

ADJUSTMENTS

Equipment Required: DC VTVM, Audio (AC) VTVM
IM Analyzer,
4-ohm, non-inductive load resistor
(minimum 25-watt rating)

1 — Bias Adjustment

- a. Set Volume control to minimum.
- b. Connect DC VTVM to Pin 5 of any output tube (V7, V8, V9 or V10).
- c. Adjust "Bias" control for 39.0 volts.

2 — Phase Inverter Adjustment

IMPORTANT: Note in the schematic that the C (common) speaker terminals are not grounded — the 4-ohm terminals are grounded. Never ground the C terminals either directly or accidentally through test equipment common ground leads.

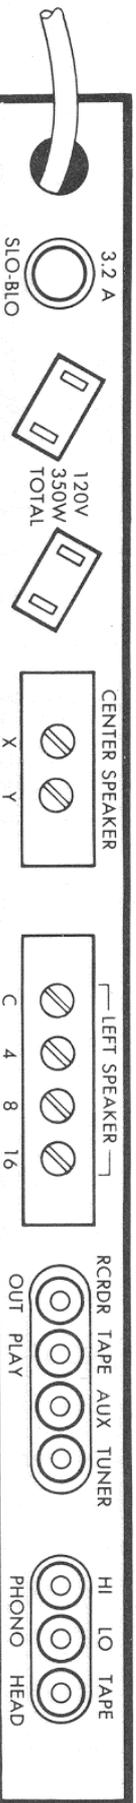

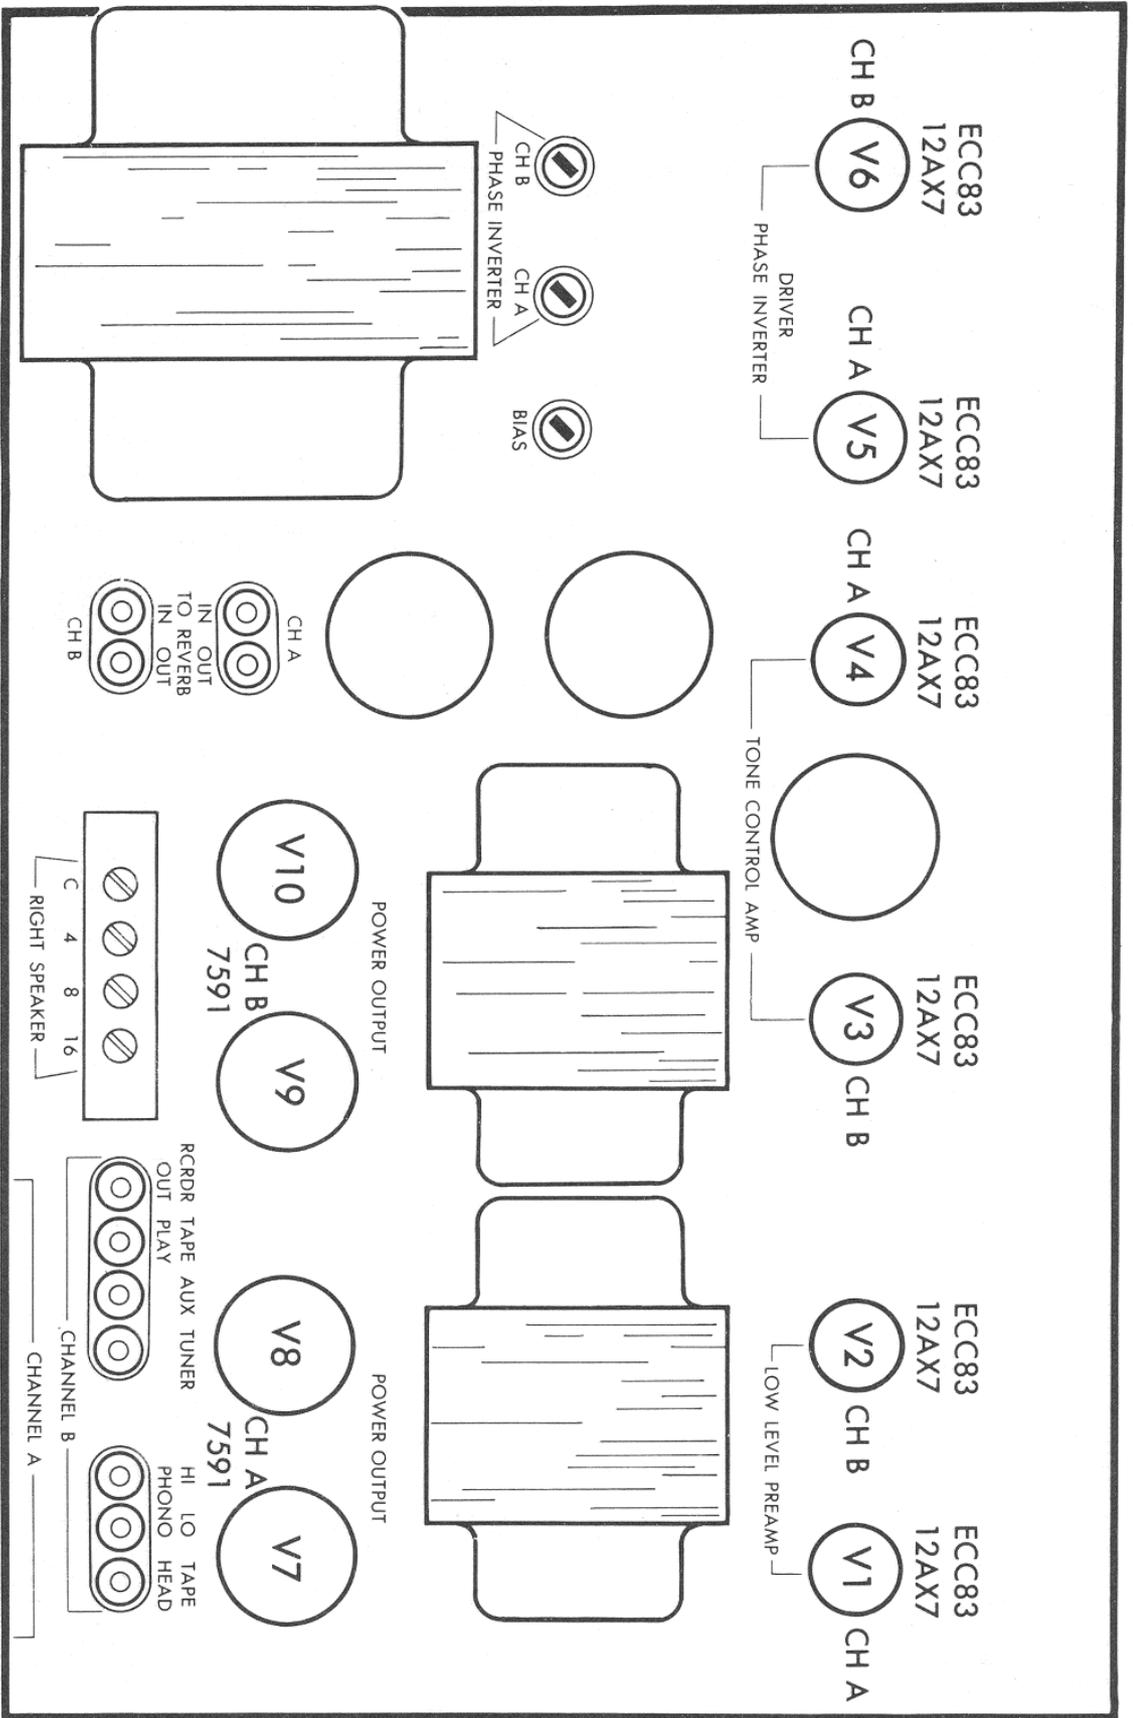

Channel A

- a. Connect a 4-ohm load between C and 4 left speaker terminals.
- b. Connect IM Distortion Analyzer output to channel A AUX input.
- c. Connect the Analyzer input ground lead to the left speaker 4-ohm terminal.
- d. Connect the Analyzer input hot lead to the left speaker C terminal
- e. Set the Selector switch to AUX, the Mode switch to STEREO, and adjust the Analyzer for 8.0 volts across the 4-ohm load.
- f. Adjust the CH A Phase Inverter control for minimum IM distortion.

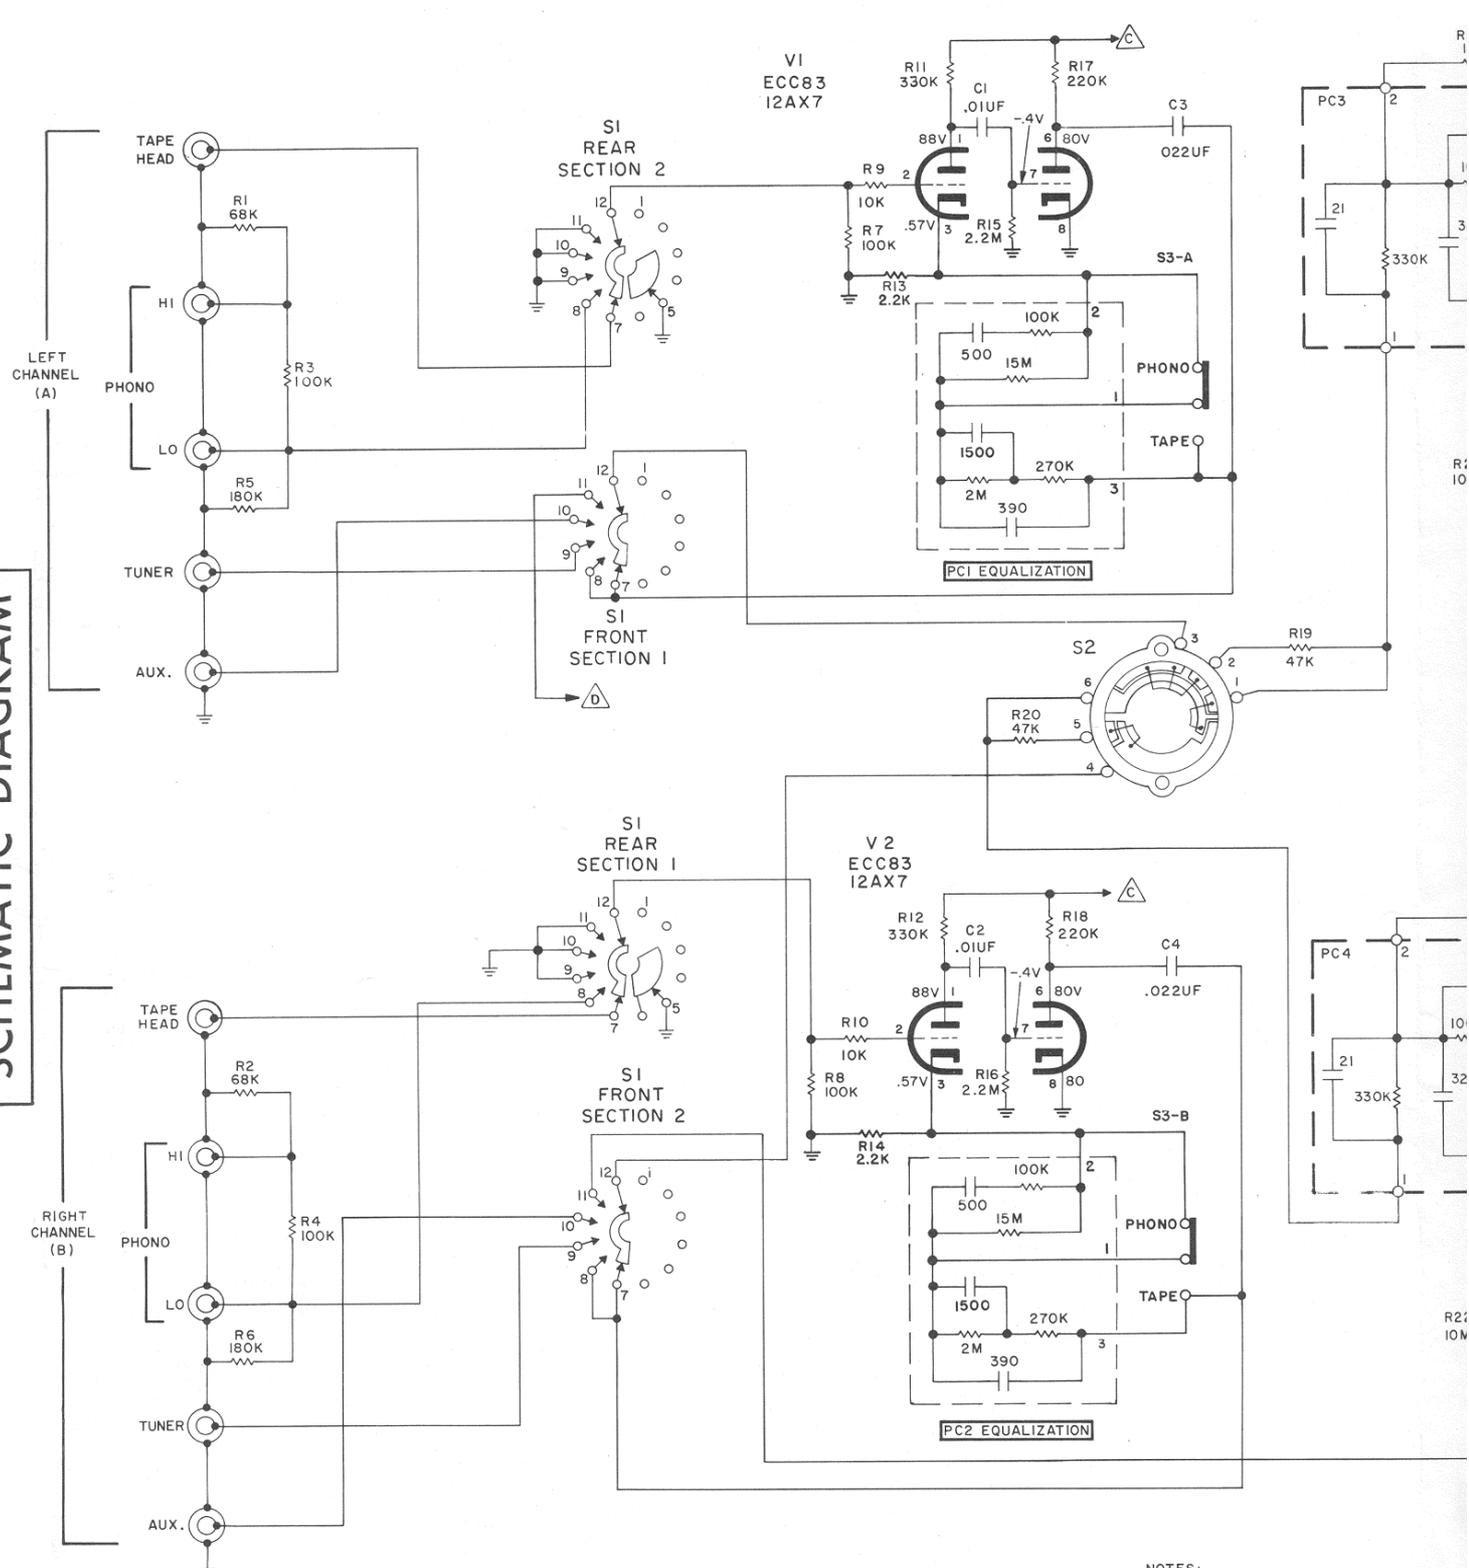

Channel B

- a. Connect a 4-ohm load between C and 4 right speaker terminals.
- b. Connect IM Distortion Analyzer output to channel B AUX input.
- c. Connect the Analyzer input ground lead to the right speaker 4-ohm terminal.
- d. Connect the Analyzer input hot lead to the right speaker C terminal.
- e. Set the Selector switch to AUX, the Mode switch to STEREO, and adjust the Analyzer for 8.0 volts across the 4-ohm load.
- f. Adjust the CH B Phase Inverter control for minimum IM distortion.

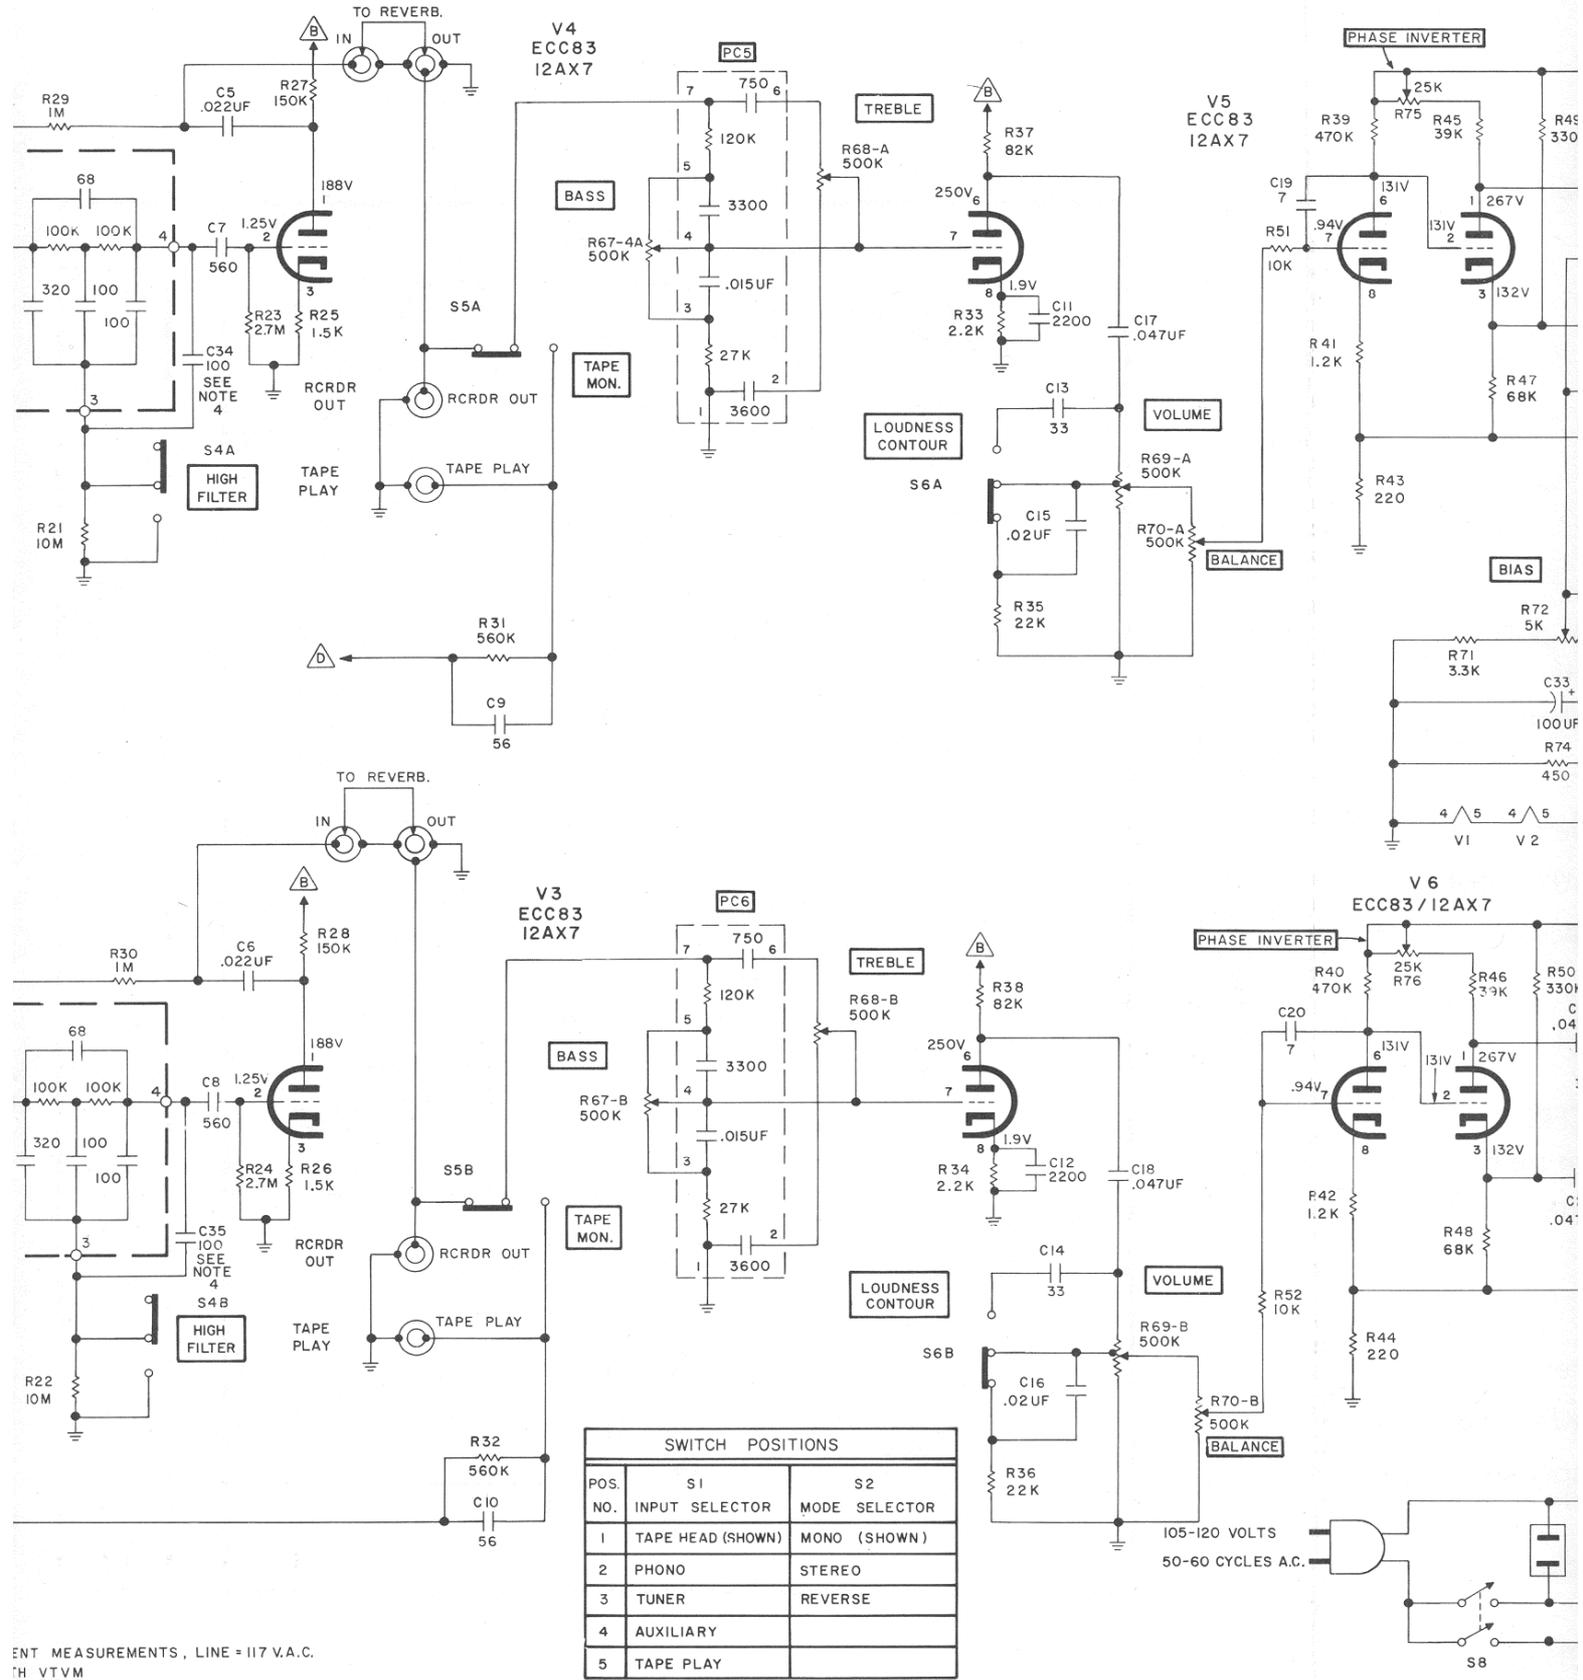

TUBE LAYOUT
