050 AND PD-7050-S COMES IN FIVE VERSION DISTINGUISHED AS FOLLOWS:

Type	Applicable model		Power requirement	Except destination
	PD-7050	PD-7050-S		
KU	○	—	AC120V only	U.S.A.
KC	○	—	AC120V only	Canada
HEM	○	○	AC220V, 240V (switchable) *	European continent
HB	○	—	AC220V, 240V (switchable) *	United Kingdom
SD	○	—	AC110V, 120-127V, 220V, 240V (switchable)	General market

\* Change the position of jumper of the Transformer board assembly.

- This service manual is applicable to the KU, KC, HEM, HB and SD types.
- As to the KC, HEM, HB and SD types, please refer to pages 76.
- Ce manuel d'instruction se réfère au mode de réglage en français.
- Este manual de servicio trata del método ajuste escrito en español.

# 1. SAFETY INFORMATION

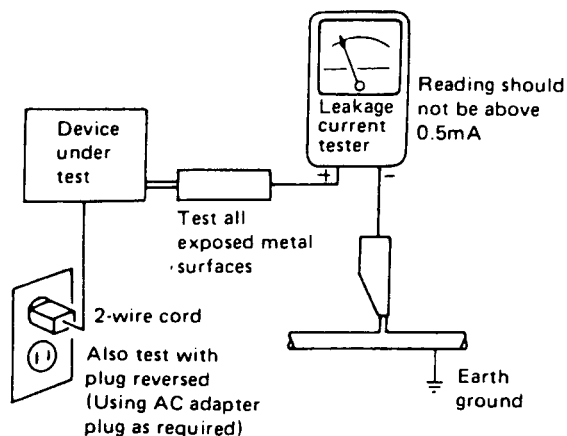

(FOR USA MODEL ONLY)

## 1. SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

### LEAKAGE CURRENT CHECK

Measure leakage current to a known earth ground (water pipe, conduit, etc.) by connecting a leakage current tester such as Simpson Model 229-2 or equivalent between the earth ground and all exposed metal parts of the appliance (input/output terminals, screwheads, metal overlays, control shaft, etc.). Plug the AC line cord of the appliance directly into a 120V AC 60Hz outlet and turn the AC power switch on. Any current measured must not exceed 0.5mA.

AC Leakage Test

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

## 2. PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the appliance have special safety related characteristics. These are often not evident from visual inspection nor the protection afforded by them necessarily can be obtained by using replacement components rated for voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

Electrical components having such features are identified by marking with a  $\Delta$  on the schematics and on the parts list in this Service Manual.

The use of a substitute replacement component which does not have the same safety characteristics as the PIONEER recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current PIONEER Service Manual. A subscription to, or additional copies of, PIONEER Service Manual may be obtained at a nominal charge from PIONEER.

**ADDITIONAL LASER PRECAUTIONS**

- 1. Laser Interlock Mechanism**  
 The clamp switch (S102) detects the completion of the Load in operation, and the ON/OFF status of the clamp switch is in turn detected by the microcomputer. The laser diode is designed not to oscillate while the clamp switch is in OFF status. Consequently, if S102 is accidentally short-circuited, the interlock mechanism will become incapable of operation.  
 Moreover, when short-circuiting occurs between Pins 4 or 5 of CXA1081S (IC 1) and GND, or between Pin 29 of CXA1081S (IC 1) and GND, or between the terminals of Q1 (a Fault Condition will occur in all three cases), the laser diode will oscillate continuously. Note that during TEST Mode (see page 36), the interlock mechanism does not operate.
- 2. While the bonnet is in opened status, if the pickup is positioned to allow direct visibility of the objective lens at the outer periphery from the outer diameter of the disc clamper (80-mm diameter), the pickup can be flooded with radiation of more than class 1 of the laser optical system during any Fault Condition in Item 1 above or during TEST Mode.**

## 2. SPECIFICATIONS

### 1. General

Type.....Compact disc digital audio system  
 Usable discs.....Compact Disc  
 Signal format.....Sampling frequency: 44.1 kHz  
 Quantized bit number: 16 bit linear

#### Power requirements

European models.....AC 220 V, 50/60 Hz  
 U.K., Australian models.....AC 240 V, 50/60 Hz  
 U.S., Canadian models.....AC 120 V, 60 Hz  
 Other models.....AC 110/120-127/220/240 V  
 (switchable), 50/60 Hz

Power consumption.....15 W

Operating temperature.....+5°C - +35°C

Weight.....4.3 kg (9 lb, 8 oz)

External dimensions.....

420(W) x 315(D) x 84(H) mm  
 16-1/2(W) x 12-2/5(D) x 3-1/4(H) in

### 2. Audio section

Frequency response.....4 Hz - 20 kHz ( $\pm 0.5$  dB)

S/N.....104 dB or more (EIAJ)

Dynamic range.....95 dB or more (EIAJ)

Channel separation.....100 dB or more (EIAJ)

Total harmonic distortion.....0.0035% or less (EIAJ)

Output voltage.....2.0 V  $\pm$  0.5 V (EIAJ)

Wow and flutter.....Limit of measurement  
 ( $\pm 0.001\%$  W.PEAK) or less (EIAJ)

Number of channels.....2 channels (stereo)

Digital output.....0.5 Vp-p (75 $\Omega$ )

### 3. Functions

- Play
- Pause
- Manual search
- Programmed playback
- Track search
- Index search
- Programmed repeat
- Pause program
- Direct track search
- All track repeat
- Add-on program
- Auto program editing
- Time fade editing
- Music window program
- Auto fade in/out
- OUTPUT level control
- Timer start

The above functions can be operated with the remote control unit.

### 4. Accessories

- Remote control unit.....1
- Size AAA/R03 dry batteries.....2
- Output cable.....1
- Operating instructions.....1

#### NOTE:

*The specifications and design of this product are subject to change without notice, due to improvements.*

### 3. PANEL FACILITIES

#### FRONT PANEL

##### Indicators

REPEAT : Lights during repeat play.  
 PROGRAM : Lights after programming (after program has been memorized).

TIME/REMAIN/TOTAL : Changes each time the TIME key is pressed.

- TIME : Displays the track number of the track being played, the index number \*1, and the playback time (minutes and seconds).
- REMAIN : Indicates the time remaining on the track being played. When the TIME key is pressed again, the time remaining on the disc will be displayed.
- TOTAL : Displays the total number of tracks on one disc (TRACK) and the overall playback time (MIN, SEC).

During programmed playback operation, displays the remaining playback time of the programmed tracks (REMAIN), and the total playback time (TOTAL).

TRACK : Indicates current track number, and track numbers within program. The lower figures light up in accordance with the number of tracks recorded on the disc, and the numbers of the tracks which have been played extinguish in order. (During programmed playback only the programmed tracks light.) Above number 16 the  mark lights.

- MIN : Displays the playback time or remaining time in minutes.
- SEC : Displays the playback time or remaining time in seconds.
- MUSIC WINDOW IN : Lights when a Music Window has been programmed.
- OUT : Lights when the Music Window program starts or during fade in.
- LEVEL : Displays the volume level during fade in and fade out, and when the volume control is adjusted.
- ATT : Displays the volume level decrease during fade in and fade out and volume control adjustment.
- INDEX\*1 : Displays index numbers which divide the music and tunes within one track. During programmed playback displays the step number.
- AUTO PGM EDITING : Displayed when Auto Program Editing is set or operated.
- TIME FADE EDITING : Displayed when Time Fade Editing is set or operated.

\*1The INDEX is a signal which is recorded within a track, to indicate division of the track into separate tunes and items of music.

##### POWER switch

Press to turn power to the unit ON and OFF. If there is a disc in the unit when power is turned ON, playback will begin automatically. (Timer start function)

##### REMOTE SENSOR

##### PHONES (headphones) jack

When you wish to use headphones, insert the plug for the headphones into the headphone jack.

##### PHONES LEVEL control knob

Use to adjust the level of sound when using headphones. Turning the knob to the right increases the sound level.

**OPEN/CLOSE key**

Press when you wish to eject or load a disc. Each time the key is pressed, the tray is alternately pushed out or pulled in.

**Disc Tray**

This is where the disc is set. When power is switched ON and the OPEN/CLOSE key is pressed, the tray is ejected forward.

To insert the tray, press the OPEN/CLOSE key, or lightly push the tray in with your finger. During play operation, pressing the PLAY key causes the tray to be inserted automatically.

**STOP key**

Press to stop playback. When pressed, the player goes into stop mode and all operations stop.

**PAUSE key/Indicator**

Press to temporarily interrupt playback. When pressed again, the pause mode is cancelled and playback resumes.

**PLAY key/Indicator**

Press to begin playback, and to cancel the pause mode.

**MANUAL SEARCH Keys**

When the player is in play or pause modes, these keys are pressed to perform fast forward or fast backward operations, to allow manual searching. These operations are only carried out during the time either key is pressed.

[▶▶] : Fast forward operation (If fast forward operation is performed to the end of the disc, "End" will be displayed and the player will enter play mode.)

[◀◀] : Fast backward operation (If fast backward operation is performed to the beginning of the disc, the player will enter play mode.)

- For programmed playback, when the forward search reaches the next track, it will enter the pause mode. When it reaches the beginning of the track in backward search, the player will enter the playback mode.

- For Music Window playback, when the forward search reaches the starting point of window fade out, the player will enter the pause mode. When it reaches the starting point of the window in backward search, the player will enter the playback mode.

**TRACK SEARCH keys**

When the player is in the normal play, (or during programmed or Music Window playback) or pause modes, these keys are pressed to search for a desired track. Pressing either key causes the player to advance to the next track, or return to the previous track. The keys can also be used to check the contents of a program during program entry (but only when the player is stopped).

[▶▶] : When pressed once, the disc playback advances to the beginning of the next track on the disc; when pressed continuously, the disc playback moves to the beginning of succeeding tracks on the disc. (During programmed playback, it moves to the beginning of the next programmed track.)

During Music Window playback, the player advances to the beginning of the next programmed window.

[◀◀] : When pressed once, the disc playback returns to the beginning of the currently playing track; when pressed continuously, the disc playback moves further in reverse to the beginning of previous tracks on the disc. (During programmed playback it returns to the beginning of the previously programmed track.)

During Music Window playback, it returns to the beginning of the previously programmed window.

**TIME key**

- Use to select the method for displaying the playing time on the indicator panel. Each time the key is pressed, the indication changes from TIME, REMAIN, to TOTAL in that order. (For details concerning the display contents, refer to the explanation about the indicators.)
- If pressed after pressing the TRACK NO. key, the playback time of the selected track only is displayed.

**REPEAT key**

Press to perform repeat playback

- If pressed during normal playback mode, all tracks on the disc will be repeatedly played back.
- If pressed during programmed playback, the programmed tracks will be repeatedly played back in the programmed order.

**AUTO PGM EDITING key**

Press to program a tune which may be played back within a specified time.

**TIME FADE EDITING key**

Press this key when ending play at a desired time with fade out.\*1

**DIGITAL FADE IN key (AUTO FADE IN)**

When this key is pressed while in pause mode (during normal or programmed playback), the pause mode will be cancelled and playback will start with fade in sound\*1.

**DIGITAL FADE OUT key (AUTO FADE OUT)**

When this key is pressed during normal or programmed playback, playback will PAUSE with sound fade out\*1.

**MUSIC WINDOW key (MUSIC WINDOW)**

One Music Window step is designated by a starting point and end point stored in memory. Up to 8 Music Window steps can be programmed. During normal playback, each time this key is pressed, the start and end of the window can be designated alternately.

**TRACK NO. keys (1 to 0)**

- Use to specify track numbers (track 1 - track 99) for selection of tracks, program entry, or to confirm playback time.
- For Auto Program Edit or Time Fade Edit operation, the track number keys are used to specify the time period (in minutes).

**PROGRAM key**

Used to program a sequence of tracks:

- Press this key after selecting a desired track with the TRACK NO. keys. Tracks will be added to the program in the order in which a track is selected.

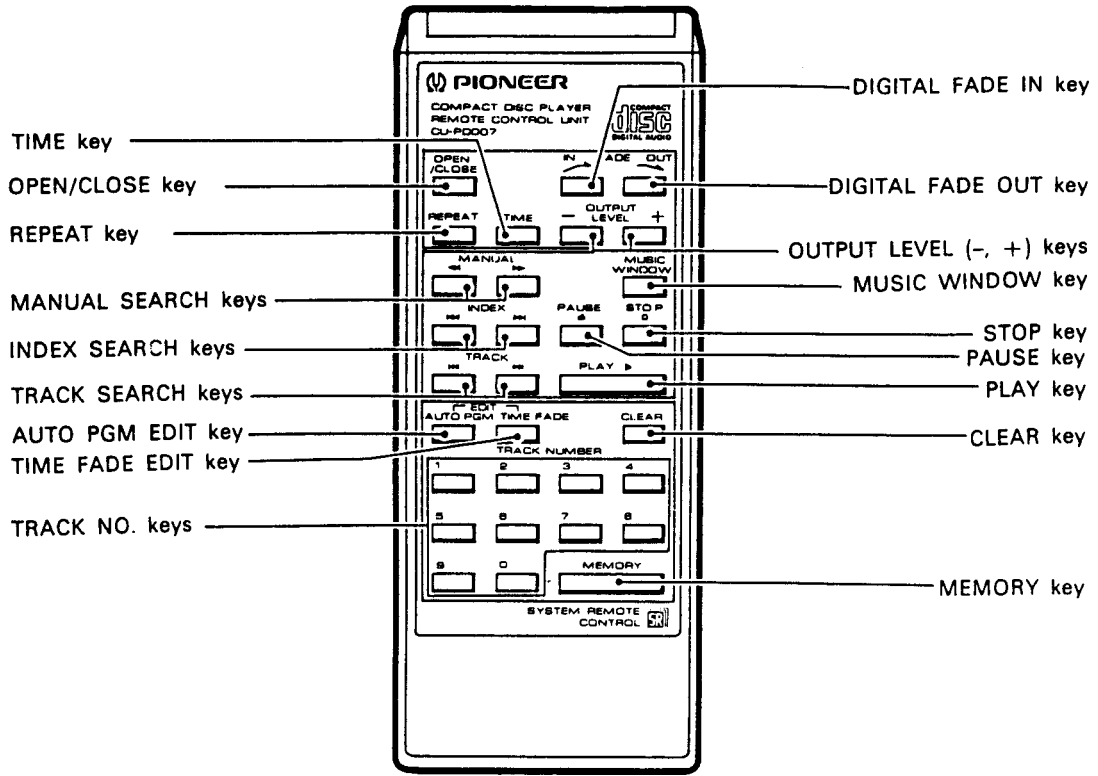

**CLEAR key (CLEAR)**

Press this key to clear the program or Music Window.

**NOTE:**

\*1 The output level of the digital out output (digital data) cannot be controlled. (It will not fade in or fade out.)

REMOTE CONTROL UNIT

REAR PANEL

**DIGITAL OUTPUT terminals (DIGITAL OUT)**

The digital output terminals output the disc's audio data and sub-code data (certain data that can be recorded onto compact discs together with audio data) in their original digital form.

# 4. DISASSEMBLY

• FLOWCHART FOR DISASSEMBLY

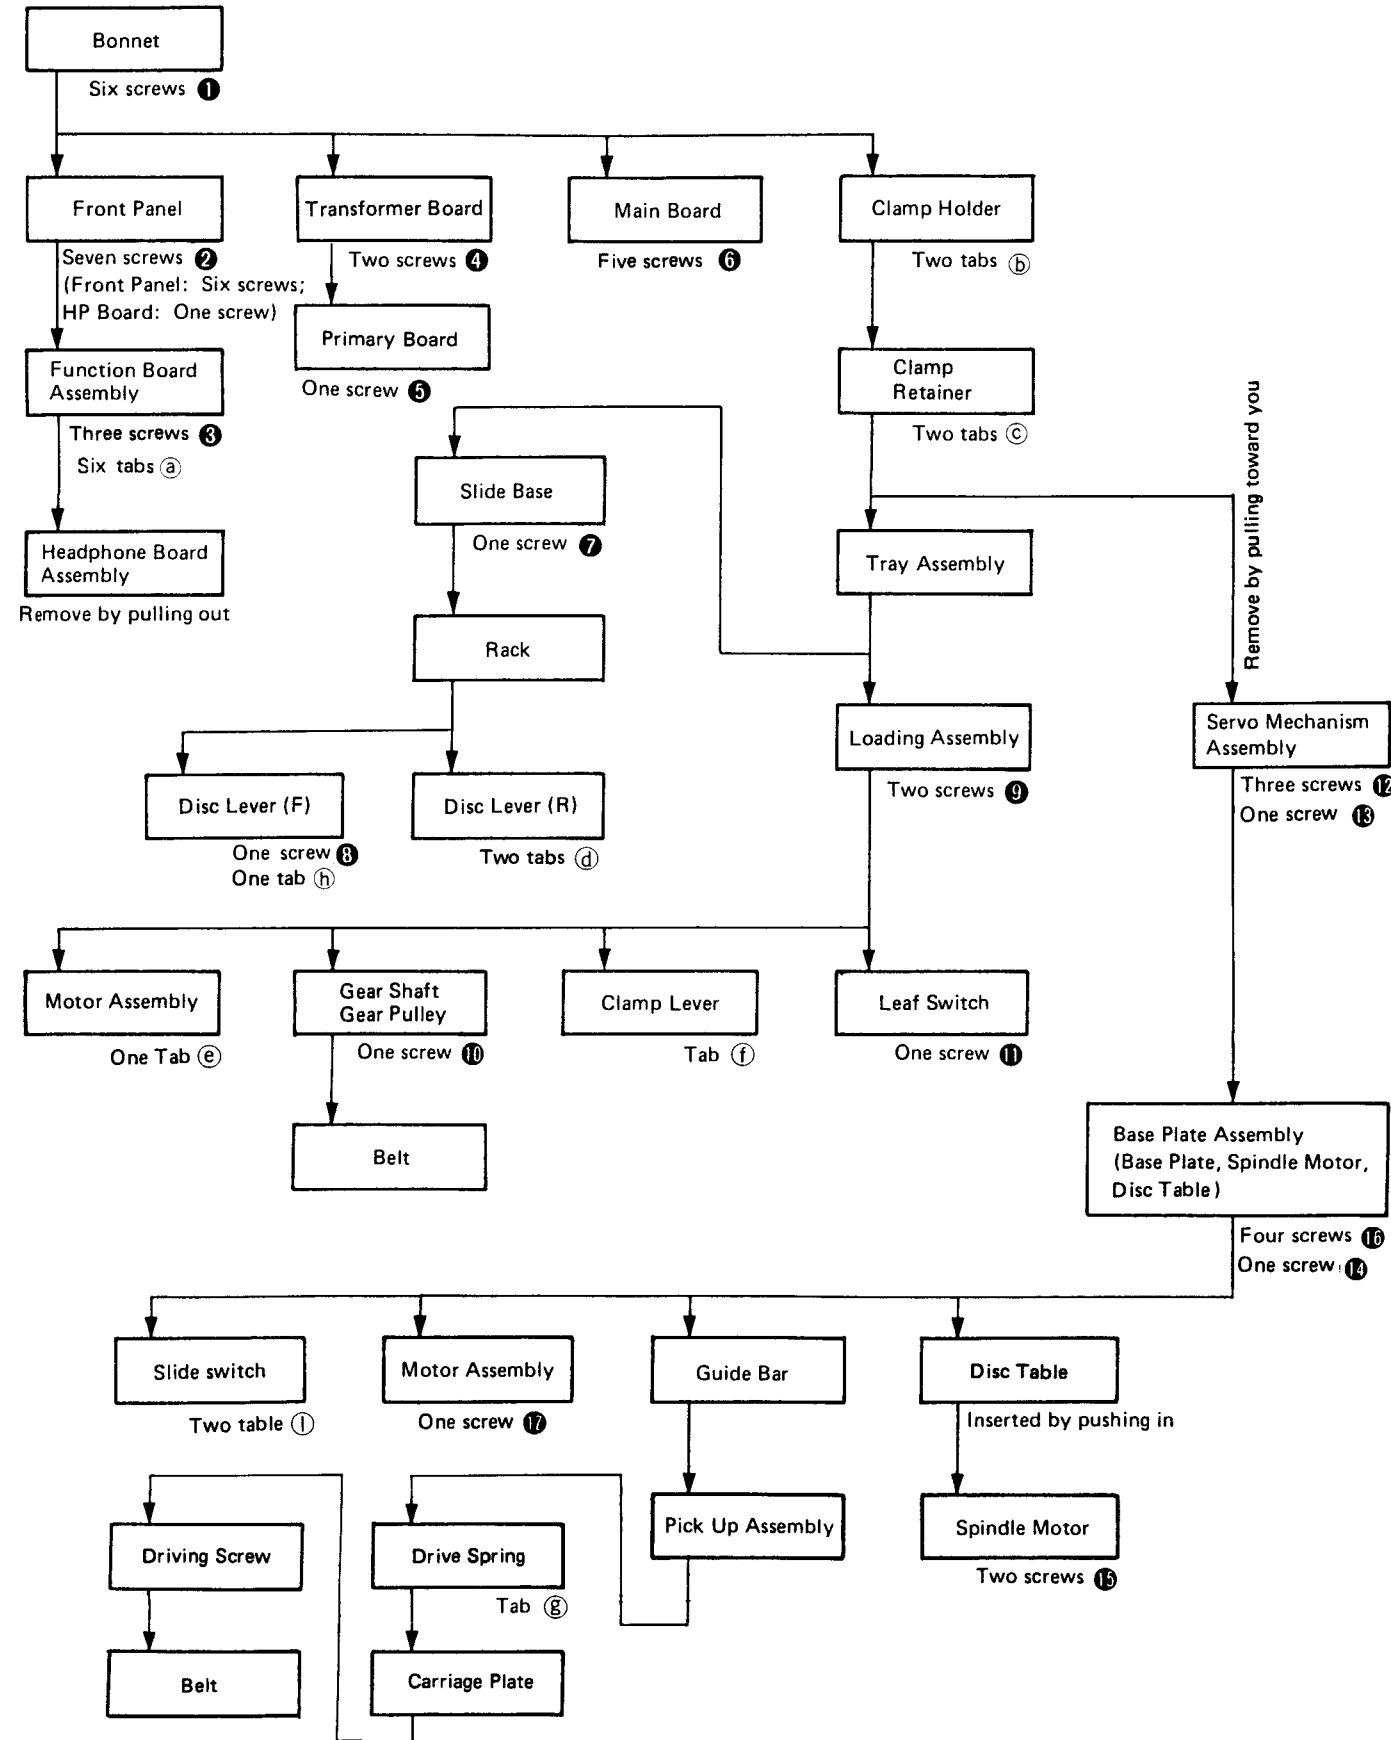

Fig. 4-1 Disassembly

Fig. 4-2 Parts disassembly (Loading mechanism and Tray assembly section)

Fig. 4-4 Disc table installation

Fig. 4-3 Parts disassembly (Servo mechanism section)

**REMOVAL OF THE TRAY**

- **Removal of the disc tray**
1. Press the rear edge of the rack, marked A in Fig. 4-5, while pulling the disc tray out to the position where it catches, illustrated in Fig. 4-6.
  2. While pulling the clamp holder B (see Fig. 4-6) upward with the right hand, hold the tray as indicated by C in the left hand and pull it outward. Take care not to allow the φ4 steel ball to fall (we recommend holding the ball in place with the left index finger while extracting the tray).

Fig. 4-5 Fig. 4-6

### 3. BLOCK DIAGRAM

• For PD-7050

## 4. CIRCUIT DESCRIPTIONS

### 4.1 ACCURATE FOCUS SERVO SYSTEM

As a method (the Accurate Focus System) for reducing the distortion of RF signals read by the pickup, delays have been applied to the output of 2 photodiodes that precede the quarter photodiodes and is followed by an addition operation in order to achieve improvements in frequency response, distortion, S/N, and so on as well as to increase the accuracy of signal reading.

(Forrner Method)

Fig. 4-1

### 4.2 IC DESCRIPTIONS

#### 4.2.1 CXA1082AS

#### FOCUS SERVO SYSTEM

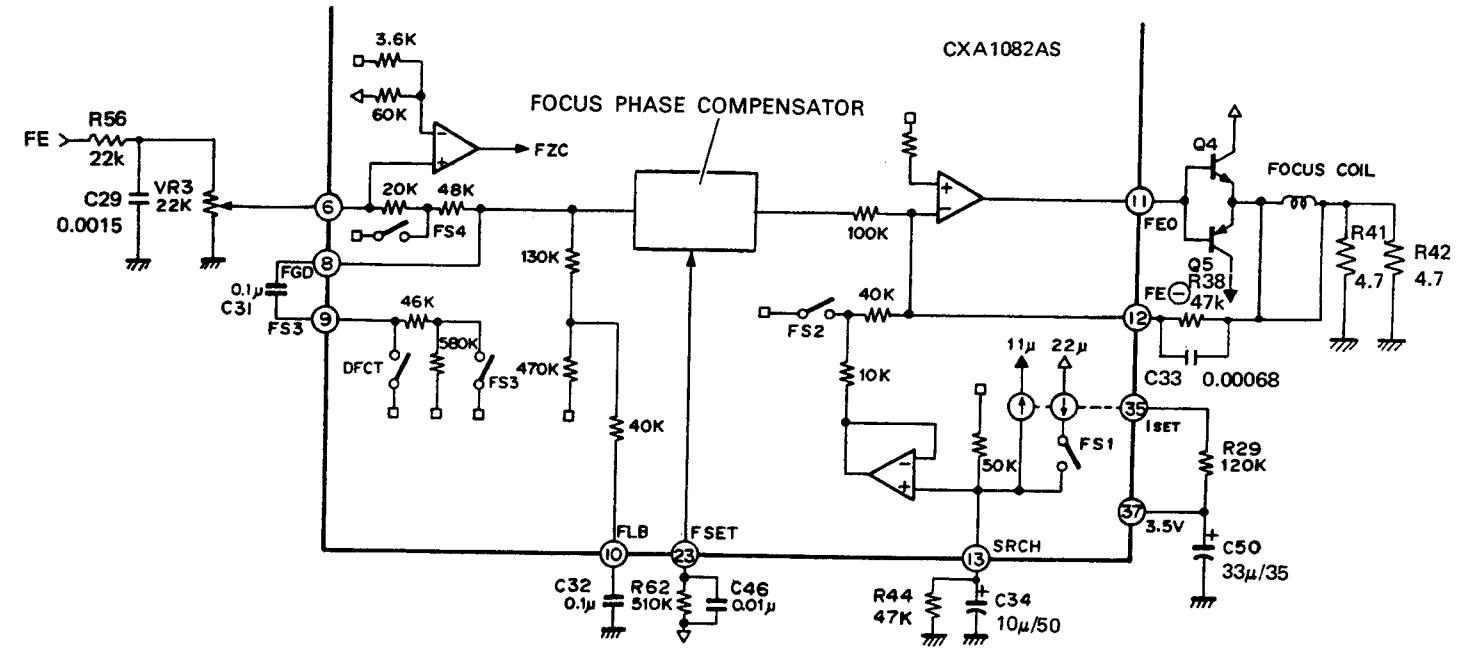

Fig. 4-2

The above figure is a block diagram of the Focus Servo System (Fig. 4-2).

When FS3 is ON, the high-cut filter gain that formed the low-range time constant can be dropped by the operation of the capacitor connected between Pins 8 and 9 as well as the internal resistor.

The capacitor between Pin 10 and GND is a time constant that boost the low-range frequency during normal play mode.

The peak frequency of the Focus Phase Compensator is in inverse proportion to the value of the resistor connected to Pin 23, and its peak value is approximately 1.2 kHz in case of 510kΩ resistance value.

The height of the focus search operation is approximately ±1.1 Vp-p in case of the time constants shown in the Fig. 4-2. This height is in inverse proportion to

the value of the resistor connected between Pins 35 and 36.

This system is set to a value that is 5.7% of difference between the reference voltage  $V_{cc}$  for the inverted input of the FZC comparator and VC (Pin 1); that is, it is set to  $(V_{cc} - VC) \times 5.7\%$ .

**NOTE:**

When the value of the resistor connected to Pin 23 is changed, changes will also concurrently occur in the peak values of the phase-compensating peak value Focus Servo and Tracking and Carriage Servo systems as well as in the  $f_c$  value of CVL LPP. In addition, the dynamic range and offset voltage of the OP Amp will also be concurrently changed.

TRACKING AND CARRIAGE SERVO SYSTEM

Fig. 4-3

The above figure is a block diagram of the Tracking and Carriage Servo System (Fig. 4-3).

The capacitor connected between Pins 14 and 15 is a time constant that functions to drop the high-range gain when TG2 is OFF. The peak frequency of the Tracking Phase Compensator is also in reverse proportion to the value of the resistor connected to Pin 23, and its peak value is approximately 1.2 kHz in case of 510kΩ resistance value.

TM3 or TM4 is switched ON in order to make a tracking jump in the FWD (forward) or REV (reverse) direction, respectively. The peak voltage to be applied to the tracking coil at this time is determined by the current value of TM3 or TM4 and the feedback resistor from Pin 18; that is:

$$\text{Track Jump Peak Voltage} = \text{TM3 (TM4) current value} \times \text{feedback resistance value} \times \frac{\text{TRK coil DCR}}{R52//R53}$$

A FWD or REV carriage kick is performed by switching TM5 or TM6 to ON, respectively. The peak voltage to be applied to the carriage motor at this time is determined by the current value of TM5 or TM6 and the feedback resistor from Pin 21; that is:

$$\text{Carriage Jump Peak Voltage} = \text{TM5 (TM6) current value} \times \text{feedback resistance value} \times \frac{R58}{R57}$$

The current value at each SW is determined by the value of the resistor connected to Pins 35 and 36. When its resistance value is 120kΩ, the respective current values will be as follows:

$$\text{TM3, TM4} = \pm 11 \mu\text{A} \quad \text{TM5, TM6} = \pm 22 \mu\text{A}$$

**SPINDLE SERVO, LPF**

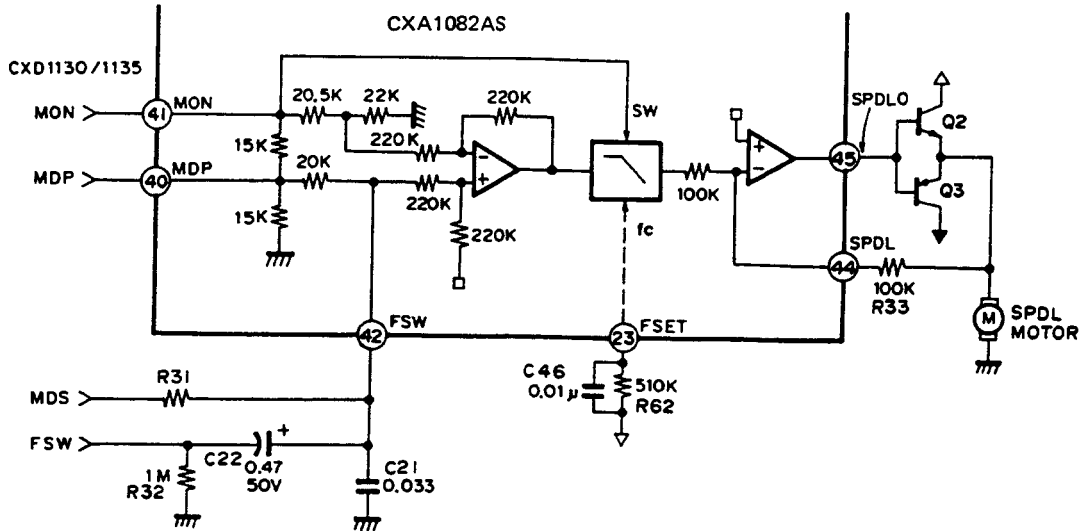

Fig. 4-4

A 200Hz LPF is formed at the 0.033  $\mu\text{F}$  connected to Pin 42 and 20k $\Omega$  resistor and a secondary LPF is formed at the built-in LPF (Pin 23: fc - 200 Hz with a 510k $\Omega$  resistor), thereby eliminating the carrier components of the CLV Servo Error signals: MDS and MDP.

In CLV-S Mode, FSW goes low and the fc value of the Pin 42 LPF is lowered to further reinforce the filter.

**VCO LOOP FILTER, 8.64MHz VCO**

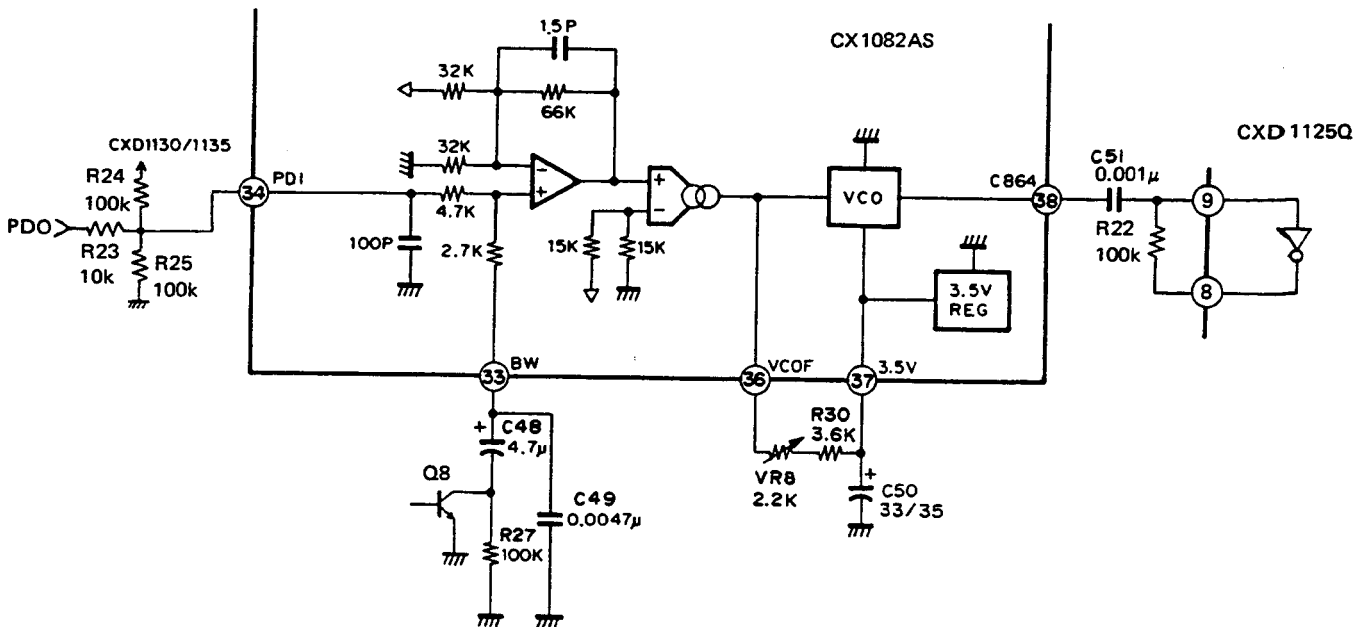

Fig. 4-5

16

The phase comparison output PDO which is input from Pin 34 subjected to V-I conversion after having its PWM carrier component eliminated at the Loop Filter. It is then added to the current from Pin 36 which is used for setting the free-run frequency in order to control the VCO frequency. The free-run frequency of the VCO is approximately in inverse proportion to the value of the resistor between Pins 36 and 37.

**COMMAND**

The input data used for operating this IC actually consists of eight bits. In the following description, however, each command will be expressed using a two-digit hexadecimal format of \$XX (with X ranging from 0 to F).

**1. \$0X (⑭ SENS = "FZC")**

This command is related to the control of the focus servo. Its bit configuration is as follows:

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	FS4	FS3	FS2	FS1

The four focus-related SWs are FS1 to FS4, which respectively correspond to D0 to D3 above.

\$00 When FS1=0, Pin 13 is charged to:  $(22 \mu A - 11 \mu A) \times 50 k\Omega = 0.55V$ .

Moreover, if FS2=0, this voltage is transmitted no further and the ⑪ output becomes 0 V.

\$02 In the above status, only FS2 becomes 1. At this time, a negative output is sent from Pin 11. This voltage level is stipulated as follows:

$$(22 \mu A - 11 \mu A) \times 50 k\Omega \times \text{Resistance value between } \textcircled{11}, \textcircled{12} / 50 k\Omega \dots \text{Equation (1)}$$

\$03 In the above status, FS1=1 so that the +22  $\mu A$  power supply is cut off.

Next, the Charge/Recharge circuit of CR is formed, and the voltage of Pin 13 drops with time as shown in Fig. 4-6 below.

Fig. 4-6. Pin 13 Voltage when FS1 Changes from 0 to 1

This time constant is stipulated by C34 that is externally connected to 50k $\Omega$ .

The alternate issuing of \$02 and \$03 enables the creation of the search voltage for focus. (See Fig. 4-7)

Fig. 4-7. Search Voltage Creation by \$02 and \$03 (Pin 11 Voltage)

**1-1. Description of FS4**

This switch is situated between Focus Error input 6 and the Focus Phase Compensator to receive the Focus Servo ON/OFF data.

\$00 → \$08  
 Focus OFF ← Focus ON

**1-2. Procedure for Applying Focus**

The following explanation will presume the below polarities:

- (a) The lens is searching the disc in the far-to-close direction.
- (b) At this time, the output voltage ① changes from negative to positive.
- (c) Furthermore, the S-curve of the focus at this time changes according to Fig. 4-8 below.

The Focus Servo is applied with Point (A) of Fig. 4-8 as its operating point. The Focus Search operation is performed and the Focus Servo SW is set to ON while Point (A) of Fig. 4-8 is being crossed. In order to also prevent malfunction, the logical product of the operation and the Focus OK signal is obtained.

This IC is designed so that FZC (Focus Zero Cross) will be output - as the signal which indicates the crossing of Point (A) - from the ④ SENS pin. In addition, the Focus OK signal is output as an indication that focus is being applied (or can be applied in this case).

To summarize the above, the focus will be optimally applied in accordance with the time chart below. (In actuality, this IC's auto sequence is being used so the system  $\mu$ -COM only sends \$47 from point (B). See auto sequence on page 20.)

Fig. 4-8 S-Curve of the Focus

Fig. 4-9. Timing Chart of the Focus ON Operation

**1-3. The 24 SENS Pin**

The data which is output by the SENS pin will vary according to the input data as follows. Since FOCS IN and TRACK JUMP are actually done by auto sequencing, the output of CXA1082AS, which uses system  $\mu$ -COM, is only BUSY of \$4X. (See auto sequence on page 20.)

- \$0X input → FZC output
- \$1X input → AS
- \$2X input → TZC
- \$3X input → SSTOP
- \$4X input → BUSY
- \$5X-\$7X input → HIGH-Z

Since any data above \$7X is a command code of CXD1135, its connection with the "SENS" pin of CXD1135 will permit the output of various types from a single pin.

**2. \$1X ( 24 SENS = "AS")**

This command is related to the ON/OFF status of TG1, TG2 and the Break circuit. Its bit

configuration is as follows:

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	ANTI SHOCK ON/OFF	Break circuit ON/OFF	TG2 ON/OFF	TG1 ON/OFF

**Brake circuit description**

These switches are used to switch the Up/Normal status of the Tracking Servo gain. Because the Servo circuit exceeds the linear range after performing a 100- or 10-track jump, the settling of the actuator becomes extremely bad such that it will, for example, return after jumping only ten tracks, although a 100-track jump was intended, and such phenomena will frequently occur. It is the Break circuit, however, that functions prevent such occurrences. By exploiting the 180° phase offset between the RF envelope and the tracking error due to the direction of the actuator transversing the tracks along the radius from the inner to outer tracks and its reverse direction, the Break circuit cuts out the unnecessary portion of the tracking error and applies a break.

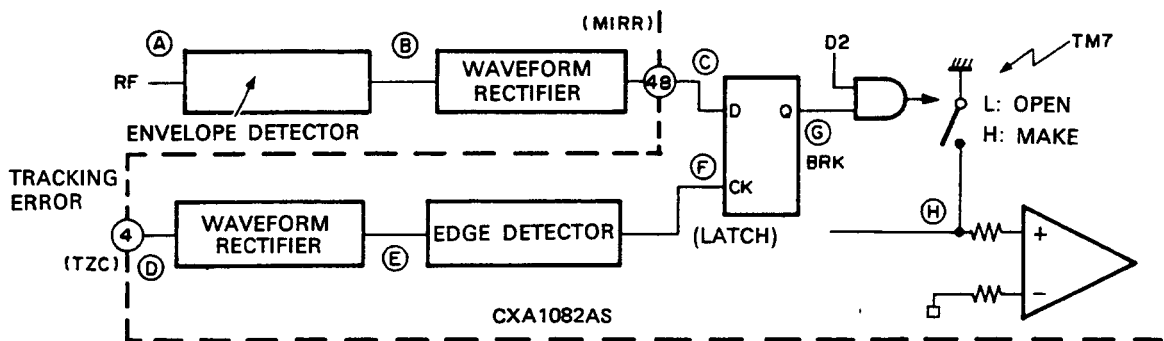

Fig. 4-10. TM7 Operation (Break Circuit)

Fig. 4-11. External Waveforms

### 3. Track Jump

This CD player is doing track jumps of 1, 10, 50, 100 via the auto sequence of CXA1082AS. The auto sequence sends the timing data from the system  $\mu$ -COM to the RAM of CXA1082AS beforehand. Therefore just by sending the serial data of the auto sequence, the TRACK JUMP and FOCUS are drawn in.

Figures a. to d. show the timing charts of the 1, 10, 50, or 100 track jump and auto sequence. The time control in the figures is done by setting \$5X with the system  $\mu$ -COM. Auto sequence starts by the sending of \$4X in the table below.

	D3	D2	D1	D0
CANCEL	0	0	0	0
FOCUS ON	0	1	1	1
1 TRACK JUMP	1	0	0	X
10 TRACK JUMP	1	0	1	X
100 or 50 TRACK JUMP	1	1	0	X

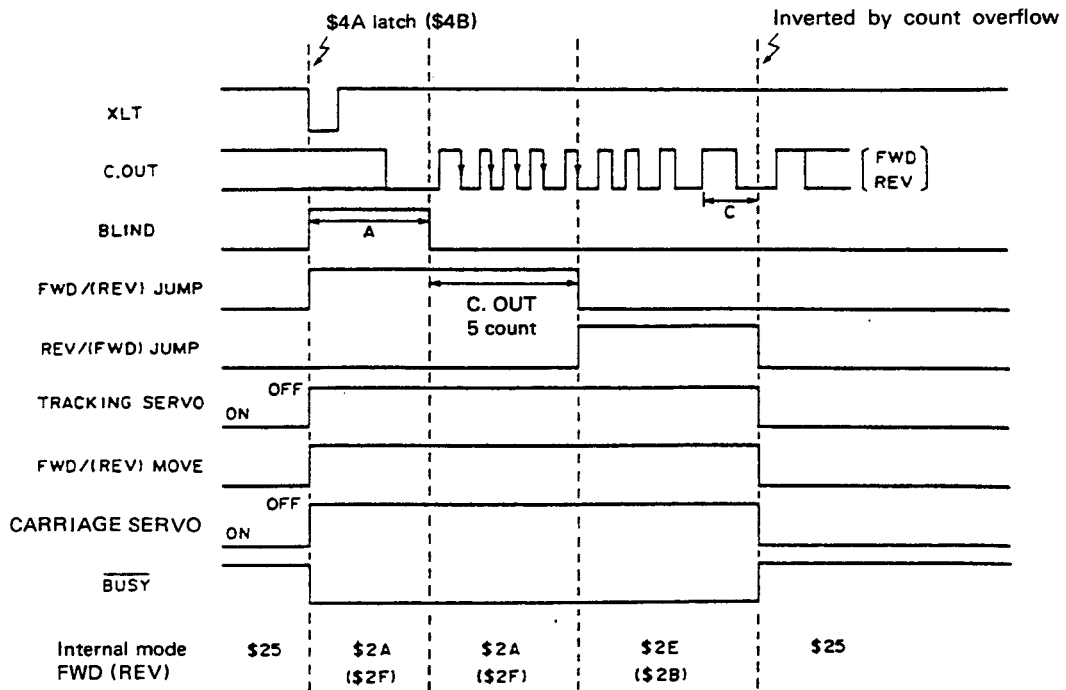

X = 0 FOWARD  
 X = 1 REVERSE

### Auto Sequence Time Chart

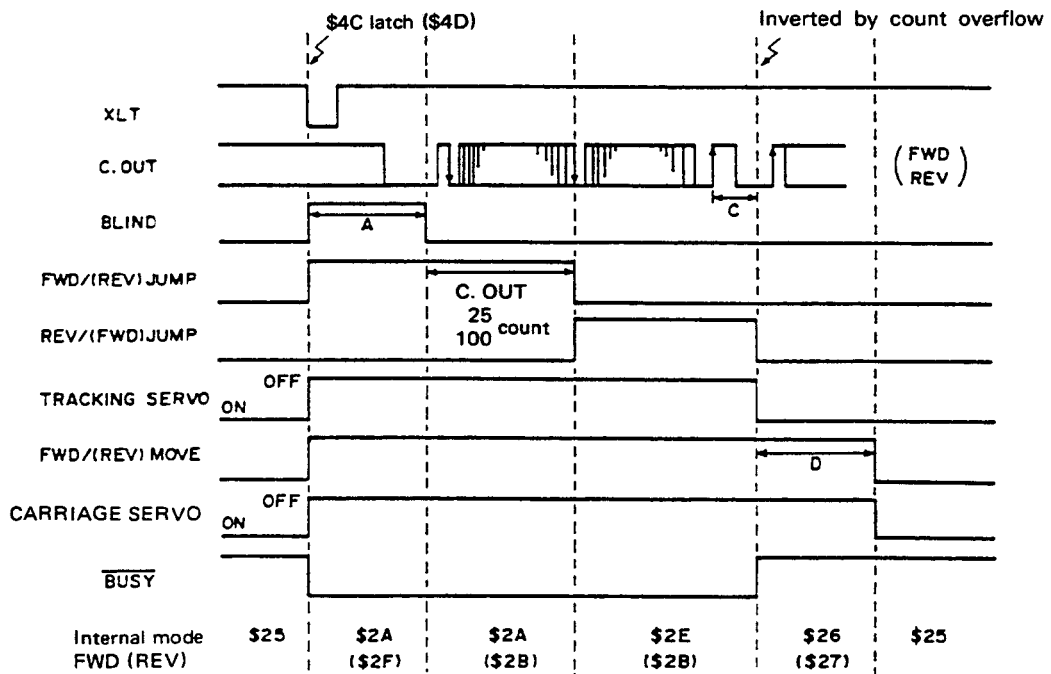

#### a. 1 track jump

b. 10 track jump

c. 50 track jump  
 100

d. Auto focus

Note: This time chart's horizontal axis is not limited to being proportional to real time.

4.2.2 CXA1081S

RF AMP

The output voltage of the photodiode that are input to the input pins (PD1 and PD2) are respectively subjected to an increase in voltage of about 5 times into a 58kΩ equivalent resistor at the RF I-V Amps (1) and (2). Furthermore, addition is per-

formed at the RF Summing Amp so that the output voltage which has been converted from the currents of the photodiodes (A + B + C + D) is output from Terminal RFO. An eye pattern check can be performed at Terminal RFO.

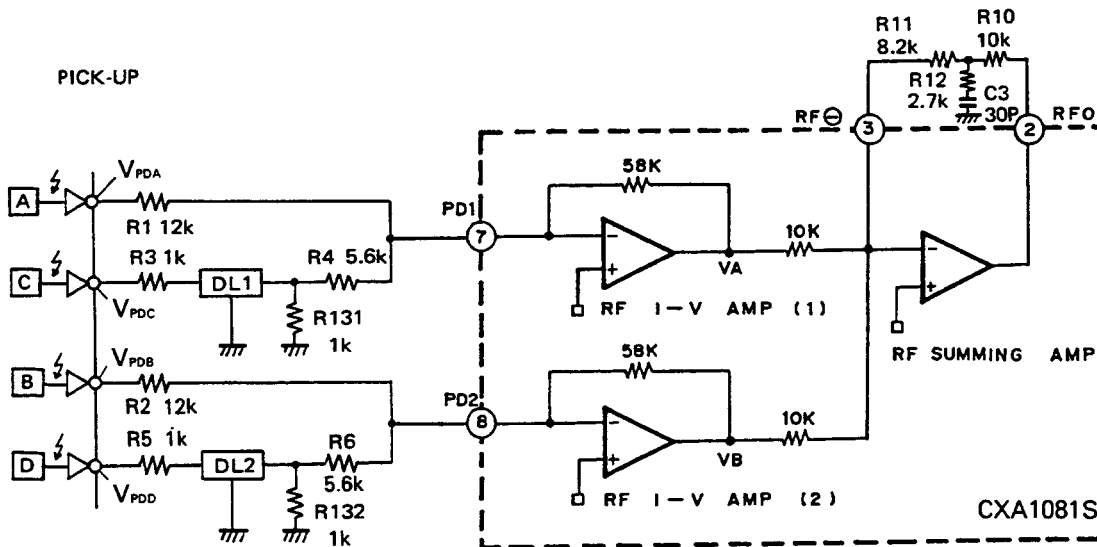

Fig. 4-12

The low-frequency component of the RFO output voltage  $V_{RFO}$  is as follows:

$$V_{RFO} = 1.8 \times (VA + VB)$$

$$= 1.8 \times (58k\Omega/12k\Omega) \times (V_{PDA} + V_{PDB} + V_{PDC} + V_{PDD})$$

**FOCUS ERROR AMP**

This amp obtains the difference between the output (VA) of the RF I-V Amp (1) and the output (VB) of the RF I-V Amp (2), then outputs the voltage which has been converted from the currents of the photodiodes (A + C - B - D).

The FE output voltage (low frequency) is as follows:

$$V_{FE} = 5.4 \times (V_A - V_B)$$

$$= 5.4 \times \frac{58k\Omega}{12k\Omega} \times (V_{PDA} + V_{PDC} - V_{PDB} - V_{PDD})$$

Fig. 4-13

**TRACKING ERROR AMP**

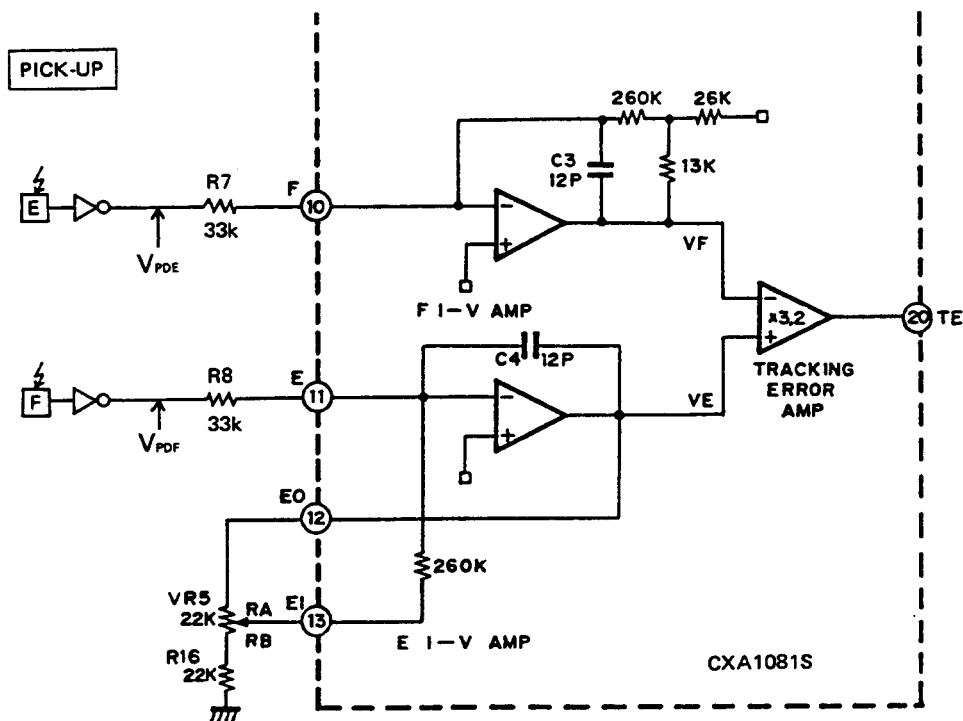

Fig. 4-14

The voltage of photodiodes for the side spots input to Terminals E and F are respectively subjected to the voltage is increased at the E I-V and F I-V Amps. That is:

$$V_F = \frac{403k\Omega}{33k\Omega} \times V_{PDF}$$

$$V_E = \frac{260k\Omega \times R_A / (R_B + 22k\Omega) + (R_A + 260k\Omega)}{33k\Omega} \times V_{PDE}$$

Furthermore, the output difference between the E I-V and F I-V Amps is obtained at the Tracking Error Amp in order to obtain the output voltage that has been converted from currents of the photodiodes (E - F) as follows:

$$V_{TE} = (V_E - V_F) \times 3.2$$

$$= (V_{PDE} - V_{PDF}) \times \frac{403k\Omega}{33k\Omega} \times 3.2$$

### FOCUS OK CIRCUIT

The Focus OK circuit functions to create the window for the timing of switching ON the Focus Servo from the Focus Search status.

With respect to the RF signal of Pin ②, both its HPF signal and the reciprocal of the LPF output (inverted phase) from the Focus OK Amp output are obtained at Pin ①.

The Focus OK output is inverted in the case below:

$$V_{RF1} - V_{RF0} \cong -0.39 \text{ V}$$

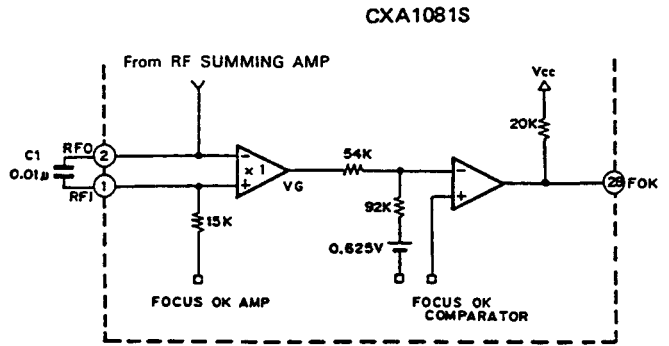

Fig. 4-15

### MIRROR CIRCUIT

Fig. 4-16

After amplifying the RFI signal, the Mirror circuit performs Peak Hold and Bottom Hold.

Peak Hold will hold the peak value at a time constant that is capable of tracking even a 30 kHz Traverse signal, whereas Bottom Hold will hold the bottom value at a time constant that is capable of tracking even the envelope fluctuations of revolving cycles.

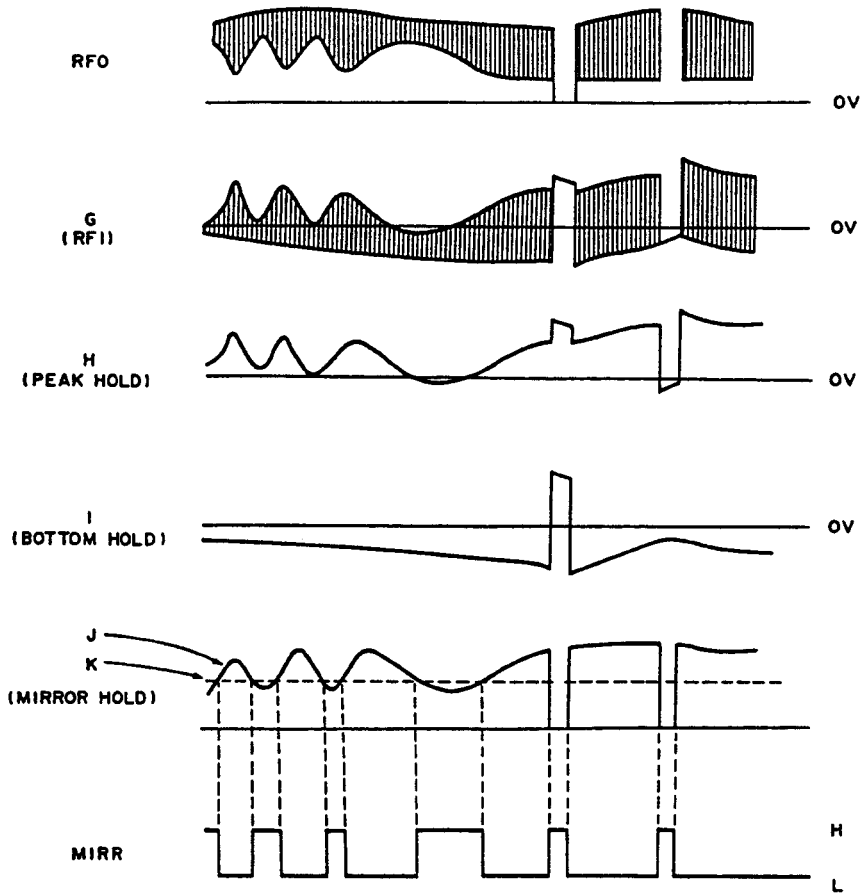

Fig.4-17

The DC-replayed Envelope signal J is obtained from the differential amplitude of these Peak and Bottom Hold signals, H and I. The Mirror output is obtained by comparing this signal J with the signal K which has been held at peak level, using a time constant of a level that is two-thirds that of the

peak value. In other words, the Mirror output is "L" upon a disc track or "H" between disc tracks (the Mirror section). Moreover, the Mirror output is also "H" when a defect has been detected.

**EFM COMPARATOR**

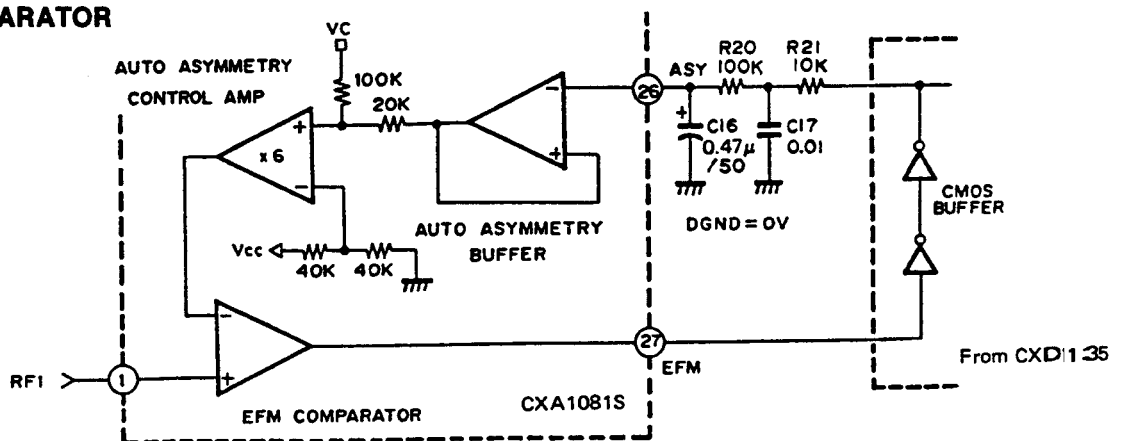

Fig. 4-18

The EFM Comparator functions to convert the RF signals into binary signals. The asymmetry caused by variance during disc manufacture cannot be eliminated merely by AC coupling. Consequently,

the reference voltage of the EFM comparator is controlled by exploiting the respective 50% probability of a 1 or 0 occurring as the value of a binary-coded EFM signal.

Note that since this EFM Comparator is of power-current SW type, its H and L levels will not equal the supply voltage, there is feedback via the decoder's C-MOS Buffer.

R20, R21, C16, and C17 serve as a LPF for obtaining the DC of  $(V_{cc} + DGND)/2$  [V].

### DEFECT CIRCUIT

After inverting the RFI signal, the Defect circuit performs Bottom Hold using two time constants, one long and one short. The Bottom Hold performed by the short time constant sends a response at a mirror-surface defect on the disc that is 0.1 ms or longer. The Bottom Hold performed using the long time constant continues holding the mirror surface at the level preceding the defect. The Mirror Defect Detection signal is generated by performing a fine plus level shift of that mirror level by use of C coupling, then making a comparison of both signals.

When this signal is used and the DEFECT output is "H," TRKG error is muted and the playability is improved.

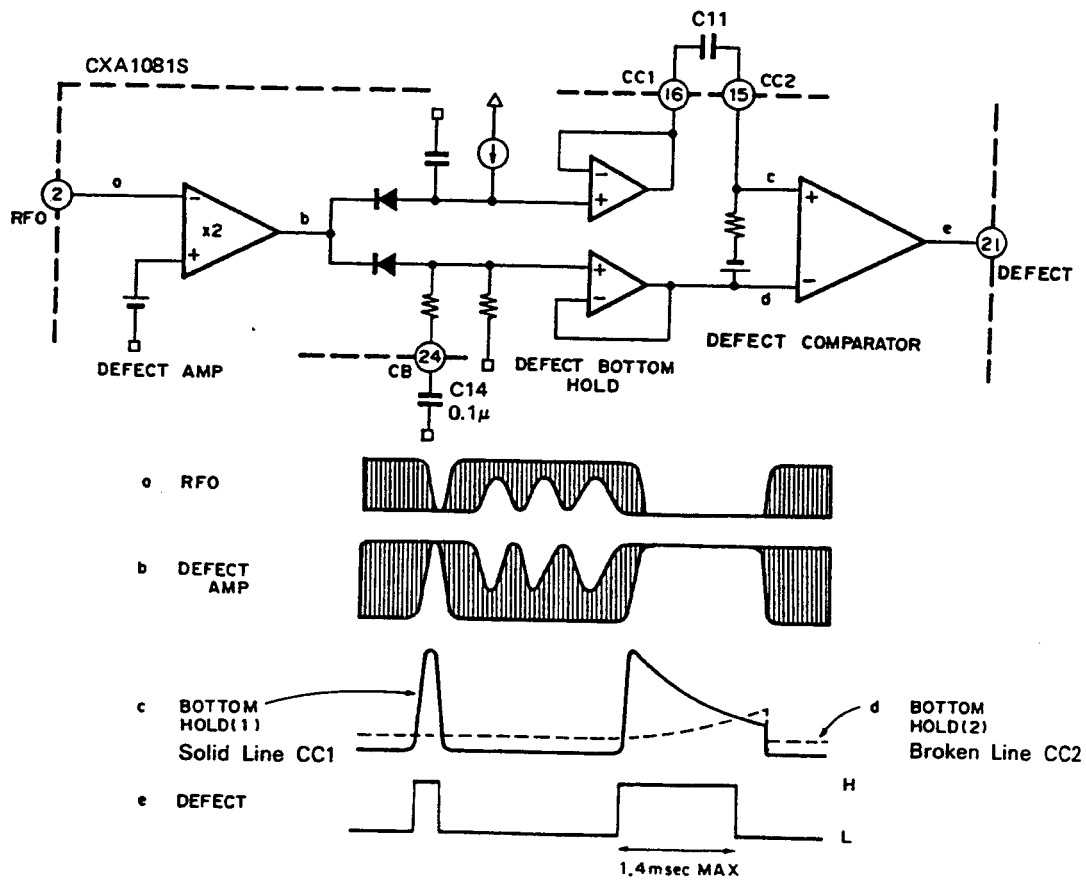

Fig. 4-19

### 4.3 TOC READING

#### Initial Settings for Reading of Table of Contents

Conditions:

- ★ Carriage is inside and the inside switch S102 is on.
- ★ Loading is completed and loading switch S101 is on.

### 4.4 CARRIAGE SERVO SYSTEM

The carriage servo system inputs the TRKG actuator's drive voltage, and through the carriage servo EQ shown in Fig. 4-20, the amount required for the carriage movement is obtained.

Also, the carriage's LOCATE operation obtains LOCATE voltage by switching over the internal current source in the serial data. This voltage is about 6V. However, during startup and lock, since the output current is limited to 200mA, the voltage will become lower than 6V.

Fig. 4-20

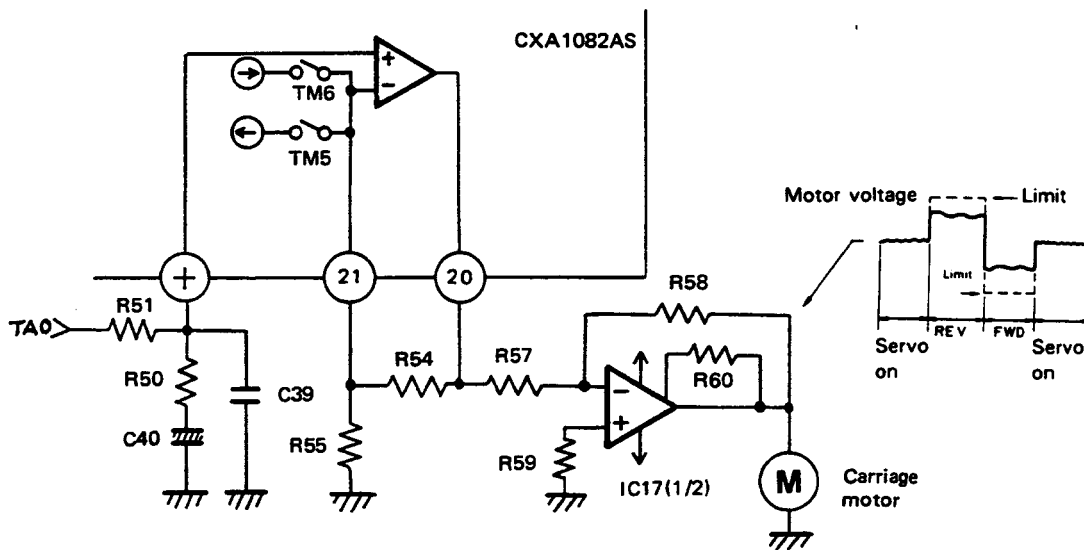

Fig. 4-21

### 4.5 DEMODULATOR

The demodulator is composed primarily of LSI CXD1135Q; it also includes a small amount of added-on circuits. Its functions are:

1. Bit clock regeneration using the EFM-PLL circuit.
2. Demodulation of the EFM data.
3. Detection, protection and internal extension of the frame sync signal.
4. Thorough error detection and correction.
5. Interpolation using averaging or previous value hold.
6. Demodulation of the sub-code and error detection for sub-code Q.
7. CLV servo for the spindle motor.
8. 8-bit tracking counter.
9. CPU interface using the serial bus.
10. Built-in 35th digital filter.

Fig. 4-22

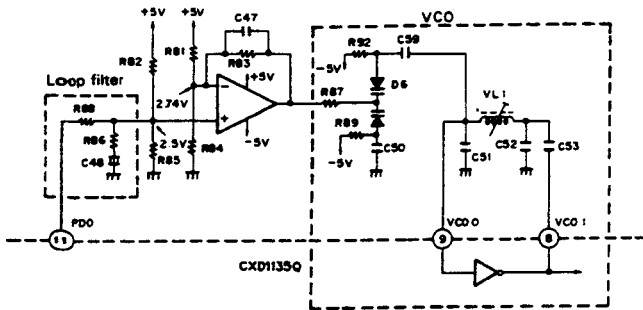

Fig. 4-23

#### 4.6 DIGITAL LEVEL CONTROL (Only for PD-7050 and PD-7050-S)

Instead of the previous method, place a digital attenuator IC in front of the audio circuit. By controlling the output level with an 8-bit data of the microcomputer and a 16-bit audio signal from the digital circuit and multiplying both within the attenuator IC, it is possible to obtain an audio signal which does not damage the quality of the audio circuit. (See Fig. 4-24) By operating the UP/DOWN key of the remote controller, every 1 dB of 25 steps (0 dB to -25 dB) level adjustment.

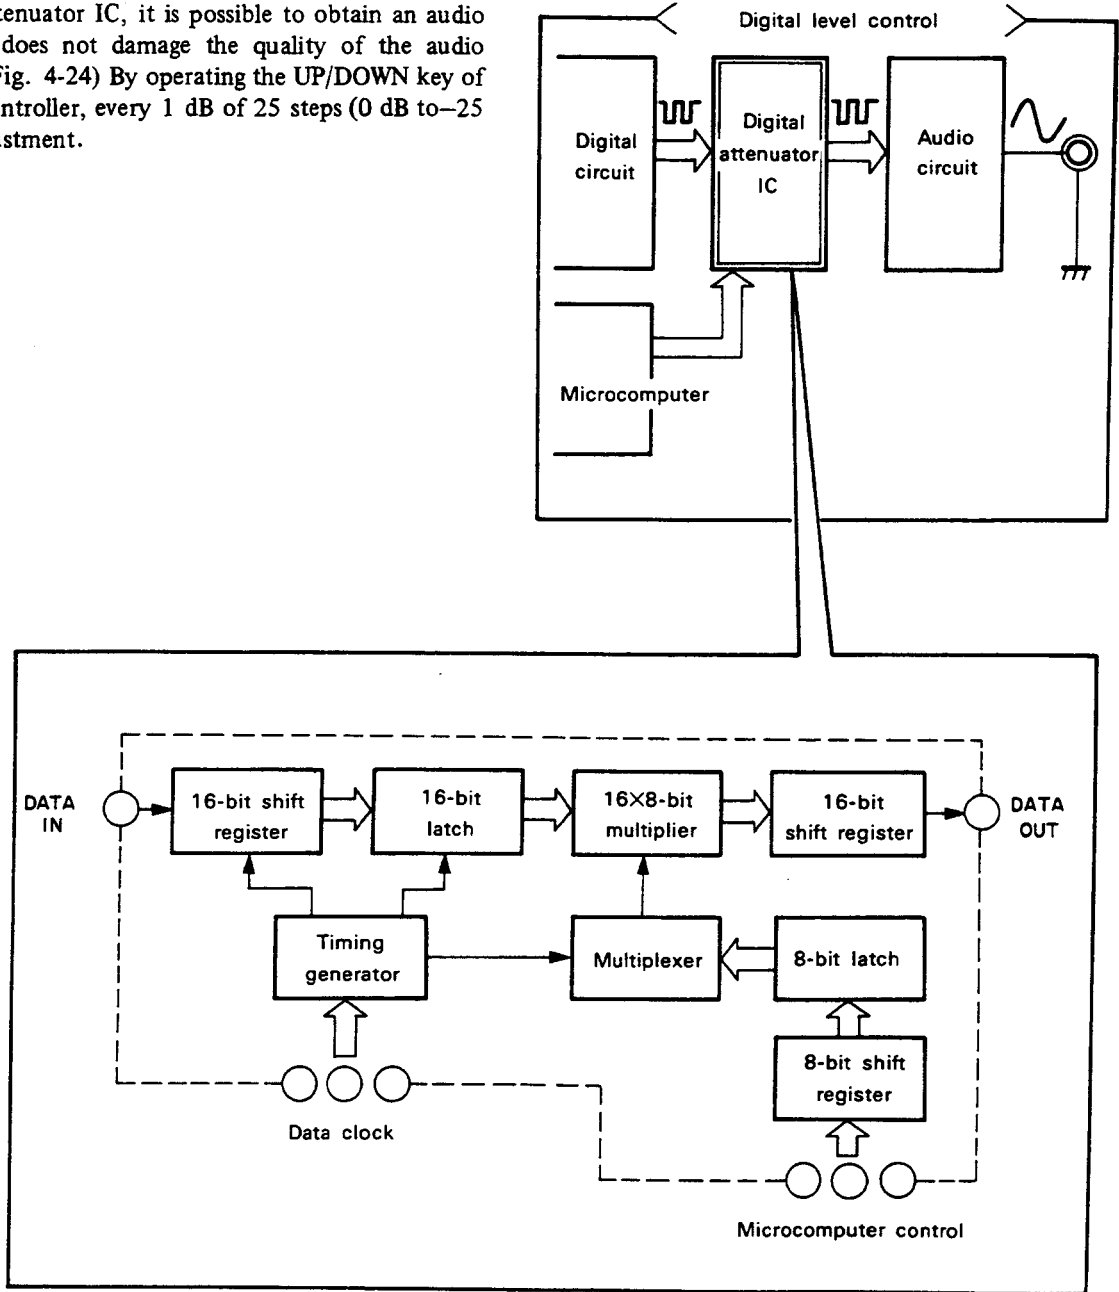

Fig. 4-24 Digital level control

## 2. OPTICAL PATH IN THE PICK-UP

### 2-1 OPTICAL PATH AND OPTICAL PARTS

Fig. 2-1 shows the configuration of this pick-up's optical part.

The wavelength of the light emitted from the laser diode is between 780 and 790 nm. The light is barely visible. This light source is spread into an ellipse from an ultra-small emission point. The light expands at a set angle.

The emitted light goes through a grating and is divided into three beams of 0 step and  $\pm 1$  step.

The other beams of  $\pm 2$ , 3, and  $n$  steps are also present, but are lost and not used. When the light reaches the half mirror, 50% is reflected. The remaining light permeates the half mirror and is lost.

The light then goes to the reflecting mirror where all the light is reflected to the objective lens (finite type).

Since this pick-up's objective lens uses a finite system (finite because the LD's convergence distance is finite), a collimator lens is unnecessary. The old models objective lenses are called infinite type. The light that is converged on an ultra-small diameter spot by these objective lenses is reflected by the disc and returns to the objective lens. Then it goes through the half mirror where 50% of it returns to the laser diode. The remaining 50% of light goes through and reaches the photo diode.

This has been a general outline of the optical path. The features of each part are explained in the following section.

### 2-2 FEATURE OF EACH PART

Fig. 2-2

#### (1) Laser diode (LD)

The size of previously-used LDs was  $9\phi$ . However, a newly-developed LD with a size of  $5.6\phi$  has been introduced. This has resulted in a compact and lightweight optical path.

#### (2) Objective lens

The collimator lens has been replaced by the finite objective lens which has a finite convergence distance for the LD's optical path. This has resulted in lower costs while preserving high performance.

The finite objective lens, like the conventional infinite lens, is a high-performance lens designed to attain sufficient optical performance even when the optical parts are not parallel within the optical path.

#### (3) Half mirror

The light that returns to the objective lens goes through the half mirror. Since the half mirror is a glass plate, it is known that astigmatism is created for the light which enters at an angle. The old model similarly used a glass plate and had a device in its optical part to cancel this astigmatism. Whereas, this new pick-up uses the astigmatism advantageously for the focus servo.

Consequently, the multi-lens used in previous models has not been incorporated in this new pick-up. This has resulted in lower costs while preserving high performance. At the same time, the points of parts have been reduced, improving dispersion and reliability.

#### (4) Axle-sliding actuator

The position accuracy of the objective lens is an important factor for the optical pick-up. The pick-up has a sliding axle for the actuator which drives the objective lens. Accurate and stable positioning of the objective lens is thus attained, resulting in stable trackability. Also, a smooth frequency response with low resonance is also realized as with the conventional spring-supported type.

**(5) Resin body**

The CD body has been made with computer-simulated technology. To keep body changes to a minimum, resin has been incorporated. Due to the mounting, materials were carefully selected and the same reliability as the previously-used aluminum has been realized.

The use of resin has made possible mounting configurations that were not possible with aluminum. Therefore the use of adhesives has been greatly reduced for improved reliability.

**2-3 RF and servo signal**

Fig. 2-3

**(2) RF and servo signals**

The beam, which has been reduced to an extremely small spot by the objective lens, now strikes the disc side on which the signal is located. Part of the beam is then reflected back to the objective lens and photo diode. A diagram showing how this beam is reflected off the disc is shown in figure 2-2. (A) shows what happens when the concentrated beam is directed at a pit. Normally, this reflected light would disrupt the output light beam. In the laser diodes used in CD players, however, noise is reduced instead, resulting in stable performance. This property is very advantageous for the half prism which allows only half of the light energy to pass.

A pit and (B) shows the same beam when reflected from a space between pits. In case (A), the beam is diffracted, so the dark part of the beam does not return to the objective lens. Instead, only the center of the beam passes through the objective lens and reaches the photo diode. In case (B), there is no diffraction because the beam does not strike a pit. Therefore, the entire beam is reflected back to the photo diode, producing brighter beam than when a pit is reached. In this system, the data on the disc, which is represented by pits, is covered into an electrical signal at the photo diode according to the intensity (brightness) of the reflected beam. The RF signal is then produced from this electrical signal by the computation circuit.

Fig. 2-3 shows how the focus signal is detected. (1) is when the beam from the laser diode is accurately focused on the disc by the objective lens. (2) shows what happens when the disc comes closer to the pickup and (3) shows what happens when the disc moves farther away. The grating and concave lens, which have no direct effect on the focusing are not shown in the diagram.

In case (1), the beam emanating from point O1 is reflected and diffracted on the disc surface to produce the condensed beam (O2). In case (2), the beam is directed at a point farther than that of beam O2. Fig. 2-4 shows the properties of the half mirror. 1 through 7 shows the shape of the beam at each point. Between points 2 and 6, which are in a straight line, the beam is circular at point 4. Point 6 corresponds to beam O2 of fig. 2-3. If we assume that fig. 2-4 shows mode (1) of fig. 2-3, that means the beam is circular because the photo diode is located at point 4. In mode (2) of fig. 2-3, the location of the photo diode is closer to the cylindrical lens than it was in fig. 2-4. That means the shape of the beam is the same as that of point 3 (an ellipse that has a longer width than height). In mode (3) of fig. 2-3, the shape of the beam is that of point 5, an ellipse that has a longer height than width.

Fig. 2-4 Half mirror

These beam shapes are shown in fig. 2-3. By performing a  $(A + C) - (B + D)$  computation using the  $\lambda$ -D photo diode quartering elements, the focus signal is produced.

Let's consider what happens as the objective lens is gradually moved closer to the disc. If the objective is fairly far from the disc, only a small amount of light will be returned to the photo diode. Furthermore, since the returning light is quartered, the focus signal would be 0.

If the objective lens is moved closer to the disc until point 7 of fig. 2-4 is reached, the shape of the beam at the photo diode becomes an ellipse that is higher than it is wide.

The focus signal would then be positive because  $(A + C)$  is greater than  $(B + D)$ . However, after the peak (vertical line) is reached at point 6, it begins to return to zero. If it becomes zero at point 4, the beam becomes an ellipse that is wider than it is high because  $(A + C)$  is less than  $(B + D)$  and the focus signal becomes negative. After peaking at point 2, the focus signal returns to zero just as when the objective lens is too far from the disc. Focusing signals produced in the above manner are shown in fig. 2-5. Due to its shape, this is called an S-curve, an important graph that expresses the properties of the focus signal.

Fig. 2-5 S-curve

Since the real purpose of the focus servo is to maintain the focus signal at zero, only a tiny section at the center of the S-curve appears as residual error.

Fig. 2-6 shows how the tracking signal is detected. The beam from the laser diode is divided into three beams. The  $\pm 1$  order beams on either side of the 0 order beam are used to produce the tracking signal. These two beams are, like the 0 order beam, are directed at the disc in a tiny spot. In principle, the spots of the two side beams are an equal distance from the center spot as shown in fig. 2-6. (The actual distance is much greater than that shown in the figure.) These two side beams are reflected and diffracted and returned to their respective detection elements in the photo diode. If these two elements detect the same intensity from both beams, it can be assumed that the primary (0 order) beam is correctly following the line of pits on the disc. Fig. 2-7 shows the relationship between the track and the output of each photo diode element (A, B and C).

Fig. 2-6 Detection of tracking error

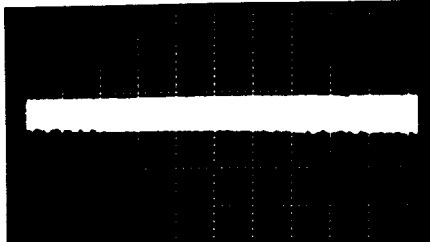

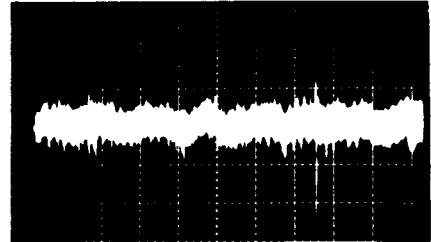

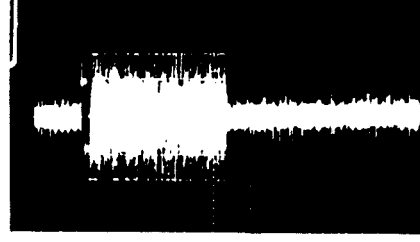

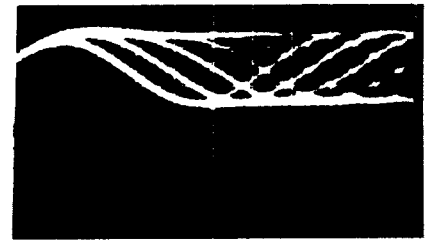

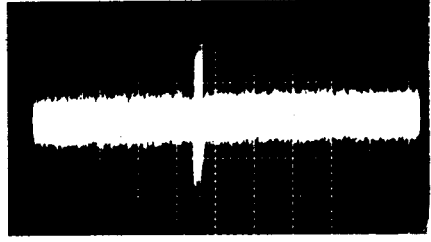

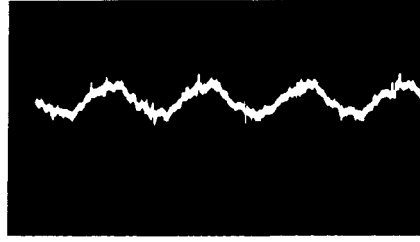

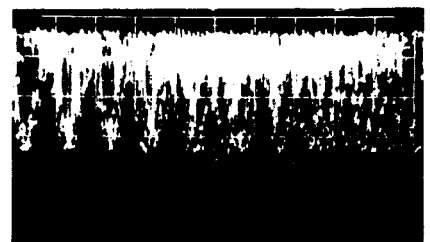

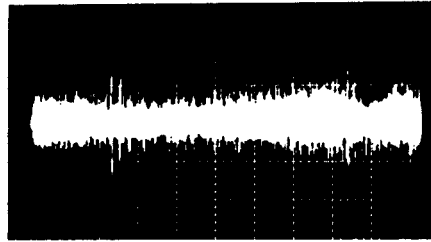

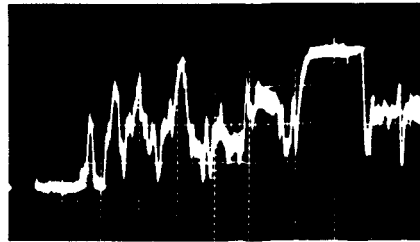

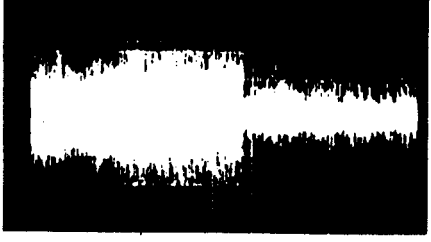

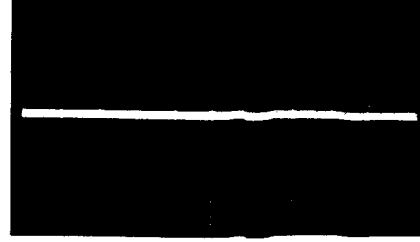

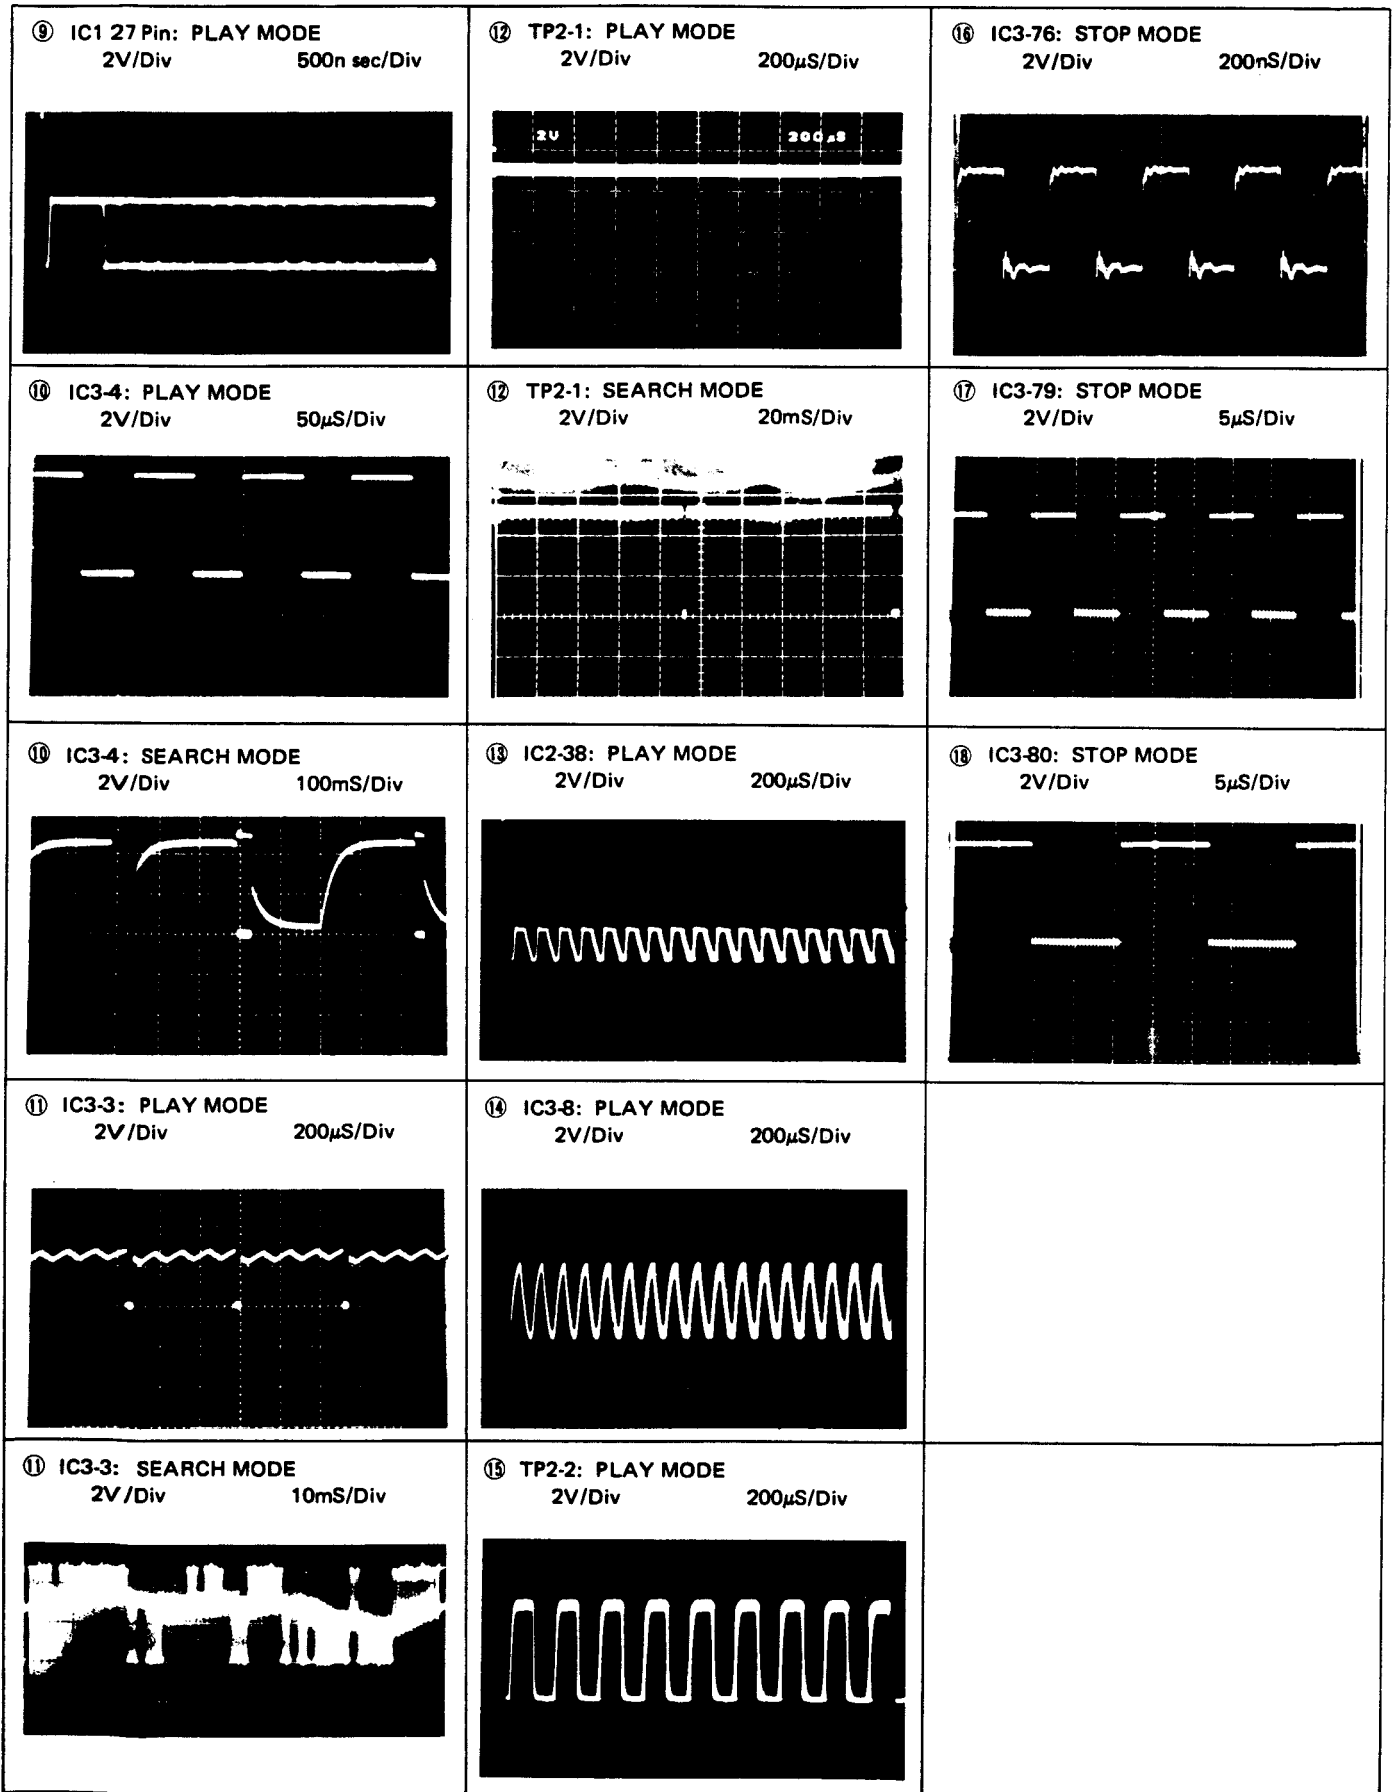

Fig. 2-7 Tracking error and the RF signal

6

**NOTE:**  
 The indicated semiconductors are representative ones only. Other alternative semiconductors may be used and are listed in the parts list.

**CIRCUIT DIAGRAM PRECAUTIONS**

This circuit diagram is applicable to the KU and KC destinations. With respect to other destinations, Sections (A) and (B) of the MAIN BOARD ASSEMBLY are substituted in accordance with the figures below.

**NOTE:**

- RESISTORS:**  
 Indicated in  $\Omega$ , 1/8W & 1/4W,  $\pm 5\%$  tolerance unless otherwise noted k;  $k\Omega$ , M;  $M\Omega$ , (F);  $\pm 1\%$ , (G);  $\pm 2\%$ , (K);  $\pm 10\%$ , (M);  $\pm 20\%$  tolerance
- CAPACITORS:**  
 Indicated in capacity ( $\mu F$ )/voltage (V) unless otherwise noted p; pF. Indication without voltage is 50V except electrolytic capacitor.
- VOLTAGE, CURRENT:**  
 □; DC voltage (V) at no input signal  
 Value in ( ) is DC voltage at rated power.  
 mA; DC current at no input signal
- OTHERS:**  
 →; Signal route.  
 ⊗; Adjusting point.

The  $\Delta$  mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.  
 \* marked capacitors and resistors have parts numbers.  
 The underlined indicates the switch position.

This is the basic schematic diagram, but the actual circuit may vary due to improvements in design.

# 9. ELECTRICAL PARTS LIST

**NOTES:**

- Parts without part number cannot be supplied.
- Parts marked by "⊙" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.
- The Δ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- For your parts Stock Control, the fast moving items are indicated with the marks ★★ and ★.
- ★★ **GENERALLY MOVES FASTER THAN ★**  
This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.
- When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex. 1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J = 5%, and K = 10%).

560Ω	56 × 10 <sup>1</sup>	561.....	RD1/4PS	Ⓜ	Ⓜ	Ⓜ	J
47kΩ	47 × 10 <sup>3</sup>	473.....	RD1/4PS	Ⓜ	Ⓜ	Ⓜ	J
0.5Ω	0R5.....		RN2H	Ⓜ	Ⓜ	Ⓜ	K
1Ω	010.....		RS1P	Ⓜ	Ⓜ	Ⓜ	K

Ex. 2 When there are 3 effective digits (such as in high precision metal film resistors).

5.62kΩ	562 × 10 <sup>1</sup>	5621.....	RN1/4SR	Ⓜ	Ⓜ	Ⓜ	F
--------	-----------------------	-----------	---------	---	---	---	---

## 10. ADJUSTMENTS

The adjustments for this unit are given below. Adjustments must be made in the order in which they are listed.

### ● ADJUSTMENTS

1. Tracking error offset, focus offset and RF offset adjustment
2. LD (laser diode) power check
3. Focus lock and spindle lock check
4. Grating adjustment
5. Tracking balance adjustment
6. Tangential adjustment
7. RF level check
8. Focus gain adjustment
9. Tracking gain adjustment
10. VCO free run frequency adjustment

### ● REQUIRED EQUIPMENT

1. Dual trace oscilloscope
2. Optical power meter
3. Test disc (YEDS-7)
4. Loop gain adjustment filter
5. Signal generator
6. Frequency counter
7. Other regular measuring equipment

### ● ABOUT THE TEST MODE

All adjustments must be carried out with the unit in the test mode.

#### How to activate and release the test mode

- ① To activate the test mode, turn ON the power switch (S501) with the test mode switch (S1) in the ON position.
- ② The test mode is released by turning the power switch OFF.

The functions of the keys in the test mode are outlined in Table 10-1.

### ● ADJUSTMENT VRs AND THEIR NAMES

- VR1: Laser power
- VR2: RF offset (RF.OFS)
- VR3: Focus gain (FCS.GAN)
- VR4: Tracking gain (TRK.GAN)
- VR5: Tracking balance (TRK.BAL)
- VR6: Focus offset (FCS.OFS)
- VR7: Tracking offset (TRK.OFS)
- VR8: VCO adjust (VCO.ADJ)

### Adjustment Point

In the test mode, the servos must be closed and opened individually. Consequently, the servos must each be closed in the proper sequence (serial sequence) in order to put the machine into the play mode. Note also that the machine will not enter the play mode when the PAUSE (  ) key is pressed.

For example, in order to change from the stop to the play mode, the function keys must be pressed in the following order:

\* In the test mode, the servos must be operated in serial sequence.

● KEY FUNCTIONS IN THE TEST MODE

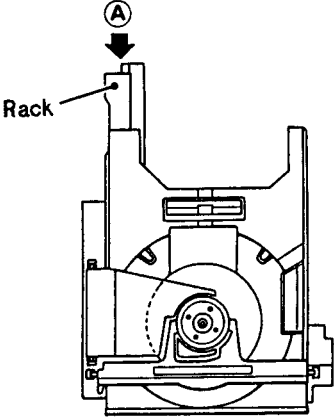

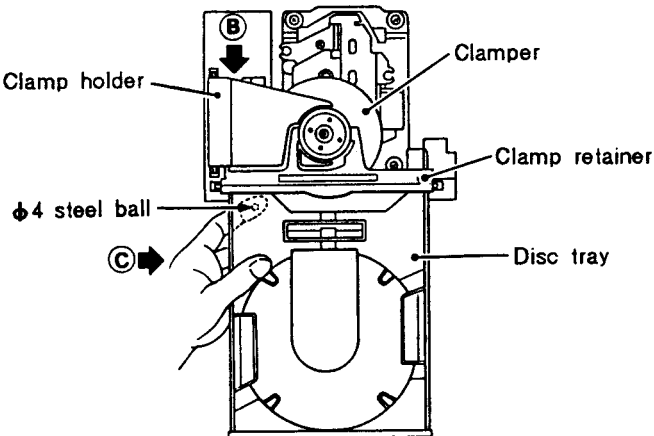

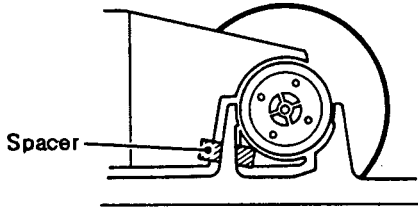

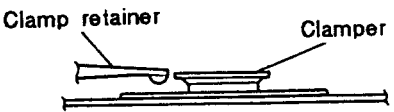

Symbol	Key name	Function in test mode	Description
	TRACK FWD	Focus servo close	Turns ON the laser diode, and raises and lowers the focusing actuator to close the focus servo.
	PLAY	Spindle servo close	Closes the servo in the CLV-A mode after kicking the spindle motor.
	PAUSE	Tracking servo close/open	Acts as a toggle: closes the tracking servo and activates play mode when pressed (provided the focus and spindle servos are closed), at which time the PAUSE indicator illuminates; opens the tracking servo when pressed again.
	MANUAL SEARCH REV	Carriage reverse (moves inward)	Moves carriage quickly (3cm/s) toward innermost track. Be careful not to move too far as there is no safety device to stop the carriage.
	MANUAL SEARCH FWD	Carriage forward (moves outward)	Moves carriage quickly (3cm/s) toward outermost track. Be careful not to move too far as there is no safety device to stop the carriage.
	STOP	Stop	Stops all servos and returns system to its initial state.
	OPER/CLOSE	Disc tray open/close	Opens and closes the disc tray. However, pickup does not return to rest on OPEN, and it remains stationary on CLOSE.
