

SANSUI 771

771 FM/AM STEREO RECEIVER, 80 WATTS RMS You enjoy greater stereo power and superior stereo performance at much less cost with Sansui's newest medium-priced FM/AM stereo receiver, the 771. Thanks to its refined CBM (Circuit Board Module) construction, the 771 outperforms many higher-priced receivers in the field. Here's how:

Thanks to CBM, which simplifies construction, reduces costs and increases electronic capabilities, the moderately-priced 771 is able to offer a very superior power amplifier—an all-stage direct-coupled OCL powerhouse delivering a continuous RMS 40W/40W (total music power of 140 watts) to drive up to two stereo pairs

of speakers at a time with less than 0.5% total harmonic distortion and a surprisingly wide power bandwidth of 15 to 40,000Hz. Its FM/AM tuner features an MOS FET-equipped FM section with sensitivity of $2.0\mu\text{V}$ (IHF) to pull in the fuzziest of stereo signals with surprising clarity. And its preamplifier and control sections are equally outstanding, providing inputs and controls for two stereo tape decks, two AUX, a microphone circuit, a superior 2-stage direct-coupled phono equalizer, distortion-free tone controls with FETs, audio muting, low/high filters and loudness, and a unique stereo/mono switch which bypasses the FM multiplex circuit when it is turned to mono position.
