EXTERNAL VIEW

The KR-4400 is one of the NEW KR series receivers. It consists of TUNER unit of well-established, PRE and TONE amplifier equipped with IC, and pure complementary OCL MAIN amplifier with differential amplifier in its first stage.

The protection circuit is composed of ASO limiter and DC drift detector of center voltage.

4-channel OUT-IN for those who wish to enjoy 4-channel reproduction can do so through this receiver by connecting a SQ, RM, or CD-4 type adapter to these jacks.

EUROPE TYPE/POWER VOLTAGE SELECTOR

EUROPE (W, L) TYPE

■ POWER VOLTAGE SELECTOR AND FUSE

The KR-4400 operates on 110 ~ 120 volts AC or 220 ~ 240 volt AC. There is the AC Voltage Selector Switch on the rear panel (except for K.P.L Type) which is set to the line voltage of the destination. Before operating this receiver, make sure that the position of the AC Voltage Selector Switch matches your line voltage. If not, it must be changed to the proper setting.

To change; turn the receiver off and pull off the power cord, then remove the stopper plate and slide the AC Voltage Switch to the opposite side. Then reattach the stopper plate to the other side.

When the position of the AC Voltage Selector Switch is changed, it is also necessary to change the power fuse. For 110 ~ 120 volt operation a 2.5 ampere fuse should be used. For 220 ~ 240 volt operation a 1.5 or 1.25 AT ampere fuse should be used.

If the power fuse fails, remove blown fuse and replace with the same type fuse of the same capacity. Any trouble in the power supply circuit will cause the fuse to blow again. When you replace the fuse, turn the fuse holder in the direction of the arrow using a Phillips screw driver. In some districts, the set will be provided with another type of fuse holder, which allows easy replacement of the fuse without using the Phillips screw driver.

NOTES:

Always disconnect power supply before replacing a fuse.

CIRCUIT DESCRIPTION

TUNER (X05-1120-10, -42, -61)

The FM section is the acknowledged one including a FET in the front end, IF block of four stage, and the diode switch circuit in the MPX stage.

FM separation is performed by adjusting VRd1 on the PRE AMP unit.

PRE AMP (X08-1270-02)

In this section, a metal can sealed monolithic IC is used.

It is made up of the differential amplifier in the first stage, emitter followers in next stage, class A driver, and pure complementary output stage.

This circuit possesses the characteristics of wide dynamic range and low distortion by drawing two power supplies, positive and negative.

TONE AMP (X11-1200-01)

This TONE AMP is stable CR control type in which the amplification part is the same IC as in PRE AMP UNIT.

MAIN AMP (X07-1280-11)

Good N.F.B effect and bias current stability are established by using the metal can sealed transistors in the differential amplifier of the first stage and in class A driver.

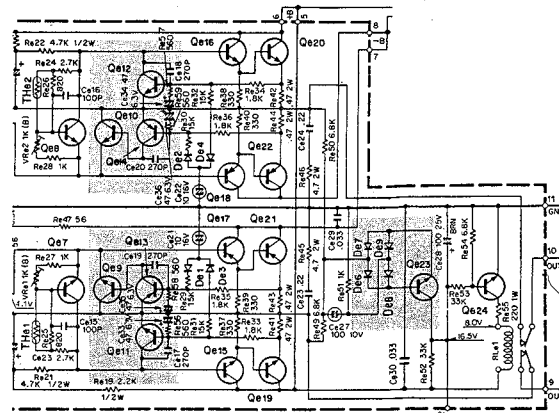

Transistors and thermistor for bias setting are used in the complementary circuit, and full temperature compensation is effective. Complementary and final circuitry consists of a direct-coupled pure complementary.

Meanwhile, protection circuit consists of both the current limiter type (ASO limiter) suppressing the over current through the power transistor, and DC drift detection type of center voltage level which operates the protection relay to cut off the speaker system from the output line.

These protective actions are self-return.

ADJUSTMENT

- Tuning dial is set to the proper point corresponding to no radio stations.
- The sweep and the r.f. generator are set to the lowest response possible on oscilloscope.
- When connecting the r.f. generator to the antenna terminal use the dummy antenna . . . refer to Fig. 2.
- Use the insulated screwdriver adjusting the i.f.t.
- SELECTOR is FM position.
- FM MUTING is OFF position unless it is required.
- Test point shown in the schematic diagram.
- For TRACKING adjustment, repeat several times and confirm the reception of broadcasting.
