II. MEASURING METHOD

TAPE SPEED DEVIATION

1. Method involving use of pre-recorded tape.

Playback on the tape recorder to be tested tape pre-recorded at 1,000 cps $\pm 0.1\%$ for measuring tape speed deviation. Connect the appropriate output to a frequency counter meter in order to measure the tape speed deviation from the resulting deviation of the measured frequency.

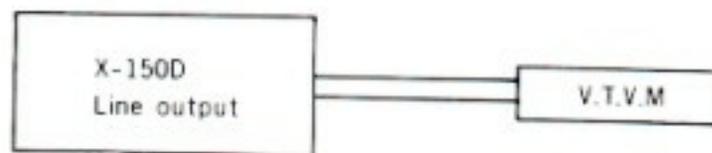

2. Method involving use of timing tape (designed for tape speed measurement).

This method utilizes a timing tape marked at intervals of $7\frac{1}{2}''$. The running time of the tape over 60 marked section is measured in order to calculate the deviation of the tape speed. In application of this method, however, it should be borne in mind that should the timing tape stretch or contract, measurement error is inevitable, so that it is necessary to measure the total length of the tape in advance.

WOW AND FLUTTER

Playback the 3,000 cps pre-recorded tape whose wow and flutter level is guaranteed to be smaller than 0.07% for measurement by means of a wow meter. It is also possible for a 3,000 cps sine wave to be recorded and played for measurement by means of the wow meter. In this case, however, the wow meter indicates a value as much as twice the value given in the specification on the first page.

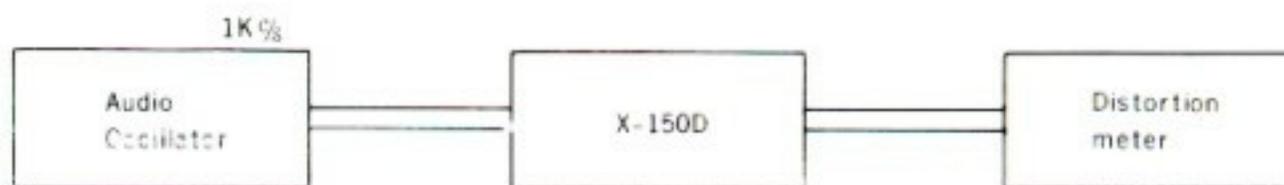

SIGNAL TO NOISE RATIO

Set the Equalizer Switch on " $7\frac{1}{2}$ ips" position and playback a tape containing a 1,000 cps sine wave recorded at "0" VU level on a standard recorder. Connect a V.T.V.M. to the line output jack of the recorder and measure its output.

Then remove the tape and measure the noise level under the same condition. Convert into decibels each of the measured values.

TOTAL HARMONIC DISTORTION FACTOR

Connect the measuring instrument as shown above, and record the 1,000 cps sine wave at "0" VU. Playback the resultant signal and measure the overall distortion factor. Measure the noise level of the tape recorder with the tape removed: connect the audio oscillator directly to the distortion meter for measurement of the distortion factor of the oscillator.

The required distortion factor may be obtained from the results of the above measurement by the following formula.

$$d_0 = d - d_1 - d_2$$

where, d_0 = Required

d = Overall distortion factor

d_1 = Noise level

d_2 = Distortion factor of the oscillator

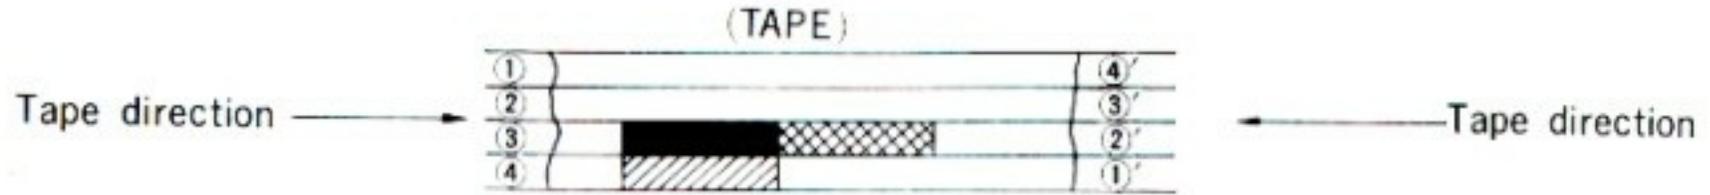

(Note: New tape of particularly good quality should be used for measurement of the distortion factor).

POWER OUTPUT

Playback a tape containing a sine wave of 1,000 cps recorded at 0 VU on a standard recorder.

Connect a V.T.V.M. to the line output jack of the recorder and measure the voltage at the output of the recorder to be tested.

CROSS TALK (Cross talk between the tracks)

As shown in the figure, first record a 1,000 cps sine wave on track No. 3 at +3 VU level. Next, remove the 1,000 cps input signal and record under a non-input condition.

Then, playback the tape on track No. 3 and No. 1 (reversed condition of tape) through the 1,000 cps B.P.F. (Band Pass Filter, Sensitivity...1:1) and obtain a ratio between the two from the following formula.

$$C = 20 \log \frac{E_0}{E_2 - E_1} \text{ (db)}$$

{

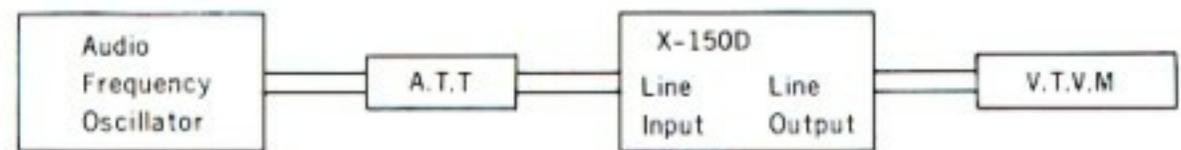

C = Desired cross talk ratio (db)

E_0 = 1,000 cps signal output level

E_2 = 1,000 cps cross talk output level

E_1 = No-input signal record level

FREQUENCY RESPONSE

Connect the measuring instrument as in the above diagram, and measure the frequency response in the following sequence :

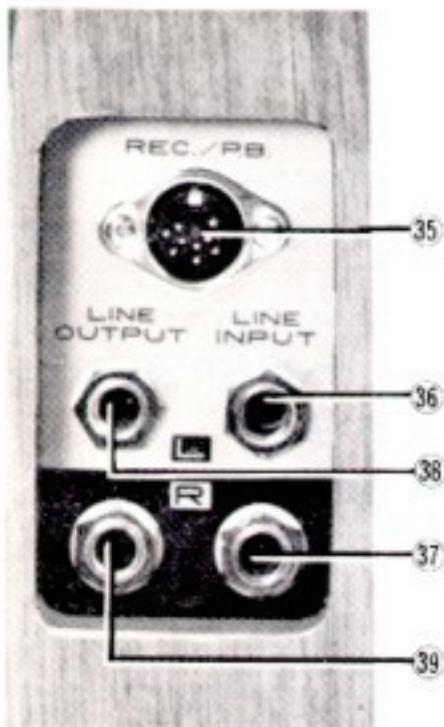

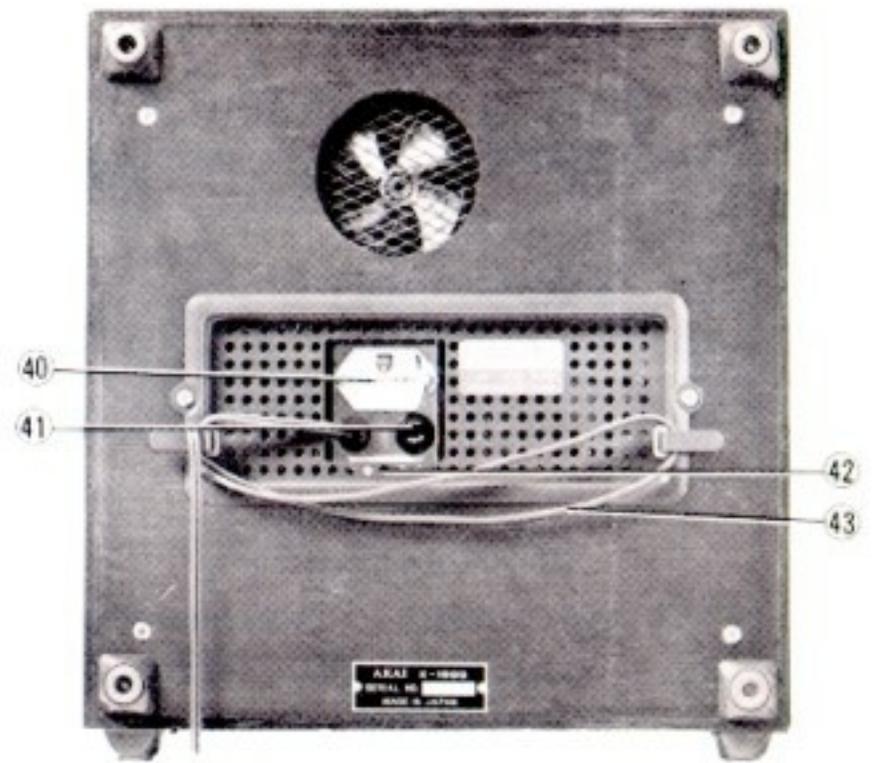

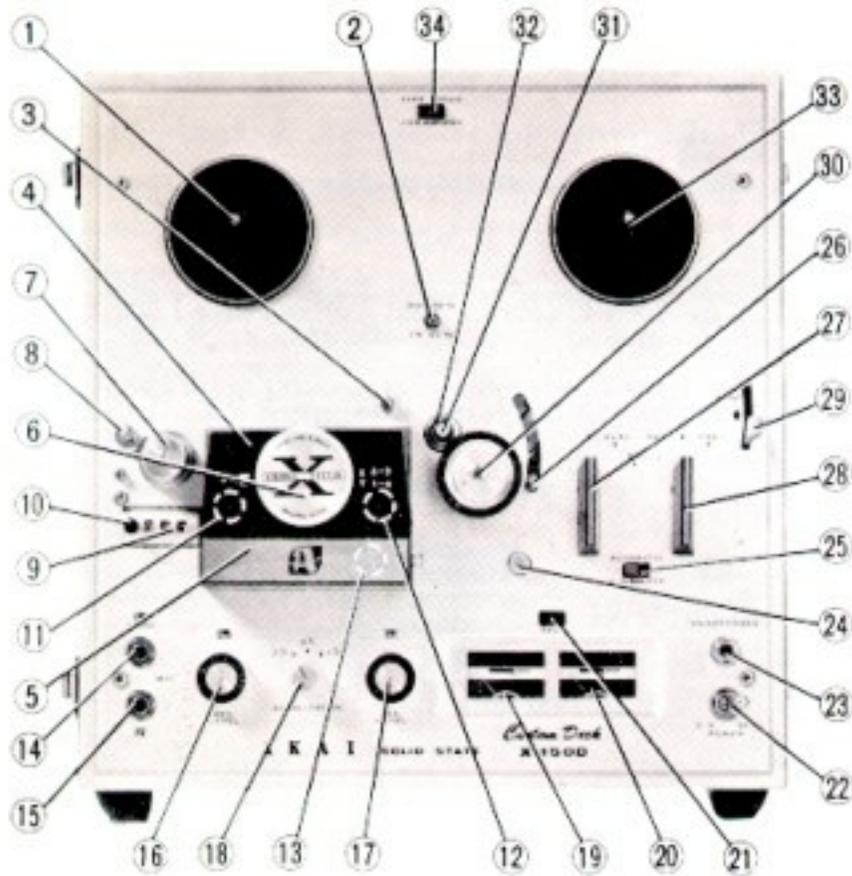

RECORD :

- 1) Give a sine wave of 1,000 cps to the Line Input of the recorder to be tested through an attenuator from an audio frequency generator.
- 2) Set the Record/Playback Knob in to "Rec" position and adjust the line input volume so that the VU meter needle indicates "0" VU.
- 3) Under the condition described in (2), lower the input level 10 db by means of the attenuator.
- 4) Record the spot frequency in the range of 30 cps to 25,000 cps from the audio frequency generator.

PLAYBACK :

- 5) Set the Record/Playback Knob in to "Play" position.
- 6) Set the Equalizer Switch on 7-1/2" or 3-3/4" position.
- 7) Connect a V.T.V.M. to the Line output.
- 8) Playback the tape previously recorded.
- 9) Adjust the output level to "0" dbm at 1,000 cps as indicated on the V.T.V.M. by the range selector of a V.T.V.M.
- 10) Playback the recorded spot frequencies with the conditions in (9); make a memo of output level and plot the value on a graph.

IV. DISASSEMBLY OF TAPE TRANSPORT UNIT & AMPLIFIERS

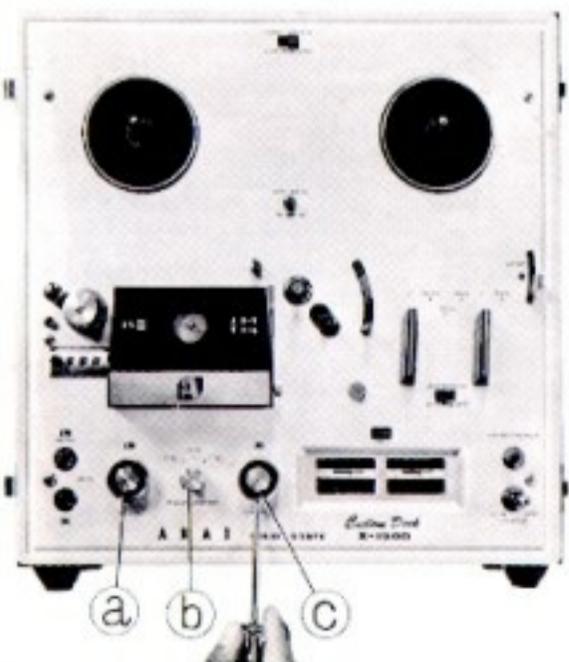

- (1) Loosen the RETAINING SCREW (a) of PINCH WHEEL (b) using a phillips-headed screw driver and remove the PINCH WHEEL by hand.

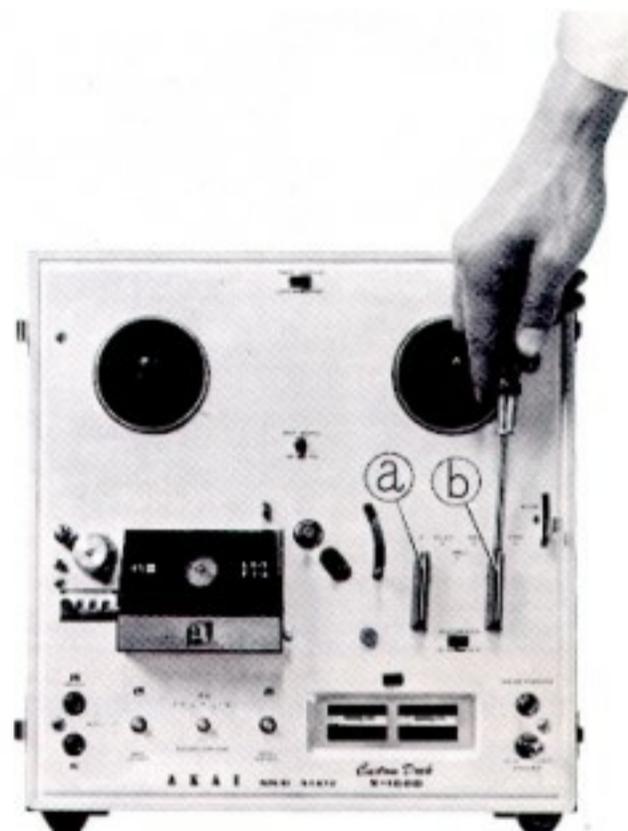

- (2) Loosen the RETAINING SCREW (a) of the TRACK SELECTOR KNOB (b) using a phillips-headed screw driver and remove the TRACK SELECTOR KNOB by hand.

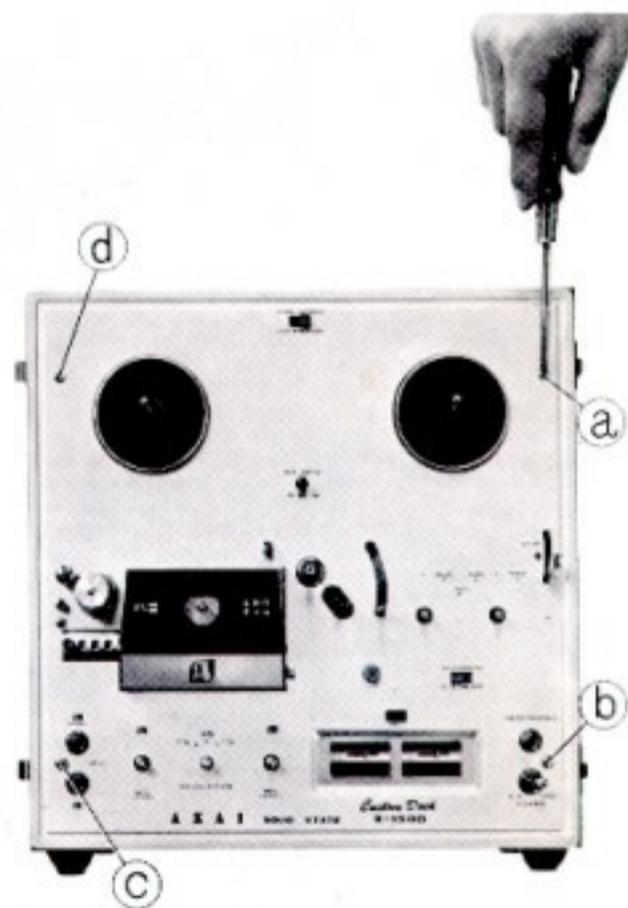

- (3) Loosen the RETAINING SCREWS of the KNOBS (a, b and c) by using a minus-headed screw driver and remove the KNOBS by hand.

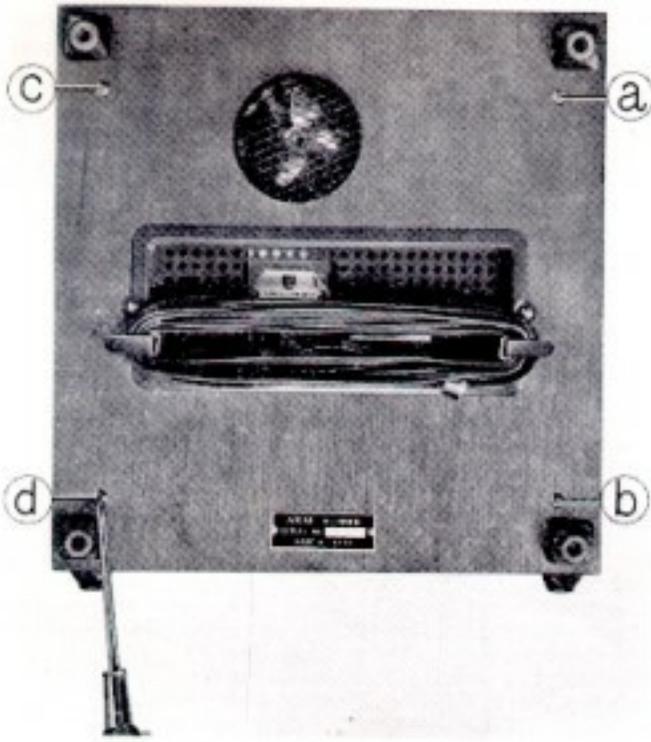

- (4) Loosen the RETAINING SCREWS of the DECK CONTROL KNOBS (a) and (b) by using a phillips-headed screw driver and remove the KNOBS by hand.

- (5) Loosen the SCREWS (marked from a to d) by using a phillips-headed screw driver and remove the DECK PANEL by hand.

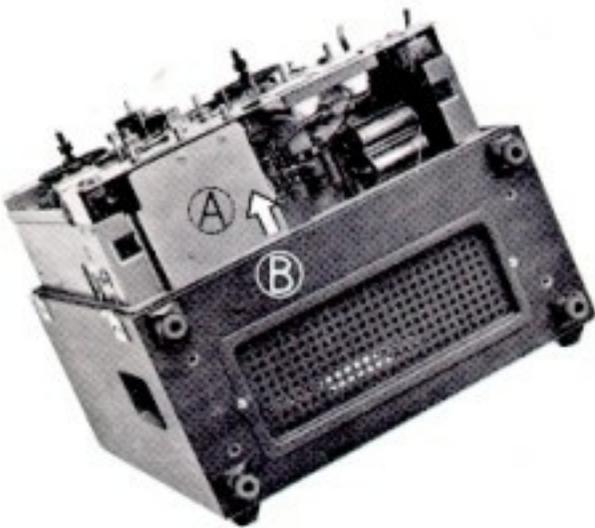

(6) Loosen the SCREWS (marked from ① to ④) by using a phillips-headed screw driver.

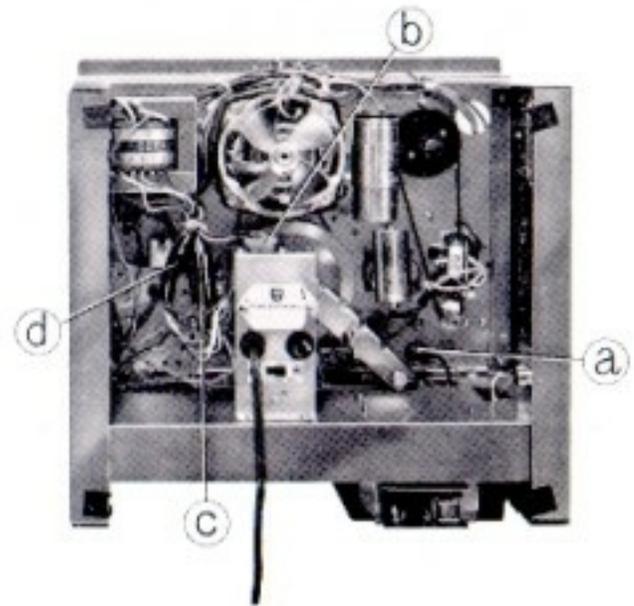

(7) Loosen the SCREWS (marked from ① to ④) by using a phillips-headed screw driver.

(8) Remove the TAPE TRANSPORT MECHANISM ASSEMBLY and AMPLIFIER ASSEMBLY ① by slowly lifting it from the CASE ② as shown in picture.

(9) Disconnect the PLUGS (marked ① to ④) carefully by hand.

(10) Loosen the SCREWS (marked from ① to ④) of the DECK FRAME by using a phillips-headed screw driver.

(11) Separate the TAPE TRANSPORT MECHANISM ASSEMBLY ① from AMPLIFIER ASSEMBLY ② carefully by hand.

V. TRANSPORT MECHANISM

Driving of Capstan

Figure 1.

- Ⓐ Motor
- Ⓑ Driving Belt (flat belt)
- Ⓒ Capstan
- Ⓓ Flywheel

High-speed rotation of *Motor* Ⓐ is reduced by *Driving Belt* Ⓑ and transmitted to *Capstan* Ⓒ, which is connected of flywheel with ample inertia and enables rated rotation by absorbing minor rotation distortion of motor itself.

Capstan Rotation :

- 606 R.P.M. at $7\frac{1}{2}^{\circ}$ (19 cm) per sec.
- 303 R.P.M. at $3\frac{3}{4}^{\circ}$ (9.5 cm) per sec.
- 151.5 R.P.M. at $1\frac{7}{8}^{\circ}$ (4.75 cm) per sec.

Motor Rotation :

- 3,000 to 1,500 R.P.M. at 50 cps.
- 3,600 to 1,800 R.P.M. at 60 cps.

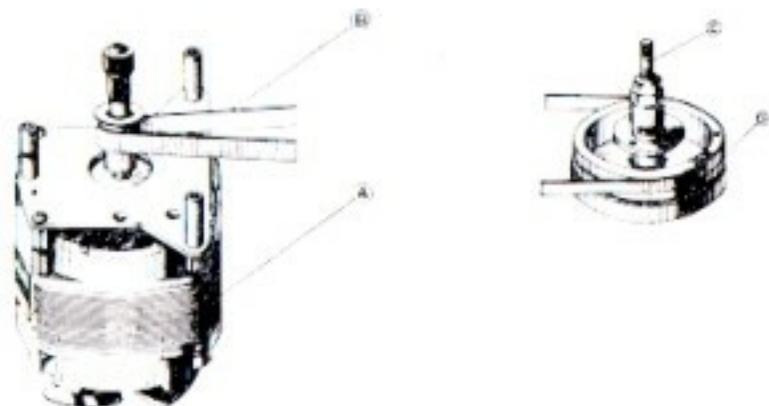

Fig. 1

Driving of Pinch Wheel

Put tape between rotating capstan and pinch wheel and push pinch wheel against capstan, this will transport the tape at rated speed. The appropriate pressure of pinch wheel is between 1,000 to 1,150 grams at the tape speed of $7\frac{1}{2}^{\circ}$ (19 cm) per second.

Recording and Playback

Turn the *RECORD/PLAYBACK KNOB* Ⓐ to "PLAY" position, and pinch wheel presses against capstan to move tape at the rated speed. At the same time, *Idler* Ⓑ moves between *Motor Bushing* Ⓒ and the *Take-Up Reel Spindle* Ⓓ to transmit the motor rotation to Ⓓ so that the tape is moved and wound on the take-up reel.

The Take-up Reel Spindle Base is made up of two plastic rollers (1 and 2) with a clutch felt in between. The Idler is rotating the plastic roller 2 under. Therefore, the tape-winding friction is adjusted by the slipping of the felt to enable rated winding of the tape.

On the other hand, the *Supply Reel Spindle* Ⓔ has a *Brake Roller* Ⓕ hung on the Plastic Roller 4 under which provides appropriate back tension by the clutch felt slipping to the rotation of the Pulley 3 above.

To prevent accidental erasure, the *Record Interlock Button* Ⓖ must be depressed before the *RECORD/PLAYBACK KNOB* can be moved to the "REC" position. The *Safety device* Ⓖ is depressed to enter the record mode.

(See figure 2)

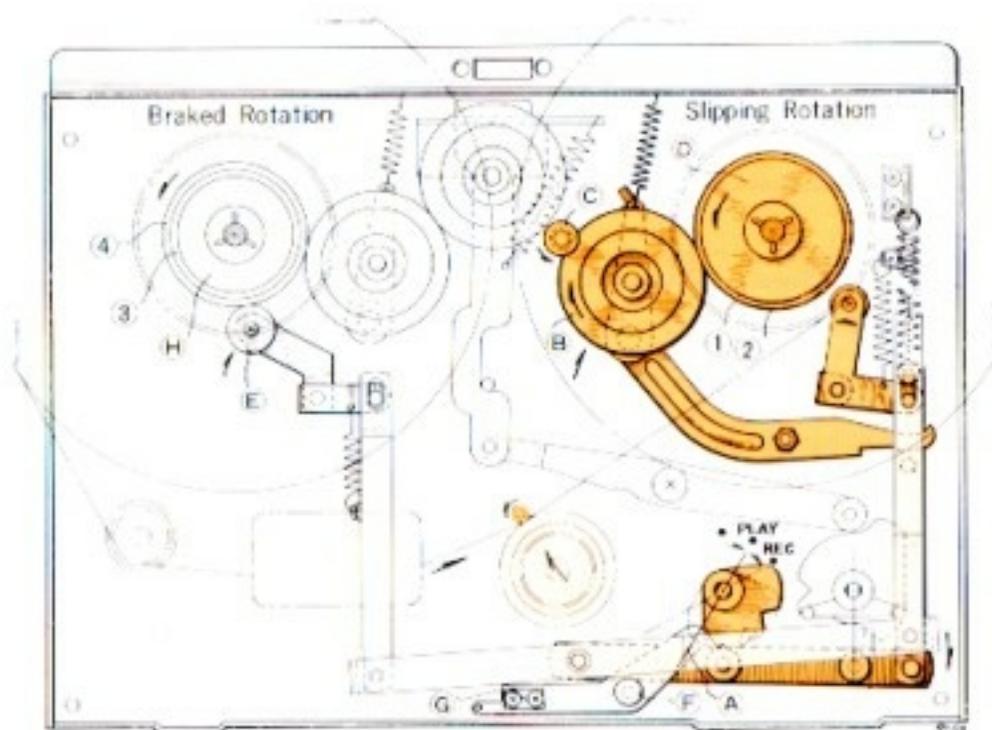

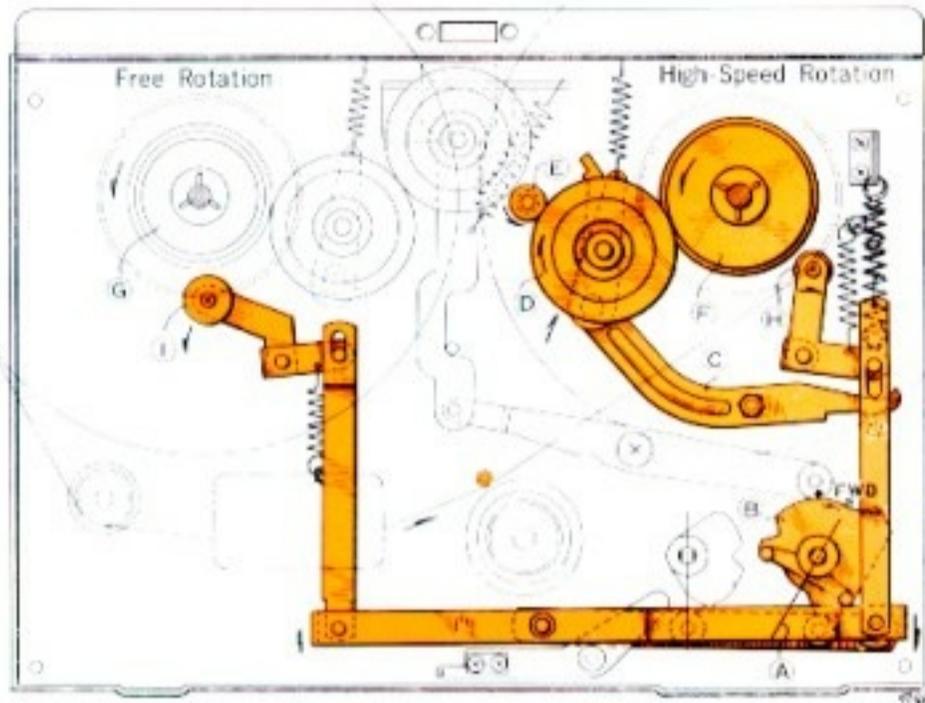

Fig. 2

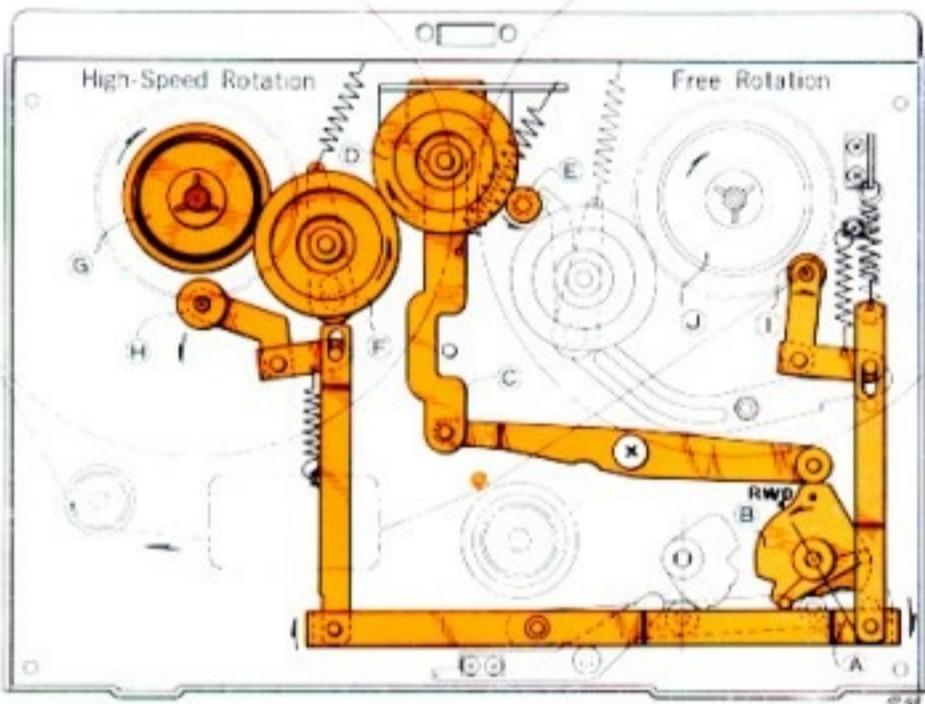

FAST-FORWARD MECHANISM

Turn the *FAST FWD-REWIND knob* (A) to "FAST FWD" position, and the *cam* (B) under the knob pushes up the *Lever* (C). The *Idler* (I) moves into the space between the *Plastic Roller* (F) above the *Take-Up Reel Spindle* and the upper part of the rotating motor drive bushing to transmit the motor rotation to the take-up reel spindle. At the same time, *Brake Rollers* (H) and (G) come off the reel spindle to free the *Supply Reel Spindle* (G), thereby allowing fast winding of the tape onto the take-up reel.

(See figure 3)

Fig. 3

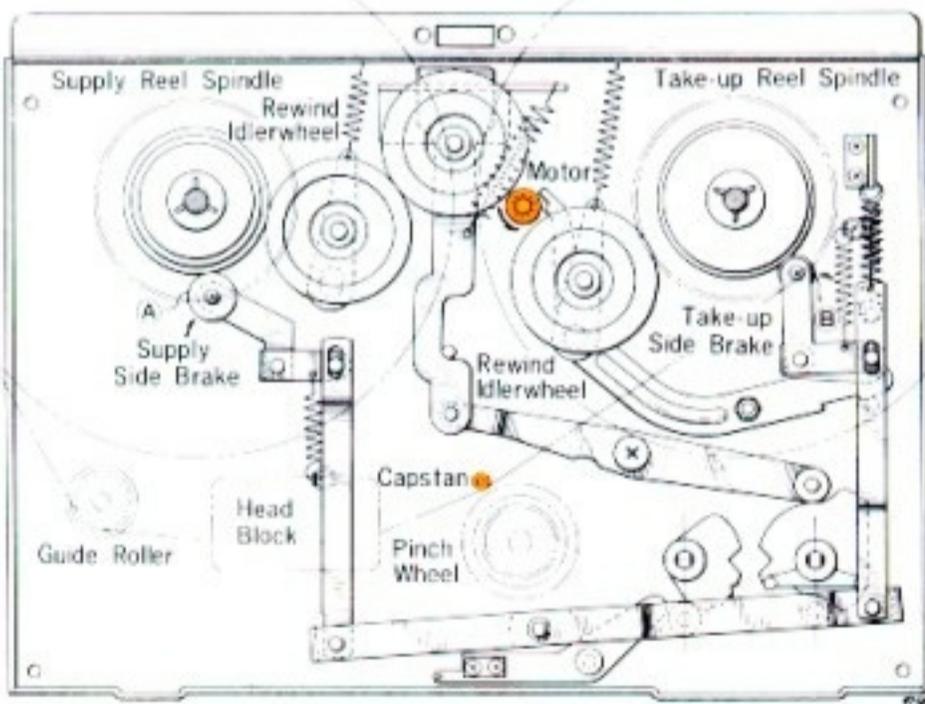

REWIND MECHANISM

Turn the *FAST FWD-REWIND knob* (A) to "REWIND" position, and the *cam* (B) under the knob pushes the *Lever* (C) up. The *Idler* (I) moves into the space between the upper part of the rotating *Motor drive bushing* (E) and the *Intermediate Pulley* (F) to transmit the high-speed rotation of the motor through the intermediate pulley to the *Supply Reel Spindle* (G). At the same time, *Brake Rollers* (H) and (G) come off the reel spindle to free the *take-up reel spindle* (D), thereby rewinding the tape into the supply reel at a fast speed.

(See figure 4)

Fig. 4

STOP CONTROL

Push the stop lever to "STOP" position, *Brake Rollers* (A) and (B) depress reel spindles to stop rotation of the reel spindles.

As the brake rubber depresses the plastic rollers under the reel spindles, no friction works on the tape itself.

RECORD/PLAYBACK CHANGING MECHANISM

By turning the RECORD/PLAYBACK KNOB ⑧ to the recording position, the LEVER ⑩ pushes the RECORDING LEVER ⑥ and ⑦, as illustrated in dotted line, then the RECORD/PLAYBACK CHANGING SWITCH (SWI) turns to recording position.

If the LEVER ⑥ does not push the LEVER ⑦ properly, the SWI does not operate properly so may occur the abnormal oscillation and also can't record.

Then must adjust the LEVER ⑥ to proper position by loosening the SCREW ④.

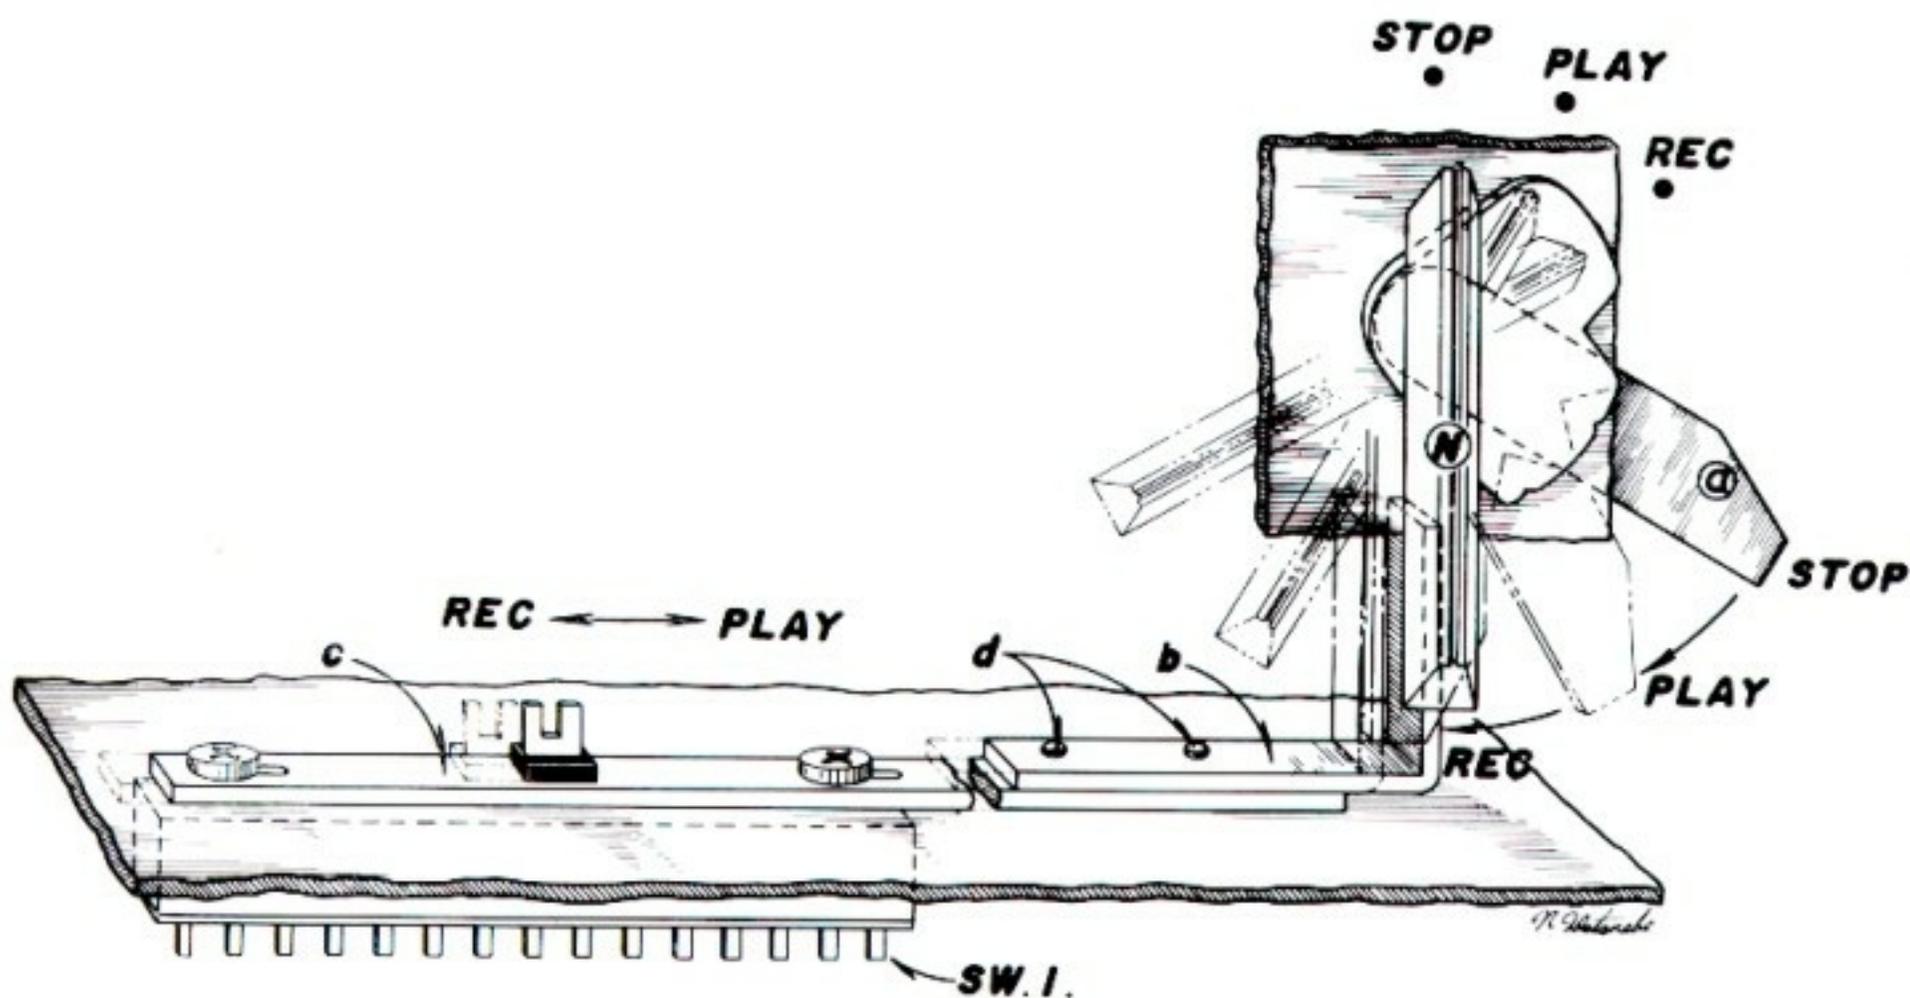

Fig. 6

VI. MECHANISM ADJUSTMENT

1. ADJUSTMENT OF PINCH WHEEL

It is important that the pinch wheel shaft is kept in complete alignment with the capstan shaft. A proper pinch wheel pressure is between 1,000 and 1,150 grams when the unit is operated at the tape speed of 7-1/2 ips. Any deviation from this specification will result in wow and flutter. Check pinch wheel pressure by a spring scale, and if necessary, adjust the pinch wheel load spring.

2. ADJUSTMENT OF TAKE-UP IDLER WHEEL

The take-up idler wheel must be kept in complete alignment with the take-up reel shaft. When the unit is set in fast forward condition, the idler wheel will contact to the upper knurled wheel of the take-up reel shaft assembly, and it will contact to the lower knurled wheel during record or play mode. Adjust idler wheel load spring so that the idler wheel pressure is kept between 50 and 80 grams. The idler wheel rapidly wears if the pressure is excessive. The slippage occurs if the pressure is smaller than the specification.

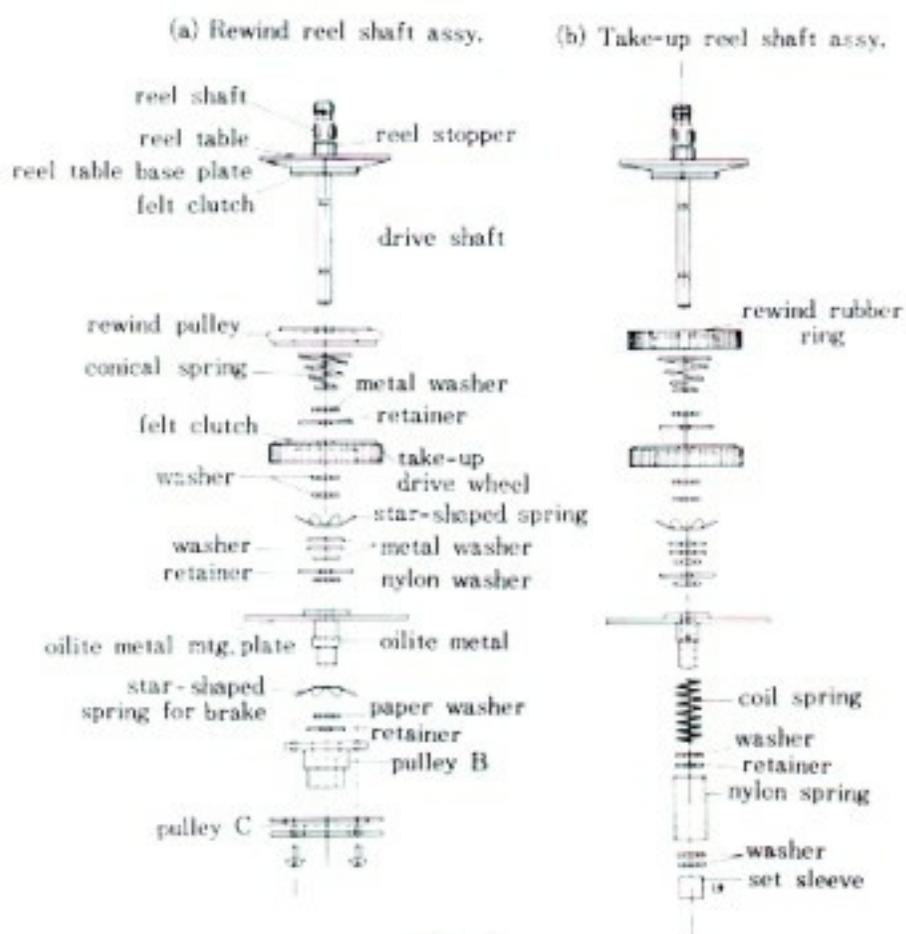

Fig. 1

3. ADJUSTMENT OF REWIND IDLER WHEEL

The rewind idler wheel must be kept in complete alignment with the rewind reel shaft. The amount of pressure to the knurled motor bushing should be maintained about 50 grams during rewind operation. Adjust both the idler load spring and rewind roller.

4. ADJUSTMENT OF INTERMEDIATE WHEEL

The intermediate wheel is located between the rewind idler wheel and the rubber ring which is used on the upper part of the supply reel shaft assembly. When the unit is set in rewind mode, it will contact to these parts simultaneously delivering torque of motor. An adequate pressure is 50 grams. Adjust the load spring of the intermediate wheel if the pressure is not sufficient.

5. ADJUSTMENT OF TAKE-UP REEL SHAFT ASSEMBLY

A felt clutch material is attached to the bottom side of the reel table base plate so that recording tape will not be stretched during fast forwarding operation due to excessive tension. To check the amount of friction of this part, place a 5-inch reel with recording tape wound by 60 m/m in diameter, and gently pull the end of tape upward using a spring scale. Adjust the conical spring so that the amount of tension at this part will be kept between 400 to 500 grams. Another felt clutch material is attached to the take-up drive wheel. It is to provide proper slipping operation during record or play mode. The procedure for checking friction of this part is same as the foregoing, and between 150 and 200 grams of friction will provide the best result. Adjust the star-shaped spring just under the take-up drive wheel. When the unit is set in rewind mode, the amount of friction of this part will greatly be reduced and will become 15 to 20 grams. Check to see whether this is satisfactory if not, readjust the star-shaped spring for Brake, and spring retainer washed accordingly. (See figure 1 (b) at left)

6. ADJUSTMENT OF SUPPLY REEL SHAFT ASSEMBLY

A felt clutch material is used between the lower side of the reel table base plate and the rewind rubber ring to protect recording tape from an excessive tension while rewinding operation. To check the amount of friction of this part, place onto the supply reel table a 5-inch reel with recording tape wound by 60 m/m in diameter and gently pull the end of tape upward by a spring scale. Adjust the conical spring so that the amount of tension is kept between 400 and 500 grams. Another felt clutch is attached to the rewind drive wheel to provide proper slipping operation during record or play mode. The procedure for checking friction of this part is same as the foregoing, and between 80 and 120 grams of friction will give the best result. When the unit is set in fast forward mode, the amount of friction will greatly be reduced and will become 15 to 20 grams.

Check to see whether this is proper, if not, readjust coil spring and spring retainer washer. (See figure 1 (a) at left)

7. ADJUSTMENT OF HEAD

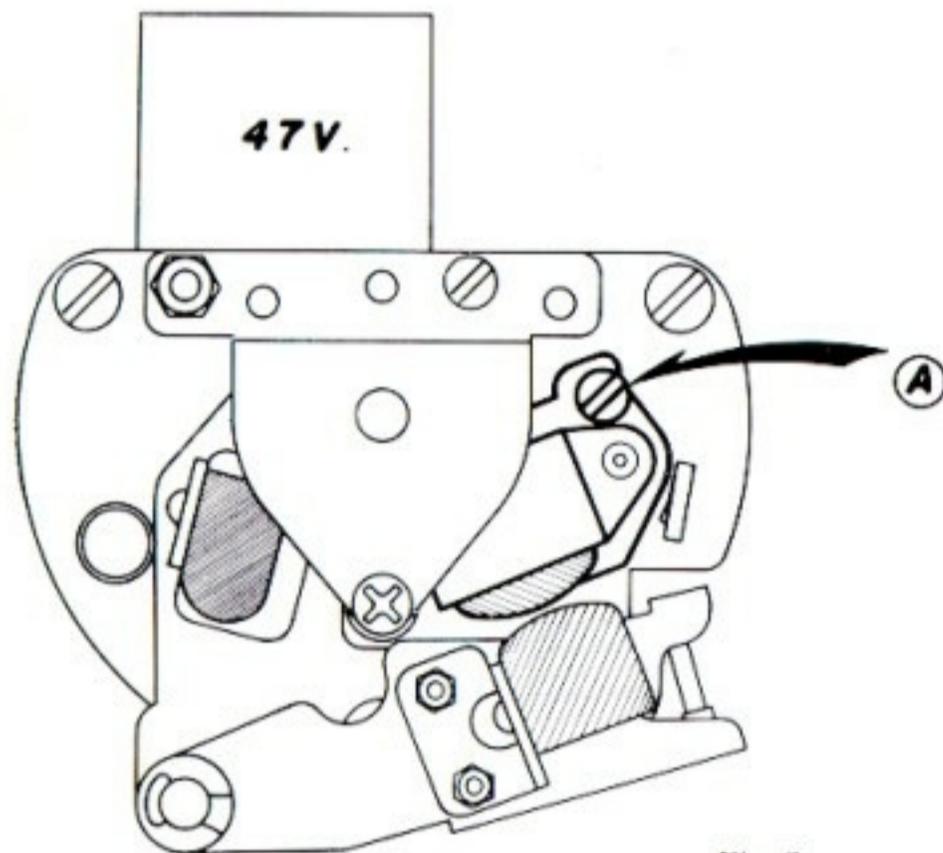

Fig. 2

- a) Playback 8,000 cps recorded tape and set the azimuth alignment of the Recording/Playback Head by turning the screw ① until the voltage of the Line Output or the VU meter reads at a maximum.
- b) Adjustment of Head Level.

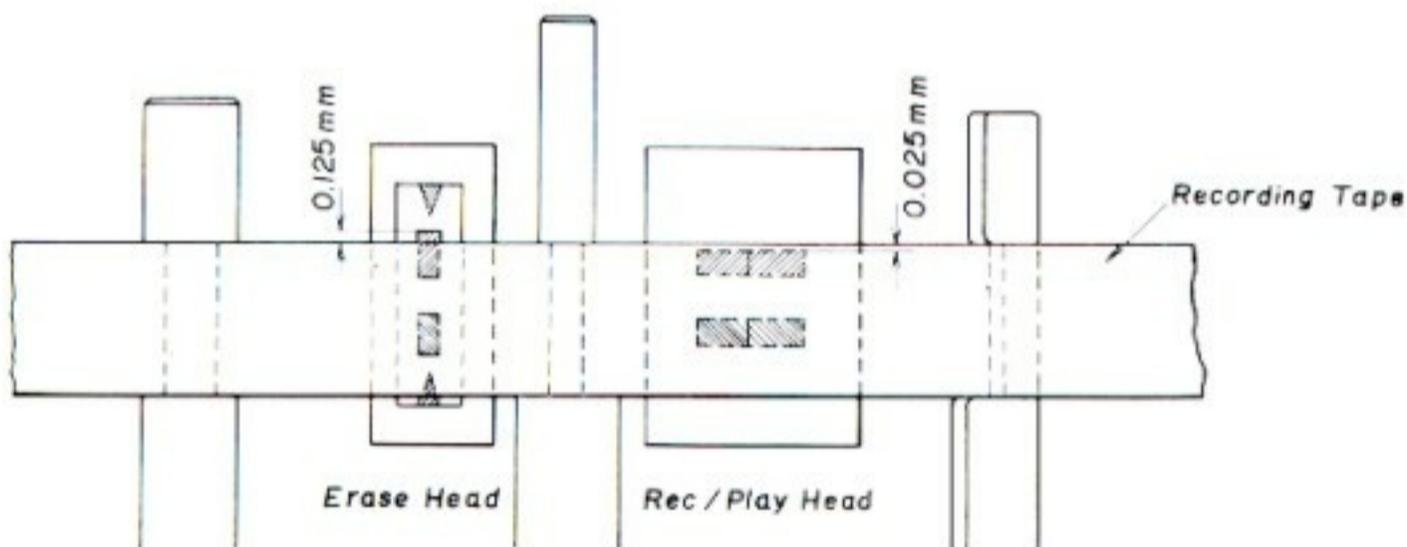

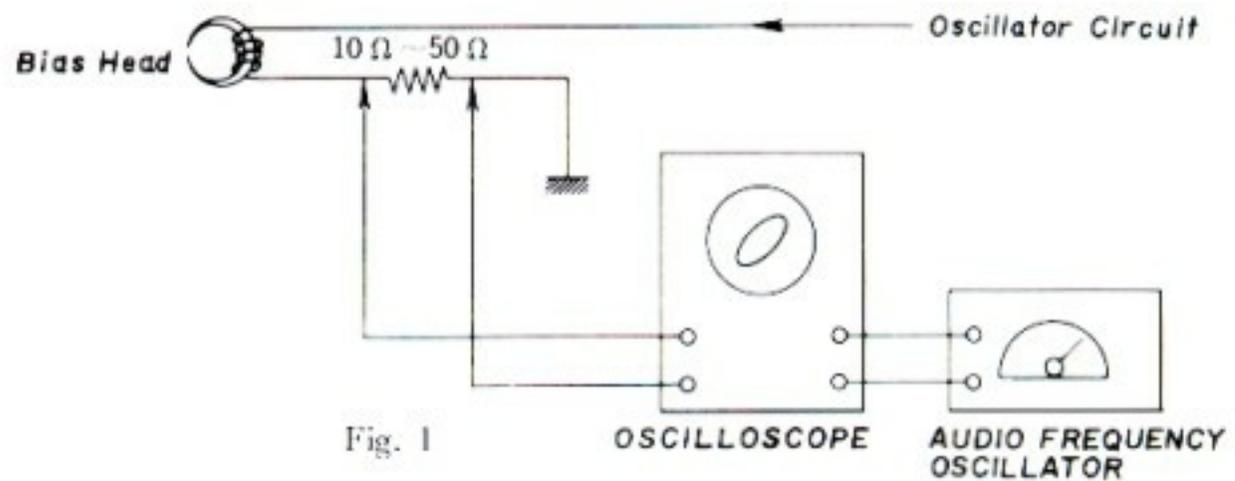

Fig. 3

- ① Position the Erase Head about 0.125 mm above the upper edge of the tape by adjusting the height of the cam provided in the lower part of the head assembly.
- ② Adjust the position of the Recording/Playback Head in a manner illustrated in figure 3 by adjusting the level control nut ① at the lower part of the head assembly.

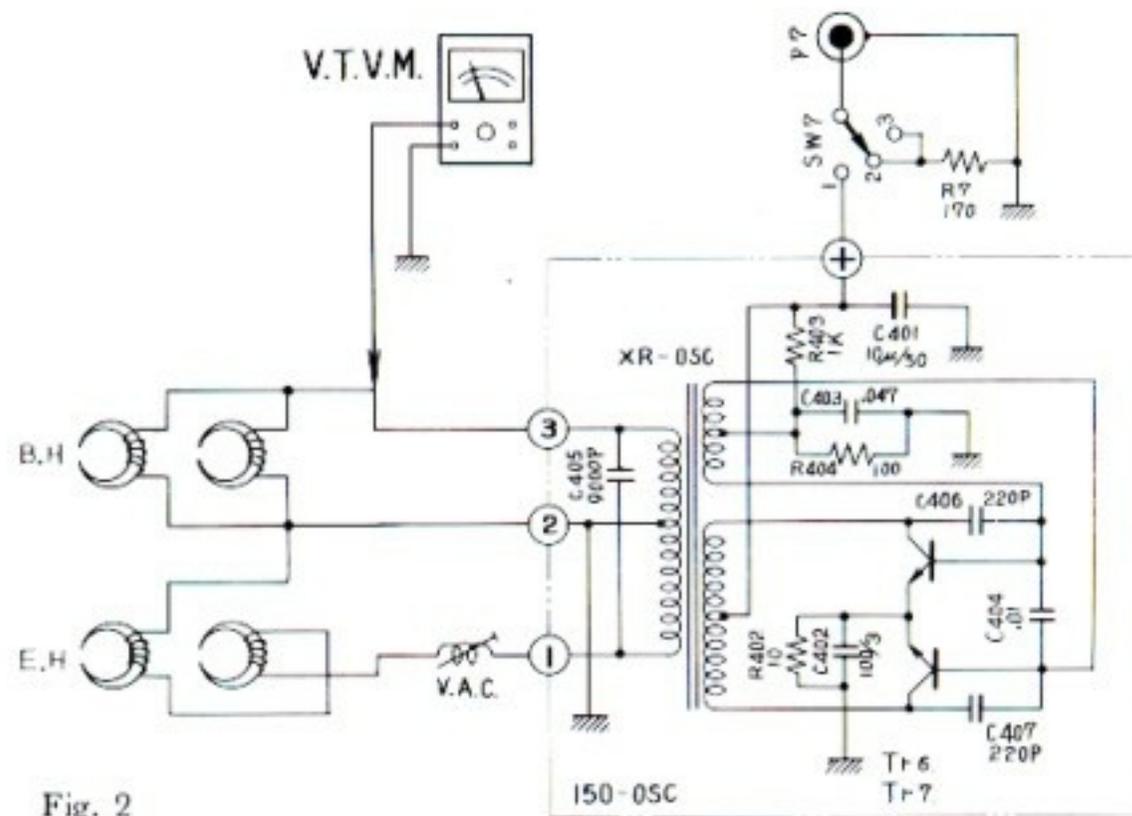

VII. AMPLIFIER ADJUSTMENT

1. ADJUSTMENT OF RECORDING BIAS FREQUENCY

- a) Connect the resistor ($10\ \Omega$ or $50\ \Omega$) in series with the bias head, and connect the signal from the resistor to the vertical input of the oscilloscope. The output of the audio frequency oscillator should be connected to the horizontal input of the oscilloscope. Proper Bias frequency of the recorder X-150D is obtained when the oscilloscope displays a circular or linear waveform with the frequency of the audio frequency oscillator in the neighbourhood of $60\ \text{kc/s}$. The frequency of the bias oscillator circuit can be adjusted by converting the value of the condenser (C 18. $10,000\ \text{PF}$).

2. ADJUSTMENT OF RECORDING BIAS VOLTAGE

- a) Connect the V.T.V.M. to the bias head and fix the recording bias voltage by adjusting the V.A.C in the bias oscillator circuit (located near the head assembly) until its readings becomes equal to the bias voltage stamped backside the head assembly. Normal bias voltage is between $60\ \text{V}$ and $70\ \text{V}$, while acceptable terminal voltage of the erase head is between $12\ \text{V}$ and $18\ \text{V}$.

3. ADJUSTMENT OF PLAYBACK GAIN

- a) Playback 0 VU tape recorded with 1,000c/s signal information and adjust the semi-fixed resistor VR201 (20K Ω) of the preamplifier card so that the pointer of the VU meter registers on 0 VU point (intermediate between red and black).
- b) When performing the above adjustments, make sure that the equalization switch has been set in coincidence with the speed of the tape.

4. ADJUSTMENT OF RECORDING LEVEL

- a) The recording level should be adjusted after the playback gain has been adjusted in the manner described.
- b) Set a standard tape (SCOTCH-111) on the recorder X-150D and put it in a recording mode of operation.
- c) Connect the signal of 1,000c/s from the audio oscillator to the line input of the recorder X-150D, and adjust the volume control so that the pointer of the VU meter registers on 0 VU (intermediate between red and black).
- d) Now record the tape and check on playback whether the pointer of the VU meter comes on the 0 VU point.
- e) If the pointer of the VU meter fails to register with 0 VU, repeat the recording and playback by adjusting the semi-fixed resistor VR 161 (2K Ω) of the recording preamplifier until the 0 VU reading is obtained both on recording and playback.

VIII. MAINTENANCE PROCEDURES

1. LUBRICATION INSTRUCTION

For maximum service life and optimum performance, lubricate the parts identified below after each 500 hours of operation. Use only light machine oil of good quality.

Motor	
Flywheel Assembly	
Rewind Idler Wheel and Wind Take-Up Idler	1 drop
Intermediate Idler	1 drop
Pinch Wheel	1 drop

Also apply a liberal film of light machine grease to each roller surface of all levers and cams.

CAUTION : DO NOT OVER-LUBRICATE, AND WIPE OFF EXCESS OIL BY A COTTON SWAB SOAKED IN ALCOHOL. OTHERWISE, THE OVER-FLOWED LUBRICANT MAY BE SCATTERED DURING OPERATION. THE RUBBER COMPONENT PARTS WILL BE DETERIORATED.

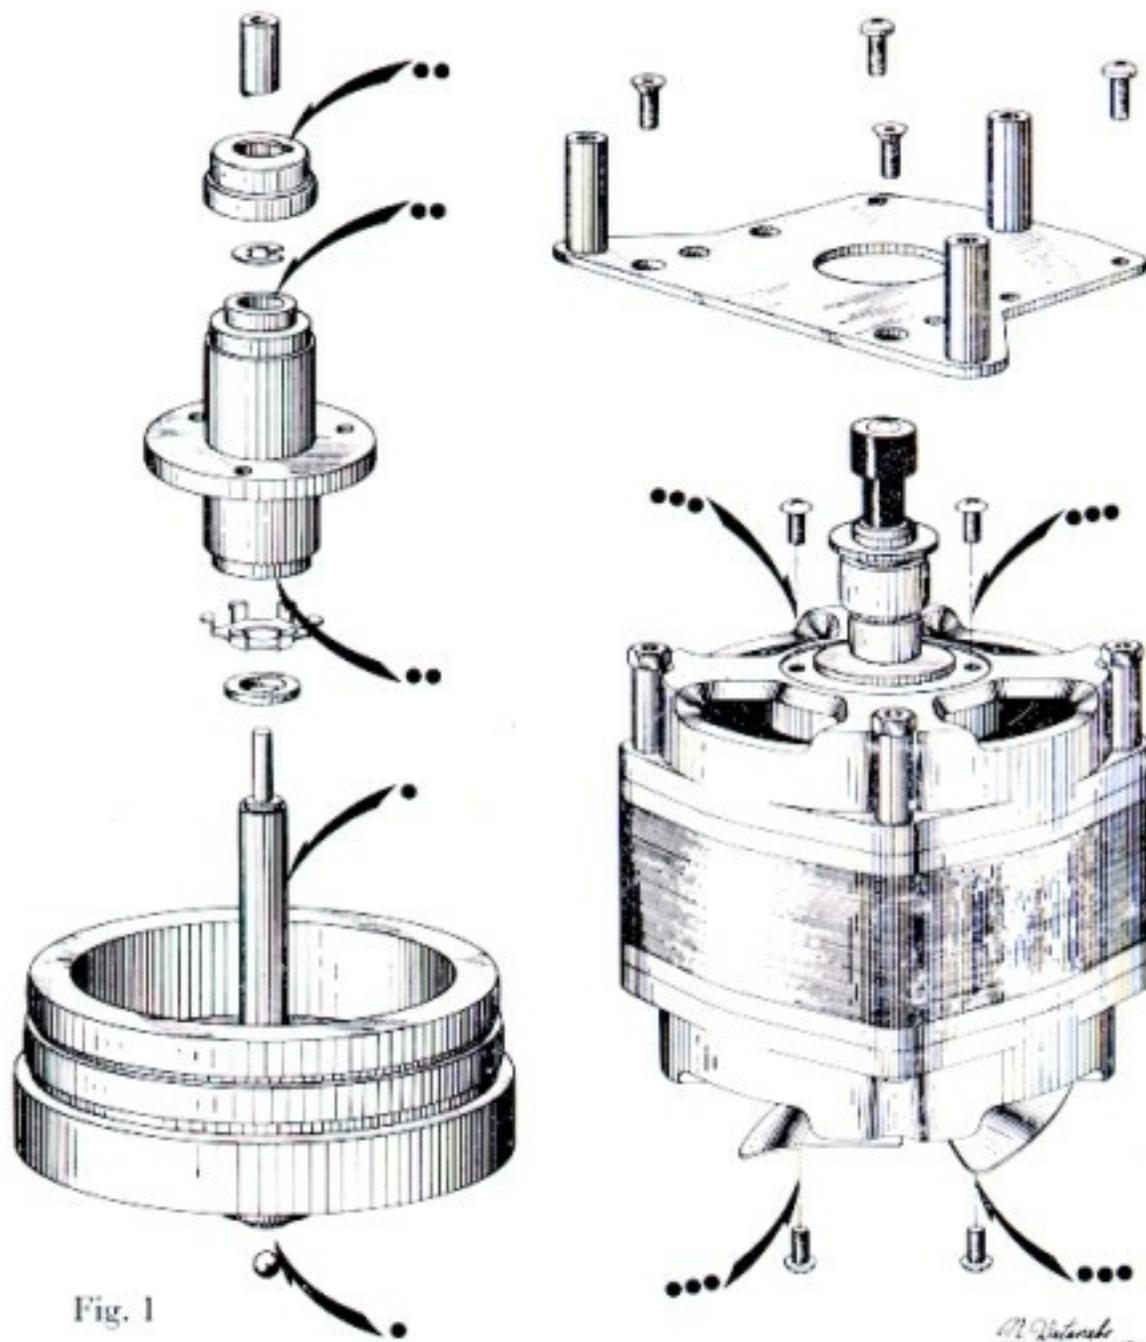

Fig. 1

● 1 drop

MOTOR

2. CLEANING TAPE HEADS AND OTHER PARTS

Wipe surface of tape heads, guide roller bearing, capstan bushing and pinch wheel periodically with a soft cloth soaked in alcohol or carbon-tet.
