● TEST MODE

1. How to enter

While holding the magazine EJECT switch, reset the unit and keep on holding the EJECT switch for more second to enter the E-88

(NOTE) In the E-88 mode, the initial position detection operation at the time of reset start is not performed.

2. Manual operation functions

The E-88 display appears when the H/U is set to the changer mode. In this condition, the changer mechanism can be operated manually using the Track search UP/DOWN and Disc search UP/DOWN keys.

Track search UP key :

Operates the Spindle/Loading motor in the direction for pulling the disc tray into the mechanism deck

Track search DOWN key :

Operates the Spindle/Loading motor in the direction for returning the disc tray into the magazine

Disc search UP key :

Operates the ELV motor in the direction for moving the mechanism deck upward

Disc search DOWN key :

Operates the ELV motor in the direction for moving the mechanism deck downward

● POSITION ADJUSTMENT

1. LPS initial position adjustment procedure

Connect the changer to the H/U. While holding the magazine [EJECT] key of the changer, press the [RESET] key of the H/U and, in about 1 second, release the magazine [EJECT] key. Press the [CD] key of the H/U to enter the E-88 mode. Move the mechanism deck to around the 1st stage by pressing the [DISC-] or [DISC+] key. Insert the adjustment tool into the tool hole on the changer mechanism. Then press the [DISC+] key to move the mechanism deck until the mechanism's slider hits the adjustment tool. When the motor locks (stops) press the [REPEAT] key of the H/U.

When the [REPEAT] key is pressed, the mechanism moves automatically to the 1st stage and the initial position adjustment completes. (The data is written in the EEPROM at this time)

3. Position adjustment function

This function writes the mechanism position adjustment values in the EEPROM in the E-88 mode

[Adjustment procedure]

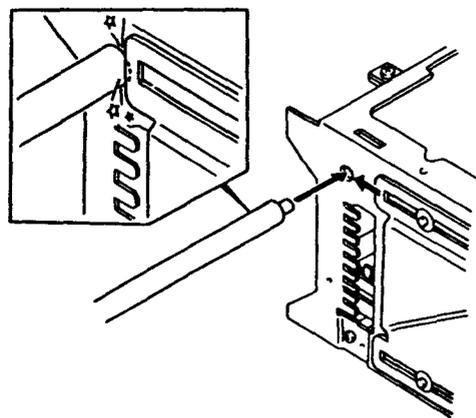

- With the mechanism in the magazine ejection condition, move the mechanism manually up and down to set the mechanism to the reference position
- Pressing the REP key of the H/U starts the judgment of the mechanism position, and the distinction whether the changer is a 6-disc or 10-disc changer.

If the mechanism position is extremely deviated from the reference position, the processing is aborted immediately

- The offset from the reference position is calculated and the 10 data and offset values are written in the EEPROM
- Data is read from the EEPROM to judge whether it has been written normally. When it is judged that the write operation has completed normally, the mechanism deck moves to the magazine ejection standby position.

When it is judged that the write operation was abnormal, the mechanism performs no operation.

(NOTE) Mechanism reference position
10 disc mechanism : 6th stage
