## CIRCUIT DESCRIPTION

### ● NF Circuit

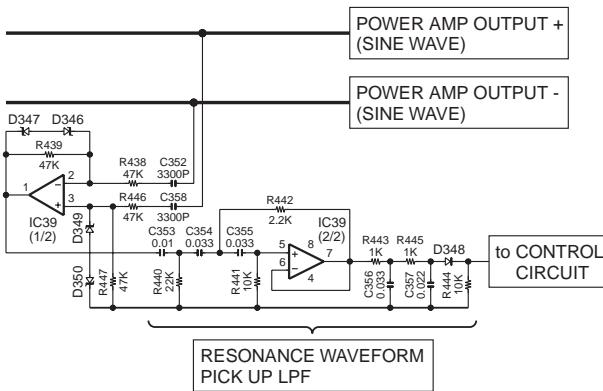

It applies NF from rear and front of LC filter. For BTL output, it receives each output by differential amplification and applies feedback to the first phase.

### ● Resonance Detection Circuit

It detects resonant waveforms generated at output when the power AMP ± output is dead-shorted ( $0\Omega$ ).

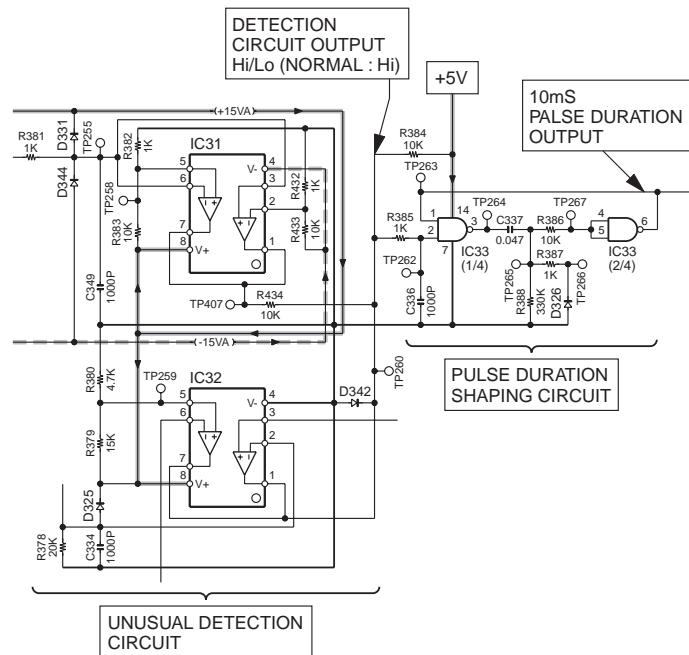

It sends detected signals to the control circuit.

### ● Pulse Shaping Circuit

It detects with either one of abnormal detections (current voltage, resonance detection or unbalance current detection) at the previous phase.

It generates a certain width of pulse about 10msec even if input pulse width is small when input is pulled by Lo.

# CIRCUIT DESCRIPTION

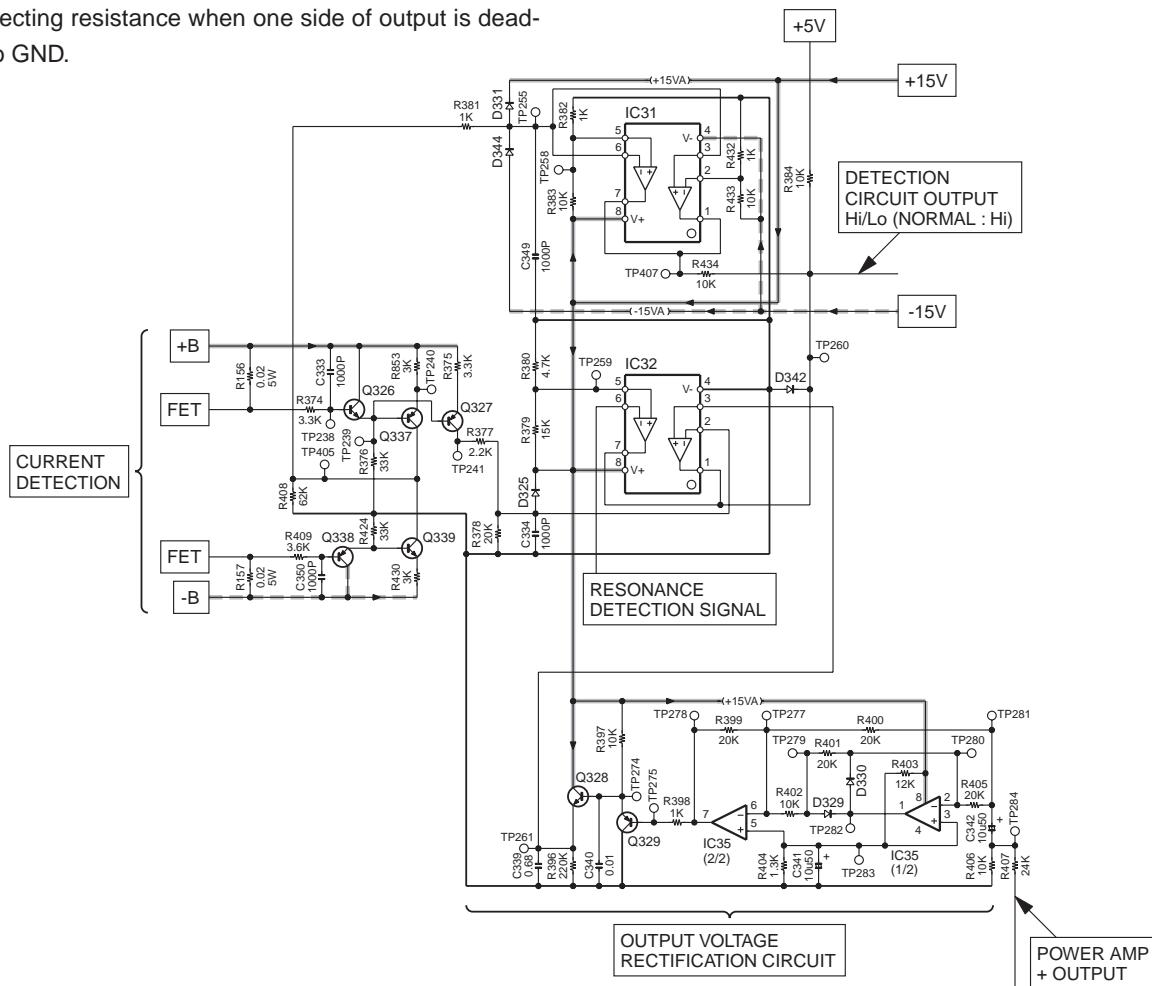

## ● Abnormal Detection Circuit

It compares signal levels of the current detecting circuit and output voltage rectification circuit with a comparator. If current > voltage, the detecting circuit operates to stop D-class circuit.

In the current detecting circuit, current flows into only one side of the detecting resistance when one side of output is dead-shorted to GND.

It detects also unbalance operation.

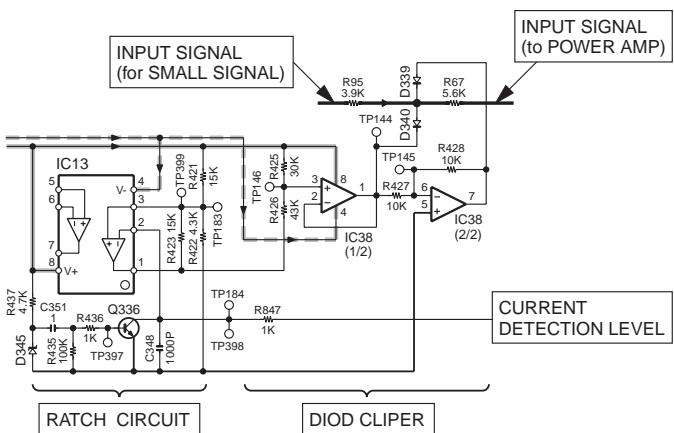

Resonance detecting signals detected with the new circuit description X10D\_2 are also input to this circuit causing abnormal detection.

## ● 1Ω Detection Circuit

The detecting circuit operates and limits the input signal when the level sent from the current detecting circuit exceeds a certain level. (Diode clip)

It detects at the current level that flows only when  $1\Omega$  is applied, and does not cancel unless P-con is turned off. (Latch circuit)
