SECTION 1

SAFETY INFORMATION

WARNING.

Any person performing the procedures described in this manual will be exposed to hazardous voltages and the risk of electric shock.

Carver Corporation assumes that any person who removes the cover from the unit has been properly trained in protecting against avoidable injury and shock.

Therefore, the procedures described here are to be performed by qualified electronics service personnel only.

We recommend that the unit be tested only when line isolation is provided by an isolation transformer. The line cord of the unit must be disconnected and the power supply fully discharged before any components are replaced. Failure to do so may result in severe damage to the unit and the risk of electric shock.

The safety tests described below must be performed properly.

CAUTION:

Before returning the unit to the customer, one of the following safety tests must be performed.

1. Check the leakage current. Connect the unit to 120 VAC supply and turn the power switch "ON". Using an ammeter, measure the current between the neutral side of the AC supply and chassis ground of the unit under test. If leakage current exceeds 0.5mA, the unit is defective.
Reverse the polarity of the AC supply and repeat.
2. Measure the resistance from either side of the linecord to chassis ground. If it is less than 500k ohms, the unit is defective.

WARNING - DO NOT return the unit to the customer if it fails one of these tests until the problem is located and corrected.

CAUTION

The lightning flash with arrowhead symbol within an equilateral triangle is intended to alert the user to the presence of uninsulated "dangerous voltage" within the product's enclosure, that may be of sufficient magnitude to constitute a risk of electric shock to persons.

The exclamation point within an equilateral triangle is intended to alert the user of the presence of important operating and maintenance (servicing) instructions in the literature accompanying the appliance.

SECTION 2

INTRODUCTION

This manual is intended for use by qualified, authorized personnel only.

Due to the unique and complex circuit designs of Carver Corporation, the following procedure is recommended to diagnose & repair problems with speed and accuracy.

The best way to figure out what is wrong is to learn what is working properly first. Then, through the process of elimination, the defective area can be located. Upon locating the defective area, you then would use your own preferred troubleshooting skills.

The removal of parts for testing, should be kept to an absolute minimum. "In circuit" analysis should provide you with enough data to determine correct operation.

At Carver Corporation we continually strive for the most reliable, cost-efficient product available.

When updates and service bulletins are sent to you, please take the time to review them and insert them into the correct service manuals.

The Carver PM-600 and PM-900 Magnetic Field Power Amplifiers are updated versions of the Carver PM-175 and PM-350 power amplifiers. They were released in March of 1990, in conjunction with the redesign and renaming of our entire professional line of power amplifiers for the 1990's.

The PM-600 and PM-900 are rack-mountable (dual-rack space) stereo power amplifiers rated at 200W per channel into 8 ohms and 300W per channel into 4 ohms for the PM-600, and 350W per channel into 8 ohms and 450W per channel into 4 ohms for the PM-900. In series-mono mode (bridged), the PM-600 will deliver 700W into 8 ohms and the PM-900 will deliver 900W into 8 ohms.

The PM-600/PM-900 features:

Left and right detented level controls

XLR, TRS and barrier strip inputs

Switch configurable XLR (Pin 2/Pin 3 High)

5-way speaker binding post outputs

Chassis/Signal ground lift

Dual channel 7-segment LED display

Triac regulated primary voltage

Triple-rail power supply for increased efficiency

Remote sequential power On/Off

Rear panel slot for Carver add-on accessories

Protection Circuitry:

Thermal

Independent L/R Short Circuit

Independent L/R High Frequency

L/R DC Offset

Clipping Eliminator (switchable)

SECTION 3

SPECIFICATIONS

Specifications for the PM-600 Magnetic Field Power Amplifier

Power Output:

Continuous Average Output Power, both channels driven:

200 watts per channel into 8 ohms from 20 Hz to 20 kHz, with no more than 2.0% THD

300 watts per channel into 4 ohms from 20 Hz to 20 kHz, with no more than 3.0% THD

Bridged-mono operation:

700 watts into 8 ohms from 20Hz to 20 kHz, with no more than 3.0% THD

Power at Clipping, both channels driven:

265 watts per channel into 8 ohms at 1 kHz

360 watts per channel into 4 ohms at 1 kHz

Dynamic Headroom:	1.2dB @ 8 ohms 1.5dB @ 4 ohms
Frequency Response:	20Hz to 20kHz (+0, - 0.5dB)
Crosstalk:	-60dB, 100Hz-10kHz
Output Impedance:	.05 ohms
Damping Factor:	Greater than 150 at 1kHz
Input Impedance:	30k ohms balanced (15k Ω each leg to ground) 30k ohms unbalanced (Noninverting input "+") 15k ohms unbalanced (Inverting input "-")
Sensitivity:	1.5V rms for rated power into 8 ohms at 1kHz 105mV for 1W output into 8 ohms at 1kHz
Gain:	28.5dB (+/- 0.5dB)
Input Overload:	+15dBu
IM Distortion:	Less than 0.1%
THD:	Less than 3.0%
Signal-to-Noise Ratio:	-106dB A-weighted, referenced to rated power -83dBW A-weighted, referenced to 1W
Slew Rate:	25V/ μ S
CMRR:	-50dB at 1kHz
Power Consumption:	1000W at full power into 8 ohms 55W at idle
Power Requirements:	120VAC/60Hz (USA and Canada) Other voltages as required for export
Display:	LED ladder; 7 indicators per channel 1mS attack time; 500mS decay time
Size (H x W x D):	3.5" (3.75" with feet) x 19" x 13.75" 89mm (95mm w/feet) x 483mm x 349mm
Net Weight:	22.5 lbs. (10.2 kg)
Shipping Weight:	25.9 lbs. (11.7 kg)

Test Note: Accurate measurement depends on a sufficiently "stiff" AC supply. The 60 Hz AC line distortion must be below IHF specifications.

Features and specifications are subject to change without notice.

Specifications for the PM-900 Magnetic Field Power Amplifier

Power Output:

Continuous Average Output Power, both channels driven:

350 watts per channel into 8 ohms from 20 Hz to 20 kHz, with no more than 1.0% THD
450 watts per channel into 4 ohms from 20 Hz to 20 kHz, with no more than 2.0% THD

Bridged-mono operation:

900 watts into 8 ohms from 20Hz to 20 kHz, with no more than 2.0% THD

Power at Clipping, both channels driven:

375 watts per channel into 8 ohms at 1 kHz
490 watts per channel into 4 ohms at 1 kHz

Dynamic Headroom:	1.4dB @ 8 ohms 2.1dB @ 4 ohms
Frequency Response:	20Hz to 20kHz (+0, - 0.5dB)
Crosstalk:	-60dB, 100Hz-10kHz
Output Impedance:	.05 ohms
Damping Factor:	Greater than 150 at 1kHz
Input Impedance:	30k ohms balanced (15k Ω each leg to ground) 30k ohms unbalanced (Noninverting input "+") 15k ohms unbalanced (Inverting input "-")
Sensitivity:	1.7V rms for rated power into 8 ohms at 1kHz 89mV for 1W output into 8 ohms at 1kHz
Gain:	30.0dB (+/- 0.5dB)
Input Overload:	+15dBu
IM Distortion:	Less than 0.1%
THD:	Less than 2.0%
Signal-to-Noise Ratio:	-104dB A-weighted, referenced to rated power -78dBW A-weighted, referenced to 1W
Slew Rate:	25V/ μ S
CMRR:	-50dB at 1kHz
Power Consumption:	1700W at full power into 8 ohms 75W at idle
Power Requirements:	120VAC/60Hz (USA and Canada) Other voltages as required for export
Display:	LED ladder; 7 indicators per channel 1mS attack time; 500mS decay time
Size (H x W x D):	3.5" (3.75" with feet) x 19" x 13.75" 89mm (95mm w/feet) x 483mm x 349mm
Net Weight:	24.3 lbs. (11.0 kg)
Shipping Weight:	27.7 lbs. (12.6 kg)

Test Note: Accurate measurement depends on a sufficiently "stiff" AC supply. The 60 Hz AC line distortion must be below IHF specifications.

Features and specifications are subject to change without notice.

SECTION 4

CIRCUIT DESCRIPTION PM-600/PM-900

TECHNICAL DESCRIPTION

This section discusses the theory of operation of the PM-600 and PM-900 magnetic field power amplifiers. The circuit descriptions discussed here apply to both amplifiers since they were developed from the same design. When there are differences between the two, the PM-600 data will be given first followed by the PM-900 data in parenthesis. For a better understanding of the circuitry involved, refer to the schematic diagrams presented later in this manual. Op-amps described in the circuitry use the following notation: U1(7) means U1, whose output appears on pin 7. Unless otherwise noted, this discussion centers around the left-channel circuitry. The right-channel circuitry is essentially identical.

Low Level Circuitry

Input signals enter the circuit via the rear-panel XLR connector, tip-ring-sleeve (TRS) phone jack, or screw terminal connections. S3 allows the polarity of the XLR connector to be configured for pin 3 hot (U.S. standard) or pin 2 hot (DIN standard). As supplied from the factory, the PM-600 and PM-900 are configured for pin 3 hot. The switch setting does not affect the wiring of the TRS jack (tip=hot) or the screw terminal connections.

U2(1) is configured as a unity gain differential amplifier driving the left-channel level control via J5 pins 7 and 8. Connector J5 provides a means of inserting into the signal chain one of several Carver add-on accessories specifically designed to be plugged into the accessory slot in the rear panel of the amplifier. U201(7) is configured as a unity gain inverting amplifier. When S1 is switched to bridge mode, U201(7) supplies an inverted input signal to the left amplifier channel while the right amplifier receives an identical but non-inverted input signal from the left channel input.

R201, R202, and U202 form an attenuator whose loss is dependent on the resistance of U202, an LED-LDR module. The drive for the LED portion of U202 comes from the clipping eliminator circuitry, which will be discussed later on.

Power Amplifier Circuitry

The PM-600 and PM-900 use the patented Carver Magnetic Field power amplifier circuitry. This innovative circuit uses the combination of a smart power supply and a highly linear, triple-rail power amplifier circuit.

U201(1) is the input stage, providing differential inputs for input and feedback connections as well as most of the open-loop voltage gain of the circuit. Overall negative feedback from the output stage via R238 and R204/R206 sets the closed-loop gain at 29.8 dB (31.9 dB). The specified 28.5 dB (30.0 dB) overall amplifier gain takes into account the small but finite losses associated with R67 and the input level controls as well as R201/R202. The output of U201(1) drives Q201 and Q210, operating as common emitter amplifiers that level-shift the drive signal and couple it to the pre-driver amplifiers Q202 and Q211. Q202 and Q211 provide additional voltage gain, and when combined with the voltage gain of the input op-amp is sufficient to swing the input signal between the +/-73V (+/-97V) power supply rails. Q203 and Q204 are connected as an NPN-PNP conjugate pair and used as a V_{BE} multiplier for bias control. Q204 is thermally connected to the output transistors and together with Q203 provides bias stabilization over a wide temperature range. RP200 allows the bias current to be adjusted to its optimum value.

Up to now, the amplifier circuitry has been fairly conventional. From this point on, there is a marked departure from convention.

The positive-going portion of the output stage is comprised of three series-connected NPN emitter-followers (Q209, Q207/Q208, Q219). The negative-going portion of the output stage is exactly complementary to the positive-going portion; three series-connected PNP emitter-followers (Q217, Q215/Q216, Q222).

The innermost pair (Q209/Q217) are driven from the opposite sides of the V_{BE} multiplier (Q203/Q204) via emitter follower drivers Q206, Q213. This looks suspiciously like a full-complementary amplifier. It is exactly that.

Q214 is also connected as a V_{BE} multiplier to maintain the operating conditions of the Q209/Q217 output pair. Q205 operates as a V-I limiter, sensing the voltage drop across emitter resistor R233, and reducing the drive signal to the output stage under overload conditions (see section on Over-Current Protection further on).

The middle set of output transistors (Q207/Q208) are driven from driver Q206. Diodes D206, D207, D208 and D209 initially force these transistors off and the innermost transistors on. This condition is true for output signals not exceeding around 22 volts (27V) peak. Once the drive signal from Q206 is sufficient to saturate Q209, Q207/Q208 take over. D210 disconnects the +22V (+27V) supply and the output signal can now swing to about +46 volts (+56V).

The outermost pair of output transistors (Q219 and Q222) are driven (by means of Q218, Q220 and Q221, Q223) from the output terminal of the amplifier via diodes D220 and D223. Looking again at the positive-half of the amplifier, Q220 level shifts the output signal towards the +73 (+97) volt supply rail. Zener D219 provides a voltage reference for Q220, preventing it from conducting until the base voltage exceeds 46V (56V) minus the 12 volt zener voltage. As long as the peak AC output voltage remains below this threshold, Q220 does not conduct. Once the AC output voltage exceeds the threshold voltage, Q220 begins conducting which turns on Q218 and Q219. Q221, Q222 and Q223 function similarly for the negative-half of the amplifier. Diodes D218 and D221 are commutator diodes that disconnect the output stage from the 46V (56V) power supply whenever the voltage at the emitters of Q219 or Q222 exceeds 46V (56V). Under high-frequency conditions, C218 and C221 provide phase lead for the outermost output transistors, ensuring that they can "stay ahead" of the audio signal.

Under small-signal conditions, the innermost pair of transistors do all the work. As the signal level grows larger and larger, the middle pairs of transistors take over. Finally, the outermost pair of transistors assume the remainder of the burden of providing a high voltage output signal to the load. This three-stage approach minimizes the voltage across each of the output devices which also minimizes the power dissipation required. Without this approach, the output transistors would be required to support the entire power supply voltage under small-signal conditions and the "unused" portion of the power supply voltage would be turned into heat.

Magnetic Field Power Supply

The main power supply for the PM-600 and PM-900 is a triple-voltage design which provides no-load voltages of ± 73 , ± 46 and ± 22 volts DC (± 97 , ± 56 and ± 27 volts DC). The triac drives the primary of the magnetic field power transformer by operating as a phase controlled switch; its gate signal depends on the signal supplied to opto-isolator U1 located on the regulator board, which isolates the drive circuitry from the AC power line. Diode bridge D1 through D4 provides steering for the phototransistor in U1, allowing the triac to fire on both alternations of the power line.

Start-up Sequence

The phase shift voltage at the junction of R2 and R8 is obtained through the POWER or SEQUENCE switches and is approximately 110-120V, regardless of whether the amplifier is configured for 115V or 230V operation.

The amplifier can be turned on remotely via the SEQUENCE RECEIVE terminal. When the Sequence Switch is turned on, power to the amplifier is held off by the diac portion of opto-isolator U2 on the Regulator Board. When a +5Vdc to +15Vdc control voltage is applied to the sequence receive terminal, base current is supplied to Q5 through R14 and collector current is supplied through D10 and the LED portion of U2. This illuminates the LED and fires the diac, which effectively bypasses the main power switch, allowing AC current to flow. Once the power supply is energized, Q6 is biased on by the +11.4V supply via D11 after a delay established by R15 and C7. This allows approximately 11Vdc to pass to the sequence send terminal, providing the ability to turn on several power amplifiers sequentially by daisy chaining the sequence terminals.

When the power switch on the front of the amplifier is turned on, capacitor C4 begins charging up through R8 and either Q2 or Q3, depending on the polarity. The positive half-cycle of the AC line will charge C4 through R8 and Q3. This charging current forward biases the base emitter junction of Q3, causing it to conduct. Q3 turns on Q4, but no gate current can flow in the triac because D6 is reverse biased. C4 continues charging until the charge on C4 exceeds the now falling voltage at the junction of the bases of Q3 and Q2, formed by divider R8 and R9. Q3 and Q4 will turn off and C4 will begin to discharge through Q2 because the junction of R8 and R9 is more negative than the emitter of Q2 (C4). Q2 will conduct and turn on Q1, and gate current will flow through forward biased D5, firing and latching the triac. On the negative half cycle, C4 is charged through Q2 and discharged through Q3, Q4, D6 and R10 into the gate of the triac. The triac begins to conduct at a minimum phase angle and applies 30-40 VAC to the primary of the transformer.

The triac is switched on and off every half-cycle of the 60Hz AC line. Thus, the triac switches the AC line current off at a rate twice the line frequency, at the instant the line current crosses the zero axis. The triac will then remain off for a number of degrees of the sinusoid, before switching on again. The phase angle at which the triac switches on is the "firing angle" of the triac.

This produces enough voltage to the primary of the power transformer to allow the secondary regulator stage to begin to operate.

Power Supply Regulation

The firing angle of the triac controls the voltage on the primary of the transformer, and is determined by the conduction of the optocoupler U1 on the Regulator Board.

As the conduction of the optocoupler increases, the amount of phase shift on C4 decreases, which increases the conduction angle of the triac. The phototransistor conduction of the optocoupler is controlled by the current through the LED portion of the optocoupler. When the LED in U1 is fully ON, the triac conducts earliest in the AC cycle: the power supply is operating at maximum output. The LED current is supplied by U1(1) on the amplifier board. This differential amplifier senses the secondary supply voltages through R22, R23, R24, R28, R29 and R30. The output voltage at U1(1) increases at the rate determined by C4 (slow start-up). The photo-transistor in the optocoupler will begin to conduct and charge C4 at a faster rate

through R2 and D1/D4 or D2/D3 "steering" diodes, depending on the polarity. This decrease in phase shift results in a longer triac conduction time and higher secondary voltages. The idle secondary voltages are set by RP1 on the amplifier board.

Load Regulation

When the amplifier is driven into a load, the DC supplies (rail voltages) will begin to "sag". Differential amplifier U1(1) senses this and increases the LED current to the optocoupler. This action increases the phototransistor conduction, which increases the triac conduction, which increases the primary voltage, which increases the secondary voltages, thus providing steady, regulated DC supplies for the amplifier stage.

Secondary Voltages

The secondary winding of the power transformer has three taps that supply the three pairs of DC supply voltages $\pm 73V$, $\pm 46V$, $\pm 22V$ ($\pm 97V$, $\pm 56V$, $\pm 27V$), each having its own bridge rectifier and filter capacitors.

Load resistor R81 on the 22V bridge rectifier (PM-600 only) insures that the triac remains latched by providing primary holding current during the time when the secondary supply rectifiers normally stop conducting.

The PM-900 does not require this loading resistor because the fan drive is tapped off the 27V supply. The fan in the PM-900 varies the airflow in direct proportion to the power output of the amplifier. This is accomplished by controlling the voltage to the fan directly in relation to the triac conduction angle through D25 and D26. When the heatsink reaches a temperature of 50° Celsius, the thermal switch closes and shorts out R68, doubling the airflow and cooling capacity. Should the heatsink temperature exceed 100° C, a second thermal switch in series with the AC line voltage opens and disables the amplifier until the heatsink temperature cools below the turn-on threshold of the thermal switch (approximately 85° C).

The $\pm 11.4Vdc$ supply is referenced to the $\pm 22Vdc$ ($\pm 27Vdc$) supply, drawn from the $\pm 73Vdc$ ($\pm 97Vdc$) supply, and regulated by Q5, Q6 and zener diodes D2 and D3. Resistors R9, R10, R61 and R62 provide a residual DC voltage after the unit is turned off, thus keeping the front end of each amplifier biased up to prevent excessive thumping. The $\pm 11.4Vdc$ supply powers the op-amps and small-signal transistors.

Protection Circuitry

Protection functions are shared by the amplifiers and the power supply. Active shutdown protection is provided for the following faults.

Over-Current and High Frequency Output Muting

The amplifiers are protected from short-term excess current through the output stage by electronic current-limiters. When the current through the output transistors becomes excessive, the voltage drop across the emitter resistors R233 and R257 bias the current limiter transistors Q205 and Q212 on, which shunt the drive current via D204 and D211. Q205 provides base current for Q7 through D203 and R279, which drives Q11. When Q11 turns on, C28 charges and turns on Q10, which in turn activates the N-channel muting FET Q1 (the FET is off with -DCV on the gate, and turns on with 0VDC). This attenuates the input signal, removing the high current condition. The input remains muted as C28 discharges through R79, which takes about 5 seconds. Q212 operates in similar fashion for the negative-portion of the output stage. R223, D205, R247 and D212 on the Amplifier Board determine the V-I limits.

As the frequency increases, C208 on the Amplifier Board causes Q205 to bias on sooner, providing a measure of protection against excessive high frequency content or high frequency oscillation.

Q7 also biases on Q12, lighting the Protect/Clip LED. C16 is charged and continues to provide base current to Q12, keeping the LED lit during the mute time.

The inputs are also muted for about 5 seconds when the amplifier is first switched on.

Clipping Eliminator Circuit

This circuit is controlled by the LED/LDR optoisolator U202, located on the Amplifier Board. The LED portion of this component is driven from a bridge rectifier (D226/D227, D225/D228) that gets its input signal from U201(1). Under normal conditions (undistorted amplifier output) there is almost no signal at this point. If the amplifier is driven into clipping, the signal level at U201(1) rises rapidly because the feedback signal no longer represents the input signal. Once this occurs, the LED in U202 illuminates, reducing the resistance of the LDR portion which in turn reduces the input signal. The clipping-eliminator circuit is activated

by switch S2 (accessed from the rear panel). When the switch is off, the signal driving the bridge rectifier is shorted to ground.

DC Offset

DC offset is sensed by a low-pass differential amplifier, formed by U1-pins 5 and 6. Left and right amplifier outputs are summed by R44 and R45, and capacitor C7 rolls off the output in the audio spectrum while +/- DC offset and single channel low frequency signals below 5 Hz are amplified. R44 and R45 have different values to ensure circuit operation if opposite halves of the amplifier decide to fail in opposite ways at the same time. If pin 7 goes positive, current through D7, R31, and U1(2) drives the output of U1(1) negative. This reverse biases the optocoupler LED on the Regulator Board and forces the conduction angle of the triac back to its initial startup position, thereby lowering all secondary power supply voltages and insuring the offset is held to a minimum value.

Overheated Output Transistors

A 100° C resettable thermal switch is mounted on the heatsink in series with the AC line, which protects the output transistors if the top cover vents are blocked or if the unit is run with excessive continuous sinewaves.

Major Faults

The slo-blo line fuse protects the unit from further damage when a major fault such as a shorted triac, shorted output transistor, or a major secondary power supply fault occurs.

If the unit is run at or near its rated power, the fuse will eventually blow. The rated line fuse does allow the unit to be operated without interruption for all musical applications.

Display Circuit

The Protect/Clip LED's are independently driven by Q9 and Q12, and illuminate any time that their respective drive transistors are biased on. Q9 and Q12 are activated by two possible sources:

- 1) The outputs of U101(1) and U201(1). These signals indicate amplifier clipping, and are the same signals that activate the clipping eliminator circuit. C36 and R76 (C27 and R17 for the right channel) establish the time constant of the clipping indicator.

2) The output of Q7 or Q8. This signal goes positive any time that the high frequency or current limit protection circuits are activated.

The display driver circuit comprised of U1(4,3,12,10) and U2(12,10,4,3) is basically a ladder comparator driving LEDs, with a twist. Assume that the signal at U1(2) is zero volts and ignore R23 and D4 for now. R12 and R13 are a voltage divider that establishes a reference voltage for the comparators (four per channel). The comparators compare their input signal against the voltages established by the tapped voltage divider made up of R21, R19, R17, and R24. The left channel LEDs are in the following sequence (lowest to highest): D11 (green), D10 (red), D9 (red), D8 (red), D7 (red), D6 (red), D5 (yellow).

The display board receives a signal from the amplifier outputs and converts it to a positive-going half-wave rectified and smoothed signal. With the input signal at zero volts, all of the comparator outputs are at -1.4V, except for U1(4) which is high. None of the LEDs (D6-D10, D13-D17) have any voltage across them; all are extinguished. As the input signal rises, it crosses, in sequence, the thresholds established at each of the four comparators. First U1(3) fires; its output goes high, and D10 illuminates. Next U1(12) fires, its output goes high; D10 extinguishes (no net voltage across it) and D9 illuminates. Finally U1(10) fires; D9 extinguishes, and (this is the twist) D4/R23 supply current to the bottom of the R17, R19 and R21 voltage divider, which inverts the relationship of the comparators to each other.

When U1(10) fires, the current through R23 reverses the sequence of the voltages that establish the thresholds for the three comparators. This allows the same comparators to perform double-duty. The new thresholds leave U1(10) high, U1(4) low, U1(12) and U1(3) low and D8 on. D6 and D7 are off. As the input signal rises further, U1(12) fires, extinguishing D8 and illuminating D7. Next, U1(3) fires, extinguishing D7 and illuminating D6. Finally U1(4) fires, extinguishing D6. The last LED is the clipping indicator, D5.

SECTION 5

CALIBRATION PROCEDURE PM-600

High Rail Voltage Adjust

With no signal and no load:

1. Adjust RP1 on the amplifier board for $\pm 73\text{VDC}$ ($\pm 0.5\text{V}$) when measured at the large filter capacitors.

2. Verify the following DC voltages on the amplifier board:

D15 Cathode	+23.5VDC ($\pm 1\text{V}$)
D17 Anode	-23.5VDC ($\pm 1\text{V}$)
D19 Cathode	+48.0VDC ($\pm 1\text{V}$)
D21 Anode	-48.0VDC ($\pm 1\text{V}$)
U1 Pin 4	-11.0VDC ($\pm 0.75\text{V}$)
U1 Pin 8	+11.0VDC ($\pm 0.75\text{V}$)

Idle Bias Adjust

With no signal and no load:

1. Adjust RP100 on the amp board for 5.0mV ($\pm 1.0\text{mV}$) across both right channel emitter resistors (R133/R157).

2. Adjust RP200 on the amp board for 5.0mV ($\pm 1.0\text{mV}$) across both left channel emitter resistors (R233/R257).

Note: This adjustment should be made after the amplifier has been on approximately two minutes, while it is still cool. After the amplifier warms up, the bias reading may be higher.

CALIBRATION PROCEDURE PM-900

High Rail Voltage Adjust

With no signal and no load:

1. Adjust RP1 on the amplifier board for $\pm 97\text{VDC}$ ($\pm 0.5\text{V}$) when measured at the large filter capacitors.

2. Verify the following DC voltages on the amplifier board:

D15 Cathode	+27.5VDC ($\pm 1\text{V}$)
D17 Anode	-27.5VDC ($\pm 1\text{V}$)
D19 Cathode	+56.3VDC ($\pm 1\text{V}$)
D21 Anode	-56.3VDC ($\pm 1\text{V}$)
U1 Pin 4	-11.0VDC ($\pm 0.75\text{V}$)
U1 Pin 8	+11.0VDC ($\pm 0.75\text{V}$)

Idle Bias Adjust

With no signal and no load:

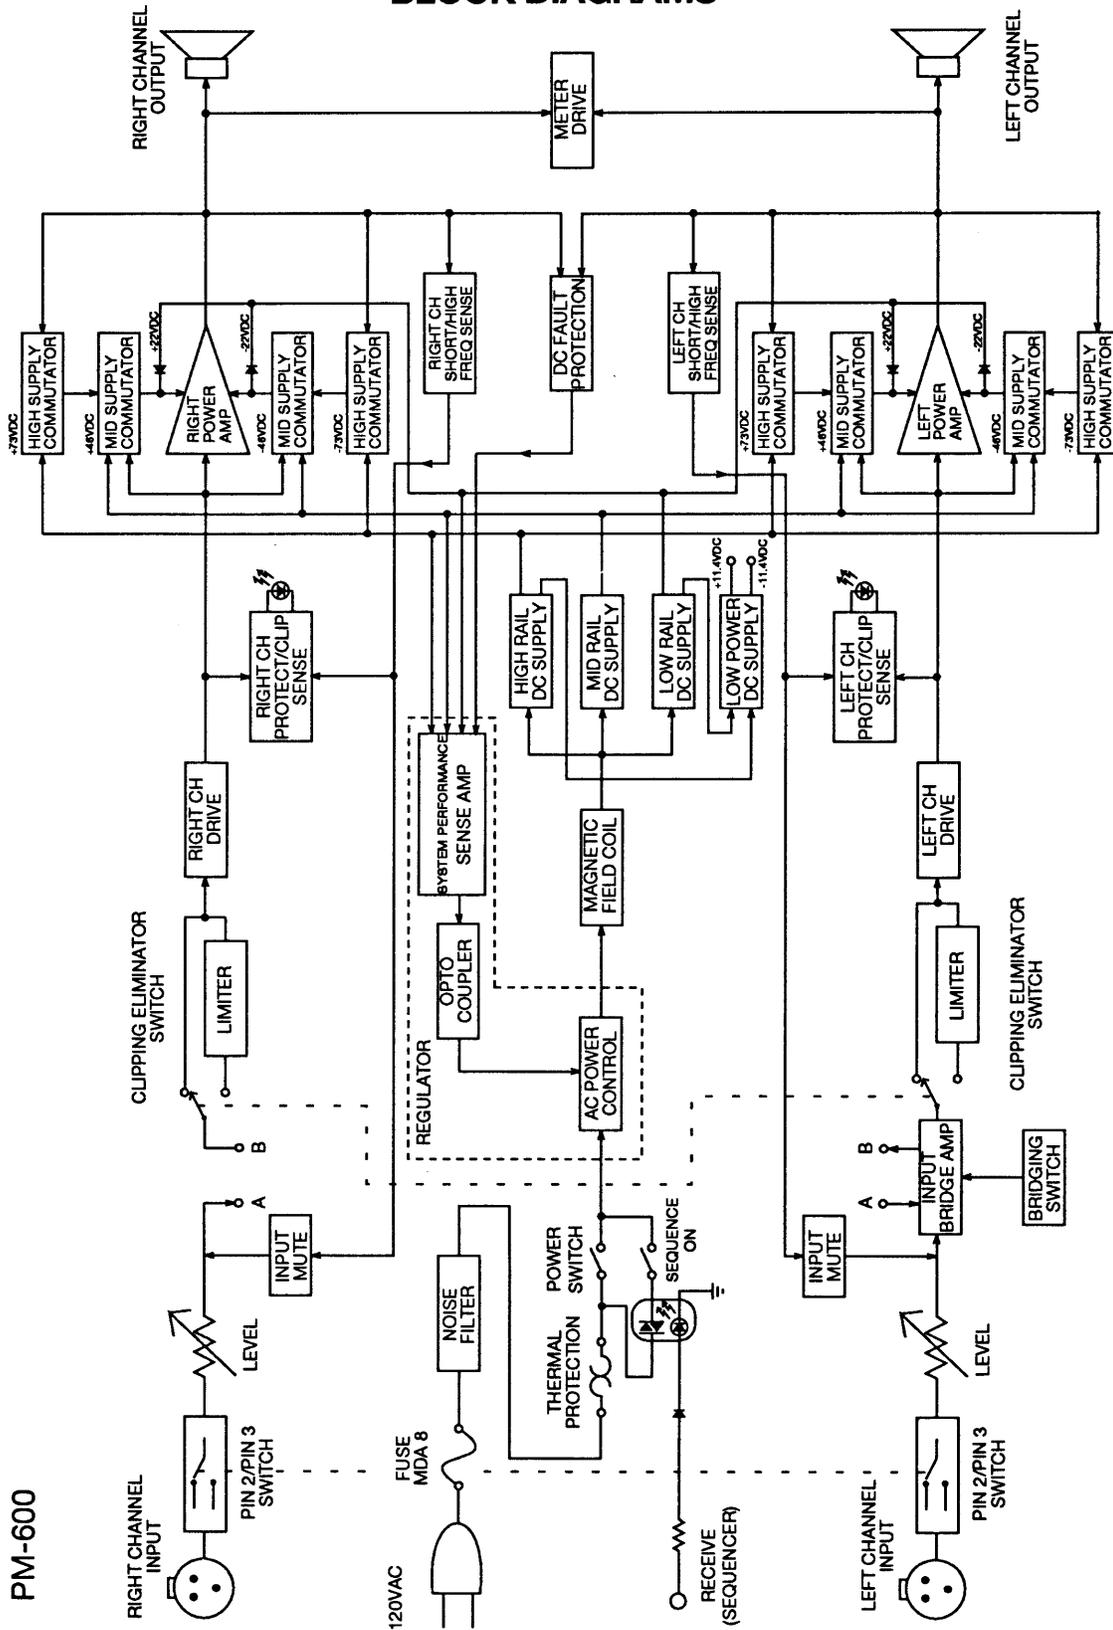

1. Adjust RP100 on the amp board for 5.0mV ($\pm 1.0\text{mV}$) across both right channel emitter resistors (R133/R157).

2. Adjust RP200 on the amp board for 5.0mV ($\pm 1.0\text{mV}$) across both left channel emitter resistors (R233/R257).

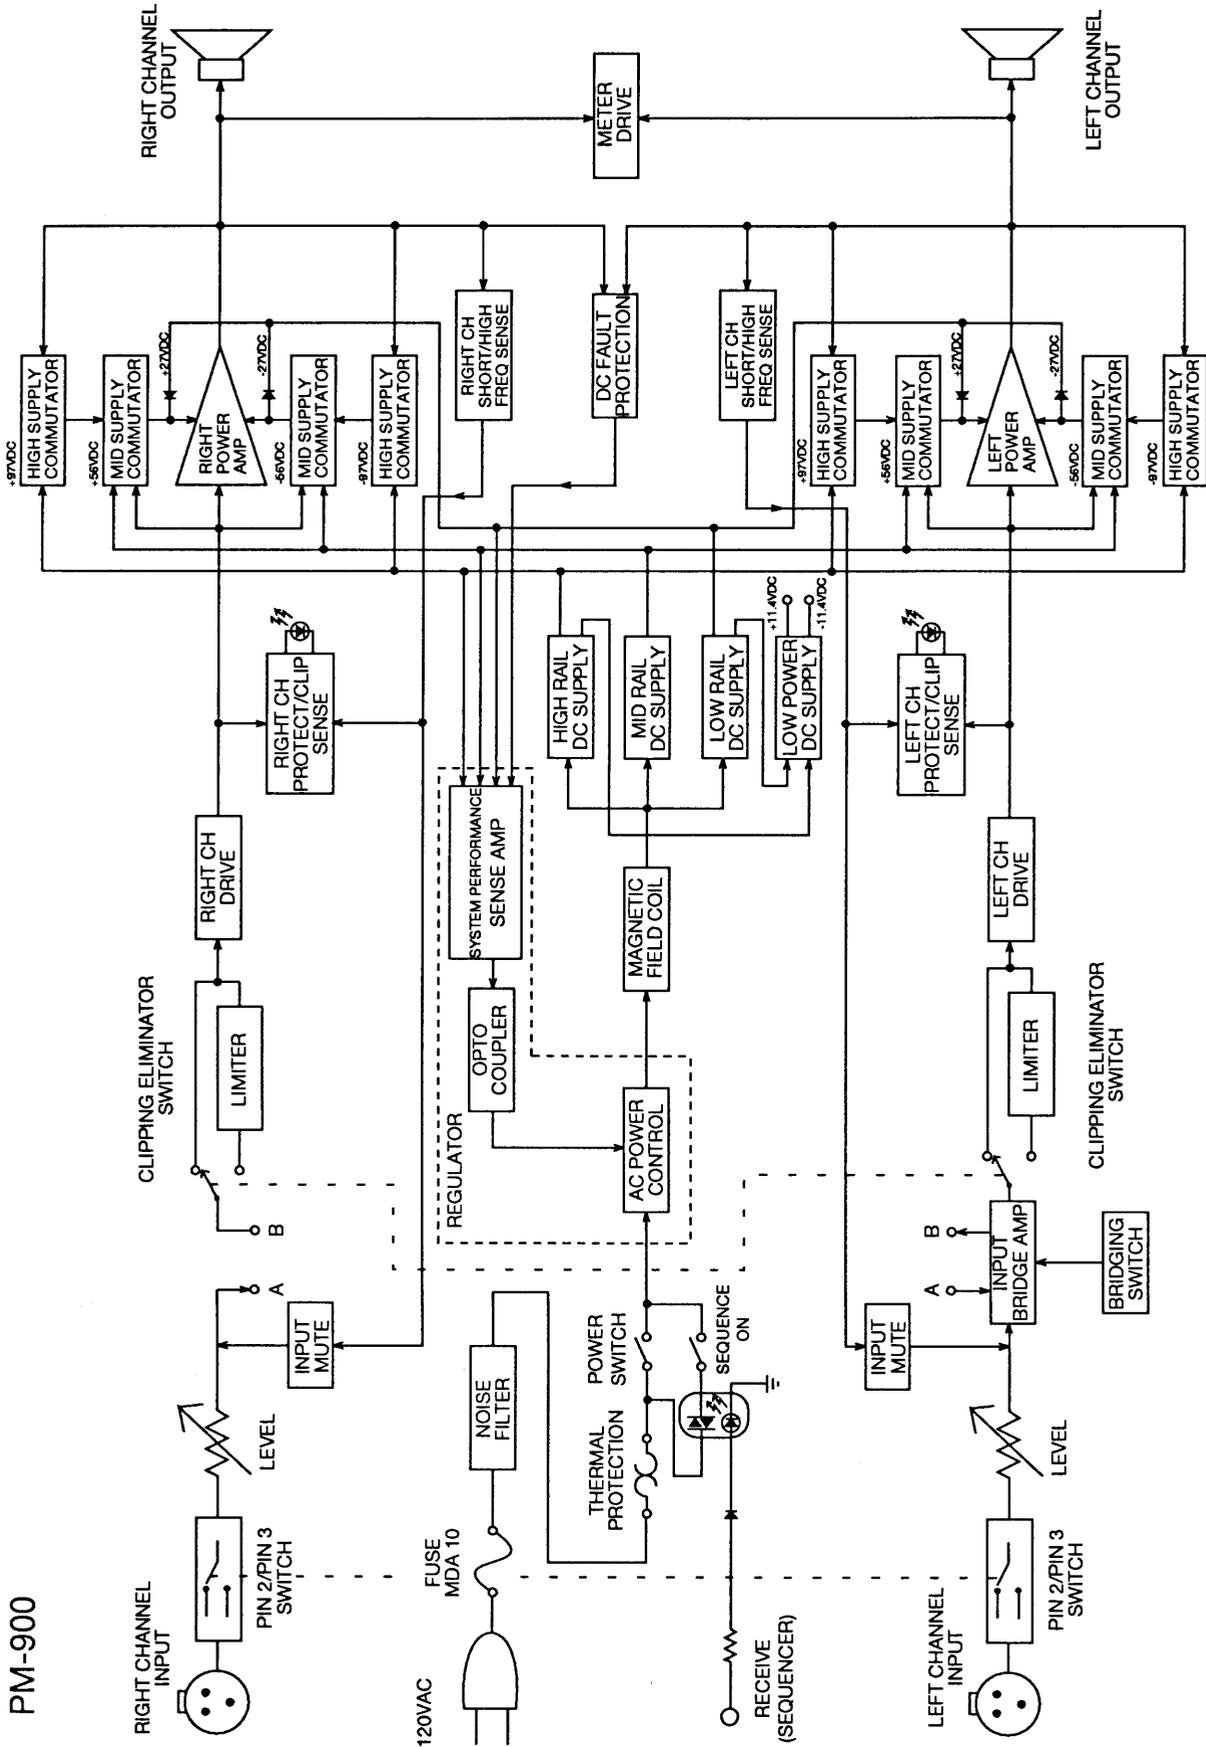

Note: This adjustment should be made after the amplifier has been on approximately two minutes, while it is still cool. After the amplifier warms up, the bias reading may be higher.

SECTION 8

PARTS ORDERING

Please provide the Model numbers of the units involved when ordering genuine CARVER replacement parts. Also provide the CARVER part number and the generic part number to confirm the correct part needed.

The Carver Parts Department is open Monday thru Friday, 7:00 a.m. to 4:45 p.m. PST.

The following phone number is to be used for part orders only!

Technical assistance is not available on this line.

1-800-433-0547

Or if you prefer to FAX in your part order, please use the following FAX number:

1-206-775-9180

From time to time, when it is necessary, we may make a substitution for the original part ordered, due to circuit revisions or part availability.

Random deviation from the original CARVER designated part is not recommended!

Complete PCB replacement is not recommended. You must have prior approval for warranty repair should PCB replacement be necessary.

SECTION 10
VOLTAGE CONVERSION

PM-600 VOLTAGE CONVERSION

BILL OF MATERIALS

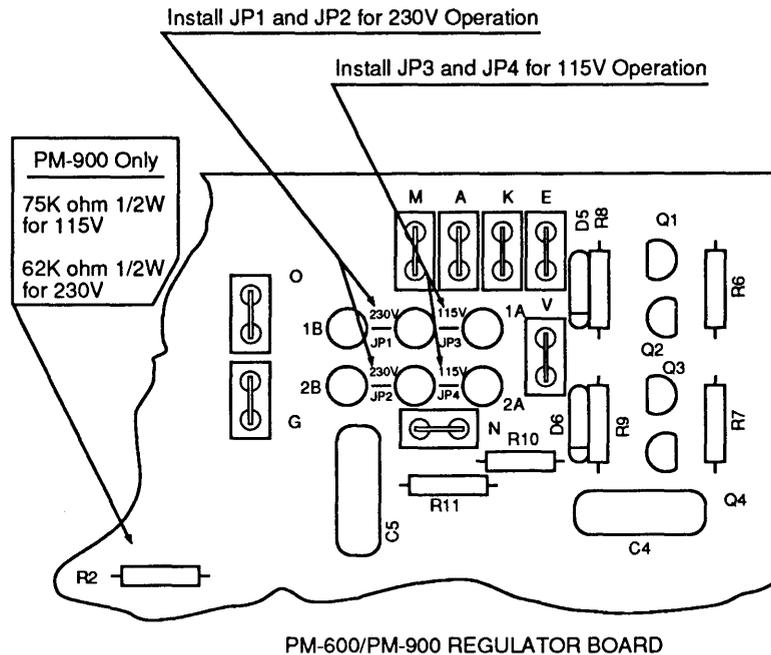

QTY	PART NO.	DESCRIPTION
1	105-50000-00	Fuse Carrier, 120V
1	105-50001-00	Fuse Carrier, 230V
1	315-13003-00	Fuse, MDA8
1	315-16002-00	Fuse, FSM4 Slo-Blo
1	530-10138-00	Label, 4A/230V Slo-Blo
1	530-10139-00	Label, 230V/50Hz 950VA

120V Operation

1. On the regulator board, remove JP1 and JP2 and install JP3 and JP4.
2. Replace the fuse and fuse carrier with an MDA8 Slo-Blo fuse (315-13003-00) and a 120V style fuse carrier (105-50000-00).
3. Remove 230V/50Hz label on rear panel near linecord.
4. Remove 4A/230V Slo-Blo label on rear panel near fuseholder.

230V Operation

1. On regulator board, remove JP3 and JP4 and install JP1 and JP2.
2. Replace the fuse and fuse carrier with an FSM4A Slo-Blo fuse (315-16002-00) and a 230V style fuse carrier (105-50001-00).
3. Apply 230V/50Hz label (530-10139-00) on rear panel near linecord.
4. Apply 4A/230V Slo-Blo label (530-10038-00) on rear panel near fuseholder.

PM-900 VOLTAGE CONVERSION

BILL OF MATERIALS

QTY	PART NO.	DESCRIPTION
1	105-50000-00	Fuse Carrier, 120V
1	105-50001-00	Fuse Carrier, 230V
1	251-10113-00	Res, CFilm, 62kΩ, 1/2W
1	251-10115-00	Res, CFilm, 75kΩ, 1/2W
1	315-13006-00	Fuse, MDA10

1	530-10141-00	Label, 230V/50Hz 1200VA

120V Operation

1. On the regulator board, remove JP1 and JP2 and install JP3 and JP4.
2. On regulator board, change R2 to 75kΩ, 1/2W resistor (251-10115-00).
3. Replace the fuse and fuse carrier with an MDA10 Slo-Blo fuse (315-13006-00) and a 120V style fuse carrier (105-50000-00).
4. Remove 230V/50Hz label on rear panel near linecord.
5. Remove 6A/230V Slo-Blo label on rear panel near fuseholder.

230V Operation

1. On regulator board, remove JP3 and JP4 and install JP1 and JP2.
2. On regulator board, change R2 to 62kΩ, 1/2W resistor (251-10113-00).
3. Replace the fuse and fuse carrier with an FSM6.3A Slo-Blo fuse (315-16001-00) and a 230V style fuse carrier (105-50001-00).
4. Apply 230V/50Hz label (530-10141-00) on rear panel near linecord.
5. Apply 6A/230V Slo-Blo label (530-10140-00) on rear panel near fuseholder.

SECTION 11

SERVICE BULLETINS

Please insert Carver Service Bulletins pertaining to the PM-600 and PM-900 here to ensure proper repair in the future.

CARVER CORPORATION SERVICE BULLETIN

Service Bulletin # PM-600-1

Model PM-600

Serial # BEFORE 483

Reason: The Molex connector used for the PMX mounting cable may be mounted backwards.

Procedure: The eight pin male Molex connector on the main amp board labeled J5 must be turned around to insure that the PMX cable mounts properly.

The silk screen on the main amp board that shows the polarity of the header is incorrect. Be sure to mount the header so that the tab of the header is towards the rear of the unit.

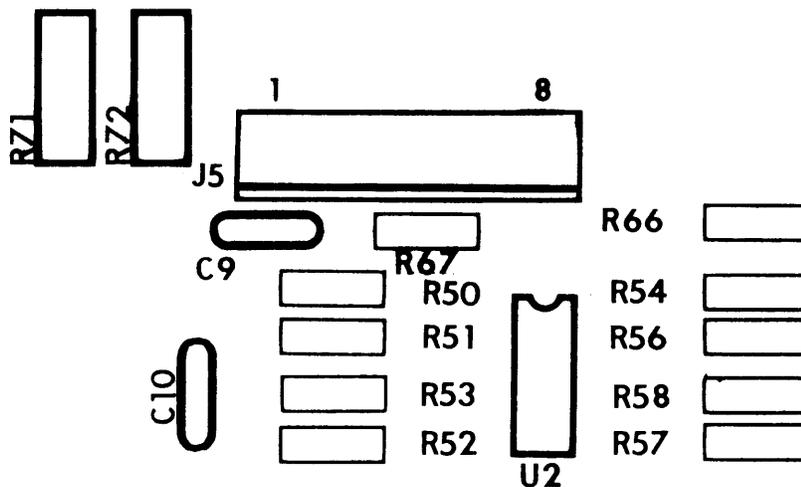

THIS IS OPPOSITE OF THE SILK SCREEN.

*FIGURE 1 SHOWS THE CORRECT HEADER MOUNTING

DATE

CARVER CORPORATION SERVICE BULLETIN

Service Bulletin # PM-600-3 | Model: PM-600 | Serial nos. 901→90X30600001

REASON:

Date: 11/01/90

To reduce noise in speaker outputs.

DELETE

Qty 1 Cable, Line Filter to
Regulator Board WP-X
550-00017-00

ADD

Qty 2 Washer, Int. Lock #4
154-20001-00

PROCEDURE

NOTE: This procedure only applies to units with the silver colored line filter marked Delta Electronics 20DBAG5.
Do not perform this modification to units with the black TDK brand line filter.

- 1) Disconnect all wires from the Line Filter.
- 2) Remove the black wire from the WP-X position on the regulator board and discard.
- 3) Remove 2 screws securing the line filter bracket to bottom of unit.
- 4) Remove the line filter assembly from unit.
- 5) Remove 2 screws and nuts securing line filter to bracket. Rotate the line filter 180° so that the end marked "LINE" is facing the load, and the end marked "LOAD" is facing the line input.
- 6) Mount the line filter to the bracket in the new position using the 2 screws and nuts previously removed.
- 7) Mount the line filter to the bottom of unit using the two screws previously removed and inserting the #4 lock washers between the screw and bracket (see Figure 1 on next page).
- 8) Connect the wiring as shown in Figure 2.

Qty 1 Tyrap 4"
P/N 159-50002-00

PROCEDURE

1. Remove Cable Harness from J-6 on amplifier board and unsolder from left and right level pots.
2. Clip tyrap securing cable to left side panel, and discard cable.
3. Install shielded cable harness to J-6 and solder onto left and right level pots (see Figure 1).
4. Mount ground lug under screw holding the pot mounting bracket to the front panel.
5. Use tyrap to secure shielded cable to the tyrap mount on the left side panel (located above power supply filter caps).
