FMJ Dv29 Circuit description.

Overview

The **DV29** is effectively a no compromise version both electronically and mechanically of the **DV79**.

The player is based around acclaimed **Zoran Vaddis V** chipset coupled to high specification **Wolfson** D to A converters for all six audio output channels, also featured in this design is a **HDMI** transmitter with digital Video and a Audio output capable of Digital Surround.

The **DV29** and the **DV79** use the same main board and power supply stage but with many of the components either upgrade or replaced with different topologies, many of the critical audio/video components with 0.1% tolerance within the DV29 and we also have an extra toroid power supply for the Audio stages.

Both the HDMI chip and Video encoder are of a higher quality than those found inside the DV79.

Power supply board.

Non-switching

Mains power arrives at IEC inlet socket SKT1 and is filtered by EMC choke L1 and Y caps C3 and C4, mains switch SW2a/b switches both Negative and Live phases before the power reaches the mains select switch at location **SW1** the switch allows the primary windings of the transformer **TX1** to be wired in either Parallel or Series configuration.

The Bridge rectifying Diode package at location **D1** forms the basis of the conventional power stage and supplies a VN35V6 (-35.6v) to the Switch mode stage, transistor **TR1** is biased by 2v7 Zener diode **DZ1** and allows for the series Zener diodes **DZ2**, **DZ3**, **DZ3** to supply the VN13V5 and VN19V rails.

We will also see a simple **A.C present circuit** this is used for delayed output relay operation and fast relay closure under interrupted supply conditions thus preventing op-amp offsets from reaching the Audio output sockets.

Switch mode

The switch mode supply is formed around the Driver/Control chip **IC1** UC3843 (used in regulating mode). The chip is referenced the -36.5V supply line and the Digital ground DGND, the supply for the chip is formed by the 12v Zener at location **DZ6** and can be seen on Pin 7 as VCC. The power supply allows for the switch-mode to be tied to Audio sampling frequency for any given compatible format **see Fig 1**.

Fig 1 PSU clock control and IC305 line status

| Fs Frequency select | PSUFS1 Pin 11 IC305a | PSUFS0 Pin 12 IC305a | PSUCLK Output Pin 5 of IC305a |
|------------------------------------|-------------------------------------|-------------------------------------|--|
| 44.1 kHz | 0 | 0 | 44.1 kHz |
| 48 kHz | 0 | 0 | 48 kHz |
| 88.2 kHz | 0 | 1 | 44.1kHz |
| 96 kHz | 0 | 1 | 48 kHz |
| 176.4 kHz | 1 | 0 | 44.1 kHz |
| 192 kHz | 1 | 0 | 48 kHz |
| Others | 1 | 1 | OFF |

The **PSU sync signal** is driven into the power supply via Resistor R9 if no Sync is present the unit is set to free run at xxxx due to the RT/RC network attached to Pin 4.

IC1 is running in regulated mode and monitors the voltage output on the +5V and +3V3 D.C lines, the two voltages are summed by **TR8** and Driven into the VFB and Comp inputs of **IC1**, the Voltage is then regulated by changing the time base of the PWM output at pin 6 (longer the time base the lower the voltage), the **PWM switching frequency** is driven into the switch-mode transformer by the high speed Nmos device at position **M1**, R5 is used to sense the Current across the gate of the Nmosfet and in the event of a short circuit will safely shut the power supply down. We derive the 12v Mech supply from the output of M1 using the Ultra-fast Diode at location D8 to rectify the PWM line.

The D.C outputs from the switch mode have extensive switch mode noise removing filters these are seen as 100n caps down to ground and Wire wound inductors in series with the supply rail.

Power supply main board

All the power supply rails are supplied to the main board via the 32 way FFC conector at location **CON1001**.

The **Digital** supplies from the switch mode stage of the power supply arrive as **3V3D**, **+5VD** and **+12VD** we also see the Display board power supplies arrive as **-19V**, **-9V** and **-13.5V** all of the supplies have a second stage of implemented on the board to remove all traces of ultra-sonic noise.

The 3V3D rail is the main 3V3 rail used to power the digital circuitry; +5VD is used for all 5v Digital/Video supplies the +12VD is used for Scart switching and to power the HDMI circuit (not DV78).

The 1V8 rail is derived from the 3V3 rail and is regulated by the adjustable regulator at location **REG1003**.

The DV29 uses a separate isolated Toroid transformer and Rectification stages based around Bridge rectifiers **DBR1000** and **DBR1001** and bulk smoothing caps C1048 and C1049 to supply the Analogue stages the smoothed D.C output from this stage is fed **L1013 (+)** and **L1015 (-)**.

Regulator **REG1001** is fed from the +15V3 rail and forms the Audio DAC supply.

The **Display board** requires several supply voltages these are simply passed through the main board, being filtered on the way to prevent transmission of noise through to the surrounding electronics. The display takes the +5V, -19V, -13V5 and -9V the -13V5 and -9V form a floating 4.5V supply biased relative to the -19V grid voltage.

Display Board

The main component of the Display board is **IC1** this is a Vacuum Florescent Display driver with keyboard scan and a serial data in/out interface.

The Chip receives display drive serial data from the **Vaddis V** chip on the main board via Con1 on pins 12, 13 and 14 these will be seen a **DIN**, **STS** and **CLK** this data is used to drive the VFD a DOUT line interfaces with the VADDIS V and supplies Keyboard Scan information. The keyboard scan is a 6 x 4 matrix with the **Key Source** appearing at S3, S4, S5, S6 and the **Keyscan** data returns appearing a K2, K3 and K4.

Please see: above for **power supply** information.

The **Infra red** pick-up at location RX1 receives RC5 data and send the data to the Vaddis V on the main board via transistors TR2 and TR3, LED 2 is used to mix the rear panel RC5, this is covered in-depth within the Coms and Video output section of this guide.

Main Board electronics

Zoran Vaddis V.

The main processor/control chip on the main board is the Zoran Vaddis V at location **IC202**, this is the latest incarnation of the very popular Vaddis range of processors and allows for a much lower component count when compared to our earlier players as many of the playback functions have moved onto the Vaddis V silicon.

Below you will see the **major functions** of the Vaddis V

- **20 Bit digital video output for external Video DAC's and HDMI output stage.**
- **Decoded Analogue Video output (internal DAC) used on the DV78 only.**
- **Digital Audio output 3 data lines 6 channels for internal L + R DAC's and L + R + C + LS + RS for DV79 and DV29 also used for HDMI for the DV79 and DV29.**
- **SPDIF output.**
- **Internal display interface.**
- **Internal ATAPI interface.**
- **Internal IR interface.**
- **Serial in/out for RS232 DV79/DV29**

A more detailed explanation of the Vaddis V and peripheral components follows.

Vaddis Power

The **Vaddis V** is powered by two separate supplies the Vaddis requires a 1.8v supply for the core, this is regulated from the 3.3v rail by **REG1003**, the 3.3v rail is used to supply power to the I/P – O/P ports of the chip.

ATAPI interface

CON203 is an ATAPI interface on a 40 way IDE connector. This is decoupled from the Drive via an array of decoupling resistors as required by the ATAPI spec.

Display Board interface

The display board interface is on the 16 way FFC flexi foil connector at location **CON202**. Power for the display also travels on the connector. There are 4 – wires to interface with the VFD driver chip these are seen as.

- **XFPDIN - Data to the display board**
- **FPDOUT - Data from the display board**
- **XFPCLK - Clock**
- **XFPSEL - Chip select**

The above control lines are level shifted to 5v logic from 3.3v levels by **IC200** (74HCT125) these are the levels required by the VFD drive chip.

The IR output from the Display board arrives as **IRRCV** this is an open collector signal, which can be wire-Or'd with the re-panel remote input.

Digital Audio

The Digital audio leaves the chip 3 sets of data lines labelled as.

- **ADAT0 - Left and Right channel data**
- **ADAT1 - Left and Right surround**
- **ADAT2 - Centre and Sub**

Along with the ADAT line we will also see the **ABCLK** and **ALRCK** as required for IS2 data conversion.

The Vaddis V also supplies a direct SPDIF output for interfacing with ancillary processing equipment.

Digital Video

The Digital Video output from the Vaddis V consists of the following signals:

- **VIDPO to 19 - 20 Bit wide digital video data**
- **CLK_27M - 27 Mhz Video clock**
- **VSYNC - Vertical sync**
- **Hsync - Horizontal Sync**

The 20 bit wide bus **VIDP0 to 19** provides video data as follows.

Interlaced video mode: **VIDP0 to 7** provide multiplexed 8 bit Y, Cb and Cr data with VIDPO being the lsb.

Progressive scan video mode: **VIDP0 to 9** provide 10 bit multiplexed Cb, Cr data with VIDP0 being the lsb. **VIDP10 to 19** provide 10 bit Y data with VIDP10 being the lsb.

Flash/ SDRAM

IC203 is a 64Mbit (32 bit x 2Meg) SDRAM. It runs at 135MHz

IC205 is a 16Mbit (16 bit x 1Meg) intel type flash IC for program storage (Player software).

The flash interfaces to the Vaddis V using the SDRAM bus it may appear that the bus connects to the flash in a random manner, however this is simply because the Vaddis bus is multiplexed that way. The Flash will be accessed at power up and the contents are copied to the SDRAM the program will then be run from the SDRAM. Series resistors are employed to isolate the flash bus from the main SDRAM bus.

EEPROM

IC204 is a 8kBit (1K x 8) Serial EEPROM. This is used for storage of non-volatile storage of player settings, region settings and bookmark data.

Clocks

CLK27MV is the 27Mhz clock for video. It is used to generate the 135Mhz clock for the Vaddis microprocessor and DSP. The **MCLKV** is the audio master clock for the Vaddis.

We run the Vaddis in **PLL bypass** mode and generate our own master clock (see main clock section of manual) for higher accuracy and improved performance across Audio and Video.

RESET

IC201 is a reset generator chip that monitors the **+3.3V** rail and ensures a reset signal **PWR_ON_RESET*** is generated on power up, or if the mains power dips below an operational level.

This signal is used to reset the Vaddis V and Flash micro only. The Vaddis V line labelled as **RESET*** resets the remaining circuitry of the player apart from the HDMI chip, this has its own reset line labelled as **HDMI_RESET** this is necessary if we require to reset the HDMI chip only (for example when the HDMI sink is connected and then disconnected).

Serial Port

The VADDIS V can interface with the external world via the **RS232** connector at location **CON900** and the RS232 Transceiver at location **IC900**, the serial data lines are shown as **SERIAL RX** and **SERIAL TX** these lines allow for direct control over the unit via RS232.

Fig 3. GPIO control signals from the Vaddis V

| Single Name | I/P-O/P | Function |
|-----------------|---------|--|
| PSUFSO-1 | Output | Control PSU Clock divider |
| ENABLE_AV | Output | SCART control High in normal operation and low in standby |
| 16/9 | Output | Scart 16/9 anamorphic control line |
| 9190INT* | Input | Interrupt signal from SII9190 HDMI transmitter |
| GAIN_SCALING | Output | High for HDCD gain scaling |
| ML_8740_0-2 | Output | SPI load signal for Audio DACs 0,1 and 2 (see note 1) |
| MC | Output | SPI clock signal for DAC control |
| MD | Output | SPI data signal for DAC control |
| FSELE0-1 | Output | Frequency select generator |
| MUTE* | Output | Active low audio mute signal |
| DDC_SDA,DDC,SCL | I/O | 12C bus for DDC channel on HDMI interface |
| PROG_INT* | Output | High for Progscan mode, Low for interlaced mode. Controls SII9130 data mux |
| HDMI_RESET* | Output | Reset signal for HDMI transmitter |
| RESET* | Output | System reset |

Clocks and SPDIF stage.

IC300 is a **SM8707E** clock generator IC. This IC is sensitive to noise on its power supply, which causes clock jitter for this reason we have an independent Low dropout – low noise **+3v3** power supply for the chip based around the regulator at location **REG300**.

X300 is a **27Mhz** crystal that **IC300** uses to generate all the video and audio clocks required by the system the crystal sits on the XTI and XTO pins of the chip, the 27Mhz output at Pin 4 (MO2) is used to drive the Vaddis chip directly bypassing the internal PLL.

The frequency of the audio master is dependent on the current audio sample rate (I.e the sample rate required by the format CD=44.1Khz and DVD=48khz etc) and this is set by the system micro via the **FSLO** and **FSEL1** this selects either the **22.5792Mhz** or **24.576Mhz** clock from frequency from IC300 this may then be divided by 2 by the clock divide chip at location IC306 depending on the status of FSEL1. Therefore 4 clock frequencies may be obtained to support all required audio samples rates.

Nand gate IC303 is used to gate FSEL1 with ENABLE_AV (which is low in standby mode) as such when in standby mode the audio clock is disabled.

Clock Buffer

IC301 us used to buffer the audio master clock. The circuit is arranged so that each device that requires the audio master clock has its own driver these are seen as.

- o **MCLK_DAC0 - Pin 18**
- o **MCLK_DAC1 - Pin 16**
- o **MCLK_DAC2 - Pin 14**
- o **MCLK_VADDIS - Pin 3**
- o **MCLK_HDMI - Pin 9**

We also run the **Mute Line** from the Vaddis V **IC301** this can be seen on Pin 12 and drives transistor **TR401**, the transistor pulls the relays **RLY400**, **RLY500**, **RLY600** to ground and un-mutes the audio outputs.

IS2 Audio Data

IC302 and **IC309** are buffers for the 12S signals these ensure that the signals travelling to the DAC's are point to point. **IC302** deals with the **ALRCK** and **ABCLK** and **IC309** the **ADATO1,2** all signal are split into three separate lines for the three stereo DACS.

PSU Clock Divider

IC304 and **IC305** form a clock divide by 1, 2 or 4 to ensure the PSU clock is always either 44.1kHz or 48Khz (**See fig 1** within the power supply description section). This circuit will also switch the **PSUCLK** off when switching between sample rates (the PSU will free run when the PSUCLK is not present).

SPDIF Output

The SPDIF output consists of **IC308** implemented as a inline buffer and parallel output buffer. Gate A buffers the signal so that the SPDIF line from the VADDIS sees fewer loads and form a feed to the Optical output transmitter, gates B,C and D drive the SPDIF in parallel so that we can drive a 75ohm load adequately. The resistors at the output of IC308 are arranged so that the output will be **500mV pk-pk** when the output is terminated with a 75 ohm load at the same time the output impedance of the circuit is 75ohms as required by the Sony Philips Digital Interface specification, the transformer at location TX301 electrically isolates the SPDIF output.

Left and Right channel D to A stages

The **Wolfson WM8740** stereo DAC requires +5V(A) and a +3V3 supply along with the Digital Audio data lines already described in this guide.

The Left channel output only will be described in this section as all audio output stages are the identical (all six channels of a DV79) apart from the HDCD gain switching for L + R only.

IC400B and associated components for a 2nd order Bessel filter with a differential input and a gain of 1 this follow by a output buffer **IC401B**, the gain of IC401B is control by the switching chip at location **IC402**, in normal use the Gain of IC401B is set to 1.1 but in **HDCD** mode the **IC402** switches a second 10k resistor in parele with R413 and the gain is set to 2.2 allowing for the higher audio output required by the HDCD standard.

C436 is a A.C coupling capacitor used to remove the few mV of offset that the DAC produces, D400 provides protection against from ESD.

The all **output relays** are under control of the Vaddis V chip but will also mute the outputs instantly under mains failure conditions. Switching drive is provided by TR401 (MUTE_BUF) and TR400 (AC_PRES) the relays are in mute mode if either the input to TR401 is Low or if the input to TR400 is high.

Please note: The **Scart** left/right audio is fed from the outputs of the left/right audio stages.

Video Encoder

The video encoder at location **IC703** is an Analogue devices **ADV7310** video encoder, supporting interlaced and progressive scan video. Please note the 0.1% tolerance components around this stage. IC703 runs on a 2.5V supply provided by **REG700** the voltage reference for the chip of 1.225V is provided by **REF700** and should be seen on **Pin 46**. C730-731 and R736 form an external PLL filter.

The Data lines into the encoder arrive as VIDP0 – 19 from the outputs of the VADDIS V chip.

The external current setting resistors for the internal DACS are seen as R721-R722 and R738-R739 these set the correct output level for the DACS.

The encoder gives out **6 video signals**, for composite, S-Video (Y and C) and shared YUV/RGB signals. The setting of the RGB or YUV mode is select with the Video settings page of the Setup menu.

The **six analogue output** signals are seen as.

- **DAC_A = Composite**
- **DAC_B = SVID Y**
- **DAC_C = SVID C**
- **DAC_D = Y or Green**
- **DAC_E = U or Blue**
- **DAC_F = V or Red**

Please note: When the player is in Progressive scan mode the composite and S-Video signals will be switched off.

The Video outputs from **IC703** are filtered by six identical filters. For instance if we look at the Composite stage we will see a very slow roll off filter comprising of C719, C721 with L701 and L703 the **-3dB** point of the filter stage is around **40Mhz**, resistors R700 and R702 form a load for the current output DAC and as such set the relative output level.

The outputs are driven by the Video op-amp at location **IC700A** this has a gain of **2.15** and is terminated by a 75ohm resistor, **D701** forms protection against ESD.

These signals now travel to the COMMS and Video extension card on Con 901.

SCART Output

RGB and Composite video signals as well as left and right audio signals are all present on the SCART output socket. As the RGB and YUV signals share the same output port at the Vaddis V the player must be set to **RGB SCART** operation to have a RGB output on the SCART. **Please note:** When in RGB SCART mode the RGB does not contain a Sync signal and the sync must be taken from the Composite out (4 wire RGB).

Also present at the Scart are a number of control flags for the monitor these include 2 GPIO control lines direct from the Vaddis.

- **ENABLE_AV**
- **16/9**

These are seen at the SCART output pins as.

- **O/6/12**
- **RGB STAT**

The 0/6/12 line (SCART pin 8) is used to inform the monitor of the screen format being sent by the player as set in the video set-up section of the software.

- **Standby = 0V**
- **16:9 aspect ratio = 6V**
- **4:3 aspect ration = 12V**

The RGB status line (SCART pin 16) will be seen as 0v = no RGB and >1v is RGB present.

HDMI output stage

Please note: Due to the plug and play nature of the HDMI/DVI interface, if presented with a reported no HDMI problem it is worth checking all set-up parameters of both the DVD player and the Plasma/Projector in use before performing component level diagnostics on this section.

HDMI is a system that transmits uncompressed digital video and digital audio over a high speed encrypted interface.

IC1102 is an **SII9030 HDMI transmitter** IC in essence the chip takes the Digital Video and Audio information and sends the Data out in HDMI format.

REG1100 is used to generate a clean regulated 3V3 power supply to Pins 18 and 33 of the HDMI chip.

IC1100 –IC1101 are 3 state octal/line drivers these form a multiplex that switches between the 2 groups of signals for the video data input stage of the SII9190 the multiplexer is control by the Signal from the Vaddis V labelled as PROG/INT this will sit at logic 1 for Progressive scan and logic 0 for interlaced.

In **interlaced mode** the 8 bit Y/Cb/Cr video data on **VIDP7-0** are passed to input port pins **D15 – D8** of the SII9190.

In **Progressive scan mode** all 20 bits of the Video data bus are used and get mapped as follow.

VIDP 19 -12 provide 8 msbits of Y data to pins D15-8

VIDP 11 -10 provide 2lsbits of Y data to pins D2-3

VIDP 9 - 2 provide 8 msbits of Cb/Cr data to pins D23 – 16

VIDP 1 – 0 provide 2 lsbits of Cb/Cr data to pins D7 - 6

Along with the VIDP video data lines we must also see

VSYNC – Vertical sync data

Hsync – Horizontal sync

CLK27M_VID – 27Mhz video clock.

SPDIF – Digital audio data (Full surround)

MCLK_HDMI – Used to strobe HDMI dig audio

At the **output** of the HDMI chip we will see the following signals at SKT100.

TMDS (Transistion Minimised Differential Signalling) this consists of a clock signal (TXC+/TXC-) and 3 data signals (**TX0+/TX0-, TX1+/TX1- and TX2+/TX2-**). All signals are differential and use current switching techniques therefore no signals will be observed unless the output is correctly terminated. In this application the clock signal will always be 27MHz and the data signals will be clock X10 so 270Mbit/s.

DDC Channel this is a 12C interface on DDC_SCL and DDC_SDA. These signals connect to the VADDIS V which is the I2C bus master, The DDC channel is used to read back information from the HDMI sync regarding it's Video and Audio capabilities and is also used for HDCP encryption authentication.

+5V Power, the HDMI interface requires a 5V supply capable of delivering around 50mA, the supply is provided by REG 1101 which delivers the required current and will shut down in the event of a short circuit.

Hotplug. The HDMI 'Hot plug' signal HDPIN is a +5V to signal the presence of equipment being connected, this converted to 3v3 logic 1 as IC1100 is not +5V tolerant.

CEC. The CEC (Consumer Electronics Control) signal is a 1-wire bidirectional control signal. It connects to the Vaddis via an ESD protection circuit D1102 at the moment this line is not used at present and is an optional part of the HDMI specification.

Comms and Final video output stage

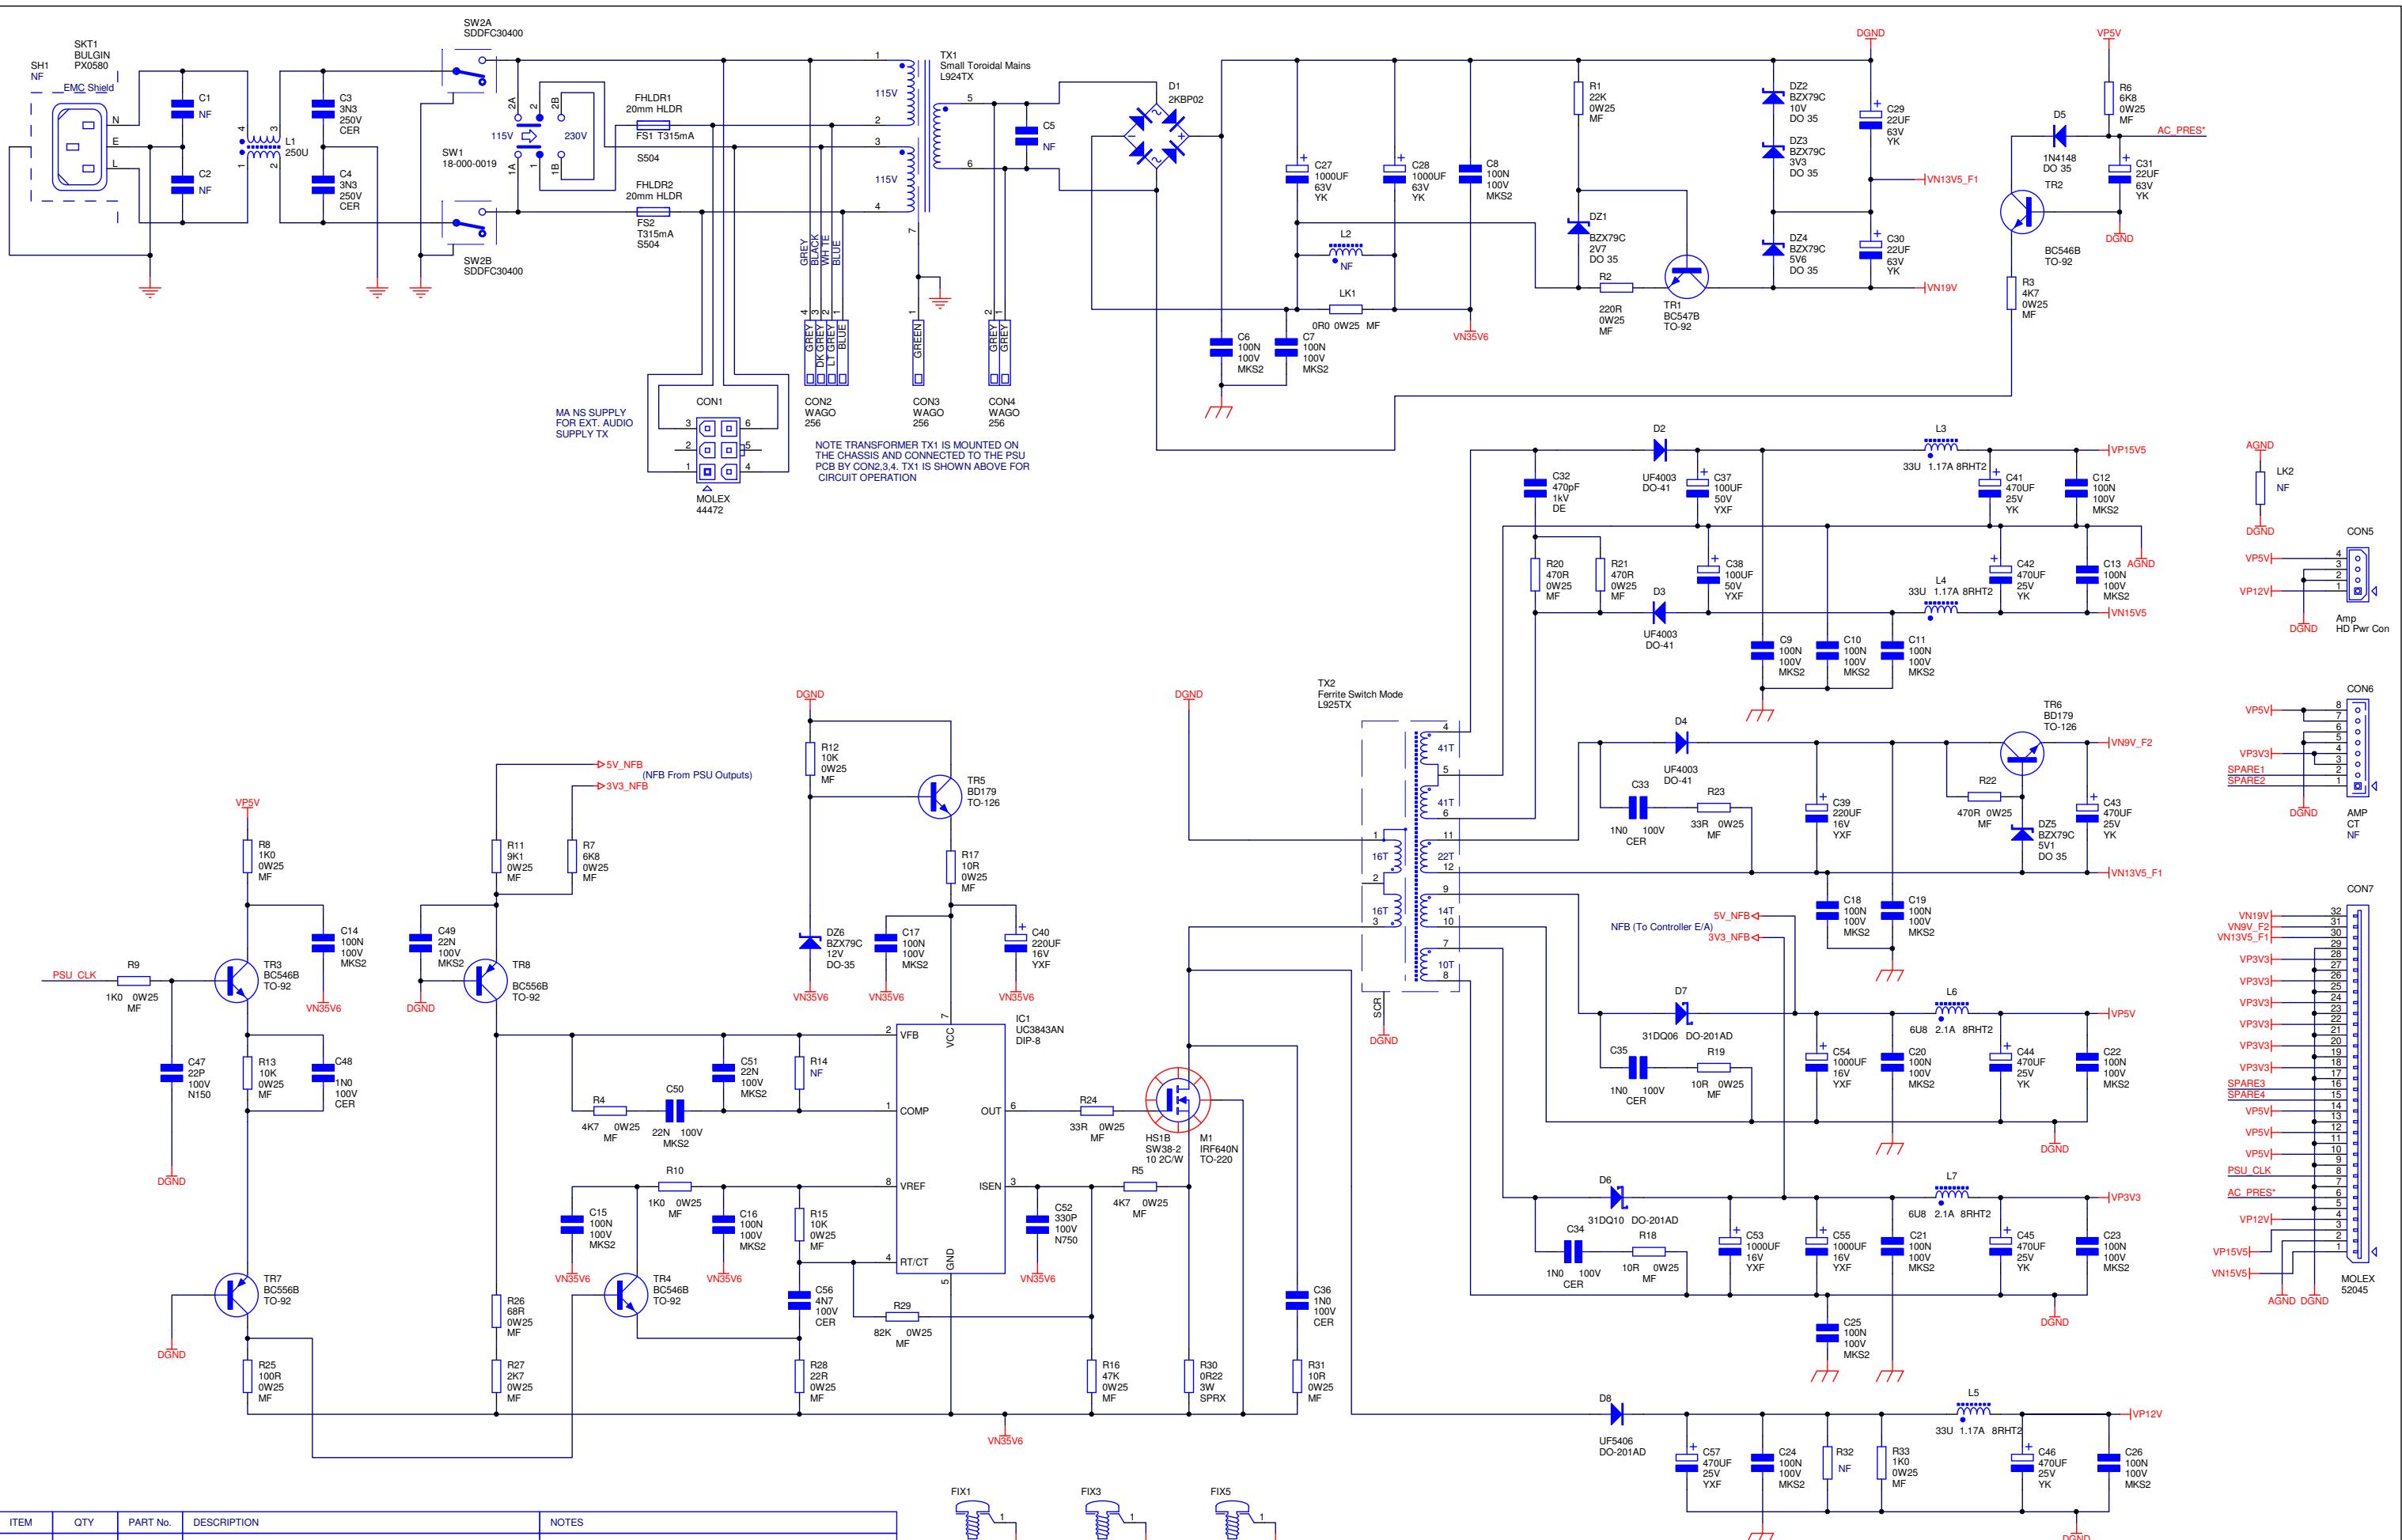

The signals from the main board travel up to the Comms board on connector **CON902**.

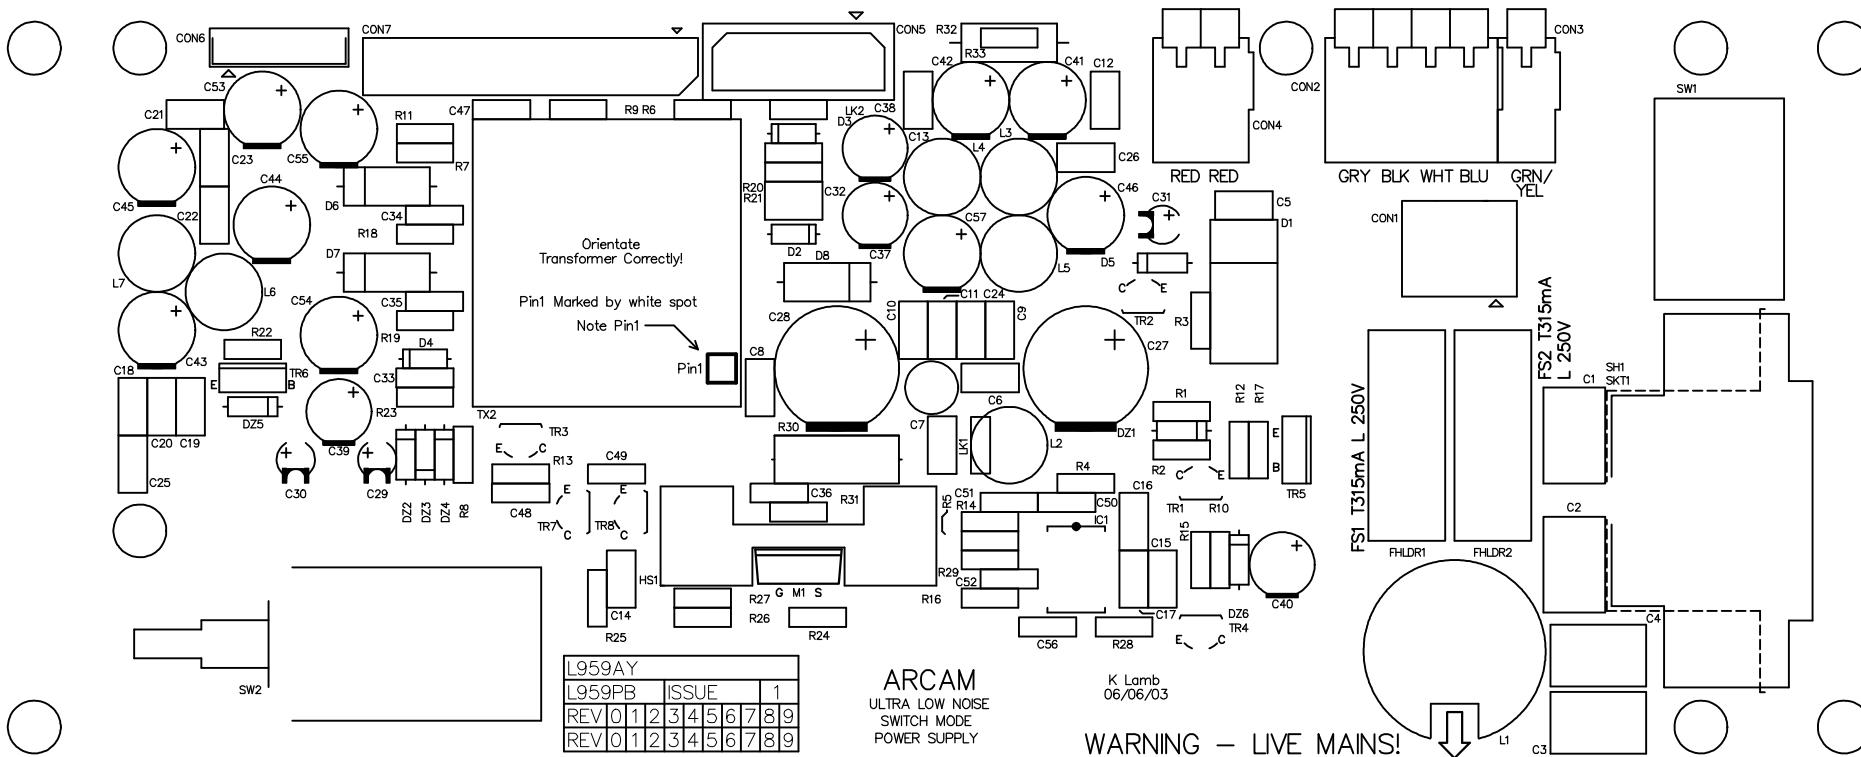

The **Video signals** simply travel via an A-C coupling net before exiting the player via the RCA-phono sockets at locations **SKT902** and **SKT903**.

The **RS232** interface is on 9 way "D" type CON900, with IC900 providing the level translation and static protection between the RS232 levels and the **3.3V** CMOS levels required by the VADDIS V, **CON900** also supplies a **+5V** Status level when ever the unit is not in standby this generated from a buffered version of the **AV_ENABLE** signal as used within the SCART output stage (0V in standby).

We have two remote input bus's on this board, the first can be seen to arrive at **SK901** on a 3.5mm mono jack signal received should be a **36Khz** modulated RC5 signal, the RC5 data then travels to the front panel and is fed to IR led that is sited just behind the front panel **IR Sensor**, we use the sensor to demodulate the and opto-isolate the signal due to the fact that the signal is floating up from ground.

The 3.5mm socket at location **SKT900** is used to receive un-modulated RC5 the 0V representing a space (equivalent to no-infra-red carrier), this input is effectively wire-Ord with the front panel IR receiver on **IRRCV** these take the form of a 5V/0V RC5 signal, with 5V representing a mark (equivalent to a burst of 36Khz carrier on infrared) and 0V representing a mark (space), the signal is simply inverted and wire-ord to the display board Infra-red led via **TR900**.

SHEET 2

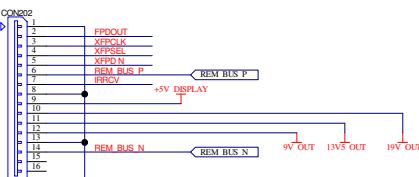

NOTES ON PCB VARIANTS

| Part number | L971AY | L974AY | L973AY |
|---|--------|--------|--------|
| Product | DV29 | DV79 | DV75 |
| Audio output channels | 6 | 6 | 2 |
| AUX PSU fitted | YES | NO | NO |
| Precision parts on component video output | YES | NO | NO |
| Transformer on digital COAX output | YES | NO | NO |
| RS232 | YES | YES | NO |

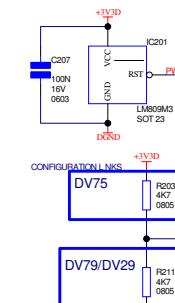

When updating the design, modify this schematic first.
The PCB is updated from this schematic.
Also update the DV79 schematic and DV75 schematic,
and get the DV79 and DV75 BOMs from their own
schematics

Audio outputs are inverted so as to be compatible with DV88. This is compensated for in software by setting a register in the DAC to invert the signal

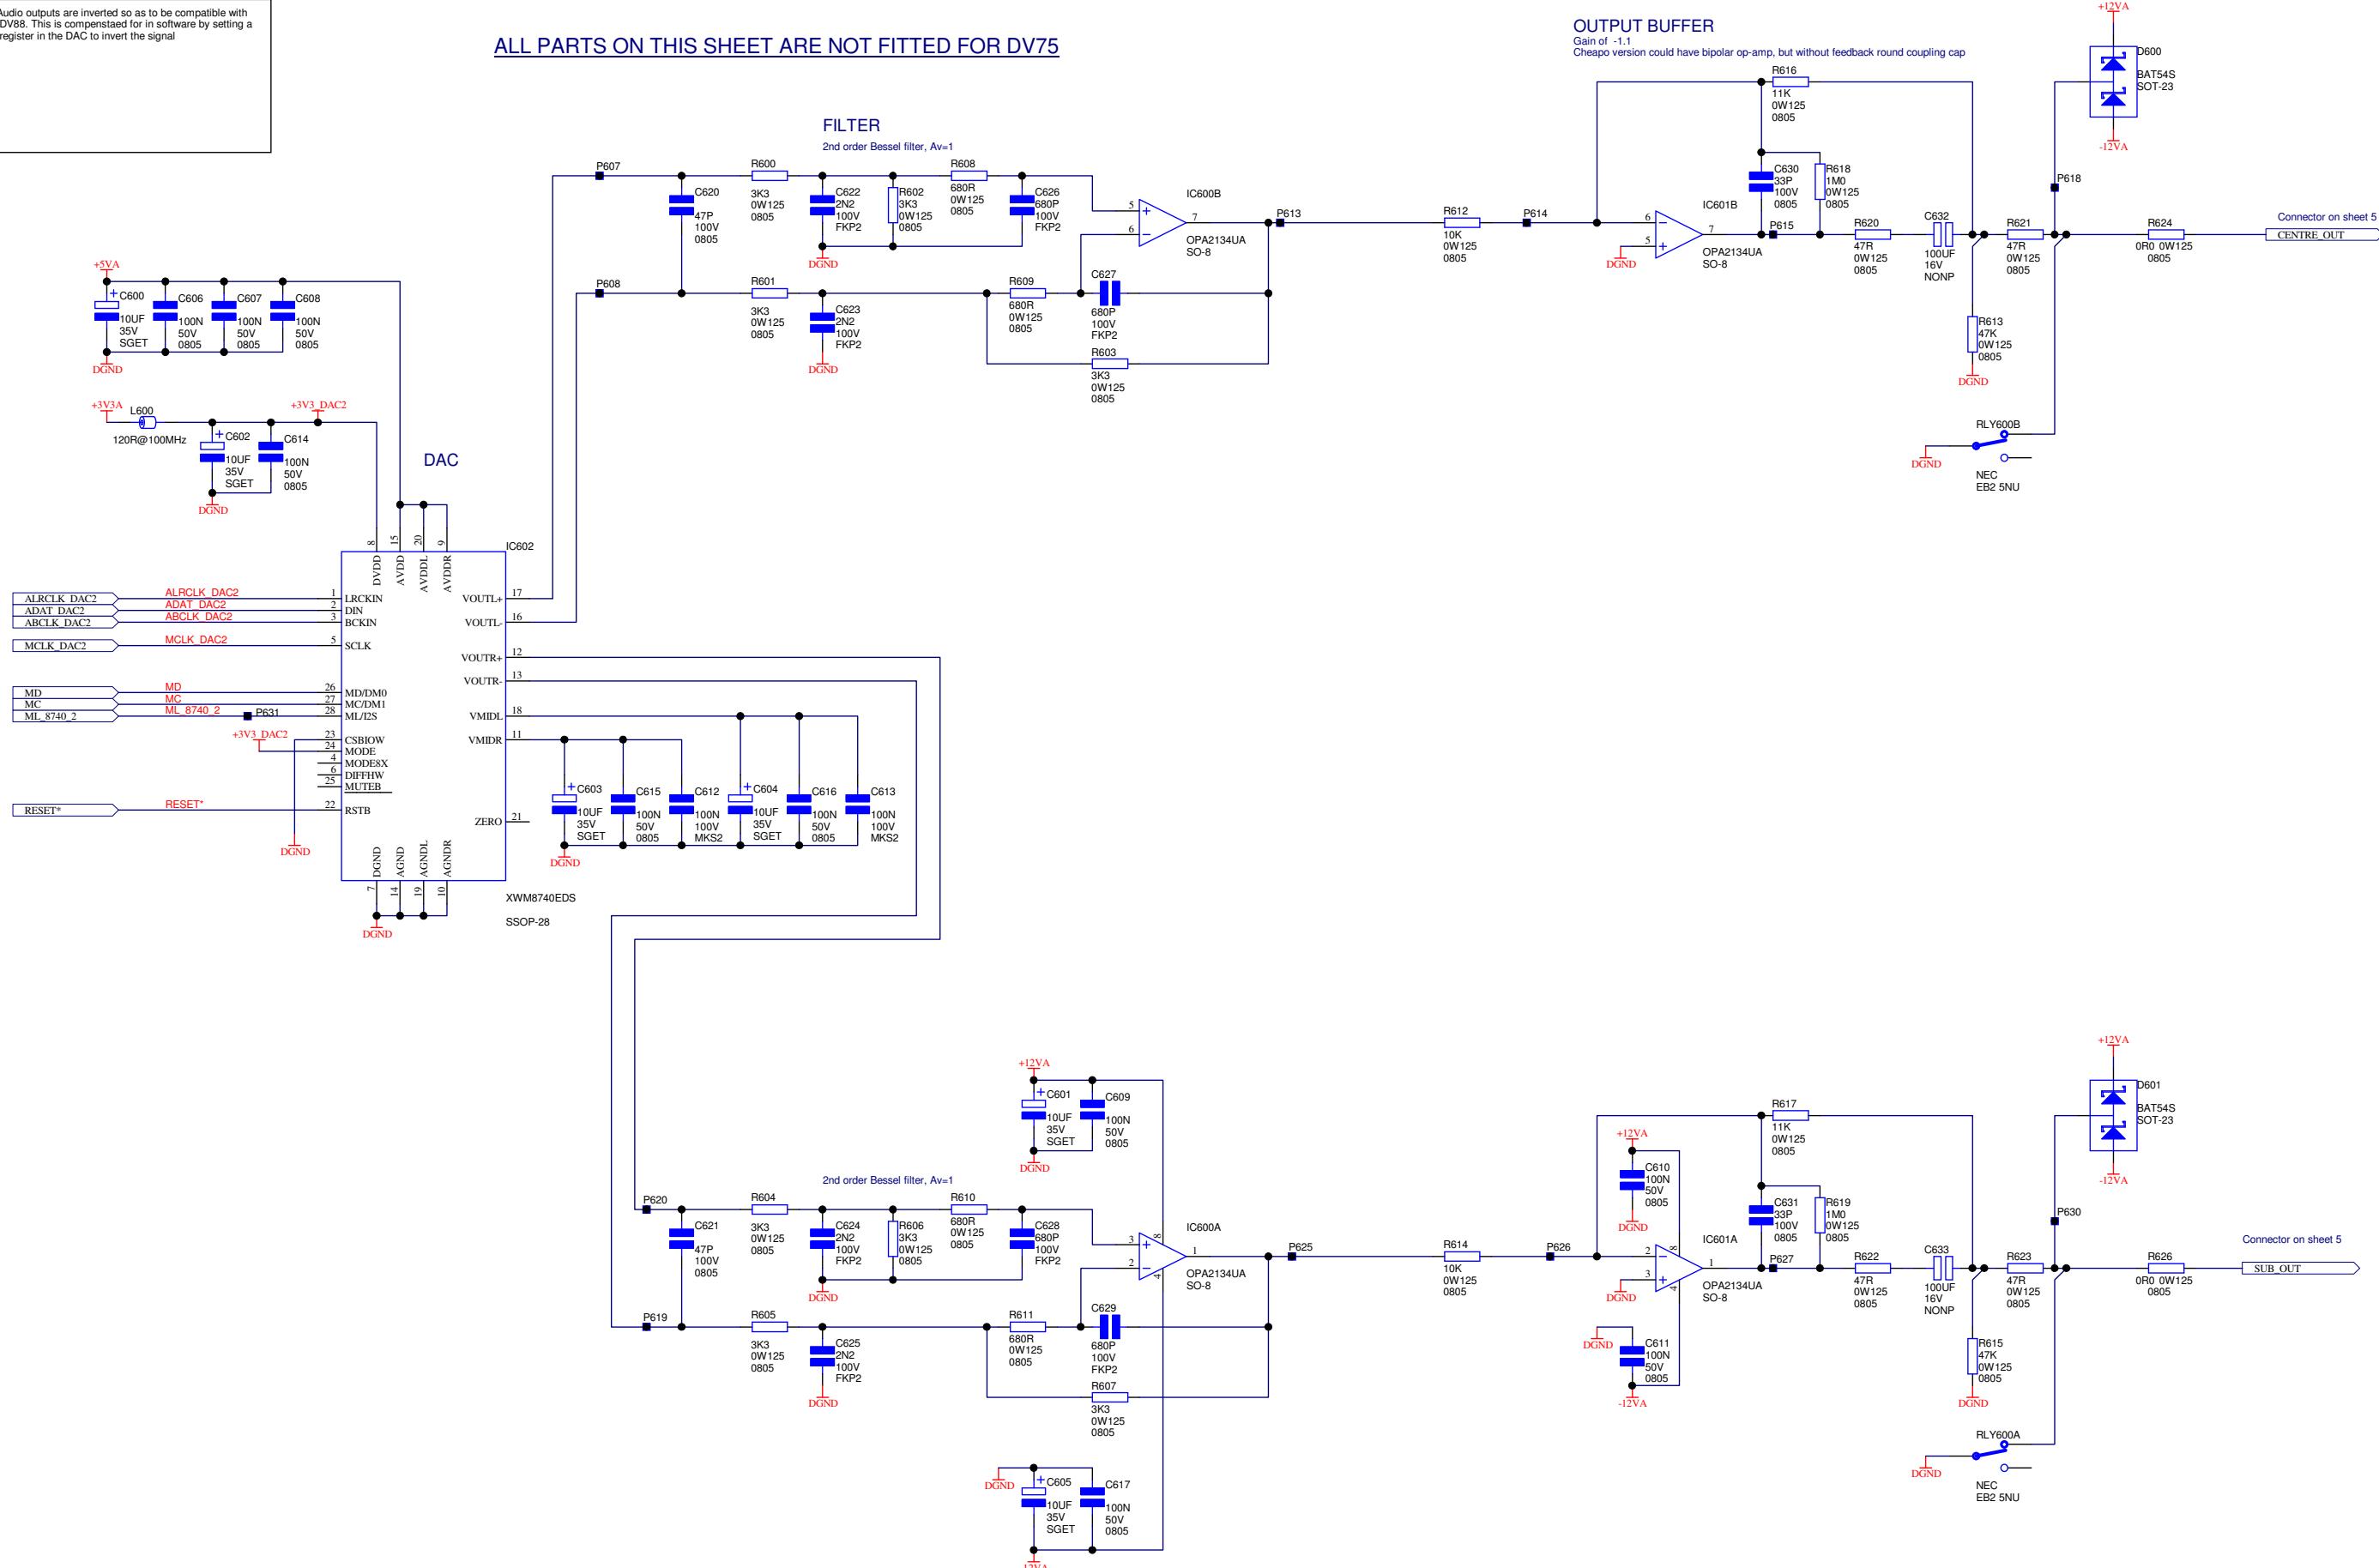

ALL PARTS ON THIS SHEET ARE NOT FITTED FOR DV7

L971AY ASSEMBLY DRAWING

| MECHANICAL DATA | |
|-------------------------|--|
| L971AY Assembly Drawing | |
| LAYER STACKUP | |
| | |
| | |

| MATERIAL | FR4 1.6MM THICK |
|---------------|-----------------------|
| COPPER WEIGHT | 1oz |
| HOLE SIZES | FINISHED (SEE NOTE 2) |
| ROUTING | SEE NOTE 3 |
| LAYERS | FOUR (SEE NOTE 4) |
| MINIMUM WIDTH | 8 MIL |
| MINIMUM GAP | 8 MIL |
| RESIST | GREEN (SEE NOTE 5) |
| IDENT | WHITE |
| VENDOR CODES | SEE NOTE 6 |
| FINISH | SILVER |
| SCORING | SEE NOTE 7 |

NOTES:
 1/ Manufacture in accordance with IPC-A-600F Class 1.
 2/ Always use NC drill file as reference. NO undersized finished holes.
 3/ All routing 2.0mm unless otherwise shown on drill drawing.
 4/ 1mm core between layers 2 and 3. (Foil Build)
 5/ Photo image resist.
 6/ Mark month/year of manufacture on ident layer.
 7/ Scoring denoted by →→→ on drill drawing.
 8/ Manufacture to UL94V-0 and mark on Ident Layer

GENERAL TOLERANCES
 PCB Dims. +/- 0.2mm
 Routing +/- 0.1mm
 All holes +/- 0.1mm

ALL DIMENSIONS IN MILLIMETERS UNLESS OTHERWISE STATED

- NOTES
 1. The following components are on the bottom of the PCB:
 R202
 C247
 C255-263
 C1106-1108
 C1110
 C1124-1125
 C1140-1141

The designators for these parts are labeled (B) on this drawing

2. Fit rubber damping pads as described on schematic

E828AP, on top of component

E828AP, on side of component

L972AY ASSEMBLY GUIDE

Place ITEM4 approx as shown under VFD.
 Double sided foam tape is used to secure position of VFD prior to soldering
 Use 2 layers of tape to space display 6mm from PCB
 Ensure VFD display is fitted straight
 Crop VFD pins to <3mm of PCB

Transformer Specification for 115/230V 50/60Hz mains transformer.

Arcam Part Number L924TX

The transformer is extremely cost sensitive. It is to employ the most cost effective techniques to achieve the specification.

The transformer output voltage will be regulated by a switch mode power supply.

The only essential specification is the fact that it must produce no acoustic noise either internally or by induced eddy currents in steel chassis etc..

All other specifications are negotiable in the interest of allowing cost reduction. Even the use of a frame TX rather than a toroid is negotiable providing it is silent.

1. The transformer MUST be silent when loaded to $P_o + 10\%$ and when supplied from $V_{in} = 270V$ r.m.s.

General Safety specification.

2. To standards BS415 / EN60065 - Class I / EN60742

3. Transformer to be used in equipment which will be sold worldwide and certified to CE, CB, UL and CSA Standards. All materials etc to be adequate for worldwide safety approvals.

Material Safety Specification

4. Winding Wire to be Grade 2 (130°C rating) to BS 60317-4 1995

5. Mylar Polyester Insulator Rated to 130°C

Electrical Specification

6. Transformer to have dual 115V primaries to allow parallel operation for 115V input and series operation with 230V input.

7. Transformer is required to provide a mains isolation barrier and provide a single secondary winding.

8. The secondary winding is to be full wave rectified and smoothed as shown in the below diagram.

9. The DC voltage so provided will be followed by a switch mode power supply which will provide a constant power load.

(i.e. the current drawn by the load will increase as the DC output voltage falls- hence the capacitor ripple voltage will be higher at low input voltage)

10. The power drawn by the load has a maximum continuous rating (P_o) of 22W.

11. Transformer input voltage range as follows:

115V (85V to 132.5V) windings in parallel

230V (170V to 265V) windings in series

Note. Extended input voltage range 85V to 265V

12. At minimum input voltage (170V AC) the minimum voltage on the capacitor must be > 22.5V with $P_o = 22W$

13. At maximum input voltage and minimum load of 6W the max voltage on output capacitor must be < 63V.

14. The secondary voltages and r.m.s currents have been calculated and are tabulated against input voltage.

The model assumes the transformer regulation is made as poor as possible while meeting spec.

The equivalent series resistance of the windings transformed to the secondary is 7ohms under this condition.

Rms figures for voltages and currents are true rms figures measured with the specified bridge rectifier, Capacitor and load resistor connected to the transformer secondary.

In the case of the load regulation for lowest cost transformer being better than the worst case specification then the transformer voltages shall be modified so that the minimum 22.5V spec is met at 170V input and the output voltages at 230V and 265V input voltage are lower than the specified voltages.

15. Temperature rise to be such that transformer is safe when operated in an enclosure with 50C maximum internal temperature.

16. Toroid to be fitted with interwinding screen.

Mechanical Specification

17. Primary wires self-ended and individually sleeved for colour coding, then sleeved together.

18. Secondary wires self-ended and individually sleeved, then sleeved together.

19. Wire type used on the terminations must be such that the wire may be bent with a minimum bend radius of 10mm through an angle of 90degrees 10times without the wire fracturing. This will allow the wires to be dressed in production without risk of damage to terminations.

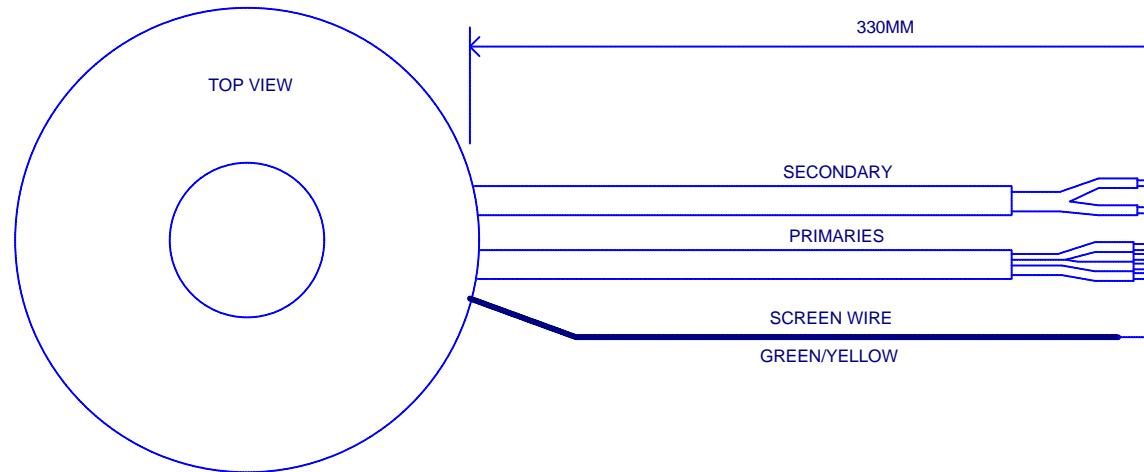

20. All wire lengths are +20, -0 mm. All wires stripped 8 +/-2mm and tinned.

21. Transformer to be marked with part number and issue number.

22. Toroidal transformer will be attached to the chassis by a dished washer and bolt (no potting required).

23. A frame transformer meeting the above spec will be chassis mounted with flying leads and should have clamp fitted to allow it to be screwed to chassis.

24. Toroidal transformer to be supplied with mounting kit consisting of metal dished washer and 2 neoprene or similar washers.

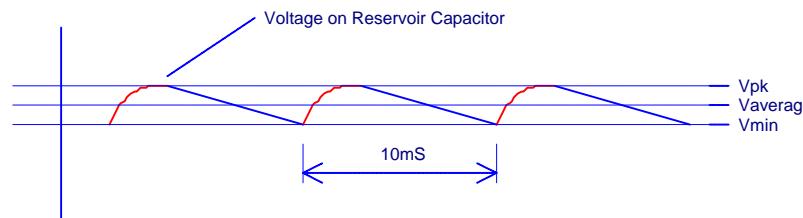

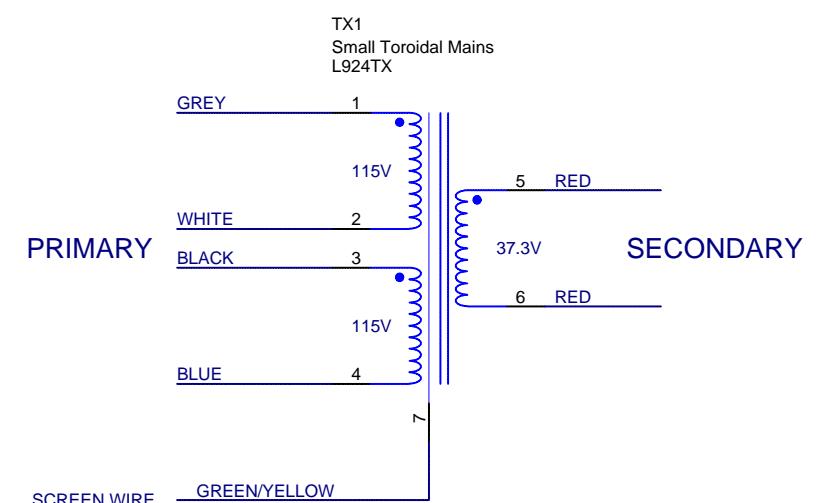

Secondary Winding Voltage and Current Specs

assuming $C=1360\mu F$, $f = 50Hz$ for $P_o = 22W$

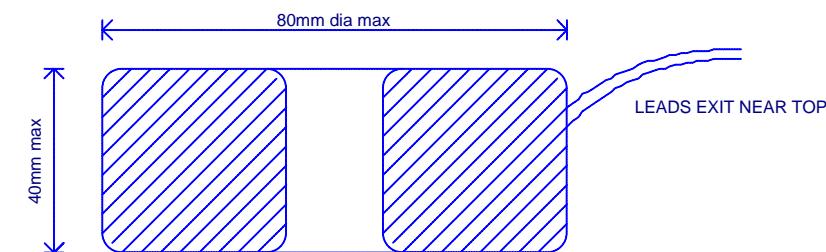

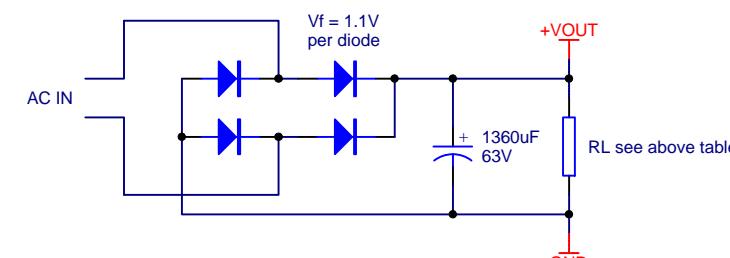

Bridge Rectifier V_f diode = 1.1V per leg = 2.2V Total

Ideal TX assumed with 7Ohm series resistor in secondary to simulate regulation.

| CORE | PQ32/30 in PC44 MATERIAL (OR EQUIVALENT) CORE TO BE GAPPED IN CENTRE LEG TO GIVE REQUIRED Lpri (GAP APPROX 0.4mm) (Lpri = 450uH +/- 10% PRIMARY INDUCTANCE MEASURED FROM PIN 1 TO 3) PART NUMBER TDK PC44PQ32/30Z-12 (OR EQUIVALENT) |
| BOBBIN CLAMP | PART NUMBER TDK BPQ32/30-1112CP (OR EQUIVALENT) PART NUMBER TDK FPQ32/30-A (OR EQUIVALENT) |

ASSEMBLY DETAILS

- PART TO BE MARKED WITH PART NUMBER / ISSUE NUMBER
- INTERNAL SCREENS TO BE FULL WIDTH. CONNECTION TO SCREEN VIA SOLDER JOINT TO COPPER (SEE DIAGRAM)
SOLDER JOINT TO BE ARRANGED TO PRODUCE A LUMP IN THE CORE WINDOW
SOLDER JOINT TO MAKE MADE TO CLEAN COPPER AND JOINT TO BE TAPE.
- SOLDER JOINT TO BE MADE HALF WAY ALONG LENGTH OF THE FOIL
SCREEN TO BE HIGHEST POSSIBLE RESISTANCE FOIL FOR LOWEST LOSSES. (I.E. FOIL AS THIN AS POSSIBLE)
SCREEN TO BE MADE FROM MAXIMUM 0.05mm (2MIL) FOIL
- WINDINGS WILL BE A TIGHT FIT ON BOBBIN. NOTES AND WINDING ARRANGEMENT SPECIFIED TO BE ADOPTED.
- TRANSFORMER TO BE FITTED WITH AN OUTER COPPER SCREEN WRAPPED AROUND THE OUTSIDE OF THE
OF THE TRANSFORMER CORE AND CONTACTING THE METAL CORE CLAMP THUS FORMING A SHORDED TURN
TO LEAKAGE FLUX. SEE DIAGRAM
SCREEN TO BE 10THOU COPPER STRIP 6 to 8mm WIDE AND FITTED OVER THE JOIN OF THE CORE HALVES.
SCREEN TO BE COVERED IN A LAYER OF TAPE.
- PIN 1 ON BOBBIN TO BE MARKED WITH WHITE PAINT (OR OTHERWISE)
THIS MARKING TO BE USED TO ORIENTATE TX DURING WINDING PHASE TEST
- 100% PHASE TEST AND ISOLATION TEST TO BE CARRIED OUT ON ALL WINDINGS.

General Safety specification

1. To standards BS415 / EN60065 - Class I / EN60742
2. Transformer to be used in equipment which will be sold worldwide and certified to CE, CB, UL and CSA Standards. All materials etc to be adequate for worldwide safety approvals.

Material Safety Specification

3. Winding Wire to be Grade 2 (130°C rating) to BS 60317-4 1995

4. Mylar Polyester Insulator Rated to 130°C

Electrical Specification

5. Transformer to have dual 115V primaries to allow parallel operation for 100/115V input and series operation with 230V input.

6. Transformer to have 2 secondary windings as shown in the adjacent diagram.

7. The output from the secondary windings are to be full wave rectified and smoothed as shown in the 'test circuit' diagram.

8. Transformer input voltage range as follows:

115V: (85V to 132.5V) windings in parallel
230V: (170V to 265V) windings in series

Note. Extended input voltage range 85V to 265V

9. At minimum input voltage (170V AC with primaries in series) and maximum load of 120mA the minimum voltage on the capacitor must be = (or >) 13.5V.

10. Temperature rise to be such that transformer is safe when operated in an enclosure with 50C maximum internal temperature.

Mechanical Specification

11. Primary windings connect to 6 way MOLEX connector 39-01-2065. Secondary windings connect to 4 way molex connector 39-01-3048. CONEXCON alternatives are allowed. Use MOLEX pin 44476-3112.

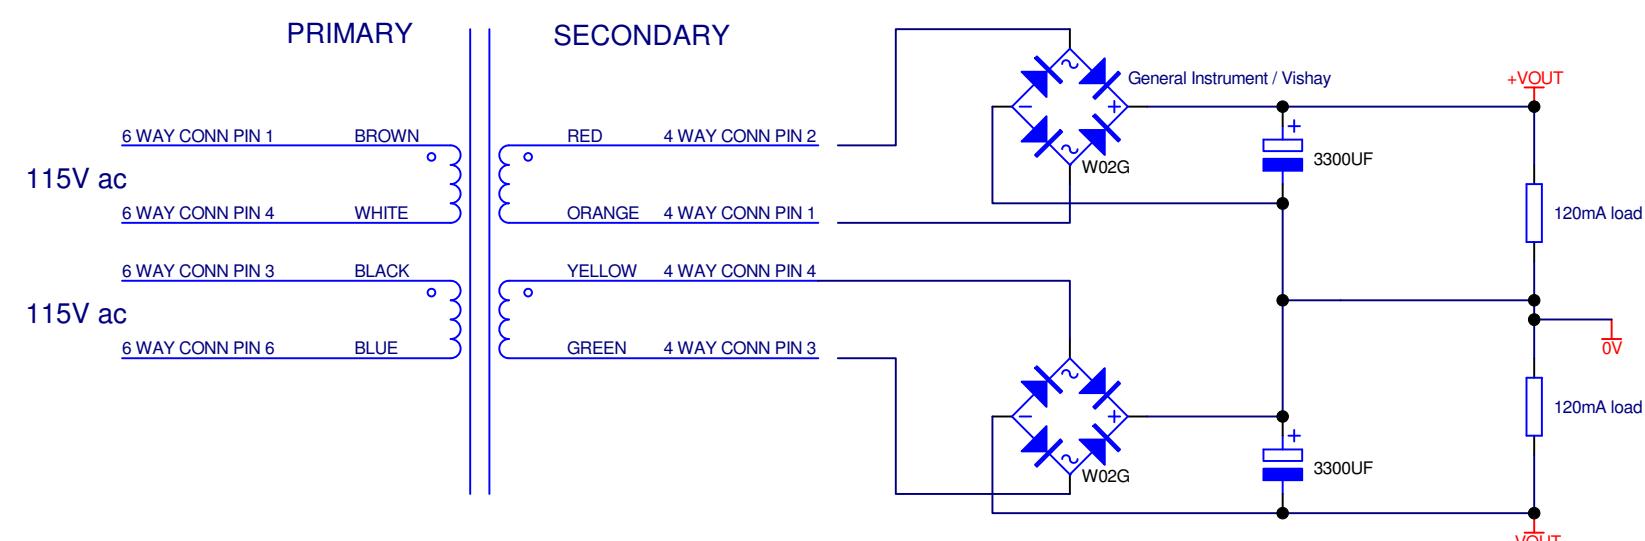

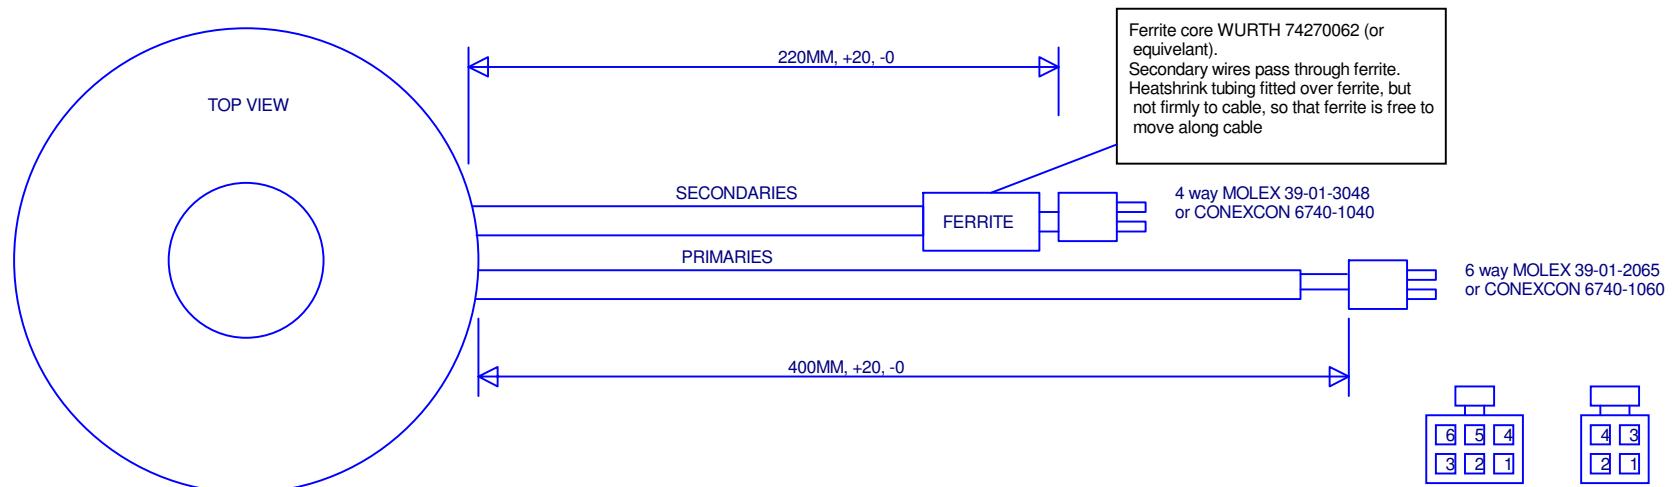

MOLEX connectors have pin numbers indicated on them.

12. Use 24 AWG wire with colours as shown. Primary wires are enclosed in a common sleeve. Secondary wires are enclosed in a common sleeve. Use PVC sleeving.

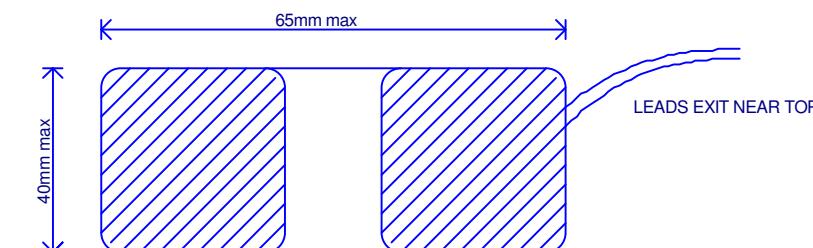

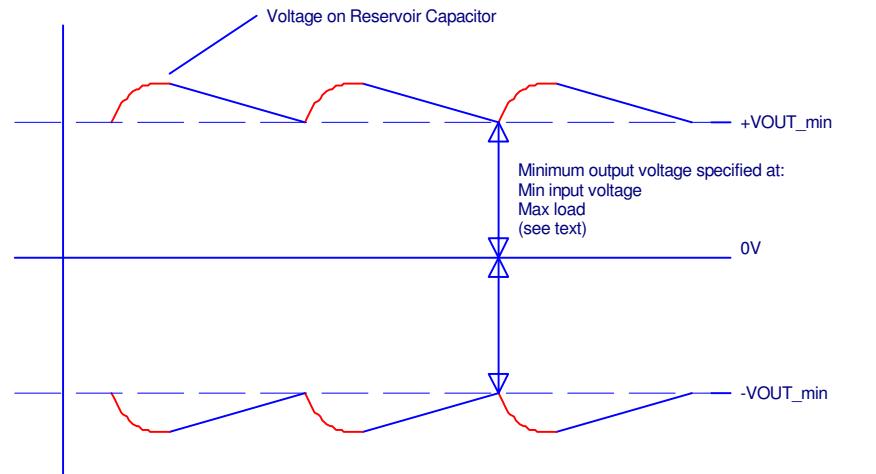

13. Transformer to be marked with Arcam part number and issue number.

14. Transformer is for Hi-Fi audio; Acoustic noise must be inaudible.

15. Transformer to be supplied with mounting kit consisting of metal dished washer and 2 neoprene or similar washers.

Pin-outs of Molex connectors, as viewed looking down at the end the wires enter the connector
