COMPONENTS DESCRIPTION

● AUDIO UNIT (X09-8560-10)

Ref. No.	Application / Function	Operation / Condition / Compatibility
IC1	μ-com	Overall control.
IC3	DC/DC converter driver	Generates the gate waveform for switching.
IC5 (2/2)	Comparator	Compares the analog signal with the triangular wave and generates the PWM waveform for the minus output-side amplifier of the BTL.
IC6 (1/2)	Comparator	Detects ASO. Compares current with voltage to detect short in the output.
IC6 (2/2)	Comparator	Detects the resonance waveform that is caused when the plus and minus terminals are shorted in the vicinity of the SP terminals, and protects from the short.
IC7 (1/2)	Comparator	Detects over current with the waveform shaped in IC17 and sends the result of the detection to the μ-com and the TR used to control the D-class amplifier.
IC7 (2/2)	Comparator	When SP+ or SP- terminal output is shorted to the ground, the current in the + power supply and that in the - power supply are unbalanced. The unbalance in the current is converted into DC voltage in Q176 and Q177, and when the voltage exceeds the preset value the output is reversed and the protection function is activated.
IC10,11	Isolation AMP	Removes the common mode noises in the input signal.
IC12	Buffer AMP	Buffer AMP for RCA output.
IC13 (1/2)	Signal amplification	Amplifies the output voltage between the SP + and SP - terminals and generates the NF signal.
IC13 (2/2)	Signal amplification	Amplifies differences between the input and feedback signals. Initial stage of the D-class amplifier.
IC14 (1/2), IC20 (1/2)	Comparator, Signal amplification	Triangular wave generation.
IC14 (2/2)	Comparator	Compares the analog signal with the triangular wave and generates the PWM waveform for the plus output + side amplifier of the BTL.
IC15,16,21	NAND gate	To gate pulse of the D-class amplifier.
IC17	NAND gate	Retains the pulse width and keeps holds a certain width when IC6 and IC7 (2/2) detect its individual over current.
IC18	Signal amplification	Amplifies and rectifies the output voltage at the SP + terminal, and generates DC voltage that is proportional to the output.
IC19 (1/2)	Signal amplification	Amplifies the potential differences caused by current running in the GND pattern, and sends it to the μ-com to obtain current.
IC19 (2/2)	Signal amplification	Amplifies the DC offset at the SP + terminal, and applies to the DC servo.
IC20 (2/2)	Signal amplification	Generates the inverted waveform of the triangular wave that is generated in IC14 (1/2) and IC20 (1/2).
IC22	Filter	Filters and rectifies the resonance waveform that is caused when the plus and minus terminals are shorted in the vicinity of the SP terminals, and sends the resultant DC voltage to IC6 (2/2).
IC24	Signal amplification	When 1Ω load is detected, lowers the voltages at pins 1 and 7 and decreases the signal clipping level in order to limit the SP output.
IC55~57	BassBoost circuit (Remote control operation)	Boosts the signal with the operations from the remote control. GAIN=0~+18dB, fc=40~100Hz
Q1,2	POWER ON SWITCH	Turns ON/OFF DC/DC converter power supply in response to the output from pin 8 of the μ-com.
Q3~5	5V constant voltage power supply	It is used as the constant voltage power supply of 5V for the μ-com and the SW5V.
Q6	SW5V control	Turns ON/OFF 5V to the SW5V line in response to the output from pin 20 of the μ-com.
Q7	Pcon over voltage control	Blocks the ON signal to the Pcon and places the Pcon in the OFF condition when the battery voltage is too high.

KAC-PS1D/X1R

COMPONENTS DESCRIPTION

Ref. No.	Application / Function	Operation / Condition / Compatibility
Q8	Pcon Switch	Places the amplifier in the ON condition by sending "L" to pin 1 of the μ -com when the Pcon terminal becomes "H" while the battery voltage is in the normal range.
Q10,11	DD converter gate control	Turns ON/OFF DD converter gate drive pulse in response to the output from pin 8 (Power_On) of the μ -com.
Q13~16	DD converter gate driver	Drives the switching FET gate in the DD converter.
Q17~20, Q22~24,27	DD converter switching FET	Repeats switching the transformer's primary side to generate high voltage at the secondary side.
Q25,26	+15V constant voltage power supply	In order to compensate HFE in Q26, both TRs in Q25 are connected with the Darlington connection and the constant voltage of +15V is obtained.
Q28,32	-15V constant voltage power supply	In order to compensate HFE in Q28, both TRs in Q32 are connected with the Darlington connection and the constant voltage of -15V is obtained.
Q29,30	Tracking when -15V constant voltage power supply is turned OFF	Adjusts the voltage drop in the -15V constant voltage power supply to the voltage in +15V side while the power OFF.
Q31,33,34	+15V constant voltage power supply for high voltage	Power supply for the gate drive signal in the output FET high side.
Q36~38, Q41,83	Power supply for FAN	In order to compensate HFE in Q38 and Q83, Q41 and Q36 are connected with the Darlington connection in Q37 to turn ON/OFF by the μ -com.
Q39	Limiter level control	When 1Ω load is detected, CEs are ON and the voltages at pins 1 and 7 of IC24 are dropped in order to limit the signal amplitude.
Q42~45, Q156~167, Q188~193	PWM shaping circuit	Generates the pulse signal for the gate drive of the high side and low side.
Q168~171, Q184~187	FET for output	Generates the PWM output waveform by the switching.
Q47,48	Power supply SW for FL	Turns ON/OFF the FL power supply from pin 22 of the μ -com.
Q50~53	Constant voltage power supply for FL filament	Supplies the constant voltage of 2.3V to the FL filament.
Q54,55	Constant voltage power supply SW for FL filament	Turns ON/OFF the FL filament power supply from pin 22 of the μ -com.
Q101,129	MUTE	Mutes the audio signal from pin 56 of the μ -com to prevent applying the shock noise.
Q102, Q131~133	ATT	Lowers the volume when temperature at the output FET or in the vicinity of the transformer increases. For 1.5dB respectively.
Q125,126	ADV	Reads the power supply voltage value to show it with the FL. Turns OFF when the power supply is OFF to save the backup current.
Q150,151	D-SW	Turns ON/OFF the D-class amplifier stage from the μ -com or protection.
Q179,180	DC detection	Turns ON when DC is detected at the SP terminal and sends it to pin 64 of the μ -com.
Q181,182	ASO detection	Voltage amplification circuit used when the ASO is detected
Q174, Q176~178	Ground fault detection	When SP+ or SP- output is shorted to the ground, sends the signal to pin 6 of the IC7 and protects against the ground fault.
Q175	ASO detection	Current amplification circuit used when the ASO is detected
Q603	LOGO-LED	Turns on the LOGO LED from pin 4 of the μ -com.

COMPONENTS DESCRIPTION

● PREAMPLIFIER UNIT (X08-4310-10)

Ref. No.	Application / Function	Operation / Condition / Compatibility
IC1 (1/2)	Signal amplification	Mixes Lch and Rch to make Mono signal.
IC1 (2/2)	Signal amplification	Buffer to send the signal that comes through LPF and Bass Boost to the Line Out.
IC2	Frequency fixed LPF	LPF fixed at 400Hz.
IC3	Signal amplification	Amplifies the signal that comes through SensVol and outputs it with low impedance.
IC4	Frequency variable LPF	LPF with variable frequency between 40~200Hz.
IC5,6 (1/2)	Band-cut filter	Attenuates the frequency in the specific range between 40~100Hz.
IC6 (2/2)	Reverse circuit	Changes the phase by 180 degrees.
IC7	Frequency variable HPF	Attenuates the frequency in the range of 15~60Hz that is lower than the specific frequency.
IC8 (1/2)	Signal amplification	Amplifies the signal component to reduce noises in the subsequent BRF stages.
IC11	FL driver	Communicate with the μ-com, generates the data for FL display and reads in KEY.

MICROCOMPUTER'S TERMINAL DESCRIPTION

● MICROCOMPUTER: 78F0533GK011A (X09-856: IC1)

Pin No.	Pin Name	I/O	Application	Truth Value Table	Processing Operation Description
1	P_CON	I	Clears the stop mode by turning the P-CON ON		L: Clear the stop mode
2	D_CURENT	I	Detects the D-class over current		Enters into the protection operations.
3	NC	O	Not used		Output L fixed
4	PON_ILLUM	O	LOGO LED+B SW		H: ON, L: OFF, Initial condition "L"
5	FAN1	O	FAN rotation control	①	H: Rotation, L: Stop, Initial condition "L"
6	RESET	I	Reset		
7	D_POWER	O	D-class amplifier power supply control		H: D-class ON, L: D-class OFF
8	POWER_ON_1	O	Amplifier power supply control		H: Amplifier power supply ON, Initial condition "L"
9	FLASH_W	I	Used when writing in the flash		
10,11	NC	O	Not used		Output L fixed
12	REGC	-			
13	VSS	-			
14	EVSS	-			
15	VDD	-			
16	EVDD	-			
17,18	NC	O	Not used		Output L fixed
19	NC	O			
20	5V_SW	O	SW5V ON: L		L: SW5V ON, Initial condition "L"
21	NC	O	Not used		Output L fixed
22	PON_FL	O	FL power supply (Grid and Filament) control		H: ON, L: OFF
23-33	NC	O	Not used		Output L fixed
34	ROTARY_CW	I	Encoder pulse input		Detects pulse width

KAC-PS1D/X1R

MICROCOMPUTER'S TERMINAL DESCRIPTION

Pin No.	Pin Name	I/O	Application	Truth Value Table	Processing Operation Description
35	ROTARY_CCW	I	Encoder pulse input		Detects pulse width
36~38	NC	O	Not used		Output L fixed
39	REF5V_OUT	O	Supplies to AVREF (pin 47)		Output H fixed
40,41	NC	O	Not used		Output L fixed
42	VFD_INH	O	Panel VFD driver INH		Driver output switching
43	VFD_CE	O	Panel VFD driver CE		Command control terminal of the driver
44	VFD_DATA_M	O	Panel VFD driver data line		μ -com → driver input
45	VFD_DATA_S	I	Panel VFD driver data line		μ -com → driver input
46	VFD_CLK	O	Panel VFD driver communication CLK		Communication clock
47	AVREF	-	DA REF voltage		Receives the reference voltage from pin 39.
48	AVSS	-			
49	IMP_DET	I	Detects load IMP at SP terminal		Reads the impedance and turns on the limiter when it is 1Ω load.
50	TEMP2	I	Temperature detection 1 (at output TR side) (For display and protection)		Displays the temperature and overheat protection.
51	TEMP1	I	Temperature detection 1 (at power supply side) (For display and protection)		Displays the temperature and overheat protection.
52	NC	O	Not used		Output L fixed
53	AD_V	I	Detects BU voltage (For display)		Displays the voltage and condition.
54	NC	O	Not used		Output L fixed
55	AD_I	I	Detects primary current (For display)		Converts into the current and displays current value.
56	MUTE1	O	Mute control of the amplifier input stage		L: MUTE1 ON, H: MUTE1 OFF, Initial condition "L"
57	NC	O	Not used		
58~60	NC	O	Not used		Output L fixed
61	ATT1	O	Output signal level attenuation control		L: Output attenuation, Initial condition "L"
62	ATT2	O	Output signal level attenuation control		L: Output attenuation, Initial condition "L"
63	LIMIT	O	Limits the peak value of the D-class amplifier input signal	②	Clips the audio signal quickly with "H"
64	DC_DET	I	Output DC OFFSET voltage detection		Enters into the voltage error protection operations.

Truth value table

① FAN (Pin 5)

Calculated temperature based on the detected voltage at TMP_1 (pin 31)		Note
Lower than 35°C	Remains as L	In the case of "H" output, it recovers to "L" when the temperature decreases to 30°C.
35°C or higher	H output	

② LIMIT (Pin 63)

Voltage detected at IMP_DET (pin 49)		Note
Lower than 3.8V	Remains as L	Recover by P-CON OFF or RST.
3.8V or higher	H output	

TEST MODE

● How to enter the test mode and how to clear the test mode

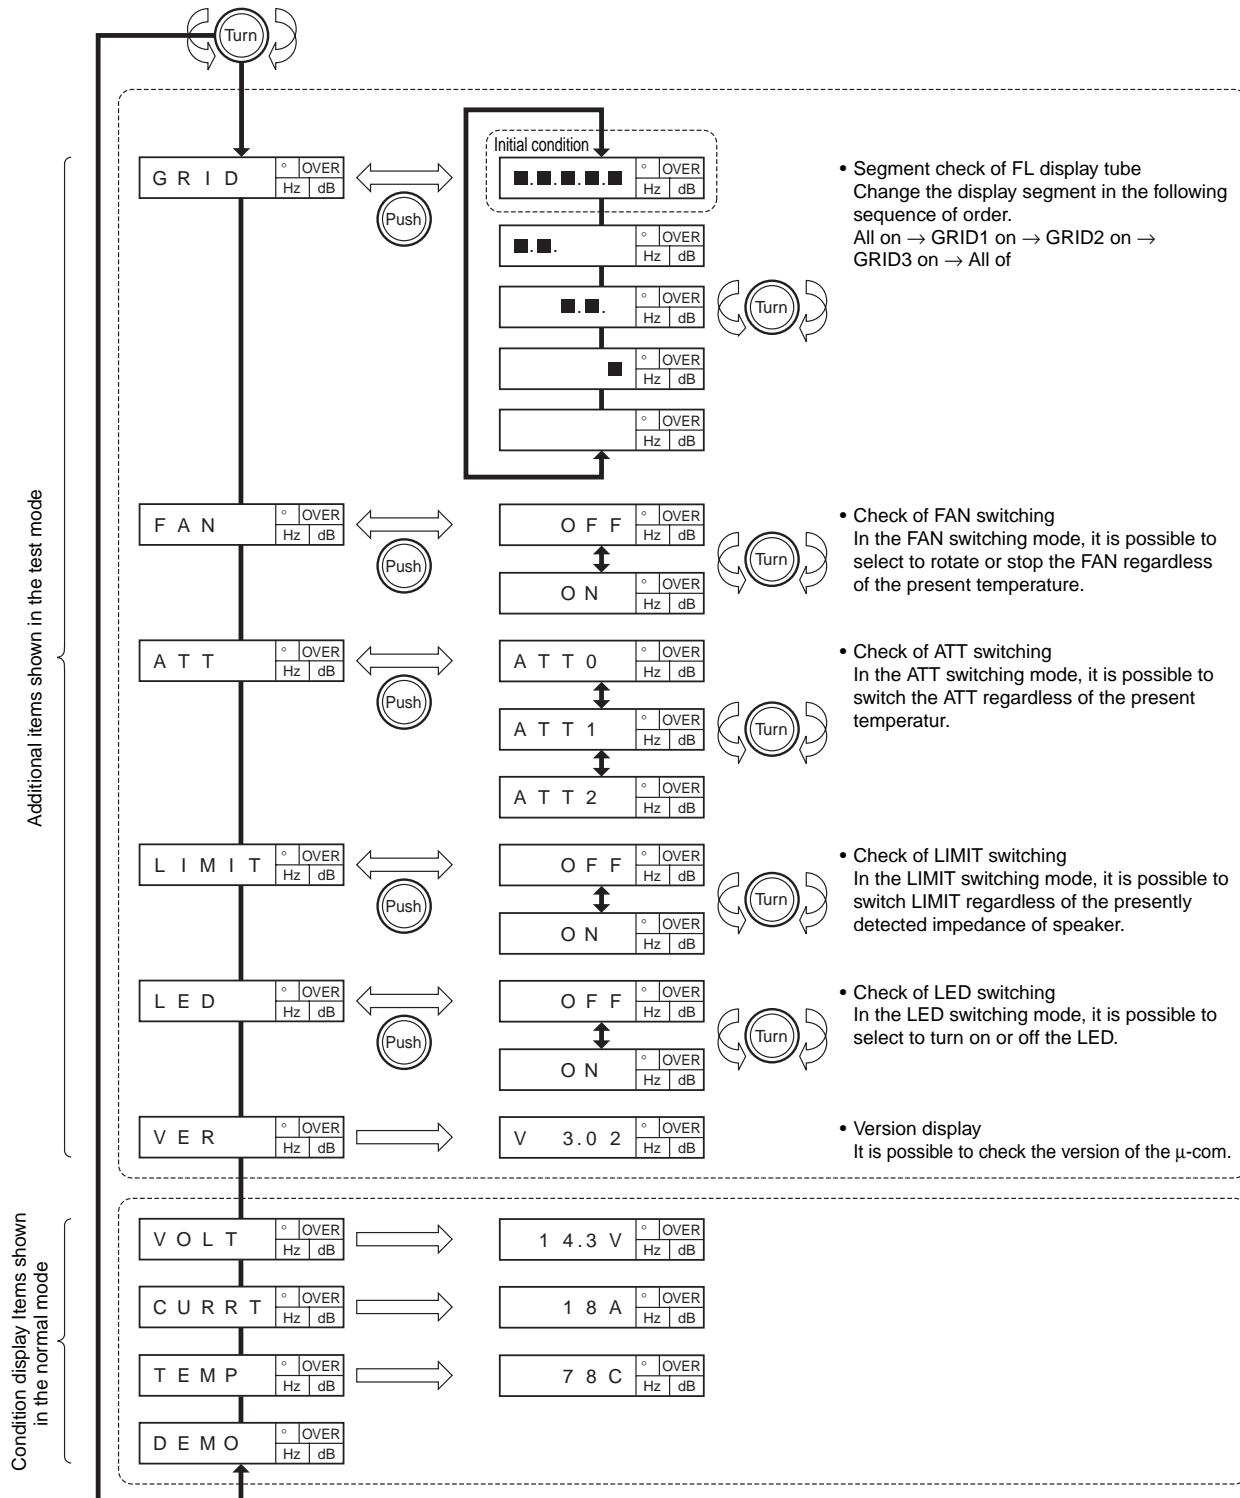

• How to enter

In the backup connection condition (when the battery is being connected), turn ON the P_CON while keep pushing the rotary push key.

• How to clear

P_CON OFF or reset to clear the mode. (Clear the mode even in case of the protection.)

* Do not clear the mode if the protection recovers automatically.

● Items in the test mode and test operations

• INFORMATION display (Display of conditions)

In the test mode, the following items can be checked in addition to the normal INFORMATION display.

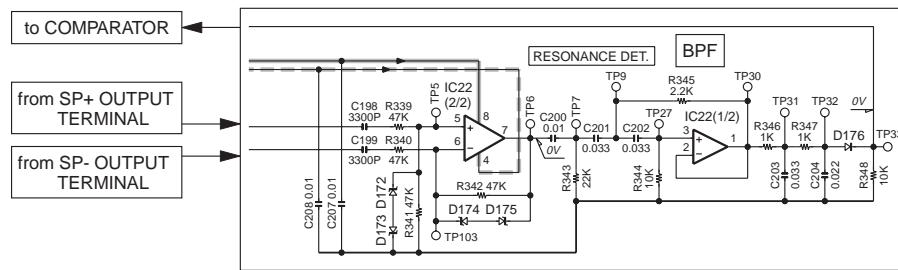

Each item can be selected with the rotary encoder and the settings can be changed with the push key.

KAC-PS1D/X1R

CIRCUIT DESCRIPTION

● Short detection circuit between SP+ and SP- terminals

If the SP+ and SP- terminals are shorted in the vicinity of the terminals, the self oscillation occurs in the D-class amplifier. The oscillation in opposite phase is caused between the + and - terminals of the BTL, and this oscillation is applied to the differential amplifier, IC22 (2/2) to limit the amplitude with the zener diodes such that the voltage does not exceed the withstand voltage.

● Power supply circuit for FL

- V-FL

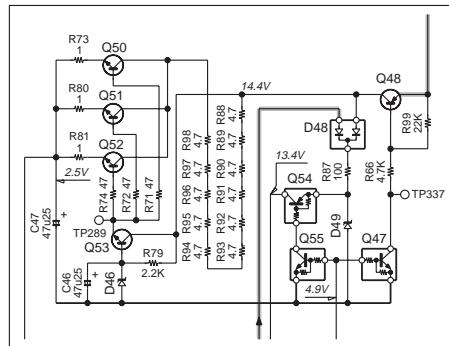

V-FL is the power supply for grid of FL. D48 is used to select either the battery or +15V power supply that has higher voltage.

The power supply voltage is set to constant 13V in D49. The power is turned ON/OFF with Q54 and is applied to FL driver.

- FIL+

Power is supplied by the battery and the voltage is set to 2.3V in D49 so that it is applied to the filament of FL.

The power is turned ON/OFF in Q48 in response to the FL-ON signal from the μ -com.

The output from pin 7 of IC22 is rectified through the band pass filter whose center frequency is about 3kHz.

The DC voltage generated after the rectification is applied to the comparator, (IC6 (2/2)) and generates "L" at pin 7 of IC6 when the voltage exceeds the preset threshold.

● Ground fault detection circuit

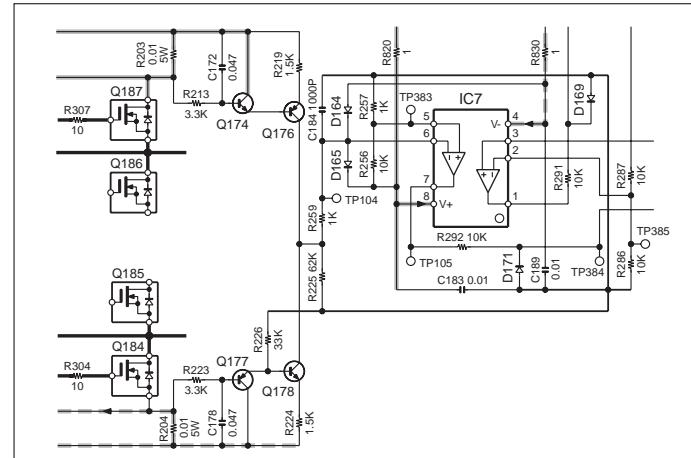

When SP+ or SP- output terminal is shorted to the ground, the current running in the +B power supply and that in the -B power supply are unbalanced.

The current unbalance (\pm) is measured by R203 and R204 and the currents are mixed in R225.

When the currents become out of balance due to the above shorting to the ground, the voltage is caused across R225.

When this voltage exceeds the threshold decided by R256 and R257, the "L" output is generated at pin 7 of IC7.

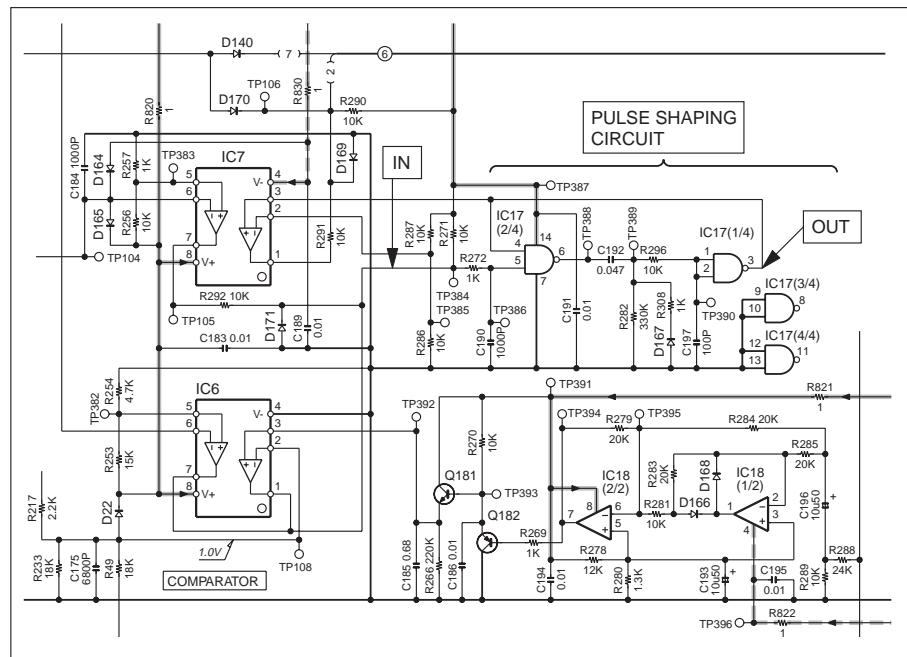

As a result, the over current protection operation is activated.

CIRCUIT DESCRIPTION

● Pulse shaping circuit

When either output from the ASO detection (IC6-pin 1), ground fault detection (IC7-pin 7) or short detection (IC6-pin 7) is "L", the pulse with a constant width of about 10msec is generated even if the input pulse width is small. The input to the pulse shaping circuit is pin 5 of IC17 and the output from the circuit is pin 3 of IC17.

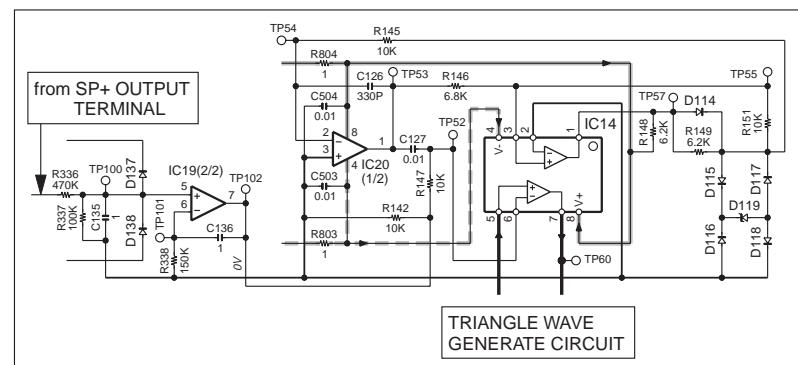

● Servo circuit

Amplifies DC offset voltage that is output to SP+ terminal in IC19 (2/2).

Feedbacks the output from pin 7 of IC19 to the triangular wave generation circuit.

Corrects DC offset voltage at SP+ terminal towards 0V by incorporating the feedback in the triangular waves that are applied at pin 6 of IC14.

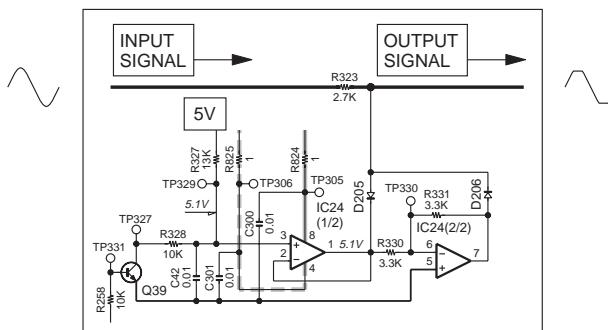

● LIMIT circuit

IC24 (1/2) is a voltage follower and IC24 (2/2) is a reverse amplifier that has no gain.

Q39 is turned ON/OFF in response to H/L of LIMIT (pin 63) from the μ -com.

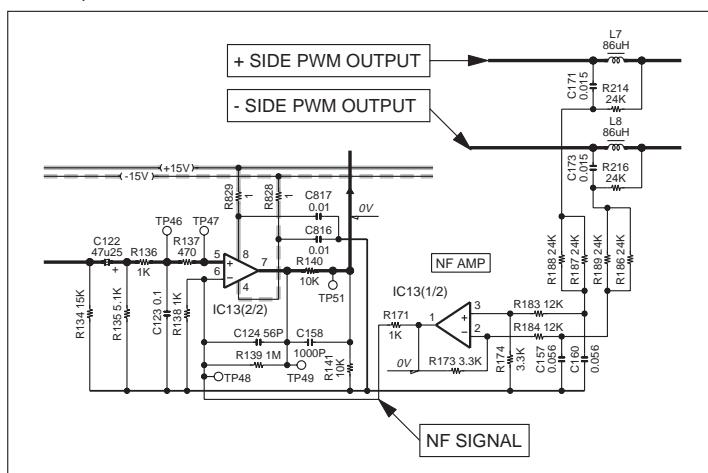

Voltage at pin 3 of IC24 becomes 2.2V and 5V in response to ON/OFF of Q39.

When the u-com detects 1Ω load, the input signal is clamped at $\pm 2.8V$, in which 0.6V of vf from D205 and D206 is added, and peak value of the signal is limited.

● NF circuit

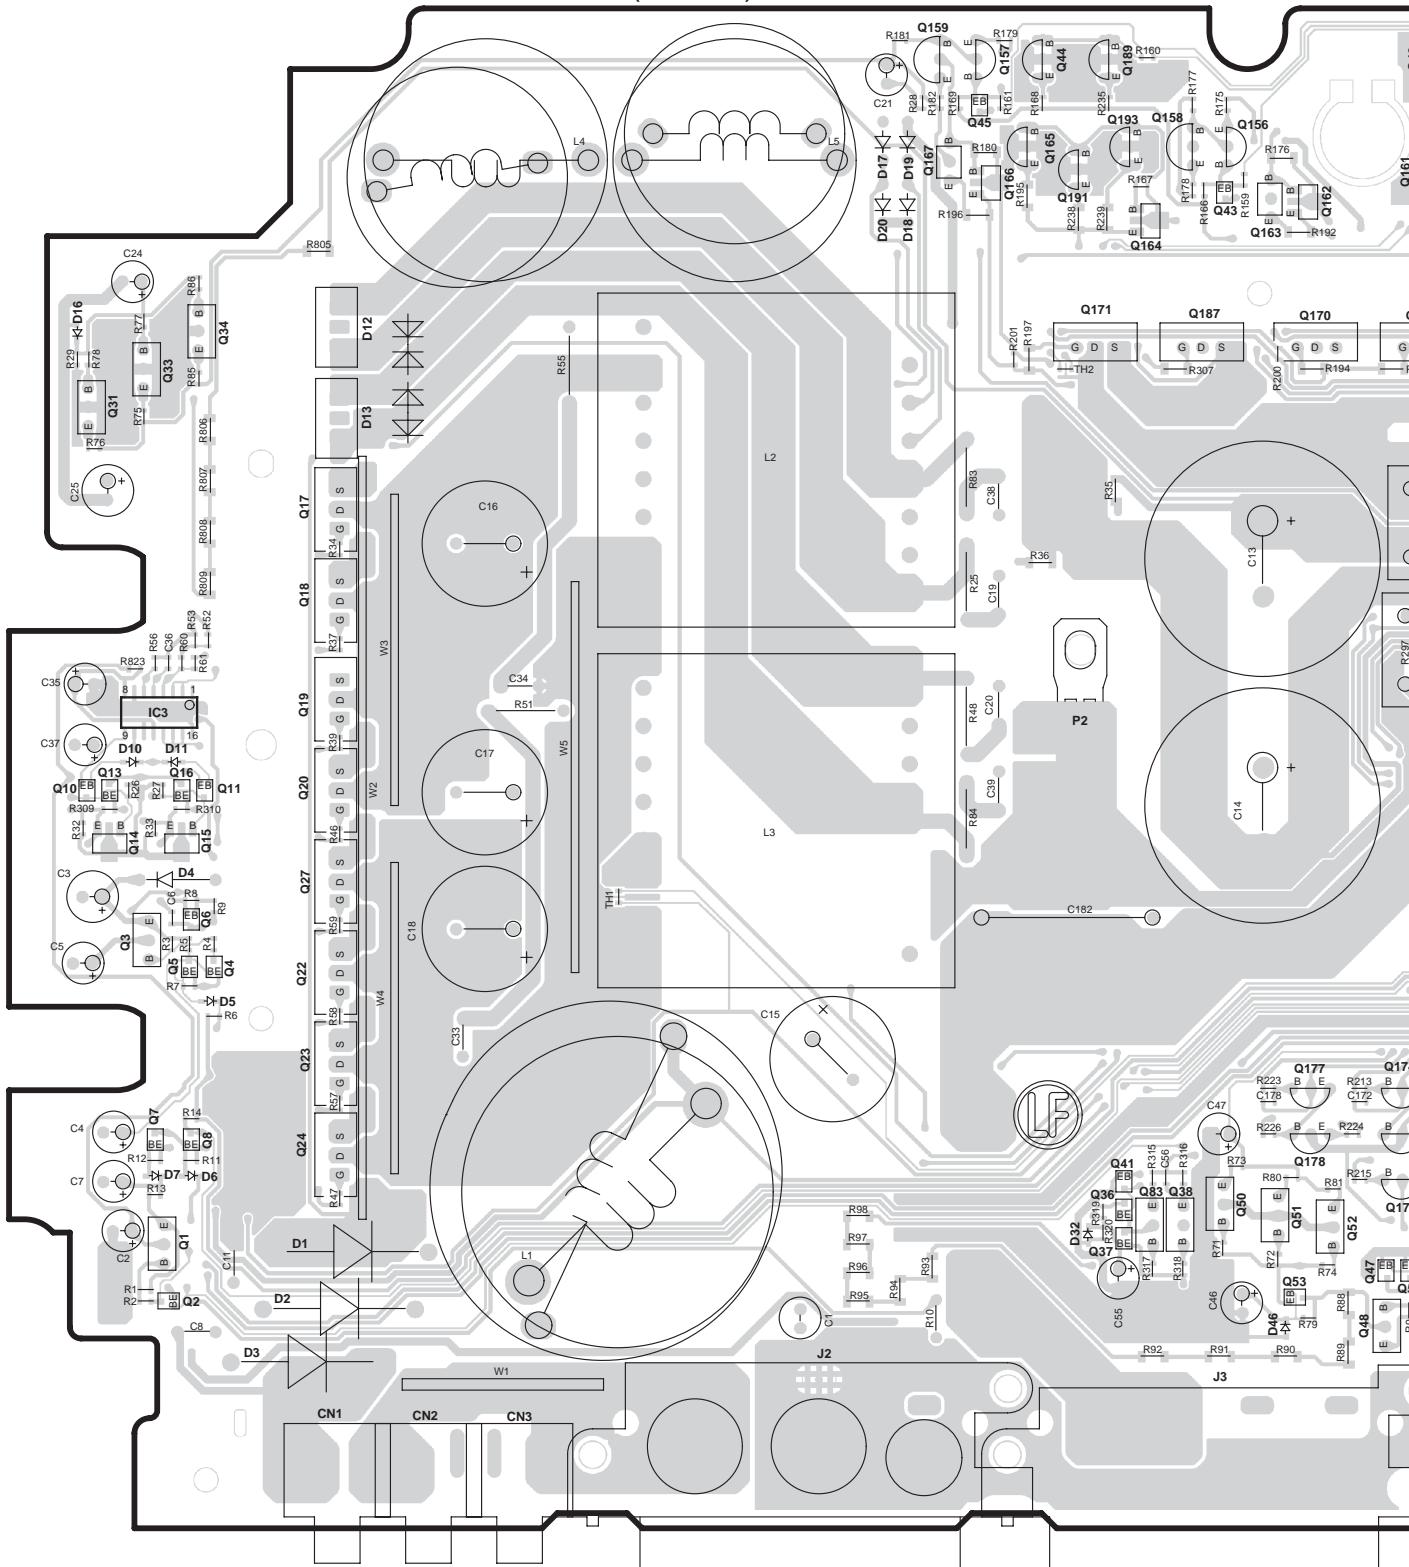

Differentially amplifies the signal in IC13 (1/2) for the BTL output and applies negative feedback signal to pin 6 of IC13 (2/2).

KAC-PS1D/X1R

SPECIFICATIONS

CEA-2006

RMS Watts per channel @ 4Ω, 1% THD+N 600W x 1
Signal to Noise Ratio (Reference: 1W into 4Ω) 80dBA

Audio Section

Max Power Output 2400W
Rated Power Output (+B=12.0V)
 (4Ω) (20Hz~200Hz, 0.5% THD) 400W x 1
 (2Ω) (100Hz, 0.5% THD) 800W x 1
 (1Ω) ≥800W x 1
Rated Power Output (+B=14.4V)
 (4Ω) (20Hz~200Hz, 0.5% THD) 600W x 1
 (4Ω) (DIN45324, +B=14.4V) 600W x 1
 (2Ω) (100Hz, 0.5% THD) 1200W x 1
 (1Ω) ≥1000W x 1
Frequency Response (+0, -3dB) 5Hz~400Hz
Sensitivity (rated output)
 MAX 0.2V
 MIN 5.0V
Input Impedance 10kΩ

Signal to Noise Ratio 105dB
Low Pass Filter Frequency (-24dB/oct.) ... 40~200Hz (variable)
Infrasonic Filter Frequency (-24dB/oct.) .. 15~60Hz (variable)
Band Reject Filter OFF/ -6dB/ -12dB
Band Reject Filter Frequency 40~200Hz (variable)
Phase Inverter 0° (Normal)/ 180° (Reverse)
Bass Boost Circuit 0~18dB (variable)
Bass Boost Frequency 40~100Hz (variable)

General

Operating Voltage 14.4V (11~16V allowable)
Current Consumption 75A
Installation Size (W x H x D)
..... 340 x 60 x 225mm (13-3/8 x 2-3/8 x 8-7/8 inch)
Weight 3.8kg (8.38 lbs)

KENWOOD follows a policy of continuous advancements in development. For this reason specifications may be changed without notice.

INSTALLATION
