INTEGRATED STEREO AMPLIFIER

SPECIFICATIONS

POWER AMPLIFIER SECTION

Dynamic power: 70 watts, both channels operating; 8 ohms
90 watts, both channels operating; 4 ohms

Continuous RMS power output

[Rated Output]: At 1 kHz
28 watts per channel, 8 ohms
35 watts per channel, 4 ohms
23 watts per channel, both channels operating, 8 ohms
27 watts per channel, both channels operating, 4 ohms

Power bandwidth: 10 Hz to 40 kHz, IHF

Harmonic distortion: Less than 0.5 % at 1 kHz rated output

IM distortion: Less than 0.5 % at rated output

PREAMPLIFIER SECTION

Frequency response: MIC, 20 Hz to 20 kHz ± 0 dB
PHONO, RIAA curve ± 1 dB
TAPE -1, TAPE -2
TUNER
AUX
REC/PB (input) } 10 Hz to 60 kHz ± 3 dB

Input sensitivity and impedance: MIC } 2 mV 47 k
PHONO }
TAPE -1, TAPE -2 } 250 mV 50 k
TUNER
AUX
REC/PB (input)

Signal output and output impedance: REC OUT 250 mV 10 k
REC/PB 30 mV 82 k

GENERAL

Power consumption: Approx. 115 W (Canada Model)
Approx. 70 W (USA Model)
Approx. 165 W (AEP, UK and E Model)

Power requirement: 120 V ac (USA and Canada Model)
110, 127, 220, 240 V ac (AEP, UK and E Model)

Dimensions: 410 (w) x 120 (h) x 280 (d) mm
16 $\frac{1}{8}$ (w) x 4 $\frac{3}{4}$ (h) x 11 $\frac{1}{8}$ (d) inches

Net weight: 6.2 kg (13 lb 9 oz)

Shipping weight: 8.6 kg (18 lb 13 oz)

SERVICING NOTES

1. Cautions on handling IC's

- a. Excessive heat may destroy an IC. Never re-install a used IC.
- b. Check the related components for defects before replacing the IC.
- c. When installing new IC's, do not apply excessive heat. Solder quickly while holding a wet rag on the heat-sink tab as shown in Fig. A.
- d. Do not short adjacent IC leads when performing electrical checks as this might damage the IC.
- e. Always solder the IC heat sink to the printed circuit board to avoid damage.

Fig. A. IC installation

2. Power amplifier adjustment

No adjustment is required.

3. Power transistor replacement

When replacing the power transistor, apply a coating of a heat-transferring grease to both sides of the mica insulator. Any excess grease squeezed out when the screw is tightened should be wiped off.

Fig. B. Nylon rivet removal

4. Nylon rivet removal

- a. To remove the nylon rivet, push its end with a tweezers as shown in Fig. B.
- b. To reinstall the rivet, insert the flared part into the opening first, then push its head as far as it will go.
5. This set uses bonded parallel lead wires shown in Fig. C. Refer to the lines stenciled on them when performing electrical checks.

Fig. C. New lead wires

Shipping weight: 8.6 kg (18 lb 13 oz)

1-2. CIRCUIT DESCRIPTION DIGEST

The following description might help your repair work. Since stages are listed by transistor or IC reference designation, refer to the block diagram on page 5 and schematic diagram on pages 13 and 14.

Preamplifier (IC101)

This amplifier increases the signal level provided by phono cartridge or other signals to the level required at the input of the following buffer amplifier, and also performs proper equalization. Fig. 1-1 shows that the preamplifier operates both as phono equalizer and flat amplifier corresponding to the selected feedback loop. Note that IC101 contains two identical low noise amplifier chains and bias circuit. This also requires two power supply which are same but oppositely poled. The IC101 block diagram is shown in Fig. 1-2.

Fig. 1-1. Simplified preamplifier circuit

Fig. 1-2. IC diagram

LOUDNESS Circuit

R117, C113, C115 and R118 form a loudness circuit and compensate for the characteristics of the human ear which vary according to the loudness of the sound being heard. When LOUDNESS switch is ON and the VOLUME control is set for 30 dB attenuation, the frequency response is changed as shown in Fig. 1-3 regardless of the tone control function.

Fig. 1-3. Loudness circuit response

TONE CONTROL Circuit

Referring to Fig. 1-4, the tone control circuit consists of tone control network and power amplifier. This is basically same as the conventional negative feedback type tone control circuit as the power amplifier output is fed back to the input circuit through the tone control network.

Fig. 1-4. Tone control circuit

Power Amplifier (Q102 ~ Q109)

[Preamplifier Q102, Q103]

Q102 and Q103 form a paraphase amplifier but signal output is extracted from the collector circuit of Q102. This circuit has various advantages in direct-coupling systems. One is high stability despite temperature variations and another is high input impedance without reducing the amplifier gain. The ac output appears across load resistor R132 (2.2k) in the collector circuit. An emitter decoupling circuit is formed by the emitter-base resistance of Q103, R149 and C123 in the base circuit of Q103.

[Thermal compensation and noise suppressor (D101)]

As all the stages are directly coupled, dc stability is required. The negative temperature coefficient of D101 provides thermal compensation for the following driver stage. It also acts as a noise suppressor to reduce the popping noise due to unbalanced current flow in the following stages when the power switch is turned off.

[Driver (Q104)]

Though this stage is a conventional flat amplifier, it determines the output voltage swings because the following stages are basically emitter-followers. The ac load resistor for this stage is R135.

[Dc bias supply (Q105)]

Q105 is biased into heavy conduction and operates as a small resistance providing the necessary forward bias on the two cascaded emitter-followers. This circuit

has the advantage of stable operation even at high power output levels.

[Complementary (Driver) Q106, Q107]

These transistors operate as emitter-followers to provide the current swings demanded of the output stages and also provide the necessary phase inversion to drive the power-output stages in push-pull. Phase inversion is performed by using PNP and NPN type transistors.

[Power transistors (Q108, Q109)]

The output transistors Q108 and Q109 are connected directly to a power supply of about ± 30 V. Q108 supply power to the load during positive half cycles and Q109 operate during negative half cycles. As all the stages are directly coupled and designed to obtain zero potential at the output terminal, the large coupling capacitor at the output (which may cause power reduction and frequency distortion at low frequencies) is eliminated.

Power Supply

[Rectifier (D301 ~ D304)]

A full-wave bridge rectifier and centertapped transformer provides positive and negative dc power supplies for the power amplifier.

[Ripple filter (Q301, R303, C308)]

These components reduce the ripple voltage in the negative dc power supply for buffer amplifier and driver stages of the power amplifier section to an extremely-low-value.

TA-1055 TA-1055

1-3. BLOCK DIAGRAM

1-4. LEVEL DIAGRAM

Note: Signal voltages are measured with an ac VTVM and expressed in dB referred to 0.775 V, 1 kHz.

SECTION 2

DISASSEMBLY AND REPLACEMENT

Note: All screws in this service manual are Phillips type (cross recess type) unless otherwise indicated. (-): slotted head.

2-1. BOTTOM PLATE REMOVAL

1. Remove the seven screws shown in Fig. 2-1.

Fig. 2-1. Bottom view

2-2. FRONT PANEL REMOVAL

1. Remove the two screws at both sides of the wooden case.
2. Remove the bottom plate as described in Procedure 2-1.
3. Remove the three screws from front top and bottom of the front panel as shown in Fig. 2-1 and 2-2.
4. Pull off the TONE and VOLUME control knobs.
5. This frees the front panel with pushbutton.

Fig. 2-2. Front panel removal

2-5. CHASSIS LAYOUT

fuse
(AEP, UK and E Model)

fuse
(USA and Canada Model)

2-3. FRONT SUBCHASSIS REMOVAL

1. Remove the front panel as described in Procedure 2-2.
2. Remove the two screws at each side of the front subchassis as shown in Fig. 2-3.
3. Remove the five screws shown in Fig. 2-3.

2-4. PUSHBUTTON SWITCH REPLACEMENT

1. Remove the front subchassis as described in Procedure 2-3.
2. With a soldering iron having a soldersucking tip, clean the solder from each lug of the switches and printed circuit board.

2-2. FRONT PANEL REMOVAL

1. Remove the two screws at both sides of the wooden case.
2. Remove the bottom plate as described in Procedure 2-1.
3. Remove the three screws from front top and bottom of the front panel as shown in Fig. 2-1 and 2-2.
4. Pull off the TONE and VOLUME control knobs.
5. This frees the front panel with pushbutton.

SECTION 3 REPACKING

The original shipping carton and packing materials are ideal containers for shipping the unit. However to secure the maximum protection, the am-

and E Model

SUPPLEMENT

No. 1
November, 1973

Subject: Modification of TA-1055

TA-1055 (USA, Canada, AEP, and UK Model) has been modified. This supplement contains revised diagrams and the changed and additional electrical parts list. File this supplement with TA-1055 Service Manual (USA, Canada, AEP, UK and E Model).

Note: E Model applies to this supplement from the sets with the serial number 400,001

The existing TA-1055 Service Manual (USA, Canada, AEP, UK and E Model) is valid except the followings:

<u>Page*</u>	<u>Section</u>	<u>Description</u>
9	3	REPACKING
10	4-1	Front Subchassis Wiring Diagram
11	4-2	Mounting Diagram
13	4-3	Schematic Diagram
16	5	EXPLODED VIEWS (1)
17	5	EXPLODED VIEWS (2)
18	6	ELECTRICAL PARTS LIST▲

* Pages in TA-1055 Service Manual (USA, Canada, AEP, UK and E Model)

▲ Parts which are listed in TA-1055 Service Manual but not mentioned in this supplement remain valid.

Applicable Serial Number:

USA Model	No. 804,001 and later
Canada Model	No. 701,301 and later
AEP Model	No. 513,301 and later
UK Model	No. 652,501 and later
E Model	No. 400,001 and later

SECTION 1 REPACKING

The original shipping carton and packing materials are ideal containers for shipping the unit. For the maximum protection, the amplifier must

be repacked in these materials precisely as before as shown in the figure below.

Note: USA Model Serial No. 804,001 and later
 AEP Model Serial No. 513,301 and later
 UK Model Serial No. 652,501 and later
 Canada Model Serial No. 701,301 and later
 E Model Serial No. 400,001 and later

USA and Canada Model

Ref. No.	Description	Position	Ref. No.	Description	Position
S1, S2	FUNCTION SW (PHONO-MIC)	PHONO	S8	MODE SW (STEREO-MONO)	STEREO
S3	FUNCTION SW (TUNER ON/OFF)	OFF	S9	HIGH FILTER SW	OFF
S4	FUNCTION SW (AUX ON/OFF)	OFF	S10	LOUDNESS SW	OFF
S5	MONITOR SW (TAPE-SOURCE)	SOURCE	S11	MAIN SPEAKER SW	ON
S6	MONITOR SW (TAPE 1-SOURCE)	SOURCE	S12	REMOTE SPEAKER SW	OFF
S7	MONITOR SW (TAPE 2-SOURCE)	SOURCE	S13	POWER SW	OFF

Note: All resistance values are in ohms. k = 1000, M = 1000 k.
All capacitance values are in μF except as indicated with p, which means $\mu\mu F$.
All voltages are dc measured with a VOM having 20 k ohms/volt input impedance. No signal in.
Voltage variations may be noted due to normal production tolerances.
