1. SPECIFICATIONS

1-1. TV PART

TV STANDARD	PAL B/G (F. FA MODEL), PAL BIG SECAM-L(L. LA MODEL) PAL I (P.PA MODEL) PAL/SECAM B/G D/K (D. DA MODEL)
SCREEN SIZE	14" : 34cm (A34JLL90X) 20" : 48cm (A48JLL90X) 21" : 51cm (A51EAL55X01)
MAIN VOLTAGE	230V AC 50Hz, 110~250V AC 50Hz(DA MODEL)
POWER CONSUMPTION	STAND BY MODE : BELOW 3 Watts OPERATION MODE : 14" = 68 Watts 20" = 78 Watts 21" = 88 Watts
SOUND OUTPUT	1.5 Watts (at 60% mod. , 10% THD)
SPEAKER	3 Watts 16 Ohm
ANTENNA IMPEDANCE	75 Ohm unbalanced input
TUNING SYSTEM	FS (FREQUENCY SYNTHESIS) TUNING
RECEPTION CHANNEL UNIT	VHF-L : E2 - S7 VHF-H : S8 - S36 UHF : S37 - E69
MEMORY CHANNEL	70 PROGRAMS
AUX. TERMINAL	RCA TYPE AV INPUT JACK HEADPHONE JACK (3.5mm Ø)
REMOTE CONTROLLER	R-35 with 2 "AA" type batteries
TELETEXT	8page memory TOP and FLOF - West option : German/Deutch/Flemish,French,Italian, Spanish/Portuguese,Swedish/Finnish/Danish,Czech/Slovak -East option : Polish,Czech/Slovak,Rumanian,Hungarian,Servocroat German/Deutch/Flemish,French,Italian -Turkish option : Turkish,English,German/Deutch/Flemish,French, Italian,Spanish/Portuguese,Swedish/Finnish/Danish -Cyrillic option : Russian,Lettish/Lithuanian,Estonian,Ukranian, Czech/Slovak,Servocroat,English
OTHER FEATURE	ON SCREEN DISPLAY,SLEEP TIMER,ON/OFF TIMER AUTO TUNING CHILD LOCK TELETEXT PICTURE TYPE SELECTION 2-TUNER,TV/AV
WEIGHT	14" : 13.8kg(set) 20" : 23.6kg(set) 21" : 26.2kg(set)

1-2. VCR PART

GENERAL	temperature	5 °C ~ 35 °C (operating) -20 °C ~ 60 °C (storage temperature)
	format	standard
	tape width	12.65 mm
	tape speed	SP : 23.39mm/sec LP : 11.70mm/sec
	max. recording time with fullsize cassette	SP : 240min. with E-240 video cassette
		LP : 480min. with E-240 video cassette
AUDIO	recording system	longitudinal track
	input	-3.8dBm(500mVrms), more than 47Kohms, unbalanced.
	output	-3.8dBm(500mVrms),less than 1Kohm, unbalanced
	frequency range	100Hz to 8KHz
	signal to noise ratio	40dB(more than)
VIDEO	signal system	PAL/SECAM colour and CCIR mono chrome signals, 625lines/50fields.
	recording system	Rotary 2-head herical scan with a slant double azimuth combination video head.
	input	1Vp-p, 75 ohms, unbalanced
	output	1Vp-p, 75 ohms, unbalanced
	signal to noise ratio	45dB with NETTETE IMAGE control at center position.
	horizontal resolution	240 lines with NETTETE IMAGE control at center position

* Design and specifications can be subjected to change without notice.

CHANNEL COVERAGE

SYSTEM	PAL,SECAM-B/G PAL-I/I PAL,SECM-B/G,DK HYPER BAND	PAL,SECM-B/G HYPER BAND	PAL-I	OAK-B/H
CHANNEL	VHF ch 2 - 12 UHF ch 21 - 69 CATV ch X,Y,Z,S1-S41	VHF ch 2 - 12 UHF ch 21 - 69 CATV ch X,Y,Z,S1-S41	UHF ch21 -69	VHF LOW ch 1A- 5 VHF HIGH ch 5A-N11 UHF ch 21 - 69

2. SAFETY INSTRUCTION

WARNING

BEFORE SERVICING THIS CHASSIS, READ THE "X-RAY RADIATION PRECAUTION", "SAFETY PRECAUTION" AND "PRODUCT SAFETY NOTICE" BELOW.

2-1. X-RAY RADIATION PRECAUTION

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must not exceed the specified limit. The nominal value of the high voltage of this receiver is 22-23kv(14"), 25-26kv(20", 21") at max beam current.
The high voltage must not, under any circumstances, exceed 27.5kv (14", 20"), 29.0kv(21").
Each time a receiver requires servicing, the high voltage should be checked. It is recommended the reading of the high voltage recorded as a part of the service records. It is important to use an accurate and reliable high voltage meter.
2. The only source of X-RAY Radiation in this TV receiver is the picture tube. For continuous RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.

2-2. SAFETY PRECAUTION

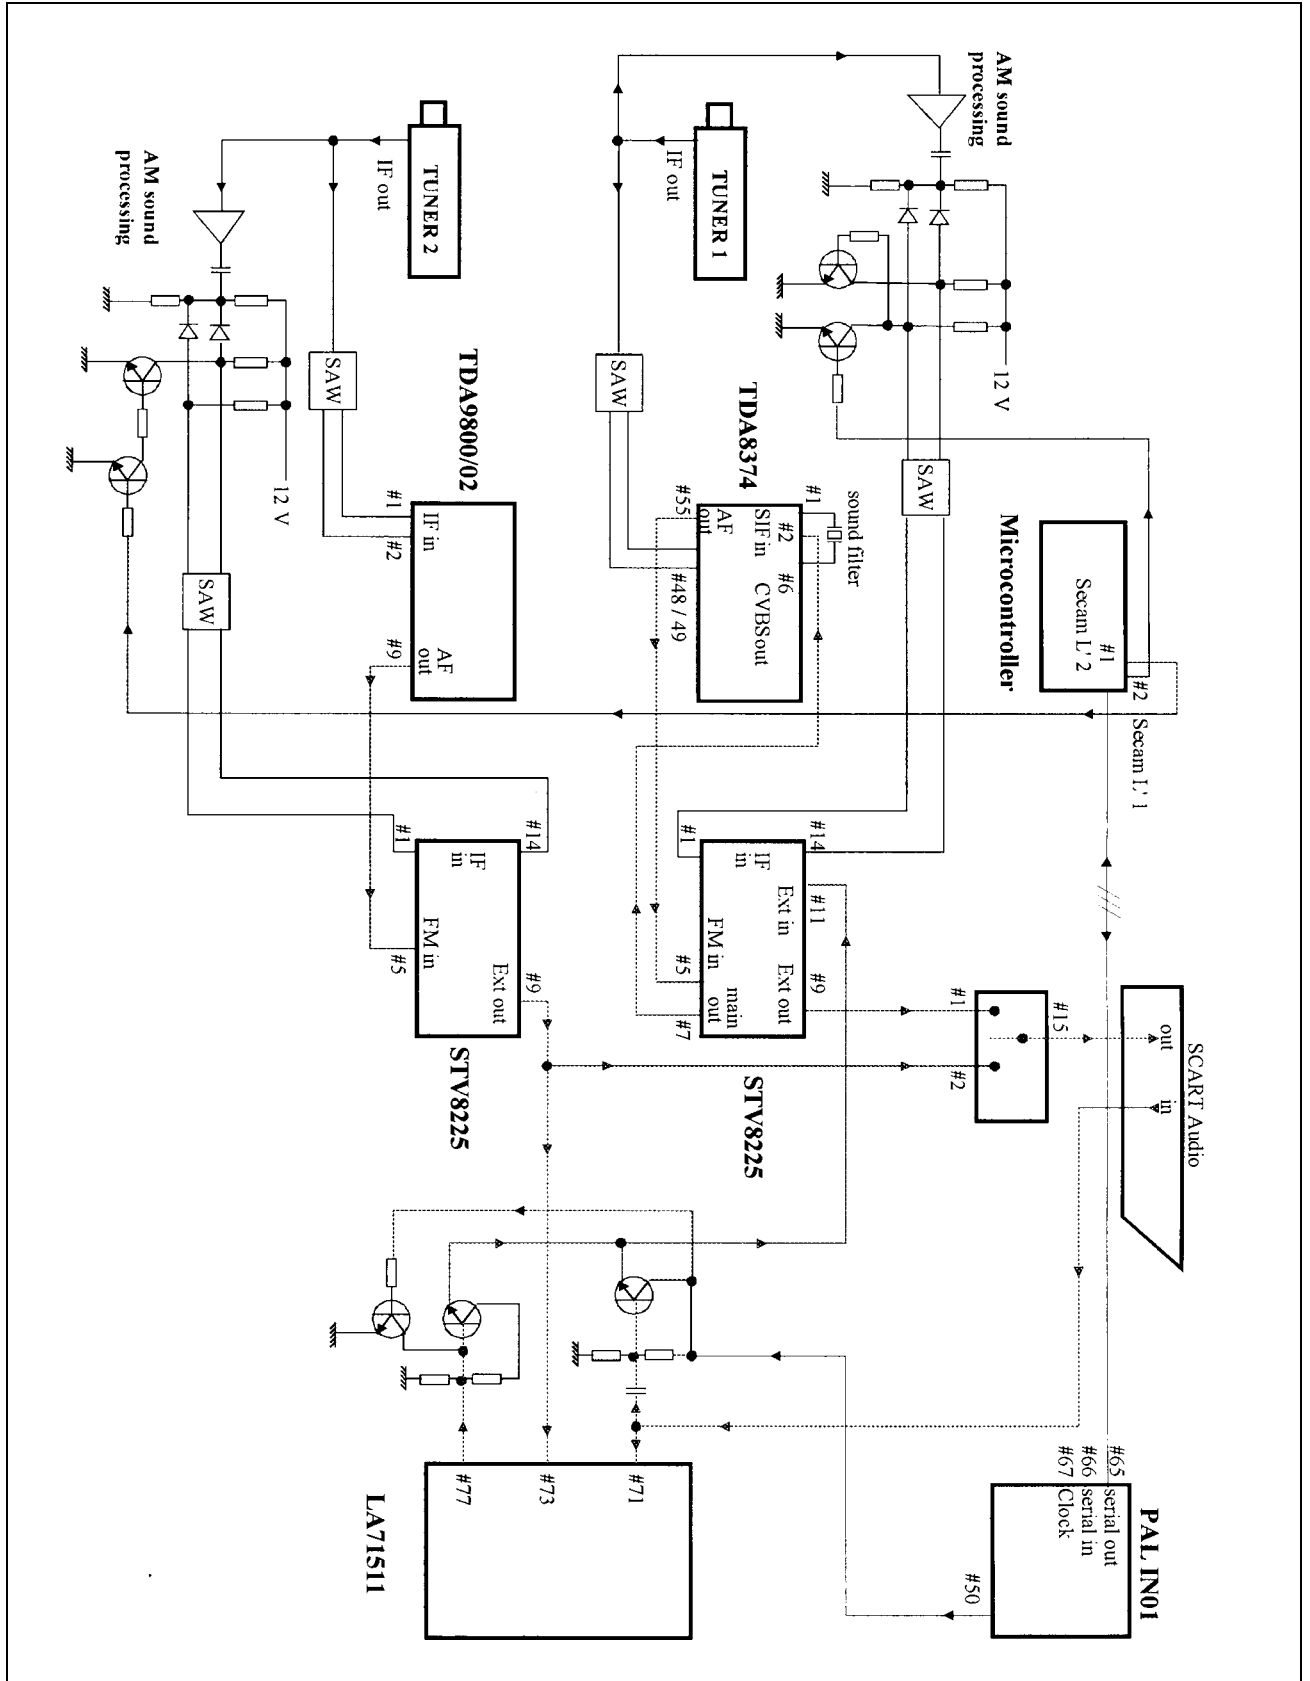

1. Potentials of high voltage are present when this receiver is operating. Operation of the receiver outside the cabinet or with the back cover removed involves a shock hazard from the receiver.
 - 1) Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment.
 - 2) Always discharge the picture tube to avoid the shock hazard before removing the anode cap.
 - 3) Discharge the high potential of the picture tube before handling the tube. The picture tube is highly evacuated and if broken, glass fragments will be violently expelled.
2. If any Fuse in this TV receiver is blown, replace it with the FUSE specified in the Replacement Parts List.
3. When replacing a high wattage resistor(oxide metal film resistor) in circuit board, keep the resistor 10mm away from circuit board.
4. Keep wires away from high voltage or high temperature components.
5. This receiver must operate under AC260 volts, 50Hz/60Hz.
(AC 100~250 volts, 50/60Hz) NEVER connect to DC supply or any other power or frequency.

2-3. PRODUCT SAFETY NOTICE

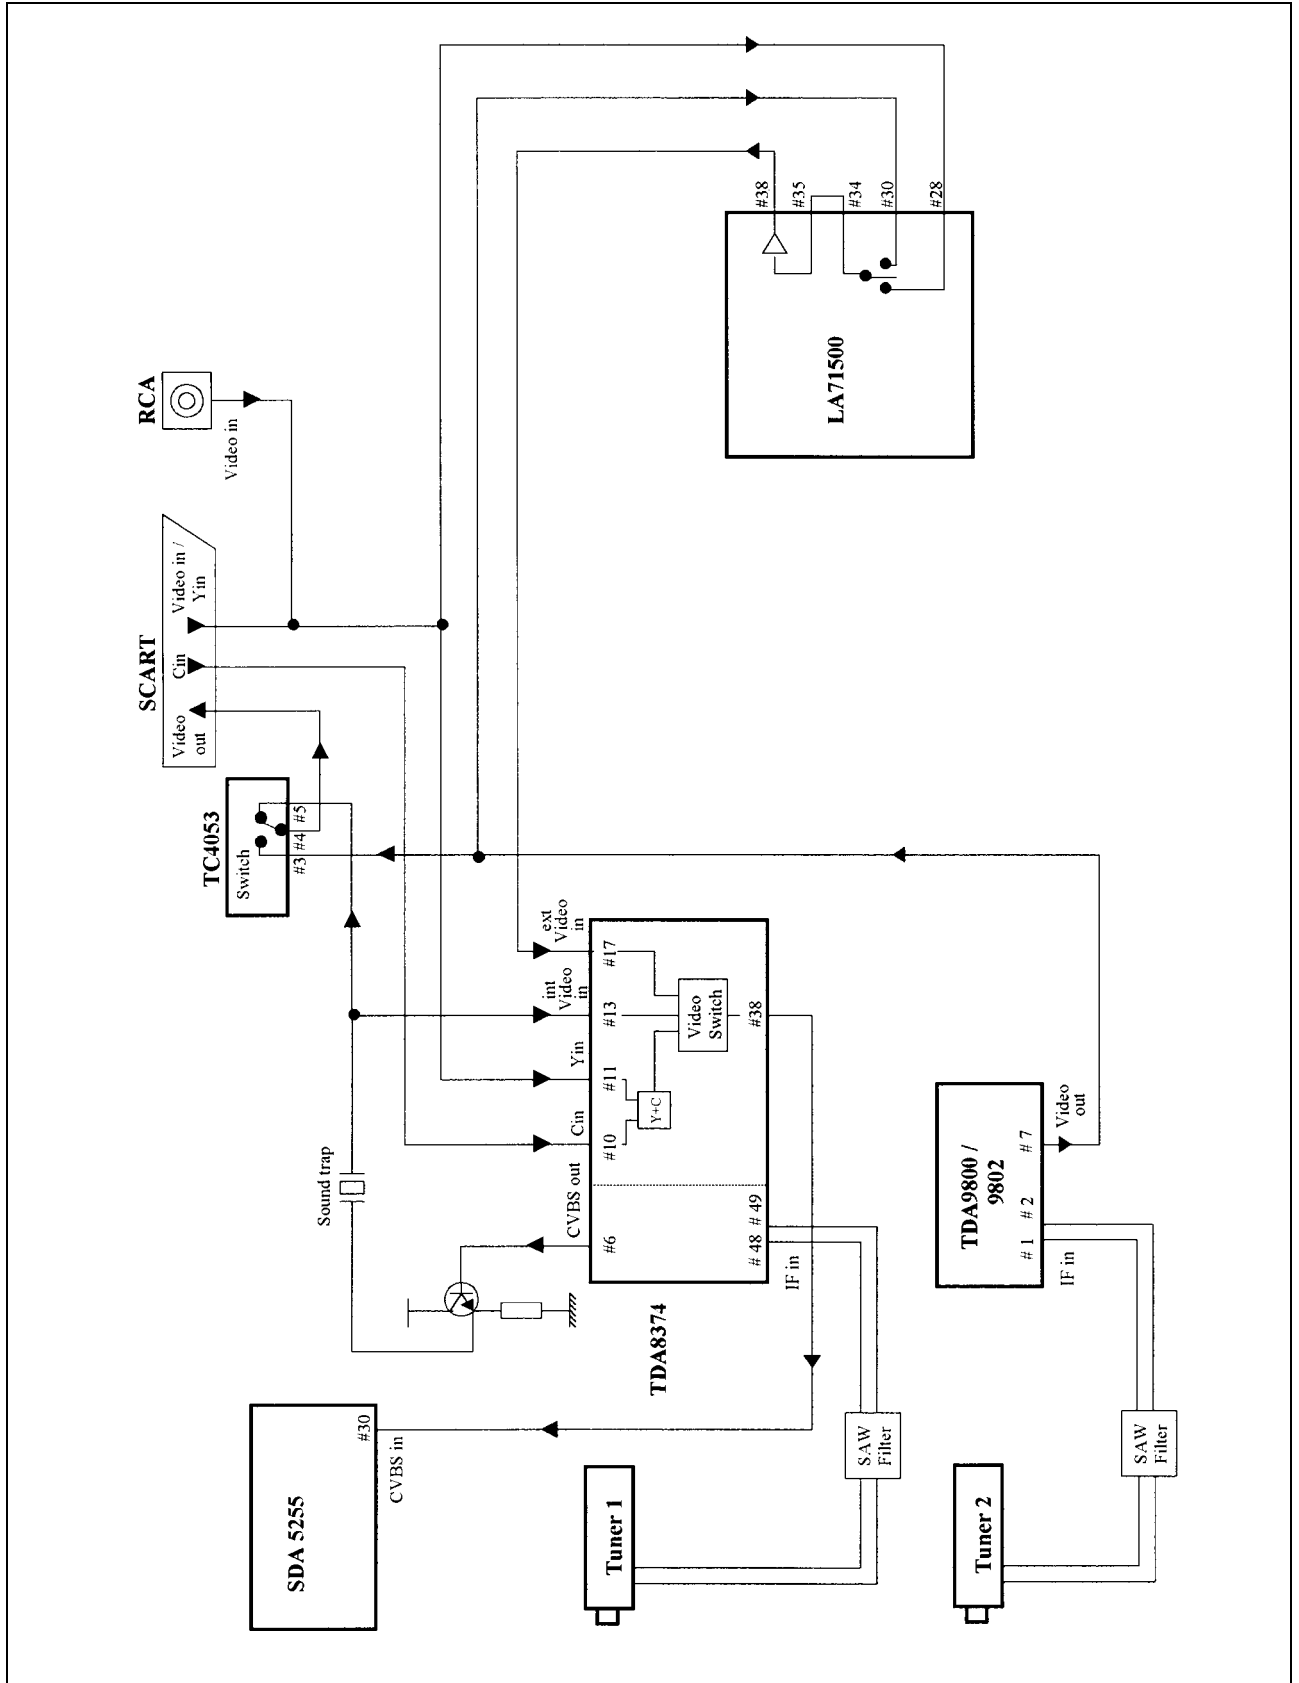

Many electrical and mechanical parts in this chassis have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the X-RAY RADIATION protection afforded by them cannot necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this manual and its supplements, electrical components having such features are identified by designated symbol on the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitute replacement parts which do not have the same safety characteristics as specified in the parts list may create X-RAY Radiation.

4. ALIGNMENT INSTRUCTIONS

4-1. MAIN TUNER AFT

1. STANDARD B/G

- 1) Set a signal generator with
 - RF FREQUENCY = 38.9 MHz
 - RF OUTPUT LEVEL = 80 ± 5 dBuV
- 2) Connect the signal generator RF output to TP1 (TUNER IF OUTPUT)
There must be no signal input to the TUNER.
- 3) Press the "VCO" KEY and wait until the TV screen display "AFT OK"

4-2. SUB TUNER AFT

1. STANDARD B/G

- 1) Set a signal generator with
 - RF FREQUENCY = 38.9 MHz
 - RF OUTPUT LEVEL = 80 ± 5 dBuV
- 2) Connect the signal generator RF output to TP2 (TUNER IF OUTPUT)
- 3) Connect the DC voltage meter to TP3.
- 4) Adjust L201 (AFT COIL) for $2.2V \pm 0.1V$.

4-3. MAIN TUNER AGC

- 1) Set a Pattern Generator with RF level 60 ± 2 dBuV, 210.25 MHz.
- 2) Connect a OSCILLOSCOPE PROBE to P101 (TUNER AGC INPUT).
- 3) Adjust AGC UP/DOWN KEY the voltage drop about 1.8V DC over below it's maximum voltage.

4-4. SUB TUNER AGC

- 1) Set a Pattern Generator with RF level 60 ± 2 dBuV, 210.25 MHz.
- 2) Connect a OSCILLOSCOPE PROBE to P101 (TUNER AGC INPUT).
- 3) Press the "SUB AGC" KEY and monitoring the SUB TUNER PICTURE.
- 4) Adjust R202 (SUB AGC VR) the voltage drop about 1.8V DC over below it's maximum voltage.

4-5. SCREEN

- 1) Apply a COLOR BAR PATTERN SIGNAL.
- 2) Press the "SCREEN" KEY .
- 3) Connect a OSCILLOSCOPE PROBE to P906 (CRT CATHODE R,G,B)
- 4) Adjust the screen volume on FBT such that the highest black level voltage $130 \pm 5Vdc$.

4-6. WHITE BALANCE

- 1) Apply a COLOR BAR PATTERN SIGNAL.
- 2) Adjust the R,G,B UP/DOWN KEY of the other color which did not appear on the screen to obtain WHITE.

4-7. FOCUS

- 1) Apply a RETMA PATTERN SIGNAL.
- 2) Adjust the FOCUS VOLUME on FBT to obtain optimal resolution.

4-8. GEOMETRY

1. S-CORRECTION

- 1) Apply a CROSSHATCH PATTERN SIGNAL.
- 2) Adjust the S-CORR UP/DOWN KEY obtain the same distance between horizontal lines.

2. VERTICAL SLOPE

- 1) Apply a RETMA PATTERN SIGNAL.
- 2) Pressing the V-SLOPE +/- KEY, the lower half of the screen is blanked.
- 2) Adjust the border line of blanked picture coincident with the center marks of the pattern using the V-SLOPE +/- KEY.

3. VERTICAL CENTER

- 1) Apply a RETMA PATTERN SIGNAL.
- 2) Adjust the center line of pattern coincident with the mechanical center marks of the CRT using the V-CENTER +/- KEY.

4. VERTICAL SIZE

- ※ The V-CENTER adjustment has to be done in advance.
- 1) Apply a RETMA PATTERN SIGNAL.
 - 2) Adjust the upperside of the pattern coincident with the mechanical center marks of the CRT using the V-SIZE +/- KEY.

5. HORIZONTAL CENTER

- 1) Apply a RETMA PATTERN SIGNAL.
- 2) Adjust picture centering with H-CENTER +/- KEY.

4-9. ADJUSTMENT

1. X-POSITION AND P2,P3 ADJUSTMENT

1) Adjust point : X-POSITION

Checking point : oscilloscope ch1 = H/SW (PY04 #6)

oscilloscope ch2 = PB ENVE (PY04 #4)

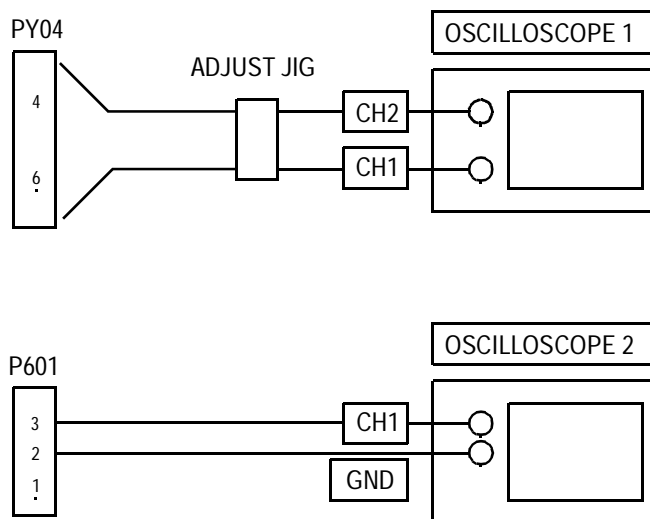

Triggering : CH1

Measuring Equipment : oscilloscope, path jig

Mode : PLAYBACK, ATK OFF

Test tape : DP-2 (6KHz)

CONNECTION METHODE

■ Adjustment Procedure

- 1) Connect the PATH JIG to PY04 after Test tape PLAYBACK
- 2) Pressing the "ATK OFF" KEY.
- 3) Insert the DP-2 TAPE. (Auto playback)
- 3) Adjust the waveform of PB ENVE to maximum (figure1) using X-position VR.
- 4) Adjust IN/OUTPUT GUIDE until the exact waveform appear as bellow figure2.

max.
(figure 1)

(figure 2)

2. AUTO PG ADJUSTMENT

- 1) After adjustment of 9-1. Press the " REC." button.
- 2) Eject the Test tape.

3. AZIMUTH ADJUSTMENT

- 1) Adjust point : AZIMUTH SCREW
Checking point : SOUND OUTPUT (P601)
Measuring Equipment : oscilloscope or audio level meter.
Mode : PLAYBACK
Test tape : DP-2 (6KHz)

■ Adjustment Procedure

- 1) Connect the measuring equipment to the AUDIO OUTPUT (P601) terminal.
- 2) After test tape playback, adjust the output level maximally by varying the azimuth screw.
(6KHz -3.8dBm +1dBm/-3dBm)
- 3) Fix the azimuth screw with locking paint.

※ If EEPROM (I703) has been changed :

- Option data has to be changed and
- all alignment function has to be readjusted.

■ SECAM-L AFT

1. MAIN TUNER AFT

1.1 STANDARD SECAM-L

- 1) Set a signal generator with
 - RF FREQUENCY = 34.5 MHz
 - RF OUTPUT LEVEL = 80 ± 5 dBuV
- 2) Connect the signal generator RF output to TP1 (TUNER IF OUTPUT)
There must be no signal input to the TUNER.
- 3) Press the "VCO-L" KEY and wait until the TV screen display "AFT-L OK"

2. SUB TUNER AFT

2.1 STANDARD SECAM-L

- 1) Select the PR. of received SECAM-L
- 2) Set a signal generator with
 - RF FREQUENCY = 34.2 MHz
 - RF OUTPUT LEVEL = 80 ± 5 dBuV
- 3) Connect the signal generator RF output to TP2 (TUNER IF OUTPUT)
- 4) Connect the DC voltage meter to TP3.
- 5) Adjust R240 (AFT VR) for $2.2V \pm 0.1V$.

5. SERVICE REMOCON DIAGRAM

5-1. HOW TO CHECK TV SECTION WITHOUT VCR DECK

IF YOU WANT TO CHECK TV SECTION WITHOUT DECK MECHANISM, THEN PLEASE PERFORM IN THIS ORDER.

1. PULL OUT THE POWER CORD.
2. REMOVE THE VCR DECK MECHANISM.
3. SUPPLY THE MAIN POWER. (MAIN SW ON)
4. WAIT FOR ABOUT 10 SECONDS. (YOU CAN SEE THE LIGHT OF POWER LED IF THE TV IS NORMAL)
5. TURN ON THE TV USING THE REMOCON.(YOU CAN SEE THE OSD 'EMERGENCY')
6. CHECK THE TV SECTION.

5-2. REMOCON

To Enter The " SERVICE MODE "

Press blue, yellow, green, red power buttons in regular sequency within five seconds using USER REMOCON after setting TV/VCR off.

5-3. REFER TO GENERAL ADJUSTMENT

1. S-CORR +/- (S-CORRECTION)

Press this button to adjust the same distance between horizontal lines on screen of crosshatch pattern.

2. H-CENTER +/- (HORIZONTAL CENTER)

Press this button to adjust picture centering with H-center on screen of RETMA pattern.

3. V-CENTER +/- (VERTICAL CENTER)

Press this button to adjust the center line of the pattern coincident with the mechanical center marks of the CRT on screen of RETMA pattern.

4. V-SIZE +/- (VERTICAL SIZE)

Press this button to adjust the upperside of the pattern coincident with the mechanical center marks of the CRT on screen of RETMA pattern.

5. V-SLOPE +/- (VERTICAL SLOPE)

Press this button to adjust the border line of blanked picture coincident with the center marks of the pattern.

6. R,G,B +/- (WHITE BALANCE)

The screen is become WHITE adjusted R,G,B level by this button.

7. ATK OFF (Auto tracking off)

Press this button to adjust X-PATH adjustment.

FRONT panel's LEDs are lighted up if you press this button. (without TAPE)

8. SUB AGC

Press this button to adjust SUB TUNER AGC Adjustment.

Press once : picture is displayed colour pattern.

Press twice : picture is displayed black/white pattern.

9. REC

Press this pattern to adjust AUTO PG Adjustment.

10. LANGUAGE

Press this button to adjust LANGUAGE SELECTION.

11. SCREEN

Press this button to adjust the screen volume on FBT.

12. AGC +/-

Press this button to adjust MAIN TUNER AGC.

13. AFT

Press this button to adjust VCO.

14. AFT-L

Press this button to adjust VCO-L. (only use the SECAM-L model.)

15. POWER

Press this button to turn your TV/VCR on or off.

If you forget your " child lock secret No. "

1. Enter the " SERVICE MODE. "¢†
2. POWER OFF/ON

6. IC DESCRIPTION

6-1. SDA5255 (Micro controller & Teletext Decoder)

1. General description

The TDA5255 contains a slicer for VPS and TTX, an accelerating acquisition hardware module, a display generator for "LEVEL1" TTX data and a 8bit u-controller running at 333nsec cycle time.

The controller with dedicated hardware guarantees flexibility, does most of the internal processing of TTX acquisition, transfers data to/from the external memory interface and receives/transmits data via IIC and UART user interfaces.

The Slicer combined with dedicated hardware stores TTX data in a VBI 1Kbyte buffer.

The u-controller firmware does the total acquisition task (hamming and parity checks, page search and evaluation of header control bits) once per field.

2. Feature

• Acquisition :

- feature selection via special function register
- simultaneous reception of TTX and VPS
- Fixed framing code for TTX and VPS
- Programmable framing code window for TTX
- Acquisition during VBI
- Direct access to VBI RAM buffer
- Acquisition of packets x26,x27,8/30 (firmware)
- Assistance of all relevant checks (firmware)
- 1-bit framing-code error tolerance (switchable)

• Display

- Feature selectable via special function register
- 50/60Hz display
- Level 1 serial attribute display pages
- blanking and contrast reduction output
- 8 direct addressable display pages
- 12 x 10 character matrix
- 96 character ROM (standard 90 character set)
- 143 national option characters for 11 languages
- 288 characters for x26 display
- 64 block mosaic graphic characters
- 32 free addressable characters for OSD in expanded character ROM +32 inside OSD box
- double height (TOP/BOTTOM)
- conceal/reveal
- transparent foreground/background inside/outside of a box
- cursor (colour changes from foreground to background colour)
- flash (flash rate 1s)
- programmable horizontal and vertical sync delay
- hardware assisted fast display page erase
- full screen background colour in outer screen

- **Synchronization**

display synchronization to sandcastle or horizontal sync and vertical sync with start/stop oscillator or display synchronization to HS/VS with external clock independent clock systems for acquisition, display and controller.

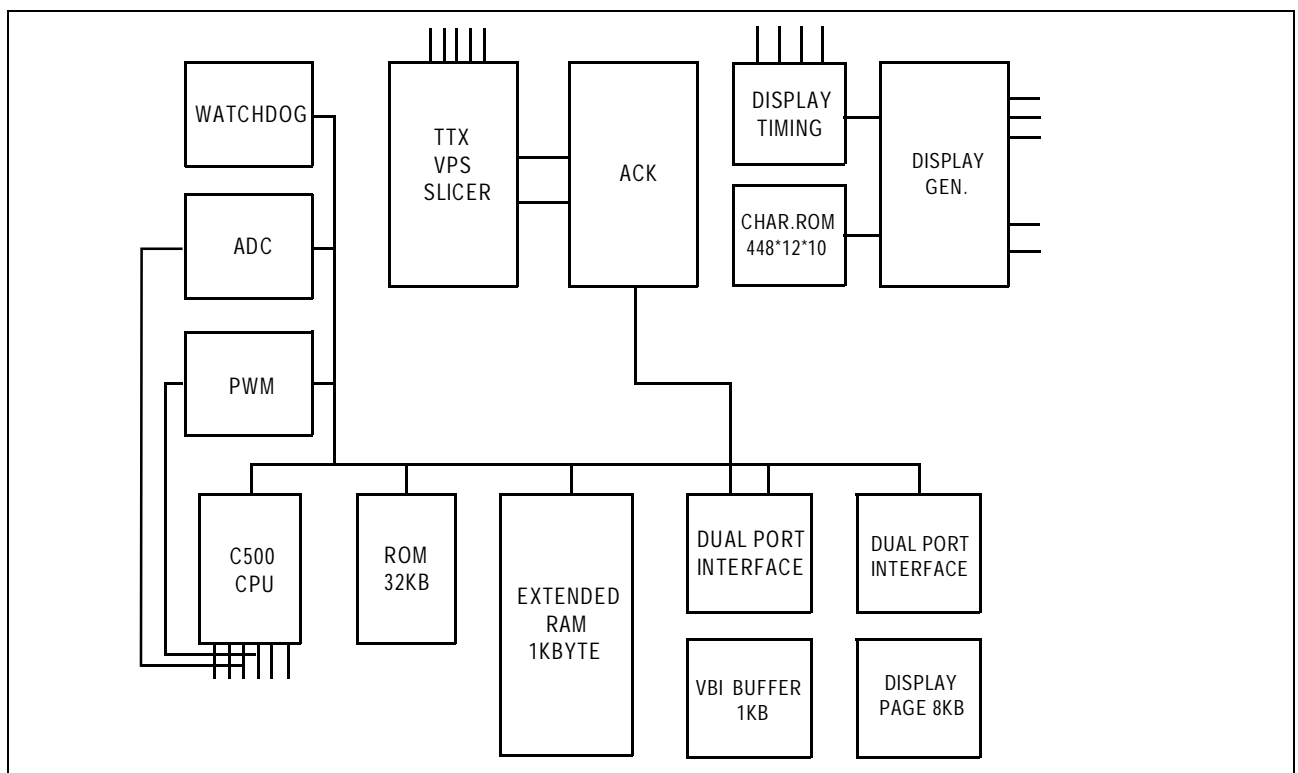

- **Controller**

- 8bit configuration
- 18MHz internal clock
- 0.33µs instruction cycle
- eight 16bit data pointer registers (DPTR)
- two 16bit timers
- watchdog timer
- serial interface (UART)
- 1Kbyte on chip extended RAM (access via MOVX)
- 8Kbyte on chip ACQ buffer RAM (access via MOVX)
- 6channel 8bit PWM unit
- 2channel 14bit PWM unit
- 4multiplexed ADC inputs with 8bit resolution
- one 8bit I/O port with open drain output and optional IIC emulation
- two 8bit multifunctional I/Oports
- one 4bit port working as digital or analog inputs
- one 2bit I/O port with optional address latch enable function

- **P-SDIP 52 package**

- **5V supply voltage**

42	P3.4T1	P.DET	POWER DETECTOR : L
43	P3.4T0	MON ON L	TV MONITOR ON : L
44	P3.2INT0	S/S DATA	SYSCON SERIAL DATA OUTPUT
45	HS/SC	H/SYNC	H SYNC IN (Active H)
46	P4.7/VS	V/SYNC	V SYNC IN (Active H)
47	R	R	RED OUT
48	G	G	GREEN OUT
49	B	B	BLUE OUT
50	BLANK	BL	BLANKING OUT
51	COR	COR	CONTRAST REDUCTION OUT
52	P3.0	EVEN/ODD	EVEN/ODD OUT for non-interlacing in TTX mode

6-2. CAT24C08P (EEPROM)

1. Typical feature

- IIC BUS compatible
- Low power CMOS technology
- 16Byte page write buffer
- Self timed write cycle with auto clear
- 100,000 program/erase cycles
- 100 year data retention
- Optional high endurance device available

2. Description

The CAT24C08P is a 8Kbit serial CMOS EEPROM internally organized as 1024x8bits.
The CAT24C08P features a 16byte page write buffer.

3. Block Diagram

4. Pin Description

PIN	SYMBOL	DESCRIPTION
1-3	A0,A1,A2	Device address input
4	VSS	Ground
5	SDA	Serial data/address
6	SCL	Serial clock
7	TEST	Connect to VSS
8	VCC	+5V POWER SUPPLY

6-3. TDA8374A(Single chip TV Processor for Negative modulation IF)

1. General Description

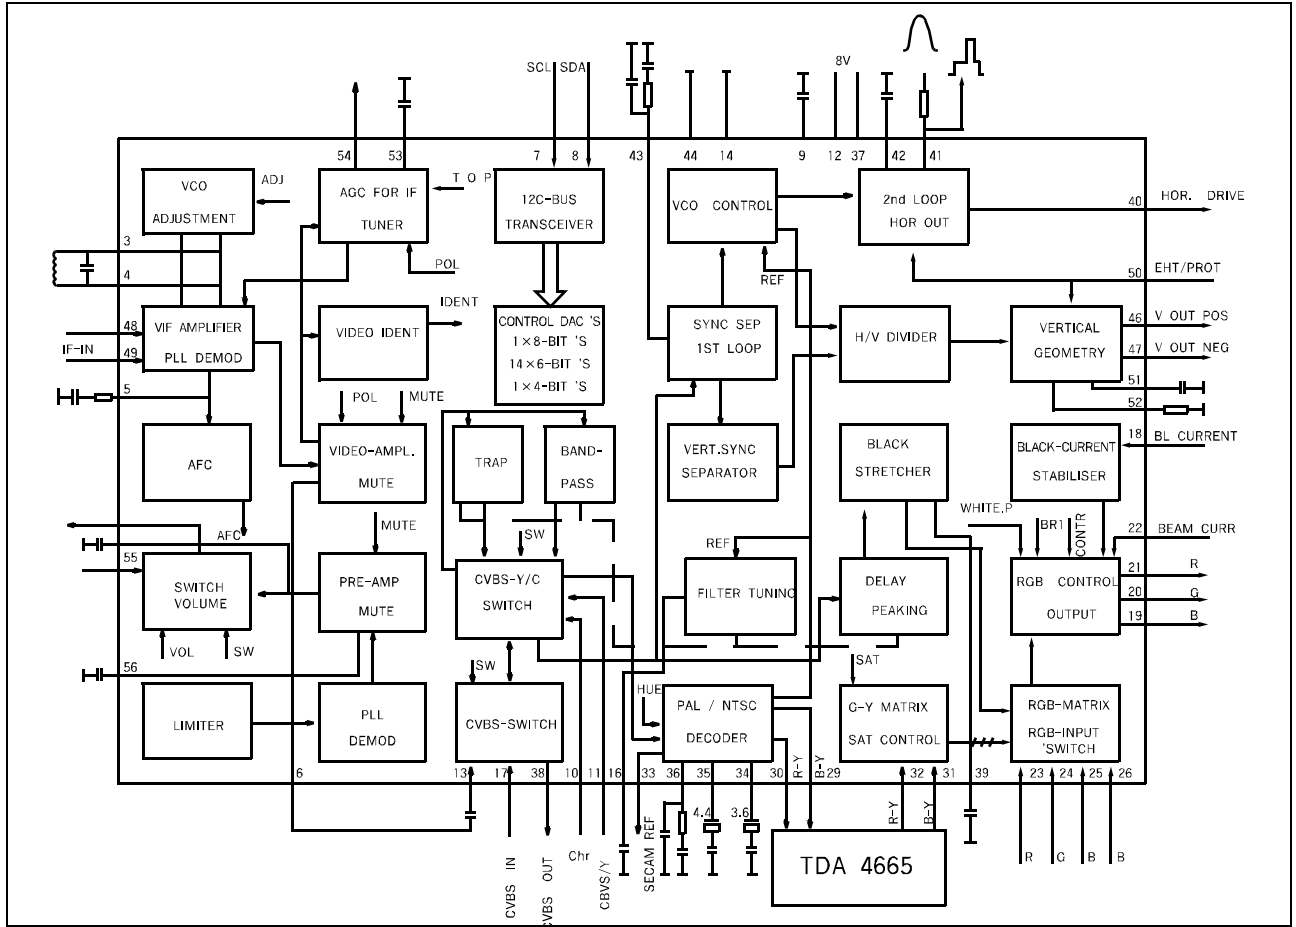

The TDA8374A is IIC BUS controlled single chip TV processors which are intended to be applied in PAL/NTSC television receiver.

TDA8374N3 : With positive and negative modulation
Applied in PAL/SECAM/NTSC TV.

2. Feature

- IF
 - Vision IF amplifier with high sensitivity and good figures for differential phase and again.
 - PLL demodulator with high linearity offering the possibility for (single standard) intercarrier stereo audio application.
 - Alignment PLL via IIC
- VIDEO
 - Integrated luminance delay line
 - Integrated chroma trap and bandpass filters (auto calibrated)
 - Asymmetrical peaking circuit in the luminance channel.
 - Black stretching of non standard CVBS or luminance signals.
- COLOUR
 - SECAM interface for application with SECAM add-on TDA8395.
- RGB
 - RGB control (brightness,contrast,saturation.
 - Black current stabilization and white point adjustment.
- INPUT/OUTPUT
 - Flexible video source select with CVBS input for the internal signal and two external video inputs (one switchable for CVBS or Y/C)
 - The output signal of the video source select is externally available(also as CVBS when Y/C input is used.)
 - External audio input
 - Linear RGB input with fast blanking.
- SYNCHRONIZATION AND DEFLECTION
 - Horizontal synchronization with two control loops and alignment free horizontal oscillator.
 - Slow start and slow stop of the horizontal drive output to enable low stress start-up and switch-off from the line circuit at nominal line supply voltage.
 - Vertical count down circuit for stable behavior with provisions for non standard signals.
 - Vertical geometry control
 - Vertical drive optimized for DC coupled vertical output stages.
- CONTROL
 - Full IIC BUS control, as well for customer controls as for factory alignment.
 - All automatic controls have an option for forced mode.
- POWER CONSUMPTION
 - Low power consumption (900mW at 8.0Volts).
- PACKAGING
 - SDIL-56 (Shrinked Dual In Line, 56pins)

3. Block Diagram

4. Pin Description

NO	NAME	DESCRIPTION
1	SOUND IF INPUT	SIF INPUT
2	EXT AUDIO INPUT	EXTERNAL AUDIO INPUT
3 4	VCO REF FILTER	The IF VCO tuned circuit is applied to these pin. Its resonance frequency must be two times the if-frequency and in between a range of 64-120Mhz. This range is suitable for the if standards as 33.4,38.9,45.75 and 58.75 MHz. The VCO freq. can be adjusted by IIC bus so a fixed coil can be used.
5	PLL LOOP FILTER	The PLL loopfilter is a first order filter with R=390 ohm and C=100nF in series to ground. The loopfilter bandwidth is 60KHz and is optimal for both fast catching and sufficient video suppression for optimal sound performance. Sound performance can theoretically be improved by adding a small capacitor(approx.0-4.7nF) between pin 5 and ground. This however must be evaluated further because the normal video signal response should not be effected.
6	IF VIDEO OUTPUT	Although the video output impedance is low it is recommended to avoid high frequency current in the output due to for instance sound trap filters. This can be achieved by means of an emitter follower at the video output with a 1k Ω resistor in series with the base.
7	BUS INPUT : SCL	serial clock line
8	BUS INPUT : SDA	serial data line
9	BANDGAP DECOUPLING	The bandgap circuit provides a very stable and temperature independent reference voltage. This reference voltage(6.7V)ensures optimal performance of the TDA8374 and is used in almost all functional circuit blocks.
10	CHROMA INPUT	The supplied C S-VHS input burst amplitude should be nominally 300mVpp. (assumed is a colour bar signal with 75% saturation and with chroma/burst ratio of 2.2/1). The C S-VHS input is internally clamped to 4V via 50 k Ω . The external AC coupling capacitor with 50* forms a high pass filter. A recommended coupling capacitor is 1 nF ; the high pass filter cut off frequency is then approximately 3kHz.
11	Y/CVBS INPUT	The Y S-VHS signal of 1Vpp (inclusive sync amplitude) is AC coupled to pin11.
12 37	MAIN POSITIVE SUPPLY	The TDA8374A has a main supply pin 12 and a horizontal supply pin 37. Both pins have to be supplied simultaneously. Notice that the IC has not been designed to use this pin 37as start pin. (pin 37 supplies the horizontal oscillator, PHI-1 and PHI-2) (pin 12 supplies the rest of the circuits in th IC) The nominal supply voltage is 8V. With min/max values of 7.2-8.8V. Also in stand-by condition th IC must be supplied with 8V.

NO	NAME	DESCRIPTION
		A Voltage detection circuit is connected to both pins. - pin12 if V12 < 6.8V than a power on reset, POR. is generated. The Hout output is disabled immediate. - pin37 if V37 < 5.8V than the horizontal output is disabled immediate.
13 17	INT CVBS INPUT EXT CVBS INPUT	It is recommended that the CVBS1 int and CVBS2 ext input amplitudes are 1Vpp (inclusive sync amplitude). This, because the noise detector switches the Φ 1 loop to slow mode (i.e. auto Φ 1 mode when FOA,FOB=0,0) when noise level exceeds 100mVrms (i.e. at S/N of 20dB)
14	GROUND	All internal circuits are connected to this ground pin 14.
15	AUDIO OUTPUT	The output signal is volume controlled and is active for both internal and external audio signals. The nominal gain is +12dB and -68dB, which gives a total control range of 80dB.
16	DECOUPLING FILTER TUNING	Voltage variations at pin 16, which can be due to external leakage current or crosstalk from interference sources, should be less than 50mV to ensure that tuning of filters/delay cells remains correct.
18	BLACK CURRENT INPUT	For correct operation of the loop CURRENT information is supplied to the black current input pin.
19 20 21	BLUE OUTPUT GREEN OUTPUT RED OUTPUT	The RGB output are supplied to the video output stages from pins 21, 20, and 19 respectively. For nominal signals (i.e. CVBS/S-VHS,-(R-Y),-(B-Y),TTX inputs) and for nominal control settings, then the RGB output signal amplitudes is typically 2V BLACK-WHITE.
22	V-GUARD INPUT /BEAM CURRENT LIMITER	The beam current limiting function is realized by reducing the contrast (and finally the brightness) when the beam current reaches too high level. The circuit falls apart in two functions: - Average beam current limiting (ABL): reacting on the average content of the picture - Peak white limiting (WPL): reacting on high local peaks in the RGB signal.
23 24 25	RED INPUT GREEN INPUT BLUE INPUT	The RIN,GIN,BIN signals (nominal signal amplitude of 700mV) AC coupled to pin 23,24 and 25 respectively. Clamping action occurs during burstkey period.
26	RGB INSERTION SWITCH INPUT	The table below a survey is given of the three modes which can be selected with a voltage on RGB insertion switch input pin ; Vpin26 IIC function Selected RGB signal 0.9V-3V IE1=0 RGB (INTERNAL) IE1=1 Rin, Gin, Bin (fast insertion on pin 23,24,25) >4V IE1=X OSD can be inserted at the RGB out pins.
27	LUMINANCE INPUT	An nominal input signal amplitude of 1V black-white MUST be DC coupled. 50PF; clamping action occurs during burstkey period.
28	LUMINANCE OUTPUT	The luminance output signal is approximately 1V black-white with typical output impedance of 250 ohm.

NO	NAME	DESCRIPTION
29 30	R-Y OUTPUT B-Y OUTPUT	The maximum output impedance of pins 29, and 30 is 500 Ω when PAL/NTSC signals are identified. When SECAM is identified by the SECAM add-on and no PAL/NTSC is already identified by the ASM, then the ASM sets the -(R-Y)/-(B-Y) output switch open (via DEMSW). This enables the -(R-Y)/-(B-Y) outputs of the TDA8395 to be directly connected to pins 29 and 30 respectively.
31 32	B-Y INPUT R-Y INPUT	The -(B-Y), -(R-Y) output signals (supplied from baseband delay line) are AC coupled, via a coupling capacitor of 10nF or greater, to the -(B-Y)/-(R-Y) inputs; both inputs are clamped during burstkey period.
33	SECAM REF OUTPUT	The SECAM reference output is directly connected to pin 1 of the TDA8395 for SECAM decoding; it also can be used as a reference for comb. filter application.
34 35	X-TAL 3.58 X-TAL 4.43	To ensure correct operation of both: - colour processing internal circuits, - sync calibration internal circuits, it is only allowed to have 3.6MHz X-tals on pin34: both 4.4MHz, 3.6MHz X-tals are allowed on pin 35. If pin35 is not used: then it is left open in application (also XA, XB=0,1).
36	LOOP FILTER BURST PHASE DETECTOR	One of the important aspects of the PLL is the loop filter connected to pin 36; it influences the dynamic performance of the loop.
38	CVBS OUTPUT	The output amplitude is 1Vpp (transfer gain ratio between CVBS1int or CVBS2ext or CVBS3ext/Y S-VHS and CVBSout is 1). The maximum output impedance is 250 Ω .
39	BLACK PEAK HOLD CAPACITOR	For the correct working of the black stretcher an external time constant should be added at the black peak hold capacitor input.
40	HOR OUTPUT	This open collector output is meant to drive the horizontal output stage. The output is active low, i.e. the line transistor should conduct during the low period of the output.
41	SANDCASTLE OUTPUT /FLYBACK INPUT	Pin 41 is a combined input/output pin. The pin provides a three level sandcastle pulse. Both burstkey pulse and vertical blanking pulse are always available, the line blanking pulse is only present when the external flyback pulse is fed to this pin. The line flyback pulse, fed to this pin is used for two functions - input signal for the PHI-2 loop - RGB line blanking. (without flyback pulse blanking occurs only during the burstkey pulse) To ensure correct working of the delay line and SECAM add-on, the output should not be loaded with more than : - Sandcastle input delay line TDA 4665 - Sandcastle input SECAM add-on TDA 8395
42	PHI-2 FILTER/	The loop filter is a first order filter.
	FLASH PROTECT	This pin requires a capacitor (C) only. A flash protection becomes active when this pin is forced >6V. The horizontal drive is switched-off immediately. Once the voltage is <6V the horizontal drive is switched-on again via the slow start procedure.

NO	NAME	DESCRIPTION
43	PHI-1 FILTER	The loop filter connected to pin 43 is suitable for various signal conditions as strong/weak and VCR signal. This is achieved by switching of the loopfilter time constant by changing the PHI-1 output current. Via IIC bus FOA/B,different time constants can be chosen,including an automatic mode which gives optimal performance under varing conditions.
44	GROUND	To this pin are connected the IC-substrate and horizontal output.
45	EAST-WEST DRIVE	not used.
46 47	VERT. DRIVE+ VERT DRIVE-	The vertical drive has a current output.The output is balanced which ensures a good common mode behavior with temperature and makes the output signal less sensitive for disturbances.
48 49	IF INPUT	The PLL freq. range is 32-60MHz with corresponding VCO freq. 64-120MHz. The IF input impedance is 2k Ω in parallel with 3pF and matches the required load for commonly used saw filters. A DC coupling is allowed, so no series capacitors between saw filter and IF input are necessary.
50	EHT/OVERVOLTAGE PROTECT IN PUT	not used
51	VERTTICAL SAW-TOOTH CAPACITOR	This pin requires a capacitor to ground of 100nF +/-5%. The optimal sawtooth amplitude is 3.5V and is determined by the external capacitor and charge current. The sawtooth bottom-level is 2V.
52	REFERENCE CUR-RENT INPUT	This pin requires a resistor to ground. The optimal reference current is 100 μ A.which is determined by this resistor.
53	AGC DECOUPLING CAPACITOR	The AGC capacitor value is 2.2 μ F and has been defined for an optimal compromise between AGC speed and tilt for all AGC modes(+/-modulation)
54	TUNER AGC OUTPUT	This output is used to control(reduce) the tuner gain for strong RF signals. The tuner AGC is an open collector output which is acting as a variable current source to ground.
55	AUDIO DEEMPHASIS	Only a capacitor has to be connected to this pin that defines the deemphasis time constant. The signal is internally connected through to the Audio switch. The capacitor can be calculated as follows.
56	SOUND DECOUPLING	This pin requires a capacitor of 10 μ F connected to ground. The pin acts as a low pass filter needed for the DC feedback loop.

6-4. TDA4665 (BASEBAND DELAY LINE)

1. Feature

Two comb.filters,using the switched-capacitor technique, for one line delay time.

Adjustment free application.

No crosstalk between SECAM colour carriers.

Handles negative or positive colour-difference input signals.

Clamping of AC-coupled input signals ((R-Y) and (B-Y)).

VCO without external components.

3MHz internal clock signal derived from a 6MHz VCO, line-locked by the sandcastle pulse (64uS line)

Sample-and-hold circuits and low pass filters to suppress the 3MHz clock signal.

Addition of delayed and non-delayed output signals.

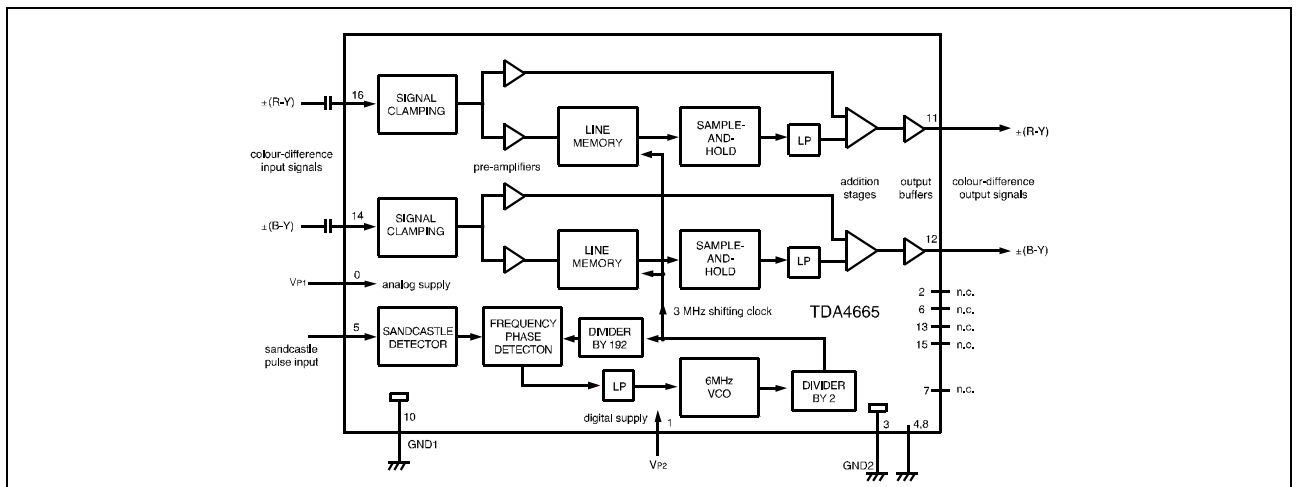

Output buffer amplifiers.

Comb. filtering functions for NTSC colour-difference signals to suppress cross-colour.

2. General Description

The TDA4661 is an integrated baseband delay line circuit with one line delay. It is suitable for decoders with colour-difference signal outputs (R-Y) and (B-Y).

3. Block Diagram

6-5. TDA8395 (SECAM DECODER)

1. Feature

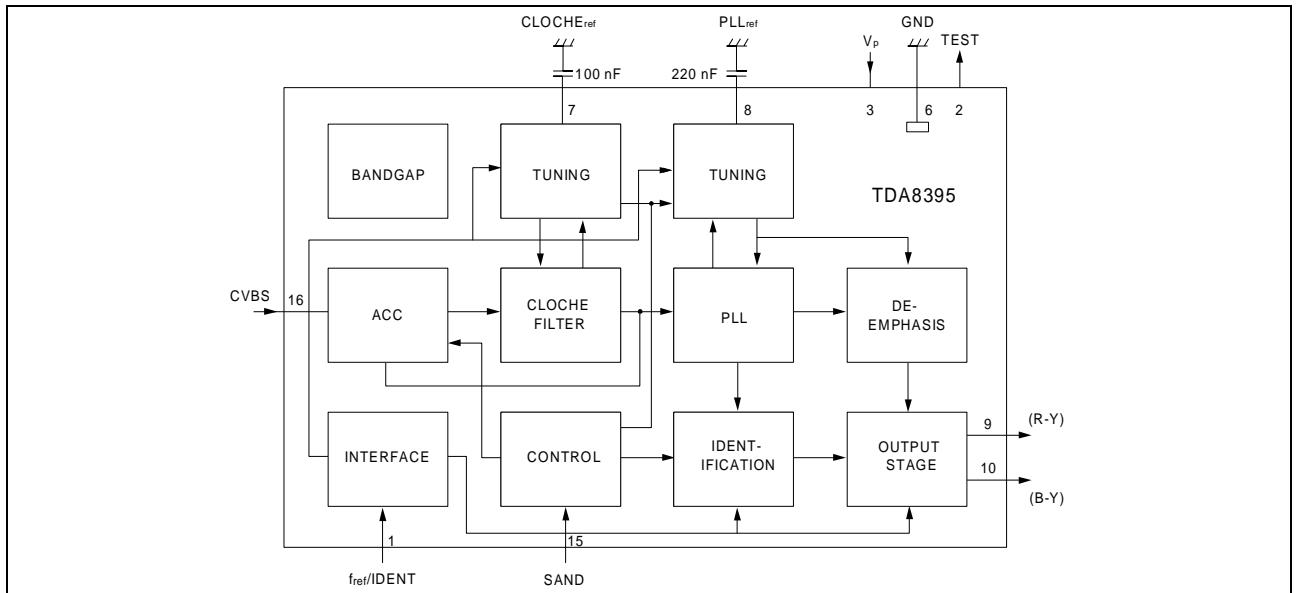

- Fully integrated filters.
- Alignment free.
- For use with baseband delay.

2. Description

The TDA8395 is a self-calibrating, fully integrated SECAM decoder. The IC should preferably be used in conjunction with the PAL/NTSC decoder TDA8362 and with the switch capacitor baseband delay circuit TDA4665. The IC incorporates HF and LF filters, a demodulator and an identification circuit (luminance is not processed in this IC)

A highly stable reference frequency is required for calibration and a two-level sandcastle pulse for blanking and burst gating.

6-6. TDA6106Q (VIDEO OUTPUT AMPLIFIER)

1. Feature

- Black-current measurement output for automatic black current stabilization (ABS)
- Single supply voltage of 200V
- Internal protection against positive appearing CRT flash-over discharge
- Protection against ESD
- Internal 2.5V reference circuit
- Controllable switch-off behavior

2. Description

The TDA6106Q is a monolithic video output amplifier (5MHz bandwidth) in a SIL 9MP package, using high-voltage DMOS technology, and is intended to drive the cathode of CRT directly. To obtain maximum performance, the amplifier should be used with black-current control.

3. Block Diagram

4. Pin Description

6-7. TDA8356 (DC-coupled vertical deflection circuit)

1. Feature

- High efficient fully DC-coupled vertical output bridge circuit.
- Vertical fly-back switch
- Guard circuit
- Protection against : 0short circuit of the output pins (7 and 4)
- Temperature (thermal) protection
- High EMC immunity because of common mode inputs

2. Description

The TDA8356 is power circuit for use in 90 and 110 colour deflection systems for field frequencies of 50 to 120Hz. The circuit provides a DC driven vertical deflection output circuit, operating as a high efficient class G system.

3. Block Diagram

4. Pin Description

SYMBOL	PIN	DESCRIPTION

6-8. TDA7056 (3W MONO BTL AUDIO PUTPUT AMPLIFIER)

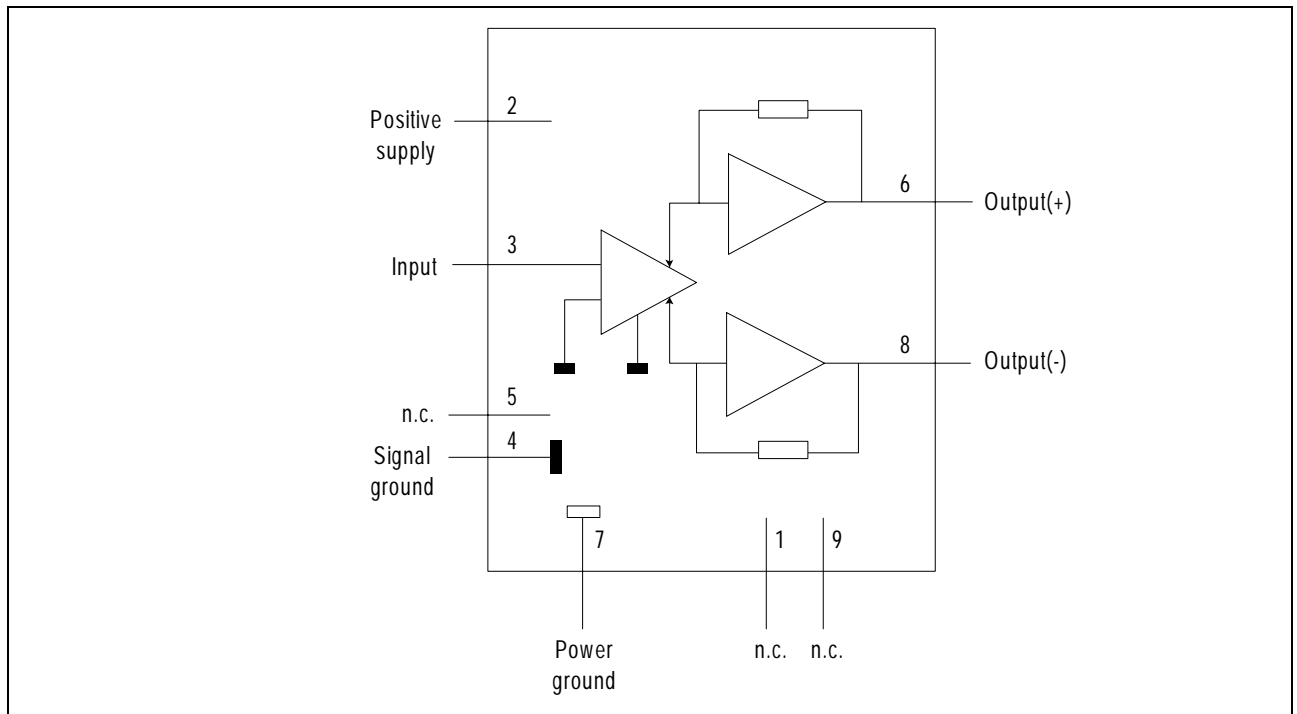

1. Feature

- No switch-on/off clicks
- Good overall stability
- Short circuit proof

2. Description

The TDA7056 is a mono output amplifier contained in a 9 pin medium power package. The device is designed for battery fed portable mono recorders,radios and television.

3. Block Diagram

4. Pin Description

6-9. STR-S5707 (Hybrid IC for a Switching Regulator)

1. Feature

Small SIP isolated package : Resin sealed type (transfer mold)

Lo power discipation at a lighter load

Many protection function function : - Pulse-by-pulse over current protection
 - Over-voltage protection with a latch
 - Thermal protection with a latch

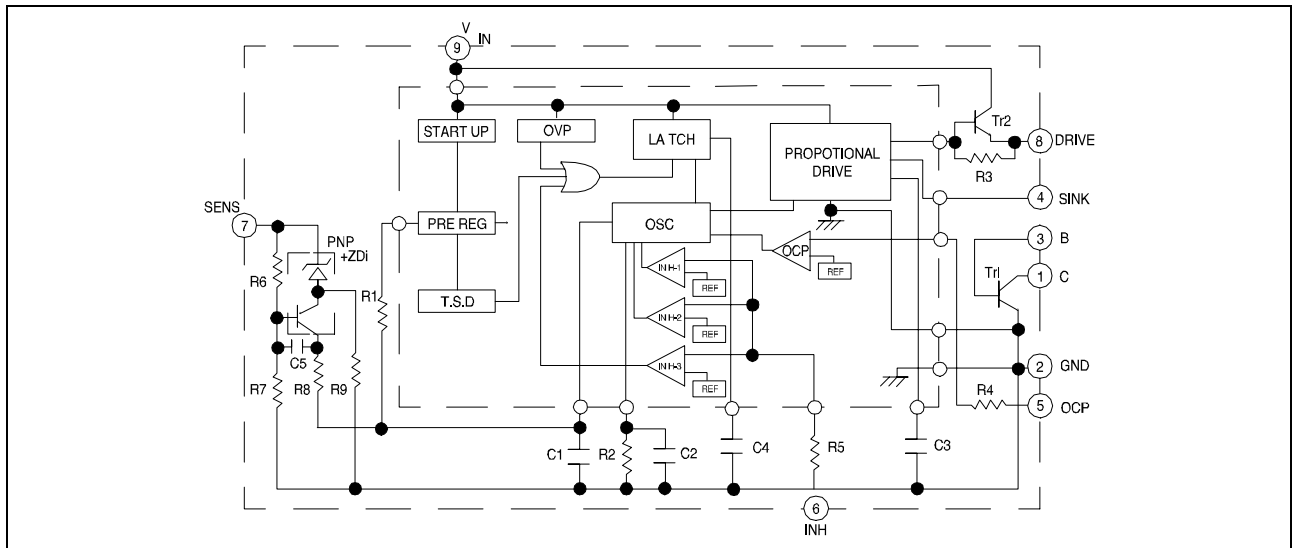

These protection functions are incorporated and can be latched with an external signal.

2. Description

The STR-S5707 is a Hybrid IC with a built in power transistor and a separate excitation control IC, designed for converter type switching mode power supply applications.

The IC is a capable of quasi-resonant mode and requires small number of external component.

6-10. TOP-210 (Three-terminal off-line PWM Switch)

1. Feature

The TOP210 is intended for 100/110/230 VAC off-line power supply applications in the 0 to 8W (0 to 5W universal) range.

Controlled MOSFET turn-on.

Integrated PWM Controller and 700V MOSFET in industry standard eight pin DIP package.

Only one external capacitor needed for compensation, bypass and start-up/auto-restart functions.

Auto-restart and cycle by cycle current limiting functions handle both primary and secondary faults.

On-chip thermal shutdown with hysteresis protects the entire system against overload.

2. Description

The TOP210 is stand-by power supply for GREEN or ENERGY EFFICIENT PRODUCTS.

6-11. LA71511MQ (QIP-80E) : A/V 1-CHIP

Application : PAL VHS VTR audio and video signal Processor

1. Feature

Applicable to multi system : PAL-GBI, MESECAM,4.43NTSC,NAP-GBI

Built-in NAP circuit to convert NTSC to PAL

Normal audio signal processing circuit (self-alignment for record bias)

Built-in SECAM discrimination circuit (MESECAM)

Built-in record and playback FM-EQ function (IIC bus control)

Y/C separation using built-in comb filter

Built-in switching circuit for 3 video/audio inputs

Serial control by IIC bus

Complete adjustment free

Crosstalk reduction by CCD IC for exclusive use (colour comb filter is unnecessary)

Operating supply voltage : 4.8V - 5.2V

6-13. LC89977M (CCD DELAY LINE IC)

1. Feature

Built-in comb filter function for colour noise reduction

Built-in 1H delay line for luminance signal

3fsc (13.3MHz) clock is generated by PLL circuit and is synchronized with fsc(4.43MHz) clock input.

Comb filter for chrominance noise reduction

Available system : PAL,GBI,4.43NTSC

The output phase of luminance signal is the same phase of input signal

Package : MFP-14S

2. Functions

2CCD shift registers. (for chrominance signal, and for luminance signal)

Timing generator and clock driver for CCD.

Delay time selective circuit.

Signal adder unit on CCD shift register.

Auto-bias circuit.

Sync tip clamp circuit for luminance signal.

Center bias circuit for chrominance signal.

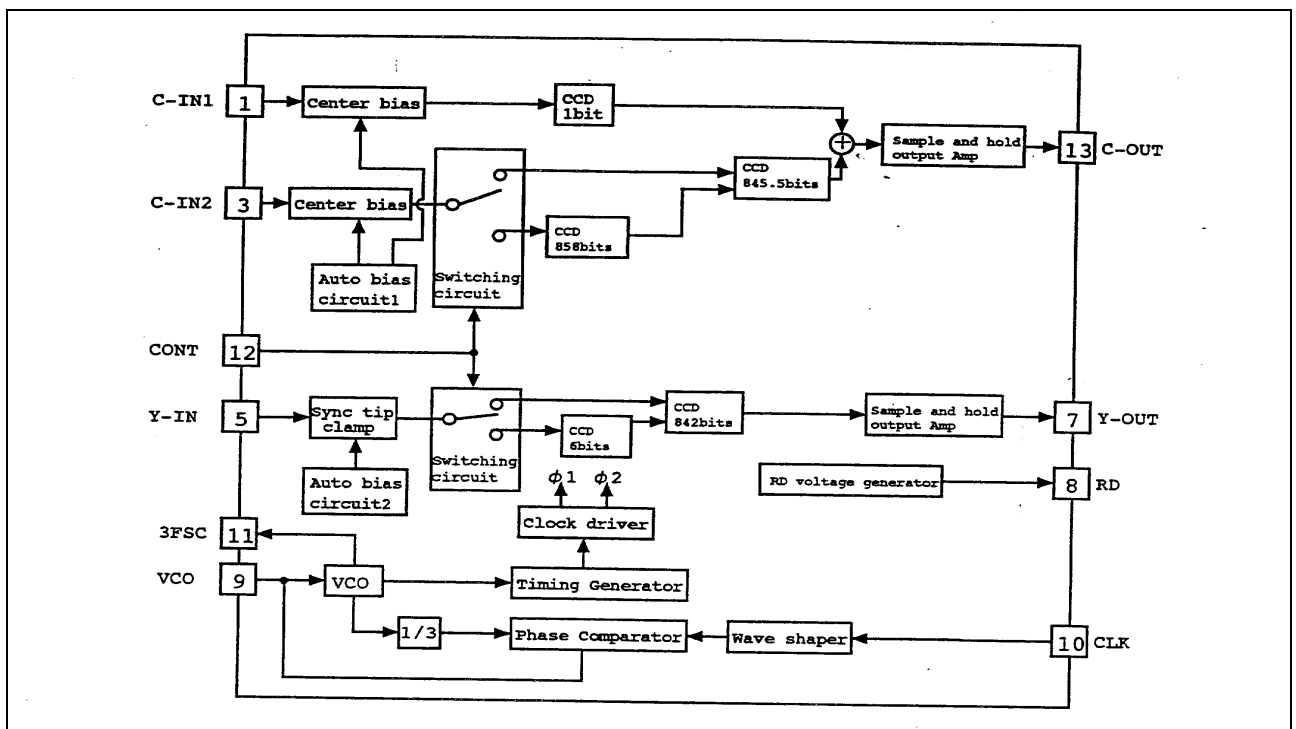

Sample and hold circuit and output Amp.

3fsc clock generator with PLL circuit.

3fsc clock output circuit.

High voltage generator for CCD Reset Drain(RD).

7. CIRCUIT DESCRIPTION

7-1. VISION IF amplifier,afc,video demodulator

The IF signal from the tuner is fed through a SAW filter to the differential IF input (pin 48 and 49). The first IF stage consists of 3AC-coupled amplifiers with a total gain control range of over 66dB. The reference carrier for the video demodulator is obtained by a PLL carrier regenerator(eliminating notch filter compromises,as in reference tuned circuits for passive carrier regeneration). Only an oscillator coil is needed(pin3,4) that can be aligned via IIC bus to the double IF frequency. The AFC information is derived from the VCO control voltage of the IF-PLL and can be read via IIC bus. Bit AFB toggles when the picture carrier is exactly at the desired IF frequency (=half the aligned IF-PLL frequency). AFA is active in a window around this point. For fast search-tuning applications this window can be increased by a factor3 (AFW bit).

7-2. TUNER AGC

The automatic gain control(AGC) circuit operates on top sync level at negative modulated signals or on peak white level at positive modulation, selected by MOD bit.

The tuner AGC is controlled via pin 54.

The tuner AGC take over point (TOP) can be set over a wide range :0.8mVrms - 80mVrms IF input signal amplitude.

The tuner AGC output may have to operate above Vcc of TDA8374.

Therefore pin54 is an open collector output, that can operate from 0.3up to Vcc+1V(at>2mA sink current)

Source select switch

TDA8374 input switch can select one of the following sources;

pin 13 front-end : CVBS1int

pin 17 : CVBS2ext

pin 11,10 : S-VHS Y,C

Selected signal is available at the CVBS output pin38, in case of Y/C input Y+C are added.

It drive teletext and the TDA8395 SECAM add-on.

For S-VHS applications, the Y,C input can be selected, independent of the CVBS source switch.

TDA8374 Y,C inputs are selected,while the source switch outputs CVBS lint or CVBS 2ext on CVBSout.

7-3. Horizontal synchronization and protection

The sync. seperator adapts its slicing level in the middle between top-sync and black level of the CVBS signal. The seperated sync. pulses are fed to the first phase detector and to the coincidence detector.

The Φ -1 loop gain is determined by the components at pin 43 (C+RC).

The coincidence detector detects whether the horizontal line oscillator is synchronized to the incoming video.

The line oscillator is a VCO-type, running at twice the line frequency.

It is calibrated with the X-tal oscillator frequency of the colour decoder and has a maximum deviation of 2% of the nominal frequency, so no alignment is needed.

Calibration is done at start up(the TDA8374 must first know what colour X-tals are connected,bit

XA,XB) after synchronization loss (Φ -1 coincidence detector "Sync Locked" bit SL).

The second phase detector $\Phi -2$ locks the phase of the horizontal drive pulses at output pin 40 to the horizontal flyback pulse at input pin 41.

This compensates for the storage time of the horizontal deflection transistor.

The $\Phi -2$ loop filter (C) is externally connected to pin 42.

The horizontal phase can be given a static off set via IIC bus (HSH "horizontal shift).

A dynamic correction is possible by current feedback into the $\Phi -2$ loop filter capacitor.

To protect the horizontal deflection transistor, the horizontal drive is switched off immediately when a power failure ("Power-On Reset "bit POR) is detected.

The power failure may have corrupted the contents of the internal data registers, so the TDA8374 should be started up again.

The TDA8374 has a separate supply input (pin 37) that only used as a clean supply voltage for the horizontal oscillator circuits.

7-4. Vertical Synchronization

The vertical sawtooth generator drives the vertical output.

It uses an external capacitor at pin51 and a current reference resistor at pin 52.

The TDA8374 vertical drive has differential current outputs for DC-coupled vertical output stage, like the TDA8356.

At TDA8356 input pins1 and pin2 this current is converted into a drive voltage via a resistor.

7-5. Geometry processing

With the TDA8374 is possible to implement automatic geometry alignment, because all parameters are adjusted via the IIC bus.

The deflection processor of the TDA8374 offers the following five controls;

- Horizontal shift
- Vertical slope
- Vertical amplitude
- Vertical s-correction
- Vertical shift

7-6. Colour decoder

The colour decoder contains an alignment-free X-tal oscillator, a dual killer and difference demodulators. Together with the TDA8395 SECAM add-on a multi standard PAL/SECAM/NTSC decoder can be built with automatic recondition.

Which standard can be decoded depends on the external X-tal used.

Two X-tal pins (34 and 36) are present so normally no external switching is required.

The IC must be told which X-tals are connected (bit XA and XB).

This is important, because the X-tal frequency of the colour decoder is also used to calibrate many internal circuit. The burst phase detector locks the X-tal oscillator with the chroma burst signal.

The phase detector operates during the burst key period only, to prevent disturbance of the PLL by the chroma signal. Two gain modes provide:

- Good catching range when the PLL is not locked.
- Low ripple voltage and good noise immunity once the PLL has locked.

The killer circuit switches off the R-Y and B-Y demodulators at very low input signal conditions (chroma burst amplitude).

A hysteresis prevents on/off switching at low, noisy signals.

Colour standard	pin34	pin35	XA	XB
PAL4.43/SECAM+NTSC4.43	none	4.43	1	0
PAL4.43/SECAM+NTSC-M	3.58	4.43	1	1

7-7. Integrated video filters

The TDA8374 has alignment-free internal luminance delay, chroma bandpass and chroma trap. They are implemented as gyrator circuits tuned by tracking to the frequency of the chroma X-tal oscillator. The chroma trap in the Y signal path is by-passed when Y/C input is selected (S-VHS). For SECAM an extra luminance delay is build-in, for correct delay of the luminance signal.

RGB output and black current stabilization

The colour difference signals (R-Y, B-Y) are matrixed with the luminance signal (Y) to obtain the RGBout output signals (pins 19, 20, 21).

In the TDA8374 the matrix type automatically adapts to the decoded standard (NTSC, PAL).

Linear amplifiers are used to interface external RGB in signals (pins 23, 24, 25) from the SCART connector. These signals overrule the internal RGB signals when the data insertion pin 26 (FBI) is switched to a level between 1.0V and 3.0V.

The contrast and brightness control and the peak white limiter operate on both internal and external RGB signals. R, G, B each have their own, independent gain control to compensate for the difference in phosphor efficiencies of the picture tube : so called "white point" adjustment.

The nominal amplitude is about 2V black to white, at nominal input signals and control settings.

TDA8374 has a black current stabilization loop, that automatically adjust the black level to the cut-off voltage of the picture tubes three gun cathodes.

Since no current is following when the voltage the cathode is equal to the cut-off voltage of the tube, the loop stabilizes at a very small gun current.

This "black current" of the three guns is measured internally and compared with a reference current, to adjust the black level of RGBout.

The black level loop is active during 4 lines at the end of the vertical blanking.

In the first line the leakage current is measured (max. acceptable 100 μ A).

In the next three lines the black levels of the three guns are adjusted.

The nominal value of the "black current" is 10 μ A.

The ratio of the "black current" for the 3 guns tracks automatically with the white point adjustment, so the back-ground colour is the same as the adjusted white point.

At switch-on of the TV receiver the black current stabilization circuit is not yet active and RGBout are blanked. Before the first measurement pulses appear, 0.5sec delay ensures that the deflection is active, so the pulses will not be visible on the screen.

During the measuring lines RGBout will supply 4V pulses to the video output stages.

The TDA8374 waits until the black current feedback input (pin18) exceeds $200\mu\text{A}$, which indicates that the picture tube warm-up.

Then the black current stabilization circuit is active.

After a waiting time of about 1.0sec, the blanking of RGBout is released.

7-8. Tuning

The AFC information of the TDA8374 is not available as an analogue voltage.

Automatic following (=frequency tracking, AFC) can be done via the IIC bus by software.

The TDA8374 AFC window is typically 80kHz wide.

This value is made higher than the 62.5kHz tuning step, to prevent an automatic following loop from continuously adapting the tuning frequency.

With this AFC window (40kHz) the maximum tuning error is less than 62.5kHz.

For high speed search-tuning-algorithms, the AFC window can be widened to 240kHz via bit AFW.

7-9. TDA8395 SECAM DECODER

The TDA8395 is an alignment-free SECAM colour decoder, including a cloche filter, demodulator and line identification circuit.

The cloche filter is a gyrator-capacitor type.

Its frequency is calibrated in the vertical retrace period.

The calibration reference(pin1) is obtained from the TDA8374 colour X-tal oscillator.(pin33).

Pin 7 is a decoupling for the cloche reference.

The voltage change at this pin due to leakage currents should be lower than 10mV, during field scan, resulting in a capacitor if minimal 100nF.

Pin 8 is the reference capacitor for the PLL.

The voltage variation during field scan at this pin should be lower than 2mV, resulting in a capacitor of 220nF.

The sandcastle input (pin15) is connected to TDA8374 pin41 and is used for generation of the blanking periods and provides clock information for the identification circuit.

The CVBS source select output (TDA8374 pin38) supplies SECAM chroma to pin 16 of the TDA8395.

This is demodulated by a PLL demodulator, that uses the reference frequency at pin 1 and a bandgap reference to obtain the desired demodulation characteristic.

If the digital line identification in the TDA8395 detects SECAM, pin1 will sink a current of $150\text{B}\bar{\text{A}}$ out of TDA8374 SECAM ref pin33.

When the TDA8374 has not detected PAL or NTSC, will respond by increasing the voltage at pin33 from 1.5V to 5V. Now the TDA8374 colour difference outputs pin30 and 29 are made high-ohmic and the TDA8395 output pin 9 and 10 are switched on.

These outputs will be disconnected and high-ohmic when no SECAM is detected for two frame periods, the decoder will be initialized before trying again.

7-10. Base band delay line TDA4665

TDA4665 is an integrated double baseband delay line of $64\mu\text{s}$.

It couples to the TDA8374 and TDA8395 without any switches or alignments.

The TDA4665 consist of two main blocks :

- Two delay lines of $64\mu\text{s}$ in switched capacitor technique
- Internal clock generation of 3MHz, line locked to the sandcastle pulse.
The TDA4665 operates according to the mode demanded by the colour transmission standard :
 - For PAL it operates as geometric adder to satisfy the PAL demodulation requirements
 - In NTSC mode it reduces cross colour interference (comb-filtering).
 - For SECAM it repeats the colour difference signal on consecutive horizontal scan lines.

A sandcastle pulse is connected to pin 5.

The top pulse voltage (should not exceed 5V) can be directly coupled to the 5V sandcastle output of the TDA8374. The R-Y and B-Y colour difference signals (from TDA8374 pins 30 and 29) are AC-coupled and clamped by the input stages at pins 16 and 14.

An internal 6MHz current controlled oscillator is line locked via a PLL to the sandcastle pulse at pin 11 and 12. This clock drives the delay lines to obtain the required 64B_j .

Sample and hold low pass filters suppress the clock signal.

The original and the delayed signals are added, buffered and fed to the output pins 11 and 12.

These are AC-coupled to the R-Y and B-Y colour difference input pins 32 and 31 of TDA8374.

The TDA4665 needs a 5V supply voltage on pin 1 for the digital part and on pin 9 for the analogue part.

7-11. TDA8356 Vertical deflection.

The TDA8356 is a vertical deflection circuit.

It can be used in 90°C deflection systems with frame frequencies from 50 up to 120Hz.

With its bridge configuration the deflection output can be DC coupled with few external components.

Only a supply voltage for the scan and a second supply for the flyback are needed.

The TDA8356 can drive max. 2A.

The vertical drive currents of TDA8374 pins 47 and 46 are connected to input pins 1, 2 of the TDA8356.

The currents are converted into a voltage by a resistor between pins 1 and 2.

Pin 2 is on a fixed DC level (internal bias voltage) and on pin 1 the drive voltage can be measured (typical 1.8Vp-p).

The drive voltage is amplified by 'A' and fed to two amplifiers 'B' and 'C', one is inverting and the other is a non inverting amplifier.

The outputs (pins 4 and 7) are connected to the series connection of the vertical deflection coil and feedback resistor. The voltage across feedback resistor is fed via pin 9 to correction amplifier 'D', to obtain a deflection current which is proportional to the drive voltage.

The supply voltage for the TDA8356 is 16V at pin 3.

The flyback generator has a separate supply voltage of 45V on pin 6.

The guard pulse is useful to synchronize OSD.

7-12. Horizontal deflection

The circuit contains H drive, line output transformer.

The H drive pulses from the TDA8374 are amplified in the horizontal drive circuit, to get sufficient base drive current for the high voltage switching transistor Q402.

During the horizontal scan period ($=52\mu\text{s}$) Q402 will conduct, and a sawtooth current flows from +123V through the primary winding of the FBT to ground.

After this time Q402 is switched-off and the energy stored in the FBT during the scan period will be transformed to the flyback capacitor C406, C416.

This energy transfer will take place in a cosine shape because the primary of the FBT and C406, 416 form a resonant circuit.

The time the energy is transferred from FBT to C406,416 and back to the FBT, is called the flyback time and will take place in about $12\mu\text{s}$.

The flyback peak voltage is about 8 times the scan voltage.

In series with the horizontal deflection coil there is a (damped) linearity corrector coil.

During the scan there is some loss in the resistance of the deflection coil.

In the first part of a line the linearity corrector stores some energy in a permanent magnet until it is saturated.

This improves the linearity of the horizontal scan speed.

The required S-correction for the picture tube can be adjusted with the value of C415.

The beam current limiting information is derived from the foot of the H.V winding of the FBT.

This is connected via resistor to +8V.

As the beam current increases, the voltage on line beam current decreases.

Beam current is damped by an integration filter before it is fed back to TDA8374 pin 22.

The TDA8374 will decrease the contrast (and eventually the brightness) to limit the average beam current.

7-13. Video amplifiers

Three TDA6106Q integrated video amplifiers drive cathode of the picture tube directly.

They are protected against CRT flashover discharges and ESD (electro static discharge).

The three video amplifiers, have a beam current output I black, used by the TDA8374 black current loop to control the black level on the cathodes.

The outputs can be connected together because the black current loop sequentially controls the black level for each cathode.

The amplification of the TDA6106Q is set by the resistors between pin 3 and 9 and between pin 3 (negative-input) and the TDA8374 output.

There are no alignment any more on the CPT panel, because of the automatic black current stabilization and because the white point adjustment can be done in the TDA8374 via IIC bus.

7-14. Power supply STR-S5707

1. Vin terminal, start-up circuit

A start-up circuit is to start and stop a operation of a control IC by detecting a voltage appearing at a Vin terminal (pin 9). At start up of a power supply, when a voltage at the Vin terminal reaches to 8V (typical) by charging up C817 by the function of a start-up resistor, R804, a control circuit starts operating by the function of the start-up circuit. After the control circuit starts its operation, power source is obtained by smoothing voltage appearing at winding of pin 6,7 of T801.

2. Oscillator,F/B terminal voltage (pin 7)

A oscillator generates pulse signals which turns a power transistor on and off by making use of charge and discharge of C1 and C2 incorporated in the Hybrid IC.

Constant voltage control of a switch-mode power supply is performed by changing both on-time and off-time except when the load is light (ex. remote control stand-by mode of TVs).

The on-time is controlled by changing a current charged by C1, which is as the result of that the detection winding of pin 5-7 of T801, which detects a change of voltage in a secondary side, connected to the sensing terminal (pin 7). has the current in accordance with an output signal from an output voltage detection circuit (an error amplifier) built in.

As an AC input voltage to the power supply gets the higher and a load current the smaller, the current flowing to the SENS terminal gets the larger, and the on-time gets the shorter.

3. Function of INH terminal (pin 6), control of off-time

Signal to the INH terminal is used as inputs to COMP.1 and COMP.2 inside of the control IC.

A threshold voltage of COMP.1, VTH1 is set at 0.75V (Ta=25°C) and an input signal to a drive circuit becomes almost 0V (the power transistor is in OFF mode) when a voltage at the INH terminal reaches the VTH1.

A threshold voltage of COMP.2, VTH2, is set at 1.5V (Ta=25°C).

When the INH terminal voltage reaches VTH2, an output from COMP.2 reverses (the power TR is in on mode).

※ Quasi-resonant operation

By inputting the voltage of winding of pin 6-7 of T801 which is synchronized with the energy discharge time of a secondary winding to the INH terminal through D810 and R808, quasi-resonant operation can be achieved.

When the power transistor turns off and a voltage higher than VTH2 is applied to the INH terminal, C3 immediately discharges and then starts charging again.

Even after the discharge of energy of a secondary winding is completed, VINH does not immediately increases. when it gets lower than VTH1, the transistor turns on.

4. Drive circuit

The STR-S5707 applies the proportional drive system in order to minimize turn-on and saturation loss, and storage time.

5. OCP function

Over-current protection is performed pulse by pulse by directly detecting collector current of the power transistor. detecting voltage is set to -1V below a reference point of GND (ground).

6. Latch circuit which sustains an output from the oscillator low and stops operation of the power supply when over-voltage protection (OVP) circuit and thermal shutdown (TSD) circuit are in operation.

As the sustaining current of the latch circuit is 500 μ A maximum when Vin terminal voltage is 4V,

the power supply circuit sustains the off state as long as current of $500\mu\text{A}$ minimum flows to V_{in} terminal from a start up resistor.

In order to prevent a malfunction to be caused by a noise and so on, delay time is provided by C1 incorporated in the IC and, therefore, the latch circuit operates when the OVP or TSD circuit is in operation, or an external signal input is provided for about $10\mu\text{s}$ or longer.

In addition, even after the latch circuit start operating, the constant voltage regulator circuit is in operation and the circuit current is at high level.

As a result, V_{in} terminal voltage rapidly decreases.

When V_{in} terminal voltage becomes lower than the shutdown voltage, $V_{IN}(\text{OFF})$ (4.9V typical), it starts increasing as the circuit current is below $500\mu\text{A}$.

When it reaches the ON-state voltage, $V_{IN}(\text{ON})$ (8V typical), V_{in} terminal voltage starts decreasing because the circuit current increases again.

When the latch circuit is on, V_{in} terminal voltage increases and decreases within the range from 4.9V typical to 8V typical and is prevented from abnormally rising.

Calibration of the latch is done by decreasing V_{in} terminal voltage below 3.3V.

The power supply can be restarted after disconnecting an AC input to the power supply once.

7. Thermal shutdown circuit

It is a circuit to trigger the latch circuit when the frame temperature of the IC exceeds 150°C (typical).

Although the temperature is actually sensed at the control chip, it works against overheating of the power transistor as the power transistor and the control IC are mounted on the same lead frame.

8. Over-voltage protection circuit

It is a circuit to trigger the latch circuit when V_{in} terminal voltage exceeds 11V (typical).

Although it basically functions as protections as protection of V_{in} terminal against over-voltage, since V_{in} terminal is usually supplied from the drive winding of the transformer and the voltage is proportional to the output voltage, it also functions against the over-voltage of secondary output which causes when the control circuit opens or in some other events.

7-15. Stand-by Mode TOP210

This IC(TOP210) is used for low-power consumption when receiver is operating in stand-by mode.

1. DRAIN PIN (pin5)

Output MOSFET drain connection. Provides internal bias current during start-up operation via an internal switched high voltage current source. Internal current sense point.

2. CONTROL PIN (pin4)

Error amplifier and feedback current input pin for duty cycle control.

Internal bias current during normal operation.

It is also used as the supply bypass and auto-restart/compensation capacitor connection point.

Service Manual

(Revision-1)

Television-VCR Combo

CHASSIS : CP-420

**ADDED MODEL: DVT-14F7 LA/PA/FA
DVT-14F9 LA/PA/FA
DVT-20F7 LA/PA/FA
DVT-20F9 LA/PA/FA
DVT-21F1 LA/PA/FA
DVT-21F2 LA/PA/FA**

Subject : Tuner change & New model

Please file and use this Revision-1 for the CP-420 chassis with the basic service manual.

Distinguishing method between New Tuner and Old one

If this frame is gray color (old : black),
then the New Tuner (S/N:4859719730) is used.

CAUTION

- 2 Tuners (Old:4859717030, New:4859719730) are not interchangeable.
Each tuner should be replaced with the same one.
- But Main PCB Assy (Old & New) are interchangeable by itself.

CP-420 Different Parts List for Tuner Change

* CAUTION : 2 TUNERS(4859717030 & 4859719730) ARE NOT INTERCHANGABLE!
