SECTION 1 GENERAL DESCRIPTION

1-1. BLOCK DIAGRAM

1-1-1. System Control Circuit

1-1-2. Capstan Servo Control Circuit

1-1-3. Audio Amp. and Bias OSC Circuit

1-2. GENERAL

The SONY Model TC-850 which is professional stereo tape recorder utilizing three motors and four heads is equipped with the following features:

- * An ac servo controlled capstan drive motor for perfect speed regulation and extremely low wow and flutter regardless of voltage and load fluctuations.
- * 10½" (265 mm) reel capacity and built-in reel locks.
- * Closed-loop dual capstan tape drive system which permits optimum tape tension and tape-to-head contact.
- * Both 2 and 4-track playback heads are provided for maximum versatility and convenience.
- * APS (Automatic Program Scanner) and ATS (Automatic Tape Stop) systems to start and stop the tape transport at the desired position.

1-3. TECHNICAL FEATURES

System control of the TC-850 is accomplished by transistor logic, relays, and solenoids. Main functions are as follows:

1-3-1. System Control Circuit

Flip-Flop Circuit

The flip-flop (Fig. 1-3-1) comprises Q606, Q607, R611 through R616, D609, D610, and C623. The normal condition of Q606 is OFF and Q607 is ON. When PLAY pushbutton S904 is depressed, the collector voltage of Q606 and base voltage of Q607 go to 0 volts. This turns Q607 OFF and Q606 ON. The resulting positive voltage developed across R614, R615, and D610 holds Q606 ON. The flip-flop

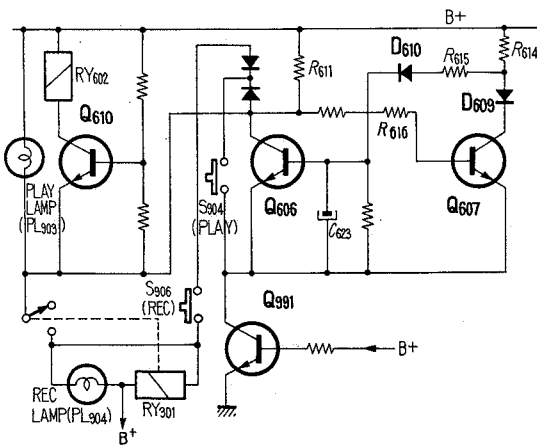

Fig. 1-3-1. Flip-flop circuit

remains in this condition until the automatic shut-off, STOP, FAST FORWARD, or REWIND switches are activated. These switches remove the ground from the emitters of Q606 and Q607, causing the flip-flop to reset.

The collector output of Q606 turns Q610 ON, which energizes PLAY relay RY602. The output also holds bias oscillator relay RY301 energized if RECORD MODE switch S401 and RECORD switch S906 have been activated.

Solenoid Operations

PINCH ROLLER solenoids PM903 and PM904 are energized by Q904 and Q906 respectively. Q904 and Q906 turn ON only when PLAY relay RY602 energizes. TAPE SHIFTER solenoid PM901 is energized by Q903. Q903 turns ON only when PLAY relay RY602 energizes or TAPE SHIFT switch S908 is actuated. BRAKE solenoid PM902 is energized by Q905. Q905 turns ON when the REWIND, PLAY, or FAST FORWARD relay energizes.

To avoid excessive heat built-up in the solenoids during extended operation, the following circuit is used (Fig. 1-3-2). Initially, +23 volts is applied across the solenoid. Also, +23 volts is applied to the network comprising R637 (R640, R634, R647), and C609 (C613, C608, C607). A high potential is instantaneously applied to the base of Q904 (Q906, Q905, Q903).

As the internal impedance of C609 (C613, C608, C607) approaches that of R638 (R641, R635, R648) the voltage at the base decreases. The voltage across the solenoid also decreases.

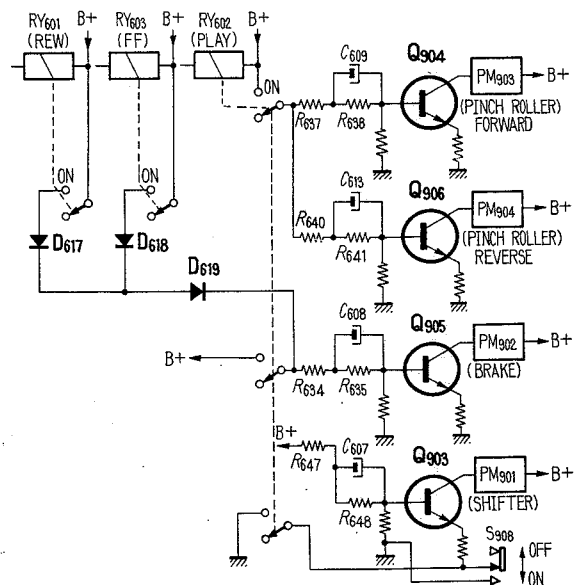

Fig. 1-3-2. Solenoid drive circuit

SHUT-OFF Stage

When a tape is threaded, the Automatic Shut-off (S909) becomes open, cutting off the positive potential applied to the base of transistor Q992 through the resistance network of R993, R994 and R995, turning Q992 OFF. This provides bias to transistor Q991 which then conducts heavily, reducing its collector voltage nearly to ground potential.

If a pulse is received at the base of transistor Q712 (supplied from the ATS circuit output), the collector of Q712 falls to ground potential. This brings the base of Q991 to ground, also, cutting off the operation of Q991 and stopping the transport.

Fig. 1-3-3. SHUT-OFF circuit

1-3-2. APS-ATS Circuit

APS-ATS Oscillator Stage

A Colpitts oscillator circuit is used in the APS-ATS control circuit, operating at approximately 220 kHz. Regenerative feedback is derived from the tank circuit (consisting of the sensing head, C701 and C702 capacitors) and is applied to the emitter of Q701 through C702 and R704. Base bias for Q701 is developed across R701 and R702 while the emitter-swamping resistor is R703. This oscillator stage operates constantly. Capacitor C703 and inductor L701 form a series resonant circuit at the oscillator frequency which is coupled to the base of Q702, keeping it ON and maintaining the Q702 collector at emitter ground potential.

If a metallic object, such as the foil sensing tape, passes near the sensing head core, the inductance of

Fig. 1-3-4. APS and ATS oscillator circuit

the sensing head changes, also changing the oscillation intensity of the tank circuit. Inductor L701 then acts as a short to ground and Q702 is momentarily cut off, resulting in a sharp rise of voltage at the collector of Q702. This produces a positive pulse to the next stage.

ATS

When a positive pulse originates from transistor Q702, it is applied to the base of transistor Q703 (through R707 and D701). This turns Q703 ON and it conducts heavily, reducing its collector potential effectively to ground. The ground level of the Q703 collector drops the base of Q704 to ground potential, also, turning Q704 OFF momentarily. (Q704 is normally on.) With the collector of Q704 increasing its positive potential in its OFF condition (due increased impedance), the potential is applied to the base of Q712 which begins to conduct heavily, dropping its collector potential to ground. With the Q712 collector at ground potential, this activates the shut-off circuit as described in the shut-off stage for that function. Q711 and its associated base biasing circuit are to keep Q712 from functioning soon after the tape transport is turned from rewind to play in APS mode. When the mode changes from rewind to play, the foil which activated the change of mode passes again across the sensing head. This supplies positive pulse to base of Q712. However, potential charged in C710 keeps Q711 ON and grounds the pulse supplied from Q704 through R736 for approximately 15 seconds.

Fig. 1-3-5. ATS circuit

APS

When the APS switch is depressed (closed), the fast forward (FF) relay is activated through D703, putting the recorder in fast forward mode. At the same time, the collector of Q705 is momentarily grounded. This removes bias voltage at the base of Q706 (through R716) and Q706 turns OFF. The collector potential of Q706 rises, therefore, biasing (through R717) the base of Q705 and (through D711) the base of Q711. Both Q705 and Q711 begin to conduct heavily and their respective collectors fall to the emitter ground potential. Simultaneously,

the collector of Q607 is grounded through the FF relay contacts, which are closed as shown in the diagram. No bias is presented to the base of Q606, turning it OFF and turning Q607 ON. With Q607 conducting, the FF relay is self-locked as current flows from the B+ through the relay to ground through Q607. Positive voltage from the normally-off Q703 collector provides bias to the base of both Q707 and Q709. The collector voltage of both Q707 and Q709 is held at emitter ground potential, which in turn prevents bias from reaching the base of Q708 and the base of Q710. Q708 and Q710 are in an OFF condition which keeps the circuit from going into play or rewind modes.

TO REWIND:

When sensing foil crosses the sensing head, a pulse (from Q702) momentarily provides bias at the base of Q703, turning Q703 ON. Q703 conducts and momentarily stops supplying base bias to Q707, which turns OFF. With Q707 turned OFF, positive potential from the collector of Q707 biases the base of Q708 (through R727) and Q708 conducts with its collector dropping to emitter ground potential. This closes the REWIND relay as current flows from B+ through the relay and through Q708 to ground. At this time the self-locking contacts of the FF relay are opened and the self-locking contacts of the REWIND circuit are closed. Switches are now op-

posite of the diagram positions. Once the REWIND relay is activated, it is self-locked in ON position through its contacts, fast forward relay contacts, and Q607.

TO STOP AND PLAY (from APS rewind mode):

When the sensing foil again crosses the sensing head (now in the APS rewind mode), Q703 again receives a momentary bias pulse (from Q702) and grounds the base of Q709, turning Q709 OFF. A positive potential is then allowed through ZD701, R722 and R733 from the FF relay coil. This potential biases Q710, which turns ON, and the collector of Q710 falls to emitter ground potential, removing bias from the base of Q607, turning it OFF. With Q607 OFF, the self-locking ground is open (remember, all switches are now opposite to the diagram positions) and the REWIND relay is released, stopping the rewind mechanism. Simultaneously, when Q710 is turned ON, its collector, now reduced to emitter ground potential, also applies this emitter ground potential to the collector of Q706 (through D709). The base of Q705 receives no bias, therefore. Q705 turns OFF and Q706 turns ON. With Q705 off, its positive collector voltage charges Q709 which delivers bias to the base of Q709 after a capacitive time-delay (through C709 and R728). This time delay is necessary to keep Q709 OFF for a short period right after Q710 is turned off.

1-3-3. CAPSTAN SERVO-CONTROL Stage

Since it is a well-known fact that the capstan servo-control system brings many advantages over the conventional capstan motors driven directly by the AC power line, only technical function of the circuit is explained here, leaving the flowery words to advertising people.

The following is the basic block diagram of the capstan servo-control system used for the SONY Model TC-850.

Fig. 1-3-7. Block diagram (Capstan servo-control circuit)

The motor used in this system is a type of AC torque motor, the speed and torque of which can be controlled by changing the supply voltage, with an AC frequency generator (FG) coupled coaxially to its shaft. The output of the FG is connected to the servo-control electronics to trigger the flip-flop (Q801 and Q802) which generates square wave output at the collector. This output is then differentiated and rectified by C803, R807 and D801 turning the wave form into positive pulses. These pulses trigger the saw-tooth generator (Q803). The saw-tooth output of Q803 is led to the comparator consisting of Q804 and Q805. Only for the period when the potential of saw-tooth wave becomes higher than the potential at the emitter of Q804 and Q805, Q804 becomes

conductive and supplies pulsating signal to Q806, which inverts the phase of the pulse signal. The signal then goes through a buffer stage (Q807) and passes through a low-pass filter for smoothing. The smoothed DC potential, which varies in direct proportion to the duration time of the pulse at emitter of Q807, controls the output of the DC amplifier consisting of Q808 and Q809. The output at the emitter of Q809 varies the impedance between collector and emitter of Q907, which is inserted in series with the capstan drive motor.

When, by a certain cause, the motor is rotating at a speed slower than the intended speed, the frequency of FG is also lower than the predetermined figure, which results in longer interval between the pulses for saw-tooth triggering. The longer interval between the pulses causes higher saw-tooth wave height, which in turn brings in a longer duration of "ON" period of Q804. Therefore, the output pulse at the emitter of Q807 becomes wider, which means higher positive biasing of Q808 resulting in less collector-emitter impedance of Q907 to increase the speed of the motor. When the motor is running too fast, operation of the servo system is vice versa. The equilibrium of the servo system is obtained where the highest potential of the saw-tooth wave becomes equal to the emitter potential of Q804 and Q805.

Tape speed selection is accomplished by changing the time constant of the saw-tooth generator Q803 and by selecting proper parameters in the smoothing low-pass filter.

Starting: The moment when the power switch of the recorder is turned on, the situation of the servo-control circuit and motor is as follows:

Q803	Q804	Q806	Q807	Q808	Q809	Q907	MOTOR
OFF	OFF	ON	OFF	OFF	OFF	OFF	OFF

This situation continues until the charged potential across C804 becomes higher than the potential

at the emitter of Q804 and Q805. When the potential across C804 becomes high enough to make Q804 conductive, the potential at collector of Q804 becomes lower than the zener voltage of D802, thus turning OFF Q806. The OFF situation of Q806 turns ON all the transistors Q807, Q808; Q809 and Q907, as well as the motor. Once the motor is started, its speed is controlled by the frequency generated by the coaxial generator as explained earlier.

Electromagnetic Braking: When changing tape speed to a slower position while the tape is in motion, it is necessary to force the speed down to make the change quick. This is accomplished by applying brake to the motor electromechanically. The change of speed selector switch to a slower position causes longer rise time of saw-tooth wave at the base of Q804 and induces base bias to Q806 to turn it ON. Then, the potential at the collector of Q806 becomes almost zero against the ground. This low potential turns OFF Q812 and, therefore, Q814. The OFF situation of Q814 turns ON Q815 generating higher potential at its emitter. This potential turns ON Q813, which shorts the servo-control signal to ground to inactivate the circuit. Meanwhile, the potential at the emitter of Q815 turns ON Q816 and Q817 to

induce braking current in the motor windings through D809, Q817 and D808. Once the frequency of FG becomes low enough to turn ON Q804 (and, therefore, to turn OFF Q806), the servo-control system takes over the motor speed control.

Stability: Since the supply potential to the servo-control circuit affects the tape speed, a voltage stabilizer consisting of Q810, Q811 and D803 is used for maximum stability of the supply potential. Also, the high stability of the circuit owes to the self-compensating comparator stage (Q804 and Q805) and use of silicon transistors throughout.

Wave Forms and Voltages: The wave forms at each stage and their relation and voltage are as follows:

SECTION 3 MAINTENANCE

Introduction

Under normal operating and environmental conditions, the tape recorder requires no special maintenance. The only requirements are routine cleaning and demagnetization of the heads and lubrication.

3-1-1. Lubrication

Use light machine oil and lubricate the pinch roller shaft. Avoid excessive lubrication. It will cause slippage of the mechanism. If the oil should spill on the pinch roller or the rubber belt, wipe it off immediately with denatured alcohol. To lubricate it, proceed as follows:

- (1) Remove the head cover and the screw securing pinch roller and then lubricate the pinch roller shaft with one drop of light machine oil.

3-1-2. Cleaning

Dusts and dirt which were brought by tape may stick to the core of the record, playback or erase head, and they may deteriorate performance of the heads. So wipe off the surface of head which contacts tape, with a clean and soft cloth dampened with denatured alcohol. To insure proper operation, the heads should be cleaned at least once during each ten hours of actual operation.

CAUTION

Do not use any other solvent on the head as some will damage the material which binds

the head laminations together. Also do not use any metallic device which scratch the head. At the same time, clean capstan, rubber belt, pinch roller, tape guide, flutter roller and tension arm.

3-1-3. Demagnetizing

The record and playback heads may occasionally acquire a degree of permanent magnetization, which will result in an increase of noise level, distortion of any recorded signal, and a gradual erasure of high frequency on any recorded tape which passed over them. These heads may be easily demagnetized with a SONY head demagnetizer HE-2 (optional accessory) or equivalent.

To demagnetize the heads, proceed as follows:

- (1) Remove the head cover.
- (2) Make sure that power switch on the TC-850 is in the OFF position.
- (3) Connect the demagnetizer to ac power source.
- (4) Bring the tips of the demagnetizer in close proximity to, but not in contact with, the heads so that the tips straddle the gap in the center of the head, run the tips up and down the heads several times, and then slowly withdraw the demagnetizer. The slow withdrawal is essential to proper demagnetization.

CAUTION

Do not bring magnet close to heads.

Fig. 3-1. Lubrication

SECTION 4 ADJUSTMENT PROCEDURES

4-1. MECHANICAL ADJUSTMENTS

Fig. 4-1-1. Adjusting parts location

4-1-1. Brake Adjustment (See Fig. 4-1-2.)

Make the brake adjustment, if proper tape tensioning is not maintained in the STOP mode.

Steps:

- (1) Remove the reel panel, referring to "Panel Removal" on page 14.
- (2) Remove the reel table by removing the six screws marked with ▲ in Fig. 4-1-1.
- (3) Place the unit in the STOP mode.
- (4) Loosen the two screws marked with ● at the take-up and the supply brake bands.
- (5) Temporarily tighten the screws marked with ● while pulling the brake band in the direction shown by the arrow as far as it will go.
- (6) When pushing the pole piece of solenoid slowly into its housing by the hand, the releasing plates of the take-up side and the supply side should touch the each brake lever at a time. If not, loosen the screw marked with ● of the part at which the releasing plate touches the brake lever faster than the other one and adjust the length of the brake band.
- (7) Place the unit in the PLAY mode.
- (8) Be sure that the brake solenoid is energized.
- (9) Loosen the three screws marked with ■ and adjust by positioning the brake solenoid holding plate so that the three screws are in the middle of the respective oval-shaped

holes of the brake solenoid holding plate.

- (10) There should be a clearance of approximately 0.5 mm (1/64") equally between the brake lining and the brake drum.

If not, loosen the screw marked with ● and adjust by positioning the brake band.

Note: If the 0.5 mm clearance is not obtained yet, loosen the three screws marked with ■ and adjust by positioning the brake solenoid holding plate.

- (11) Repeat the steps (6) through (10) until the satisfactory result is obtained.
- (12) Place the unit in the STOP mode.
- (13) Loosen the two screws marked with ▲ and adjust by positioning the stopper so that a clearance between the releasing plate and

Fig. 4-1-2. Brake adjustment

the brake lever is 1 ~ 2 mm ($\frac{3}{64}$ ~ $\frac{5}{64}$ ") as shown in Fig. 4-1-2.

- (14) Be sure that the center pole surely comes in contact with the stopper in the STOP mode.

4-1-2. Brake Torque Adjustment
(See Fig. 4-1-3.)

This adjustment should be performed for both supply and take-up sides after the brake adjustment.

Note: Words in [] are applied to the take-up brake torque adjustment.

Steps:

- (1) Place the unit in the STOP mode.
- (2) Place a 7" reel with string wound several turns counterclockwise [clockwise] on the hub (44 mm) onto the reel table. Tie the string to a spring scale.
- (3) Pull the scale in the direction shown by the red arrow, making sure that the string does not touch either flange of the reel. The reel table will rotate counterclockwise [clockwise]. Take a reading only when the reel table is in steady motion.
- (4) Adjust the position of spring A so that a scale reading is between 1,800 g-cm and 2,200 g-cm (25.0 oz-inch and 30.6 oz-inch).
- (5) Rewind the string by turning the reel counterclockwise [clockwise].
- (6) Turn string several times clockwise [counterclockwise] on the hub (44 mm) onto the reel table.
- (7) Pull the scale in the direction shown by the black arrow, making sure that the string does not touch either flange of the reel.

The reel table will rotate clockwise [counterclockwise].

Take a reading only when the reel table is in steady motion.

- (8) Adjust the angle of the spring hook by loosening the screw (E) so that a scale reading is between 650 g-cm and 750 g-cm (8.95 oz-inch and 10.4 oz-inch).

SPECIFICATION:

Brake Torque of Supply Reel	
in clockwise turning	650 ~ 750 g-cm (8.95 ~ 10.4 oz-inch)
in counterclockwise turning	1,800 ~ 2,200 g-cm (25.0 ~ 30.6 oz-inch)
Brake Torque of Take-up Reel	
in clockwise turning	1,800 ~ 2,200 g-cm (25.0 ~ 30.6 oz-inch)
in counterclockwise turning	650 ~ 750 g-cm (8.95 ~ 10.4 oz-inch)

4-1-3. Take-up Tension and Back Tension Adjustment of Reel Table
(See Fig. 4-1-4 and Fig. 4-1-5.)

Note: Set the TAPE SPEED switch to 7½ ips (19 cm/s). Hold the actuator so that the SHUT-OFF switch is activated (a rubber band or piece of masking tape will hold the actuator as though tape were threaded on the unit).

A Take-up Tension Adjustment

- (1) Set the reel size selector switch S910 to 10".

Fig. 4-1-3. Brake torque adjustment

- (2) Place a 10" reel with string wound several turns clockwise on the hub (76 mm) onto the take-up reel table.
Tie the string to a spring scale.
- (3) Place the unit in the PLAY mode.
- (4) Pull a spring scale and then allow to take up the string on the reel while approaching the scale to the reel at the same speed of tape running [7½ ips (19 cm/s)].
- (5) Adjust the upper side slider on resistor R903 so that a scale reading is between 400 g-cm and 500 g-cm (5.6 oz-inch and 7.0 oz-inch).
- (6) Place the unit in the STOP mode.
- (7) Set the reel size selector switch S910 to 7".
- (8) Place a 7" reel with string wound several turns clockwise on the hub (44 mm) onto the take-up reel table.
Tie the string to the spring scale.
- (9) Perform the steps (3) and (4) in order.
- (10) Adjust the lower side slider on resistor R903 so that a scale reading is between 280 g-cm and 320 g-cm (3.9 oz-inch and 4.5 oz-inch).

B Back Tension Adjustment

- (1) Set the reel size selector switch S910 to 10".
- (2) Place a 10" reel with string wound several turns counterclockwise on the hub (76 mm) onto the supply reel table.
Tie the string to the spring scale.
- (3) Place the unit in the PLAY mode.

- (4) Pull a spring scale and then allow to take up the string on the reel while approaching the scale to the reel at the same speed of tape running [7½ ips (19 cm/s)].
- (5) Adjust the upper side slider on resistor R902 so that a scale reading is between 450 g-cm and 550 g-cm (6.3 oz-inch and 7.6 oz-inch).
- (6) Place the unit in the STOP mode.
- (7) Set the reel size selector switch S910 to 7".
- (8) Place a 7" reel with string wound several turns counterclockwise on the hub (44 mm) onto the supply reel table.
Tie the string to the spring scale.
- (9) Perform the steps (3) and (4) in order.
- (10) Adjust the lower side slider on resistor R902 so that a scale reading is between 180 g-cm and 220 g-cm (2.5 oz-inch and 3.1 oz-inch).

Fig. 4-1-4. Adjusting parts location

Fig. 4-1-5. Take-up tension and back-tension adjustment of reel table

4-1-4. Pinch Roller Pressure Adjustment
(See Fig. 4-1-6 and Fig. 4-1-7.)

Steps:

- (1) Remove the reel panel referring to "Panel Removal" on page 14.
- (2) Place the unit in the STOP mode.
- (3) Push the pole piece of the solenoid into its housing by the hand, and make sure that the clearance between the ring and the pinch roller lever is 0.5 ~ 1 mm ($1/64 \sim 3/64$ ").
- (4) Make a loop with a piece of string and attach the spring scale to the pinch roller shaft with the loop of string. See Fig. 4-1-6.
- (5) Hold the actuator so that the SHUT-OFF switch is activated (a rubber band or piece of masking tape will hold the actuator as though tape were threaded on the unit).
- (6) Place the unit in the PLAY mode.
- (7) Pull the scale horizontally in the direction shown by the arrow. The capstan shaft, pinch roller and the scale should be in a line.
- (8) Check a scale reading when the pinch roller just leaves the capstan shaft.
- (9) Adjust the adjusting nut so that a scale reading is between 1 kg and 1.4 kg (2.2 lb and 3.1 lb).
- (10) Make sure that the solenoid operates normally when a mode is changed from the PLAY to the STOP and vice versa several times. If the tape slips, readjust the above steps.
- (11) Lock the adjusting nut with the lock nut.
Note: Be careful not to move the adjusting nut.
- (12) Apply lock paint to the nuts.

Fig. 4-1-6. Pinch roller pressure adjustment

Fig. 4-1-7. Pinch roller pressure adjustment

4-1-5. Tape Path Adjustment
(See Fig. 4-1-8.)

Steps:

- (1) Attach a head assembly to the unit.
- (2) Tighten two head assembly holding screws.
- (3) Thread a blank tape.
- (4) Place the unit in the PLAY mode.
- (5) Align the upper edge of the tape just on the upper edge of the 4 track (2 track) p.b. head core by turning the locking screw located on the left side of the 4 track (2 track) p.b. head.
- (6) Turn the locking screw located on the left side of the 4 track (2 track) p.b. head counterclockwise by approximately 5° from the position obtained in the preceding step (5), so that the upper edge of the tape is approximately 0.05 mm higher than that of the 4 track (2 track) p.b. head.
- (7) Align the upper edge of the tape just on the upper edge of the 2 track (4 track) head core by turning the locking screw on the right side of the 2 track (4 track) p.b. head.
- (8) Remove a screw (øK 2.6x6) on the tape guides, (A) and (D) located near the pinch rollers.
- (9) Adjust by turning the upper portion of the tape guides, (A) and (D), so that the tape goes through the middle portion of the tape guides, (B) and (C).
- (10) After the adjustment, fix the tape guides, (A) and (D), with the screws.

Fig. 4-1-8. Tape path adjustment

4-2. ELECTRICAL ADJUSTMENTS

Precaution:

Before making the adjustments, carefully read the following:

- (1) Set the switches to the position indicated below, unless otherwise specified.

- TAPE SPEED switch 7½ ips (19 cm/s)
- SOS/ECHO switch OFF
- MONITOR switch TAPE
- TAPE SELECTOR switch NORMAL
- Reel size selector switch7" (178 mm) reel
- TAPE SHIFT switch OFF

- (2) Set the PB volume control at the level of 0 dB (0.775 V) on the VTVM when playing back the first tone (400 Hz, 0 dB) of SONY alignment tape J-19-F2, unless otherwise specified.

- (3) Connect a VTVM and a 100 kΩ resistor in parallel with the LINE OUT jack.

- (4) Adjustment should be performed for both L-CH and R-CH.

- (5) Clean the heads with soft cloth dampened with denatured alcohol and also demagnetize them with a head demagnetizer.

- (6) A blank test tape should use a new tape or a sufficiently-demagnetized tape.

- (7) The test equipments required for the adjustment are as follows:

- Audio oscillator
- Attenuator
- 100 kΩ, 2.2 kΩ and 22 kΩ resistors
- VTVM
- Standard tape
- SONY SLH tape
- Non-magnetic screwdriver
- SONY alignment tapes J-19-A2, J-19-F2

- (8) SONY alignment tapes contain the following

information in the sequence indicated.

tone tape	1st	2nd	3rd	4th	5th	6th	7th
J-19-A2	12.5 kHz (-10 dB)						
J-19-F2	400Hz 0dB	400Hz -10dB	10kHz -10dB	12.5kHz -10dB	7kHz -10dB	80Hz -10dB	40Hz -10dB

Fig. 4-2-1. Input connection

Fig. 4-2-2. Record bias characteristics

Fig. 4-2-3. Adjusting parts location (1)

Fig. 4-2-4. Adjusting parts location (2)

Item	Signal Source	Setup	Mode	Adjust	Remarks														
1. Playback Head Azimuth Adjustment	SONY alignment tape J-19-A2 (12.5 kHz, -10 dB)		Playback	Azimuth Adjusting Screws (See Fig. 4-2-3)	<ol style="list-style-type: none"> Set the TAPE SPEED switch to 3¾ ips (9.5 cm/s). Set the MONITOR switch to TAPE. Adjust for maximum reading on the VTVM. <p>Note: When the same maximum output cannot be obtained at both channels, take the middle between the two positions of the screw in the maximum output levels. The difference between the two levels should be within 2.5 dB.</p> <ol style="list-style-type: none"> Check for the tape running. 														
2. Playback Equalizer Adjustment	2nd (400 Hz, -10dB) and 3rd (10 kHz, -10 dB) tones of SONY alignment tape J-19-F2	Same as Item 1	Playback	7½ ips (19 cm/s) ...R234 (Both L-CH and R-CH) 3¾ ips (9.5 cm/s) ...R237 (Both L-CH and R-CH) (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the MONITOR switch to TAPE. Set the PB HEAD selector switch to "2". Set the TAPE SPEED switch to 7½ ips (19 cm/s). Adjust R234 to obtain the same output at both 400Hz and 10 kHz. Set the TAPE SPEED switch to 3¾ ips (9.5 cm/s). Adjust R237 to obtain the same output at both 400Hz and 10 kHz. Set the PB HEAD selector switch to "4". Make sure that the frequency response is the same as in steps 4 and 6. 														
3. VU Meter Calibration	1 kHz of -60 dB (0.78 mV) to MIC jack		Record	R230 (Both L-CH and R-CH) (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the MONITOR switch to SOURCE. Set the MIC volume control VR401-1 (VR401-2) to obtain 0 dB (0.775 V) on the VTVM. Adjust R230 so that the pointer of VU meter stays at OVU. 														
4. Record Bias Adjustment	1 kHz of -10 dB (0.245 V) to LINE IN jack		Record	C311 (L-CH) 30~200pF C312 (R-CH) 30~200pF (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the MONITOR switch to TAPE. Turn C311 (C312) clockwise to the full and return it several times. Turn C311 (C312) clockwise slowly to obtain the maximum output on the VTVM. Turn C311 (C312) farther clockwise to obtain the level 0.5 dB less from the maximum. 														
5. Record Head Azimuth Adjustment	5 kHz of -20 dB (77.5 mV) to LINE IN jack	Same as Item 4	Record	Azimuth Adjusting Screws (See Fig. 4-2-3)	<ol style="list-style-type: none"> Set the TAPE SPEED switch to 3¾ ips (9.5 cm/s). Set the MONITOR switch to TAPE. Adjust for maximum reading on the VTVM. <p>Note: When the same level cannot be obtained at both channels, take the middle between the two positions of the screw in the maximum output levels. The difference between the two levels should be within 2.5 dB.</p>														
6. Record Level Adjustment	1 kHz of -10 dB (0.245 V) to LINE IN jack	Same as Item 4	Record	R125 (Both L-CH and R-CH) (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the MONITOR switch to SOURCE. Adjust the LINE volume control VR402-1 (VR402-2) to obtain 0 dB (0.775 V) on the VTVM. Set the MONITOR switch to TAPE. Adjust R125 to obtain 0 dB on the VTVM. 														
7. Dummy Coil Adjustment	10 kHz of -30 dB (24.5 mV) to LINE IN jack	Same as Item 4	Record	L303 (R-CH) and L304 (L-CH) (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the MONITOR switch to TAPE. Make a note of the output levels on the VTVM in the stereo record mode. Adjust L304 (L303) so that the levels in the monaural record mode are the same as those in stereo record mode. 														
8. Record Equalizer Adjustment	1 kHz and 10 kHz of -20dB (77.5 mV) to LINE IN jack	Same as Item 4	Record	L101 (Both L-CH and R-CH) ... with an SLH tape L102 (Both L-CH and R-CH) ... with a standard tape (See Fig. 4-2-4)	<ol style="list-style-type: none"> Set the TAPE SPEED switch to 3¾ ips (9.5 cm/s). Set the MONITOR switch to TAPE. Thread an SLH tape onto the unit. Set the TAPE SELECTOR switch to SPECIAL. Record 1 kHz signal, and make a note of the playback output level on the VTVM. Record 10 kHz signal. Adjust L101 so that the difference between the two output levels is within ±2 dB. Thread a standard tape onto the unit, and set the TAPE SELECTOR switch to NORMAL. Proceed as in the steps from 5 to 7. Adjust L102 for the correct levels. Perform the same adjustment with the TAPE SPEED switch set to 7½ ips (19 cm/s) and to 15 ips (38 cm/s). <p>The correct values are as follows:</p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td></td> <td style="text-align: center;">NORMAL</td> <td style="text-align: center;">SPECIAL</td> <td></td> </tr> <tr> <td>15 ips (38 cm/s) :</td> <td>30~20 kHz</td> <td>30~25 kHz</td> <td rowspan="3" style="font-size: 2em; vertical-align: middle;">} ±2 dB</td> </tr> <tr> <td>7½ ips (19 cm/s) :</td> <td>30~15 kHz</td> <td>30~22 kHz</td> </tr> <tr> <td>3¾ ips (9.5 cm/s) :</td> <td>50~10 kHz</td> <td>50~12 kHz</td> </tr> </table>		NORMAL	SPECIAL		15 ips (38 cm/s) :	30~20 kHz	30~25 kHz	} ±2 dB	7½ ips (19 cm/s) :	30~15 kHz	30~22 kHz	3¾ ips (9.5 cm/s) :	50~10 kHz	50~12 kHz
	NORMAL	SPECIAL																	
15 ips (38 cm/s) :	30~20 kHz	30~25 kHz	} ±2 dB																
7½ ips (19 cm/s) :	30~15 kHz	30~22 kHz																	
3¾ ips (9.5 cm/s) :	50~10 kHz	50~12 kHz
