### PS-8 SPECIFICATIONS

Frequency Response:	35Hz – 150Hz ( $\pm 3$ dB)
Maximum Amplifier Output:	100 watts RMS (20Hz – 150Hz with no more than 0.1% THD)
Crossover Frequencies:	50Hz – 150Hz, 24dB/octave, continuously variable
Driver:	8" (203mm) MMD™ DCR = $4.3\Omega$
Dimensions	17-1/2" x 10-5/8" x 16-3/4" (H x W x D) (445mm x 270mm x 426mm)
Weight:	33 lb (15kg)

Infinity continually strives to update and improve existing products, as well as create new ones. The specifications and construction details in this and related Infinity publications are therefore subject to change without notice.

**INFINITY PRIMUS PS-8 100W Powered Sub/ Plate Amp**

LINE VOLTAGE	Yes/No	Hi/Lo Line	Unit	Notes	
US 120VAC/60Hz	Yes	108-132	Vrms	Normal Operation	
Europe 220-240VAC, 50-60Hz	Yes	220-240	Vrms	Normal Operation	
Parameter	Specification	Unit	QA Test Limits	Conditions	Notes
<b>Amp Section</b>

<b>Spkr Out: Level out (L,R)Hi Pass Filter</b>					
120 VAC Version	NO			120VAC version is not provided with Spkr. Output connectors	
230 VAC Version	YES		functional	This feature exists in 230VAC Model	Direct by pass from Speaker in
<b>Signal Sensing (ATO)</b>					
Auto-Turn-On (yes/no)	YES	--	functional		
ATO Input Frequency	50	Hz	functional		
ATO Level	2	mV	functional	2mV@50Hz into Line Input w/ 1 ch. driven	
ATO Level Speaker in	35	mV	functional	35mV @ 50 Hz into the speaker input, single input driven.	
ATO Turn-on time	5	ms	functional	Amp connected and AC on, then input signal applied	
Auto Mute/ Turn-OFF Time	10	minutes	functional	T before muting, after signal removed	Auto turn of time (T) must be 5 > T <15
<b>Power on Delay time</b>					
	3	sec.	functional	AC Power Applied	
<b>Transients/Pops</b>					
ATO Transient	5	mV-peak	10	@ Speaker Outputs	
Turn-on Transient	50	mV-peak	100	@ Speaker Outputs	AC Line cycled from OFF to ON
Turn-off Transient	50	mV-peak	100	@ Speaker Outputs	AC Line cycled from ON to OFF
<b>Efficiency</b>					
Stand-by Input Power	12	Watts	15	@ nom. line voltage	Maximum allowable input power under nominal Input voltage and frequency, HOT or COLD operation.
Power Cons.@rated power	195	Watts	210	@ nom. line voltage	100 Watts @ 4 Ohms
<b>Protection</b>					
Short Circuit Protection	YES	--	functional	Direct short at output	
Thermal Protection	65 deg. C	--	functional	@1/8 max unclipped Power	Temperature rise should not exceed 35K rise
DC Offset Protection	YES	--	functional	DC present at Speaker Out leads	Relay or crowbar (for driver/fire protection)
Line Fuse Rating					External fuse with UL/SEMKO rated holder
120 VAC	2.5	Amps		Type-T or Slo Blo	
230 VAC	1.25	Amps		Type-T, Low breaking capacity	
ALL SPECS SHOULD BE MEASURED AT NOMINAL LINE VOLTAGE					

# CONTROLS AND CONNECTIONS

## Rear Panel

- 1** Subwoofer-Level Control
- 2** Crossover Adjustment
- 3** Phase Switch
- 4** LFE Input
- 5** Line-Level Inputs
- 6** High-Level Inputs
- 7** Power Switch

## SUBWOOFER CONNECTIONS

### CHOOSE THE SUBWOOFER CONNECTION THAT IS MOST SUITABLE FOR YOUR RECEIVER/PROCESSOR

If you have a Dolby® Digital or DTS® receiver/processor with a low-frequency-effects (LFE) or subwoofer output:

If your receiver/processor does not contain a Dolby Digital or DTS processor but has a subwoofer output:

**NOTE:** Some receivers have one subwoofer output. In that case, it is recommended that you use a Y connector (not included) to maximize performance.

If your receiver/processor does not have subwoofer outputs for the left and right channels or an LFE output, connect speaker wire from your receiver/amplifier to your speakers and subwoofer using two sets of speaker wire:

This figure shows how to connect bare wires to the terminals.

## OPERATION

### Power On

Plug your subwoofer's AC cord into a wall outlet. Do not use the outlets on the back of the receiver.

Initially set the Subwoofer-Level Control ❶ to the "min" position.

Turn on your sub by pressing the Power Switch ❷ on the rear panel.

Turn on your entire audio system and start a CD or movie sound-track at a moderate level.

### Auto On/Standby

With the Power Switch ❷ in the ON position, the LED on the front panel will remain lit in red or green to indicate the On/Standby mode of the subwoofer.

RED = STANDBY (No signal detected, Amp Off)

GREEN = ON (Signal detected, Amp On)

The subwoofer will automatically enter the Standby mode after approximately 10 minutes when no signal is detected from your system. The subwoofer will then power ON instantly when a signal is detected. During periods of normal use, the Power Switch ❷ can be left on. You may turn off the Power Switch ❷ for extended periods of nonoperation, e.g., when you are away on vacation.

### Adjust Level

Turn your Subwoofer-Level Control ❶ up to the "5" position (halfway). If no sound emanates from the subwoofer, check the AC-line cord and input cables. Are the connectors on the cables making proper contact? Is the AC plug connected to a "live" receptacle? Has the Power Switch ❷ been pressed to the "On" position? Once you have confirmed that the subwoofer is active, proceed by playing a CD, record or cassette. Use a selection that has ample bass information.

Set the overall volume control of the preamplifier or stereo to a comfortable level. Adjust the Subwoofer-Level Control ❶ until you obtain a pleasing blend of bass. Bass response should not overpower the room but rather be adjusted so there is a harmonious blend across the entire musical range. Many users have a tendency to set the subwoofer volume too loud, adhering to the belief that a subwoofer is there to produce lots of bass. This is not entirely true. A subwoofer is there to enhance bass, extending the response of the entire system so the bass can be felt as well as heard. However, overall balance must be maintained or the music will not sound natural. An experienced listener will set the volume of the subwoofer so its impact on bass response is always there but never obtrusive.

### Phase Control

The Phase Switch ❸ determines whether the subwoofer speaker's piston-like action moves in and out with the main speakers, 0°, or opposite the main speakers, 180°. Proper phase adjustment depends on several variables such as room size, subwoofer placement and listener position. Adjust the phase switch to maximize bass output at the listening position.

### Crossover Adjustments

The Crossover Adjustment control ❹ determines the highest frequency at which the subwoofer reproduces sounds. If your main speakers can comfortably reproduce some low-frequency sounds, set this control to a lower frequency setting, between 50Hz and 100Hz. This will concentrate the subwoofer's efforts on the ultradeep bass sounds required by today's films and music. If you are using smaller bookshelf speakers that do not extend to the lower bass frequencies, set the Crossover Adjustment control to a higher setting, between 120Hz and 150Hz.

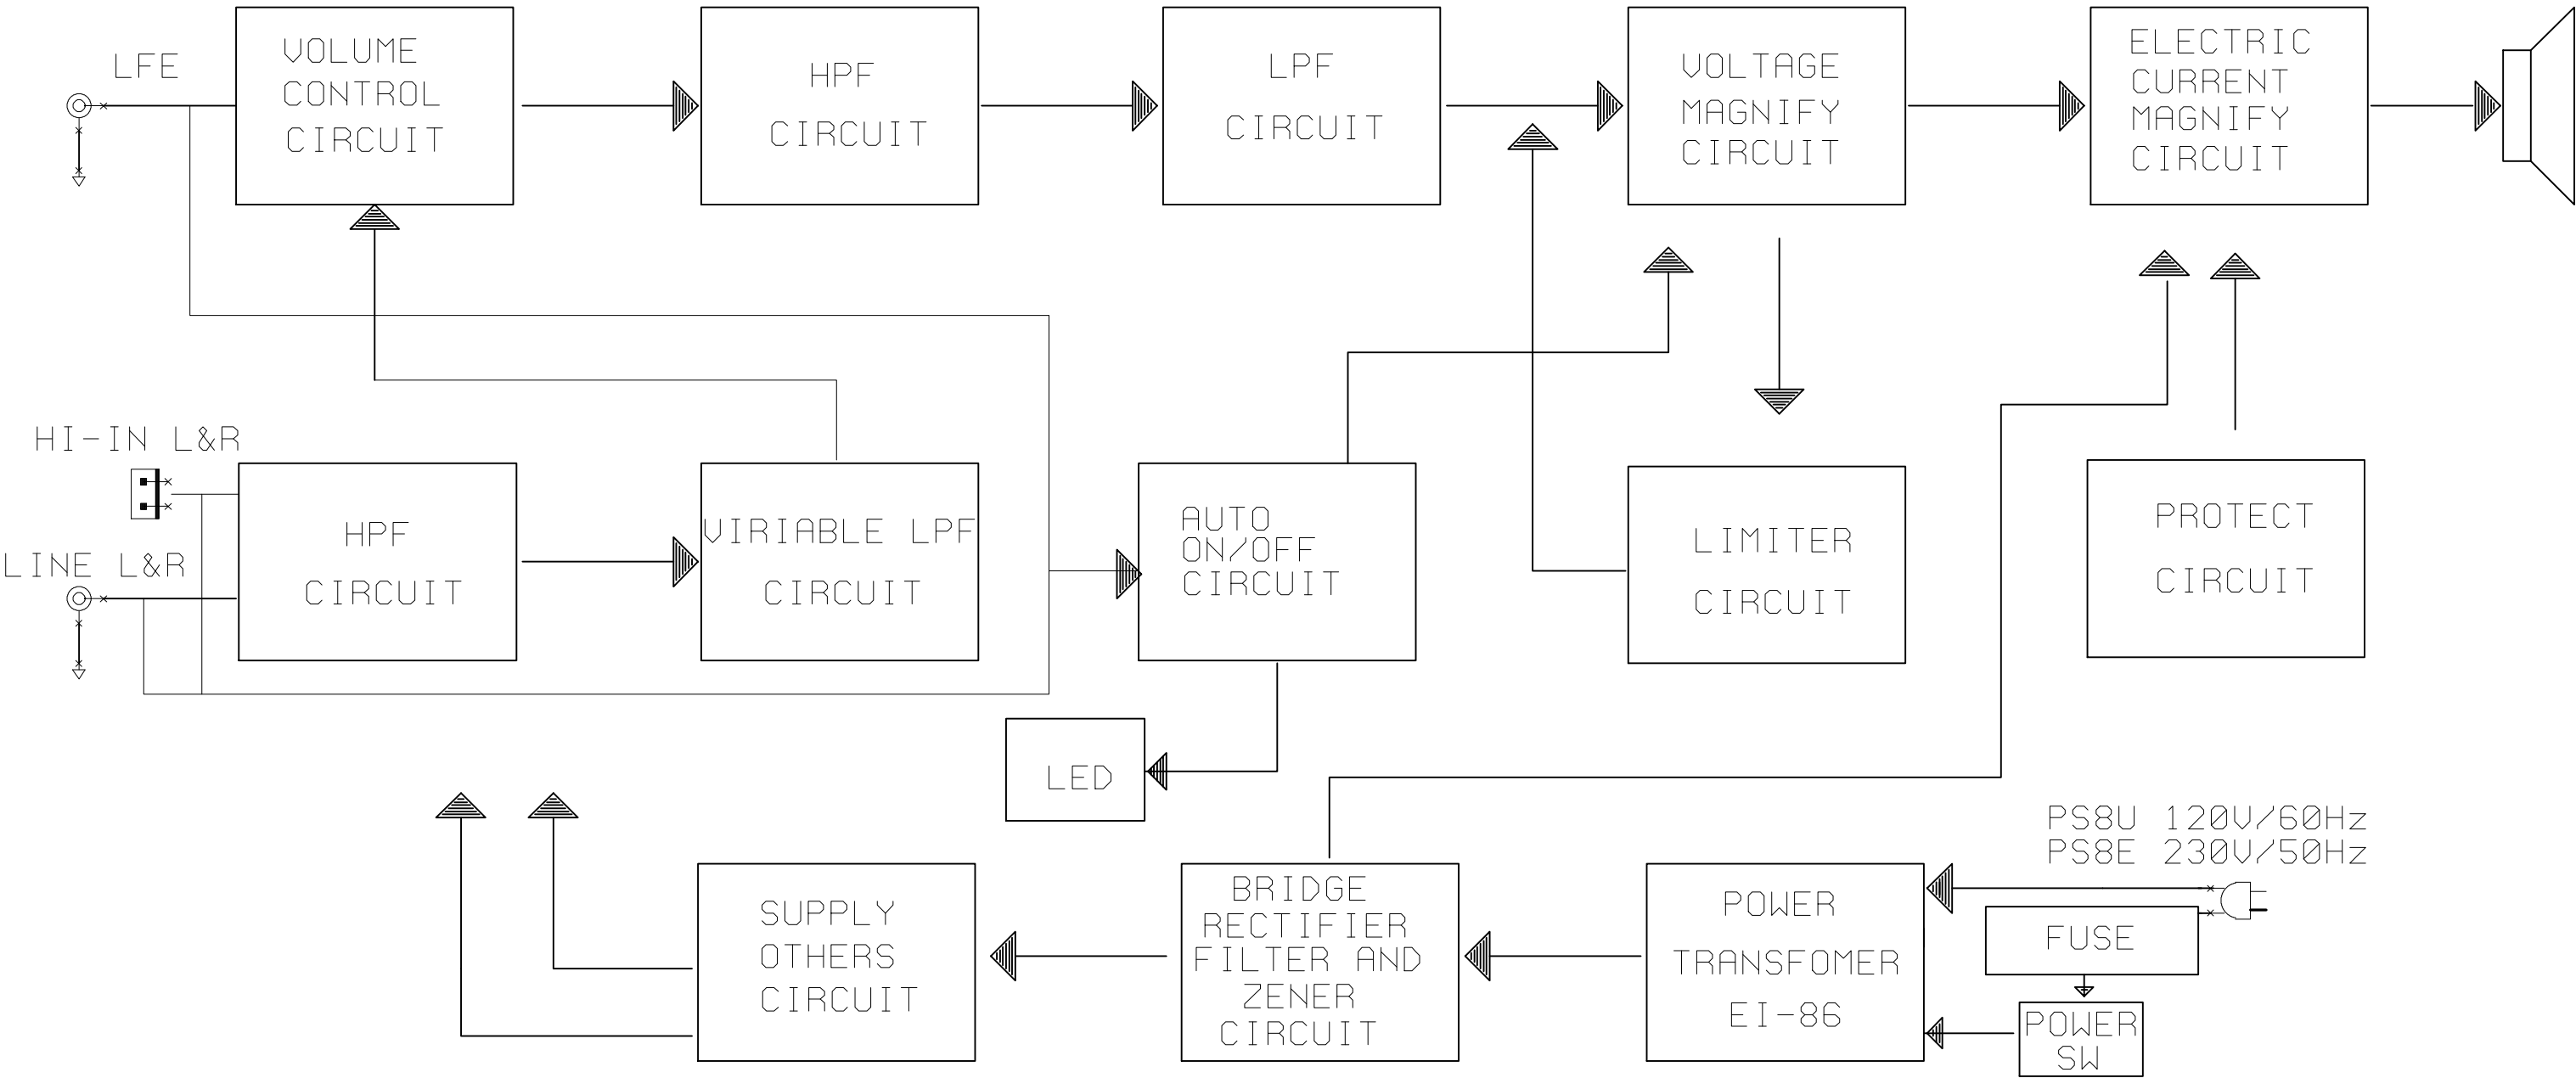

NOTE: This control will have no effect if the LFE Input ❺ is used. If you have a Dolby Digital or DTS processor/receiver, the Low-Pass Frequency is set by the processor/receiver. Consult your owner's manual to learn how to view or change this setting.

PS-8 U/E BLOCK DIAGRAM

## PS-8 Test Set Up and Procedure

### SYSTEM AURAL SWEEP TEST

#### Equipment needed:

- Function/signal generator/sweep generator
- Integrated Amplifier
- Multimeter
- Speaker cables

#### General Unit Function (UUT = Unit Under Test)

Switches/knobs on the amplifier faceplate:

Low Pass Frequency Adjust full CW (150Hz)

Phase switch – either position

1. From the signal generator, Connect both right and left line level inputs (RCA) – not the LFE jack - to signal generator and UUT. Use Y-cable if necessary from mono source.
2. On the amplifier, turn the LEVEL control full Counterclockwise (Min).
3. Turn on generator, adjust to **75mV, 50 Hz**.
4. Plug in UUT; turn the power switch ON. Turn LEVEL control full Clockwise (Max).
5. LED should now be Green; immediate bass response should be heard and felt from rear port tube opening.
6. Turn off generator, turn LEVEL control fully Counterclockwise (Min), disconnect RCA cable.
7. Connect one pair of speaker cables to one set of High Level input terminals on UUT. Cables should be connected to an integrated amplifier fed by the signal generator.
8. Turn on generator and adjust so that speaker level input at the amplifier is **1.5V, 50 Hz**. Turn LEVEL control full Clockwise (Max).
9. Green LED should light; immediate bass response should be heard and felt from the port tube opening.

#### Sweep Function

1. Follow steps 7-10 above, using a sweep generator as a signal source.
2. Sweep generator from 20Hz to 1kHz. Listen to the cabinet and drivers for any rattles, clicks, buzzes or any other noises. If any unusual noises are heard, remove woofer and test.

#### Driver Function (Woofer)

1. Remove woofer from cabinet; detach + and - wire clips.
2. Check DC resistance of woofer; it should be **4.5 ohms ±10%**.
3. Connect a pair of speaker cables to driver terminals. Cables should be connected to an integrated amplifier fed by a signal generator. Turn on generator and adjust so that speaker level output is **5.0V**.
4. Sweep generator from 20Hz to 1kHz. Listen to driver for any rubbing, buzzing, or other unusual noises.

PS-8 Electrical Parts List (See addendum for serial # ME0683-16317 and above)
