2) Set the Tentelometer as shown in Fig. 1-10 and confirm the scale (SPEC: 22~30g).
3) If it is out of specification, change the position of Tension Spring in order to adjust the tension value.

NOTE:
1. Make sure that the three probes of the Tentelometer are all in good contact with tape.
2. It is recommended to be measured three times as Tentelometer is very sensitive.

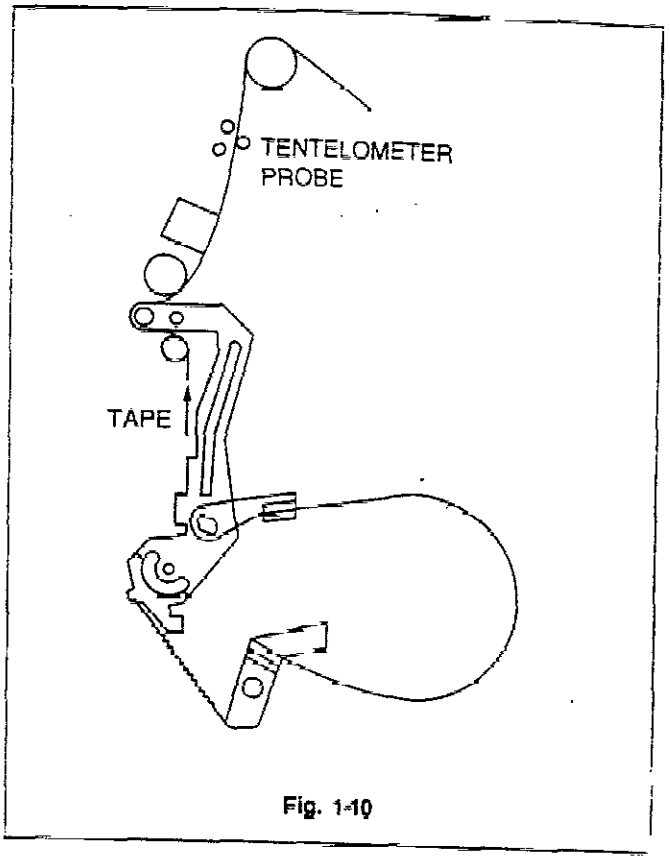

Fig. 1-10

F. After completing adjustment, turn the tracking Volume and make sure the envelope varies almost flat.
G. If the envelope varies as shown in Fig. 2-8, adjustment of the S-Guide Roller and the T-Guide Roller may be upset and then perform the adjustment again.

5) The fine adjustment of AC head

A. Tilt Adjustment (refer to Fig. 2-2)

Tape wrinkle check at the lower Flange of T-Guide Post Ass'y in Fig. 2-1.

a. If tape wrinkle is observed at the lower Flange of ⑪ adjust the Tilt Adjust Screw CCW until the wrinkle disappears.

b. If a gap observed between the lower Flange of ⑪ and the lower edge of tape, adjust the Tilt Adjusting Screw CW until the tape travels along the lower Flange.

B. Azimuth Adjustment (refer to section 2-3-2)

C. The X Position Adjustment for Interchangeability

a. Play back the Alignment Tape (SP mode) with stairstep (or monoscope) signal.

b. Place the Tracking Volume at its center click.

c. Trigger an oscilloscope with switching pulse and observe the envelope waveform of CH-2.

d. Turn the Adjust Cap CCW or CW within taper section and fix the Adjust Cap at the position where the envelope reaches a peak level.

e. Play back the Alignment Tape (EP or LP mode) with stairstep (or monoscope) signal.

f. Make sure the envelope is maximum at the center click position of Tracking Volume. If maximum envelope is not observed, perform the envelope adjustment to obtain maximum envelope output again.

g. Play back the Alignment Tape with stairstep (or monoscope) signal and make sure audio output is maximum.

• NTSC: 7 KHz • PAL: 6 Khz

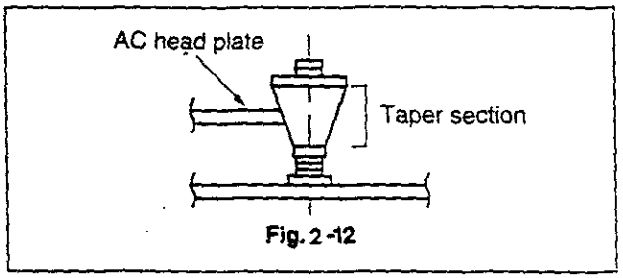

Fig. 2-12

6) Check for transitional operation from Review to Playback

A. Playback the Alignment Tape (SP mode) in the REVIEW mode and observe the envelope with an oscilloscope.

B. Switch the REVIEW mode to the PLAY mode. Make sure state within 3 seconds as shown in Fig. 2-13. If it does not rise within 3 seconds after servo locking adjust as follows.

a. Play back the Alignment Tape which has the stairstep (or monoscope) signal, looking Envelope Waveform, make sure that S & T-Guide Roller's height is adjusted correctly.

b. Change operation mode from Review mode to Play mode again and then make sure that the entrance envelope rises within 3 seconds after servo locking.

c. If not, perform the adjustment according to the section 2-3-4.

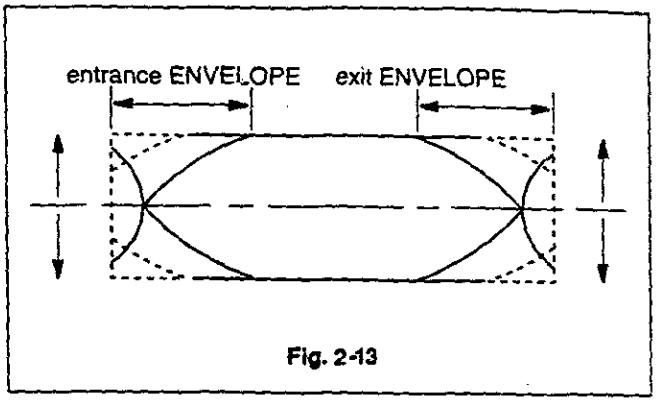

Fig. 2-13

7) Envelope Check

A. Record video signals (color bar or monoscope on T-120 Tape) and make sure the playback envelope output meets the specification as shown in Fig. 2-13.

B. In playing the same Video Deck used for the recording using the T-120, the envelope should meet the specification as shown in Fig. 2-14.

C. If the performance does not meet both specification, replace the Drum Total Ass'y.

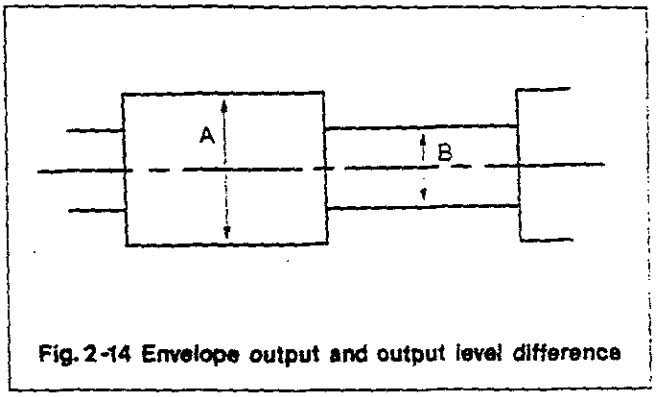

Fig. 2-14 Envelope output and output level difference

8) Final Check

Make sure no Tape wrinkle is caused at each guide.
