

SERVICE MANUAL

STEREO TUNER

TX-7100

FW, KUW, KCW, FVZW

NOTE:

MODEL TX-7100 COMES IN FOUR VERSIONS DISTINGUISHED AS FOLLOWS:

Round label on rear panel	Voltage	Type
KUW	120V only	UL approved (U.S.A.)
KCW	120V only	CSA approved (Canada)
FVZW	5-position selector	FTZ approved (West Germany)
FW	5-position selector	General export model

MISCELLANEOUS

Power Requirements	AC 120V 60Hz or AC 110V, 120V, 130V, 220V and 240V (switchable) 50/60Hz
Power Consumption	25W
AC Outlet	Unswitched 1
Dimensions	430(W) x 138(H) x 345(D)mm 16-15/16 x 5-7/16 x 13-9/16 in.
Weight Without Package	7.7 kg, 16 lb 15oz
With Package	9.7 kg, 21 lb 5oz

FURNISHED PARTS

FM T-type Antenna	1
Connection Cord with Pin Plugs	1
Polishing Cloth	1
Operating Instructions	1
Fuse 0.5A (5-line voltage)	1
Fuses 1.0A (model only)	2

NOTE:
Specifications and the design subject to possible modification without notice due to improvements.

2. FRONT PANEL FACILITIES

POWER SWITCH

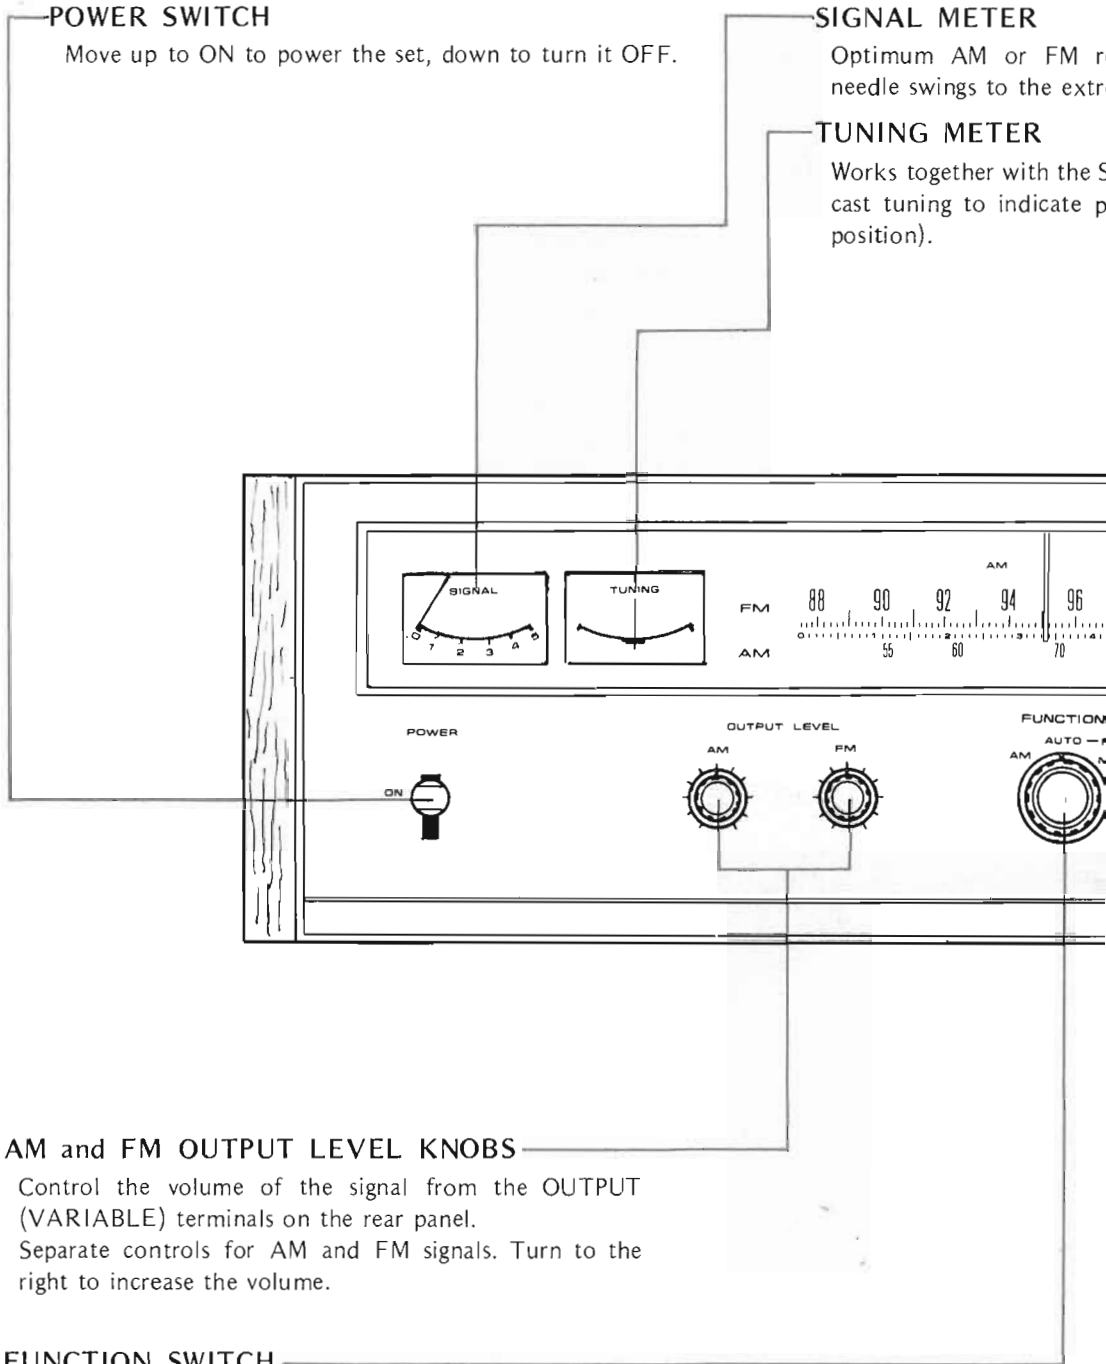

Move up to ON to power the set, down to turn it OFF.

SIGNAL METER

Optimum AM or FM reception when the needle swings to the extreme right.

TUNING METER

Works together with the FUNCTION SWITCH to indicate precise tuning (position).

AM and FM OUTPUT LEVEL KNOBS

Control the volume of the signal from the OUTPUT (VARIABLE) terminals on the rear panel.

Separate controls for AM and FM signals. Turn to the right to increase the volume.

FUNCTION SWITCH

Used to select the type of broadcast reception.

AM For AM broadcast reception.

FM AUTO. . . For normal FM reception. Provides automatic switchover to stereo when a stereo signal is received.

FM MONO. . . For monophonic reception of both mono and stereo FM signals.

ception is obtained when the
me right.

IGNAL meter during FM broad-
recise station alignment (center

FM STEREO INDICATOR

When the FUNCTION switch is set to FM AUTO, this lamp lights whenever an FM stereo broadcast is being received.

TUNING KNOB

Used to tune in both AM and FM stations.

FM MUTING LEVER SWITCH

In keeping the lever upper (not moved down to OFF), the FM muting circuit cancels out noise on unused FM bands (inter-station noise), but it also rejects very weak, faint FM stations. To receive such a station, move the lever to OFF to turn off the FM muting circuit.

MPX NOISE FILTER SWITCH

Switch on to cut high-frequency noise during FM stereo broadcast reception.

3. CONNECTION DIAGRAM

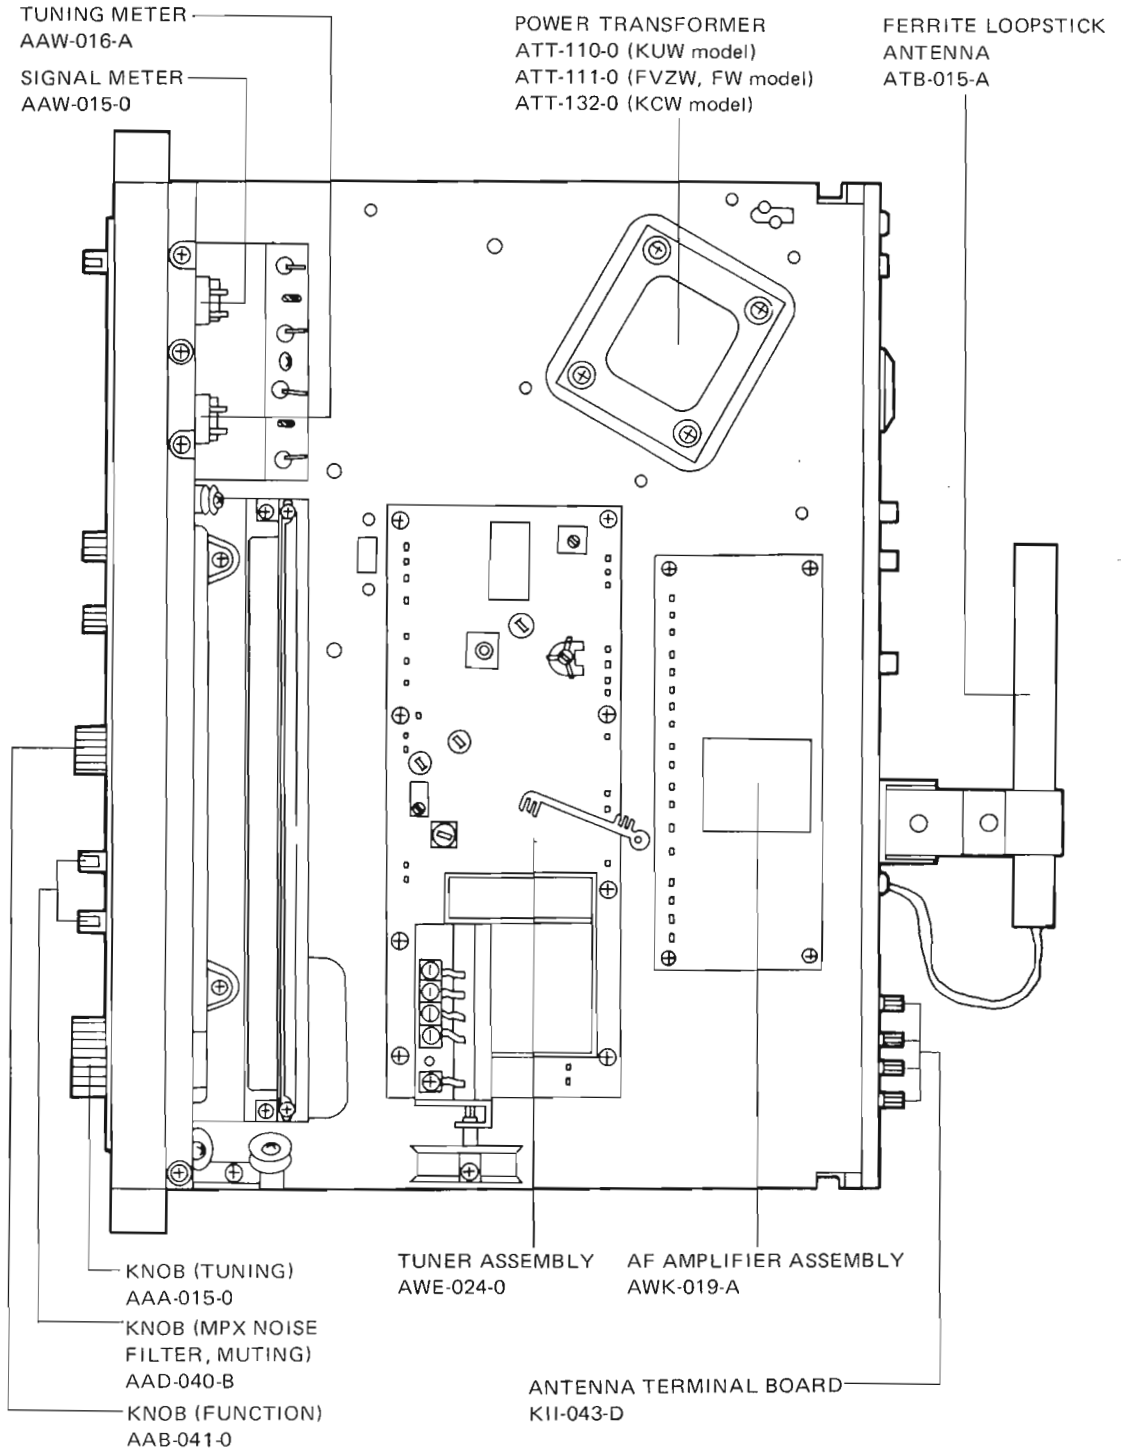

4. DISASSEMBLY

1. Remove the two screws on each side of the wooden cabinet.
Lift the cover at the rear and separate it from the set.
2. Remove all knobs.
3. Remove the two screws at the top of the front panel and the three screws at the bottom. Carefully detach the panel from the set.
4. Remove the eight screws holding the bottom plate in place and detach the bottom plate from the set.

7. CIRCUIT ANALYSIS

7.1 FM FRONT END

The front end consists of a single RF amplifier with a four-section ganged tuning capacitor. The RF amplifier is constructed from a dual gate MOS FET which gives a low noise figure (1.5dB at 100MHz) and high gain (power gain of 21.5dB). Design provides for high sensitivity, but eliminates intermodulation distortion. The four-section tuning capacitor provides double tuning of the RF tuning coils, thereby improving rejection to spurious and image signals. The signal appearing at the antenna terminals is applied to first tuning coil T1.

The secondary of T1 is a tuned circuit.

The signal is applied to one of the gates of Q1 and is amplified. The drain load consists of an RF transformer in a double tuned configuration. The amplified signal is applied to the base of transistor Q2, for frequency conversion. In parallel with this input, the local oscillator (Q3) signal is applied. The difference signal is extracted from the collector of Q2. (The difference signal is the IF signal.) The collector load of Q2 is IF transformer T5 tuned to the intermediate frequency (10.7MHz). Output of T5 goes to the IF amplifier.

7.2 FM IF AMPLIFIER

The IF amplifier consists of an integrated circuit and ceramic filter. The filter provides high selectivity without introducing delay distortion. A quadrature detection system consisting of a balanced bridge circuit in the differential amplifier of the IC is employed. This arrangement gives excellent linearity over a wide band and limits distortion to a low level.

Fig. 1

Fig. 1 shows internal construction of the IC. The first, second, and third limiters are differential amplifiers. Hence, AM suppression and the capture ratio are excellent.

The signal from the front end passes through the 10.7MHz ceramic filter, transistor Q4, and another ceramic filter to pin (1) of the IC (Q5). Inside the IC, the signal passes through the three differential type limiters, diode limiter, and quad limiter. Detection is effected with the quadrature detector.

Output from the detector passes to the muting circuit within the IC and is extracted in the form of a composite signal from pin (5). Muting provides a means of controlling the muting analog switch with DC voltage from the IF section and DC voltage from the detector section. This circuit produces no "plop" noise (regardless of whether a station is being tuned or not) providing stable operation. Output is also fed to the MPX IC for stereo auto switching.

7.3 FM MPX SECTION

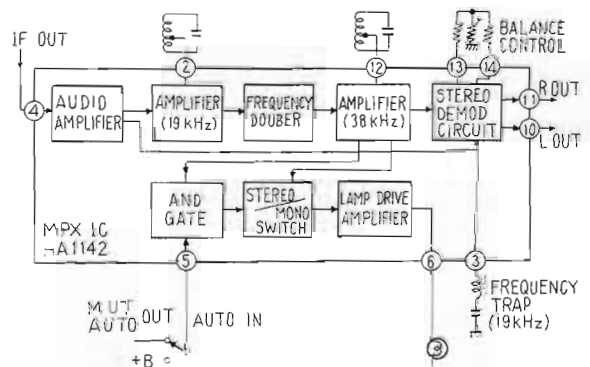

Fig. 2

The FM MPX section consists of a single IC. Construction of this IC is shown in Fig. 2. Demodulation of the signal is effected with two differential amplifiers in a "double balanced differential amplifier circuit." This arrangement provides excellent channel separation over a wide band, rejects SCA beat interference, and results in low carrier leakage and distortion. The composite signal from the IF section is applied to pin (4) of the IC and is subjected to single stage amplification. Output is split to a pilot signal path, main path (L+R), and sub path (L-R). Main and sub signals pass through a 19kHz trap circuit to the demodulator. The pilot signal is subjected to selective amplification in a 19kHz tuned amplifier and is converted to 38kHz with next multiplier circuit. The 38kHz switching signal is applied to

the demodulator. Main and sub signals are switched to provide L and R stereo signals. A part of the switching signal is also fed to the auto switching section. Auto switching involves an AND gate with input of DC voltage from the IF section and of the 38kHz signal. Control of the stereo indicator lamp is also taken from inside the IC. Switched stereo signals pass through the function switch, Q1 of the AF amplifier assembly, and a low-pass filter, providing added protection against carrier leakage and SCA beat interference.

7.4 AM SECTION

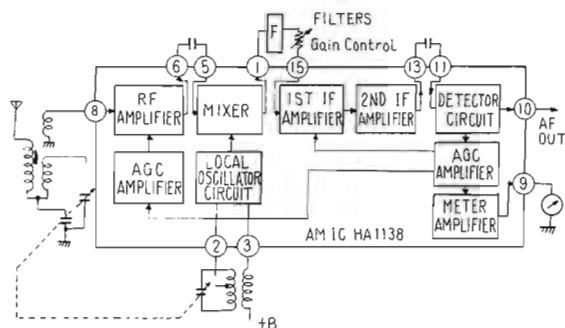

Fig. 3

The AM section also consists of a single IC. Construction is depicted in Fig. 3. The circuit is untuned but image rejection and sensitivity are improved with one stage of RF amplification. The frequency converting circuit consists of a balanced mixer. Waveform distortion has been eliminated from the local oscillator, limiting spurious response to a very low level. AGC is applied to the RF and IF amplifiers, resulting in good input characteristics. The signal from the antenna is amplified and applied to the frequency converter through a capacitor. Output from the local oscillator is also applied to the frequency converter. The difference between these inputs is taken as the IF signal. The IF signal passes through a lumped filter which removes all unwanted components. Filter output passes to the next IF amplifier stage. The IF amplifier section consists of two amplifiers. AGC is applied to the first amplifier. Detection of the IF signal follows. The resultant audio signal passes through the function switch to the AF amplifier assembly. A part of the detected signal is used as the AGC and meter drive sources.

7.5 AF SECTION

The audio section consists of four transistors for each channel (total of eight). Q1 of the AF amplifier ass'y is buffer amplifier for driving the FM low-pass filter. An emitter follower connection is used. Q3 and Q5 form a direct coupled amplifier with high input impedance. This arrangement limits any effect on the low-pass filter to a negligible level. Output from Q5 is divided into two paths, one through the output level control, function switch, and Q7 emitter follower to the OUTPUT (VARIABLE) terminal and the other directly to the OUTPUT (FIXED) terminal (level established by the voltage divider connected to the collector circuit of Q5). The low-cut filter (12dB/octave) inserted in the base circuit of Q3 functions to reject the very low range, so that the low-band component generated during muting operation does not appear at the output terminal.

7.6 POWER SUPPLY

The power supply consists of two transistors and five diodes. The set requires three DC supplies, for the AF amplifier ass'y, tuner ass'y, and the stereo indicator lamp. The AF amplifier ass'y requires 31V and 13V, the tuner ass'y 13V. The 13V supply for the AF amplifier ass'y is also applied to a part of the tuner ass'y.

The 31V DC supply is obtained through full wave rectification of the AC appearing at the secondary of the power transformer. Smoothing is effected with a single transistor ripple filter. The 13V DC supply is also obtained through full wave rectification but is applied to a voltage stabilizing circuit consisting of a transistor and zener diode.

The 6V DC supply for the stereo indicator lamp is taken from the pilot lamp supply through a half wave rectifier and RC π filter.

8. ADJUSTMENT

8.1 REQUIRED MEASURING INSTRUMENTS

- FM signal generator
- MPX signal generator
- AM signal generator
- Voltmeter (VTVM)
- Oscilloscope
- Distortion meter

8.2 AM ADJUSTMENT

● Tracking

1. Set the AM signal generator for 400Hz modulation at 30%. Connect the generator output to the AM antenna terminal through a 1k Ω dummy.
2. Connect the oscilloscope and voltmeter (VTVM) is parallel to VARIABLE OUTPUT.
3. Set the signal generator output to approximately 30dB. Set signal generator and set dials to 600kHz.
4. Adjust cores of T9 (tuner ass'y) and the bar antenna for peak output.
5. Set signal generator and set dials to 1,400kHz.
6. Adjust CT5 and CT6 (tuner ass'y) for peak output.
7. Repeat steps (3) through (6) several times, to obtain optimum tracking.

8.3 FM ADJUSTMENT

● Tracking

1. Set the FM signal generator for 400Hz modulation at 100%. Connect generator output to the FM antenna terminals through a 300 Ω balanced dummy antenna.
2. Connect the oscilloscope, voltmeter (VTVM), and distortion meter in parallel across VARIABLE OUTPUT.

3. Set the signal generator output level to 8 ~ 10dB.
 - KCW and KUW model:
Set the signal generator and set dials to 90MHz.
 - FW and FVZW model:
Set the signal generator dial to 87.4MHz, and set dial to lower end (● left side).
4. Adjust cores of T4 (tuner ass'y) and T1, T2, and T3 to obtain peak output.
5. Set signal generator and set dials to 106MHz.
6. Adjust CT4 (tuner ass'y) and CT1, CT2, and CT3 to obtain peak output.
7. Repeat steps (3) through (6) several times, to obtain optimum tracking.
8. Set the frequency to 90MHz and adjust the T5 core of the tuner ass'y to obtain peak output.
9. Detune the set so that noise only is received. Adjust the primary (bottom) core of T6 so that the tuning meter pointer indicates the center position.
10. Set signal generator and set dials to 82MHz. Set signal generator output level to 60dB. Carefully tune the set to this frequency as indicated by the tuning meter.
11. Adjust the secondary (top) core of T6 (tuner ass'y) for minimum distortion.

● FM MPX adjustment

1. Set MPX signal generator modulation for the main signal (L+R) to 1kHz at 67.5kHz deviation and for the pilot (19kHz) at 7.5kHz deviation. Set the output level to 60dB.
2. Apply signal generator modulation to the left channel only. Adjust T8 (tuner ass'y) for peak output.
3. Under this condition, adjust the core of T5 (tuner ass'y) for minimum distortion.
4. Set signal generator modulation to the pilot and L(R). Adjust VR1 (tuner ass'y) to obtain maximum channel separation.

9. DIAL STRINGING PROCEDURE

1. Set the tuning capacitor to minimum capacitance (rotor swung fully out).
2. Tie one end of the dial cord to the spring attached to the tuning pulley.
3. Pass the dial cord over pulley A and wind it around the tuning shaft (three turns).
4. String the dial cord over pulleys B, C, D, and E. Wind it around the tuning pulley (one turn).
5. Tie the end of the dial cord to the tuning pulley spring.
Turn the tuning shaft through the full range and insure that dial cord operation is smooth. Cut off any excess dial cord at the spring.
6. Set the tuning capacitor to maximum capacitance. Shift the dial pointer to the left end of the scale (starting point) and secure it there. ↓
