*Refer to Destinations' Parts List.

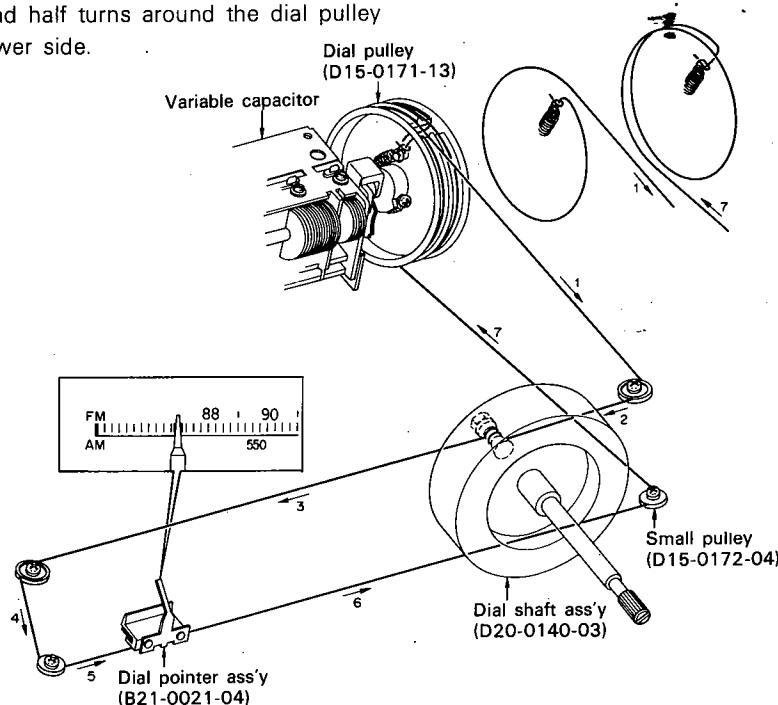

INTERNAL VIEW/DIAL CORD STRINGING

*Refer to Destinations' Parts List.

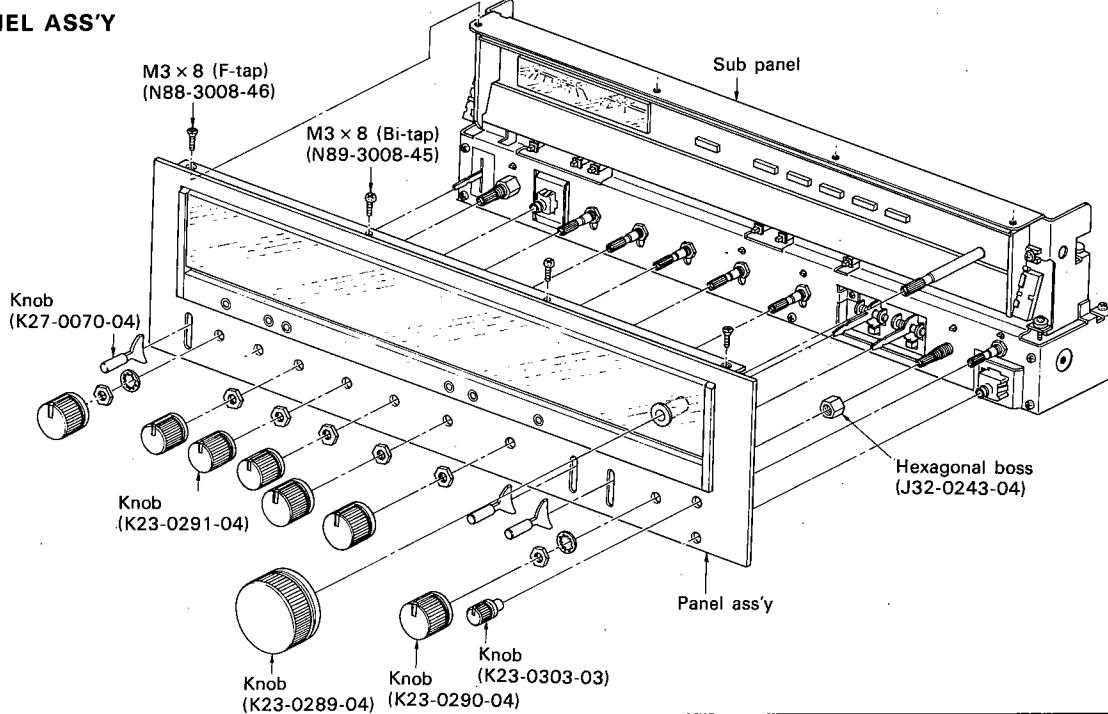

DIAL CORD STRINGING

1. Fully open the variable capacitor.
2. Set the dial pulley as illustrated, and fix it with a screw.
3. Tie the end of the dial cord and the dial spring, giving a margin of about 10 cm.
4. Hook the spring on the boss.
5. Dress the dial cord in the direction of "1" to "2", and wind it 2 turns around the dial shaft clockwise.
6. Dress the dial cord in the direction of "3" through "7", and wind it one and half turns around the dial pulley starting from its lower side.
7. Tie the dial cord rigidly with the margin cord (about 10 cm, described in 3, above) without permitting any slack.
8. Cut off the unnecessary part of the cord, and release the dial spring from the boss.
9. Fully close the variable capacitor.
10. Mount the dial pointer in position as illustrated. This setting should be checked by receiving a suitable broadcast station actually.

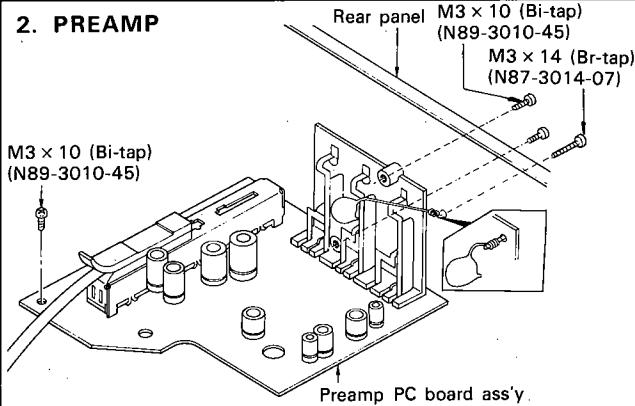

DISASSEMBLY FOR REPAIR

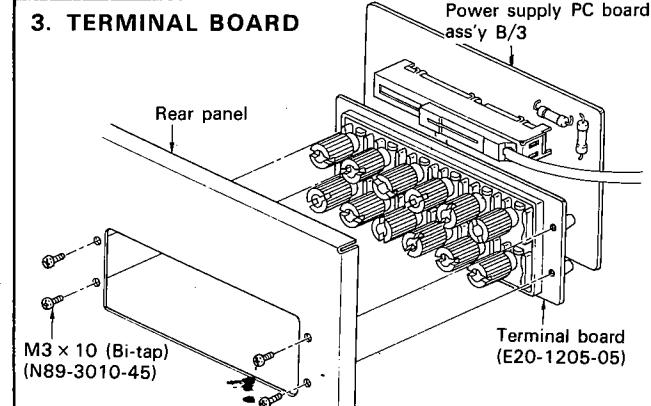

1. PANEL ASS'Y

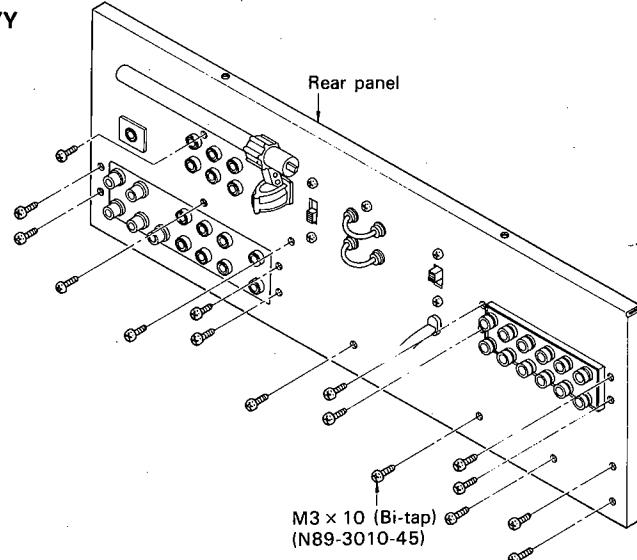

2. PREAMP

3. TERMINAL BOARD

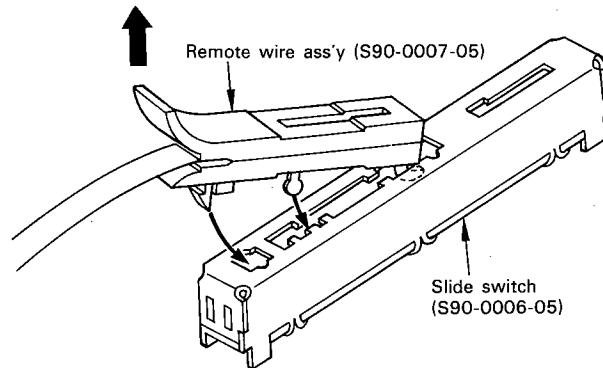

4. REAR PANEL ASS'Y

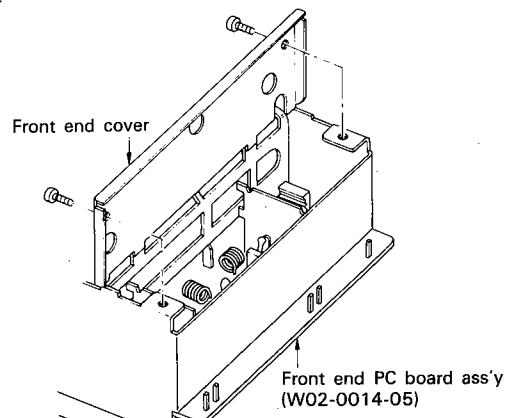

DISASSEMBLY FOR REPAIR

5. REMOTE WIRE ASS'Y

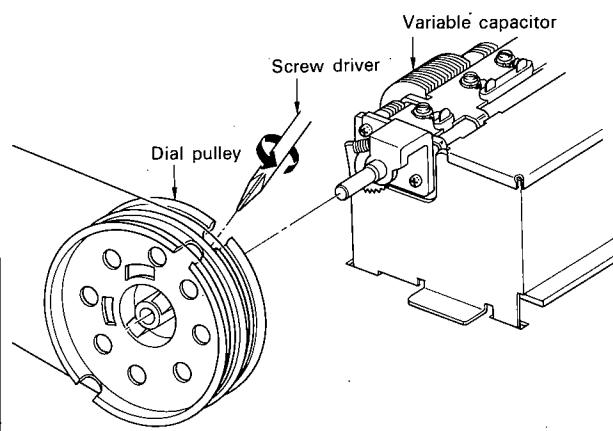

6. FRONT END COVER

Remove Preamp PC board ass'y
Front end section can be checked by opening the front end cover.

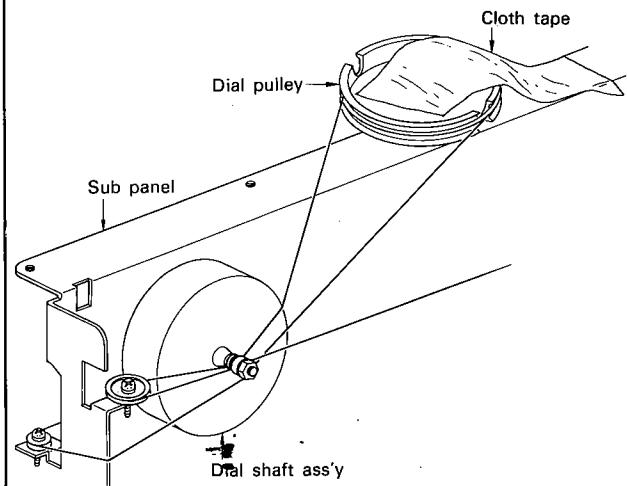

7a. REPLACEMENT OF FRONT END ASS'Y

- (1) Remove the dial pulley from the shaft of the variable capacitor.

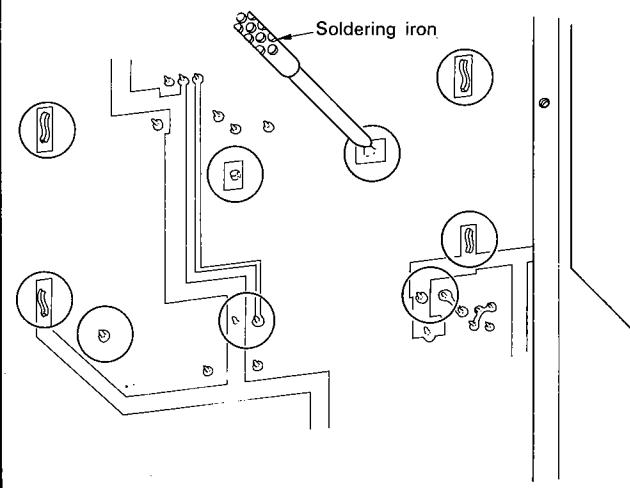

7b. REPLACEMENT OF FRONT END ASS'Y

- (2) Fix the dial pulley on the sub panel by a cloth tape.

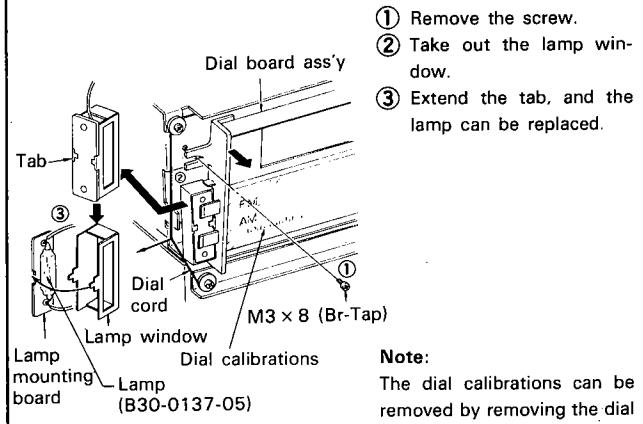

7c. REPLACEMENT OF FRONT END ASS'Y

- (3) Unsolder the circled sections, front end ass'y can be replaced.

8. DIAL CALIBRATIONS' LAMP

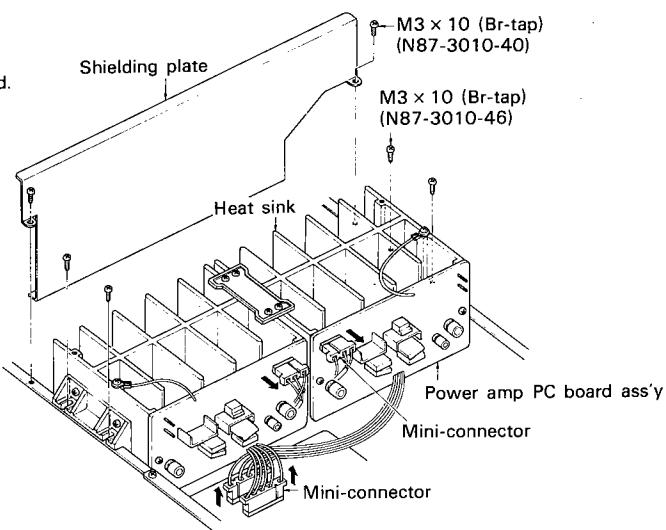

Note:
The dial calibrations can be removed by removing the dial board ass'y and the lamp window.

DISASSEMBLY FOR REPAIR

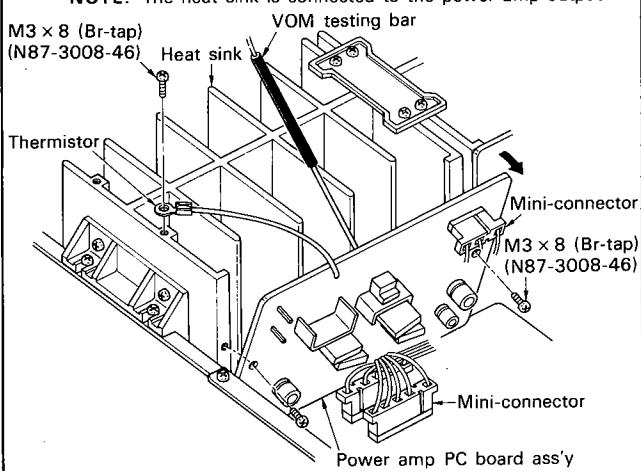

9a. POWER AMP

- (1) Remove the mini-connectors.
- (2) Remove screws.
Power amp block can be removed.

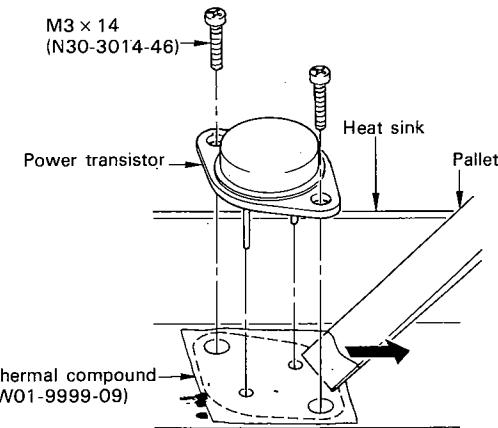

9b. POWER AMP

Power amp section can be checked as illustrated.
NOTE: The heat sink is connected to the power amp output.

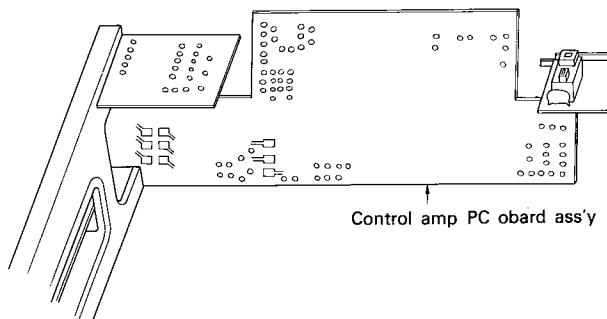

10. REPLACEMENT OF POWER TRANSISTOR

- (1) Paint thermal compound on the contact area of the heat sink.
- (2) After mounting the power transistor, clear away the remainder of thermal compound.

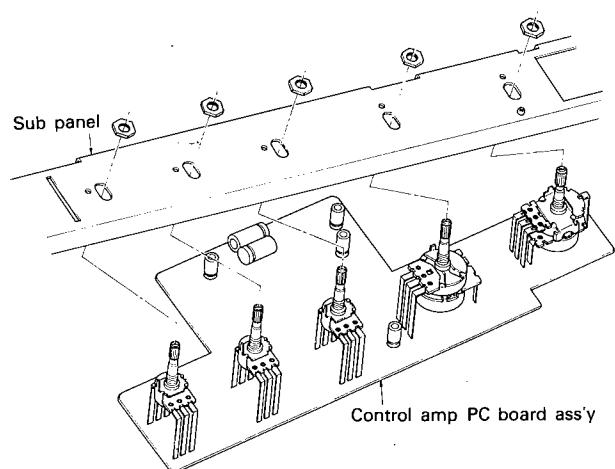

11a. CONTROL AMP

Control amp PC board ass'y can be checked by removing power amp block.

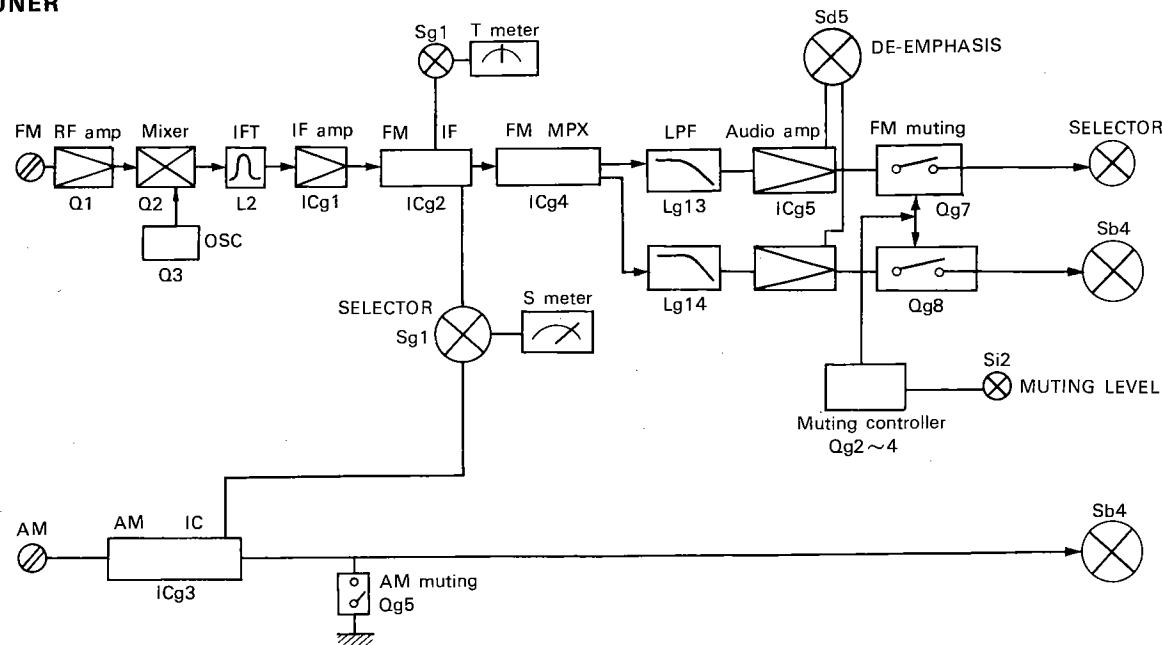

11b. CONTROL AMP

Control amp PC board can be removed as illustrated.

CIRCUIT DESCRIPTION

FM SUPPORT CIRCUITY

In addition to the ordinary muting circuit, KR-8010's FM section has a special support feature which switches a weak and noisy stereo broadcast into mono automatically. When the input signal is too weak, the voltage on pin 12 of ICg2 increases to 1.7V from, say, 0.2V in a normal tuned-in situation; and when the receiver is off-tuned, the voltage increases up to, say, 4.5V. And these two cases other than the tuned-in situation causes the collector voltage of Qg3 to rise to, say, approximately 10V. Qg2 and Qg3 constitute a schumit circuit, with Qg2 being set in the ON state, and Qg3 set in the OFF state. When the MUTING LEVEL selector Si2 is set to position "1" (consequently pin 11 of ICg2 is grounded.), an-input level of less than $2\mu V$ turns Qg2 ON. When the MUTING LEVEL selector Si2 is set to position "2" coupling pin 11 of ICg2 to nowhere, an input level of less than $10\mu V$ turns Qg2 ON. Qg4's base is controlled by the collector voltages of Qg3 and Qg1. When the collector voltage of Qg3 is "high", Qg4 is turned OFF. As a result, the gate voltage of Qg7 (Qg8) goes down below 0V, turning Qg7 OFF. Consequently, the signal line is cut out. Qg1 combines a weak and noisy stereo signal into mono, and is turned OFF for less than $15\mu V$ of input voltage. When Qg1 is turned OFF, its collector voltage is set high to, say, 7V. Qg1's collector is coupled to Qg9's base via Dg3. Therefore, Qg9 is turned ON, whereas Qg6 is turned OFF, switching ICg4 into the mono mode. Where Qg6 is turned OFF, the STEREO indicator goes off. The operation of Qg1 does not affect that of Qg4. Qg10's base potential is 0V when the MODE switch Si1 is set to the STEREO position, and 0.65V when it is set to the MONO position. In other words, Qg10 turns ON when the MODE switch is set to the MONO position, turning Qg4 ON and Qg6 OFF, and shorting Qg7.

Dg4 and 5, Cg9, and Rg30 constitute a pop noise cancelling circuit for power ON/OFF operations. They momentarily turn Qg4 OFF to bring Qg7 (Qg8) into the OFF state.

HA11223

Adoption of newly developed stereo demodulator IC HA11223.

(1) Features of HA11223

- * Monolithic IC with DIL 16 pins.
- * Built-in pilot cancelling function.
- * Low distortion (0.01% at 300mV mono) with 100% negative feedback circuit.
- * High input impedance ($75k\Omega$).
- * High S/N (86 dB at 300mV input).
- * Improved PLL circuit to minimize stereo distortion in high frequency range. (0.06% at 10 kHz Main-ch input).

(2) Operating Principle

The composite signal is fed to the No. 2 pin of IC. This signal passes through the preamplifier and is applied to the pilot canceller, 100% NFB amplifier and sync detector; also, it is applied to the phase detector $\angle 90^\circ$ via Cg39. When the control voltage is absent, VCO oscillates a frequency of approximately 76 kHz to produce an output of 19 kHz at FF 38 kHz and FF 19 kHz $\angle 0^\circ$, which is compared in phase with the pilot signal by the phase detector $\angle 90^\circ$. In practice, this phase detector is a multiplier from which an output proportional to the product of the 2 input signals (19 kHz pilot and 19 kHz VCO) is produced, provided the phase difference is not 90° .

This output, after the unwanted components are removed by the low-pass filter (Cg42, Cg43, Rg81), is applied to the DC amplifier and is fed to VCO where the output is controlled so that the phase difference between the output and the pilot signal reaches 90° . As a result, a 38 kHz phase-locked subcarrier is obtained, which passes through the stereo/mono circuit and is fed to the sync detector as a switching signal.

In the stereo/mono circuit, the 38 kHz signal becomes in-phase state and the demodulated audio signal is forcedly switched to a mono signal during reception of mono broadcast or stereo broadcast of weak signals. The function of the stereo/mono circuit is such that the pilot signal is multiplied by the 19 kHz signal (no phase difference with respect to the pilot signal) by the sync detector $\angle 0^\circ$ which produces a DC output voltage proportional to the pilot signal amplitude. This output voltage is fed to the DC amplifier to drive the lamp circuit through the switch and, the same time, it allows the stereo/mono circuit to feed the 38 kHz signal to the sync detector.

The special feature of this IC is that it has a built-in pilot canceller circuit. The 19 kHz signal leading 90° in phase with respect to the pilot signal obtained from the VCO is applied to the gain control.

Also, the output from the phase detector $\angle 0^\circ$ is sampled and fed to the gain control amplifier via the DC amplifier.

Thus, a triangle waveform which is in-phase with the pilot signal is developed since the output of the gain control amplifier contains Cg50. This triangle waveform is level adjusted by VRg3 and is fed to the No. 4 pin so that it is phase inverted by the pilot canceller circuit and is added to the pilot signal to minimize the 19 kHz component in the composite signal.

The 19 kHz switch functions to shut out the output of the gain control amplifier during reception of mono broadcast.

PARTS LIST

☆ : New parts

RD: Carbon film resistor
 RC: Carbon composition resistor
 RW: Wire wound power resistor
 RN: Meter film resistor
 RS: Metal oxide film resistor

Note:

Resistors except the special type (example: cement, metal film, etc.) are not detailed in PARTS LIST. With regard to the value, refer to the schematic diagram or the PC board illustration.

Resistors not detailed are carbon type (1/4W or 1/8W).

ADJUSTMENT

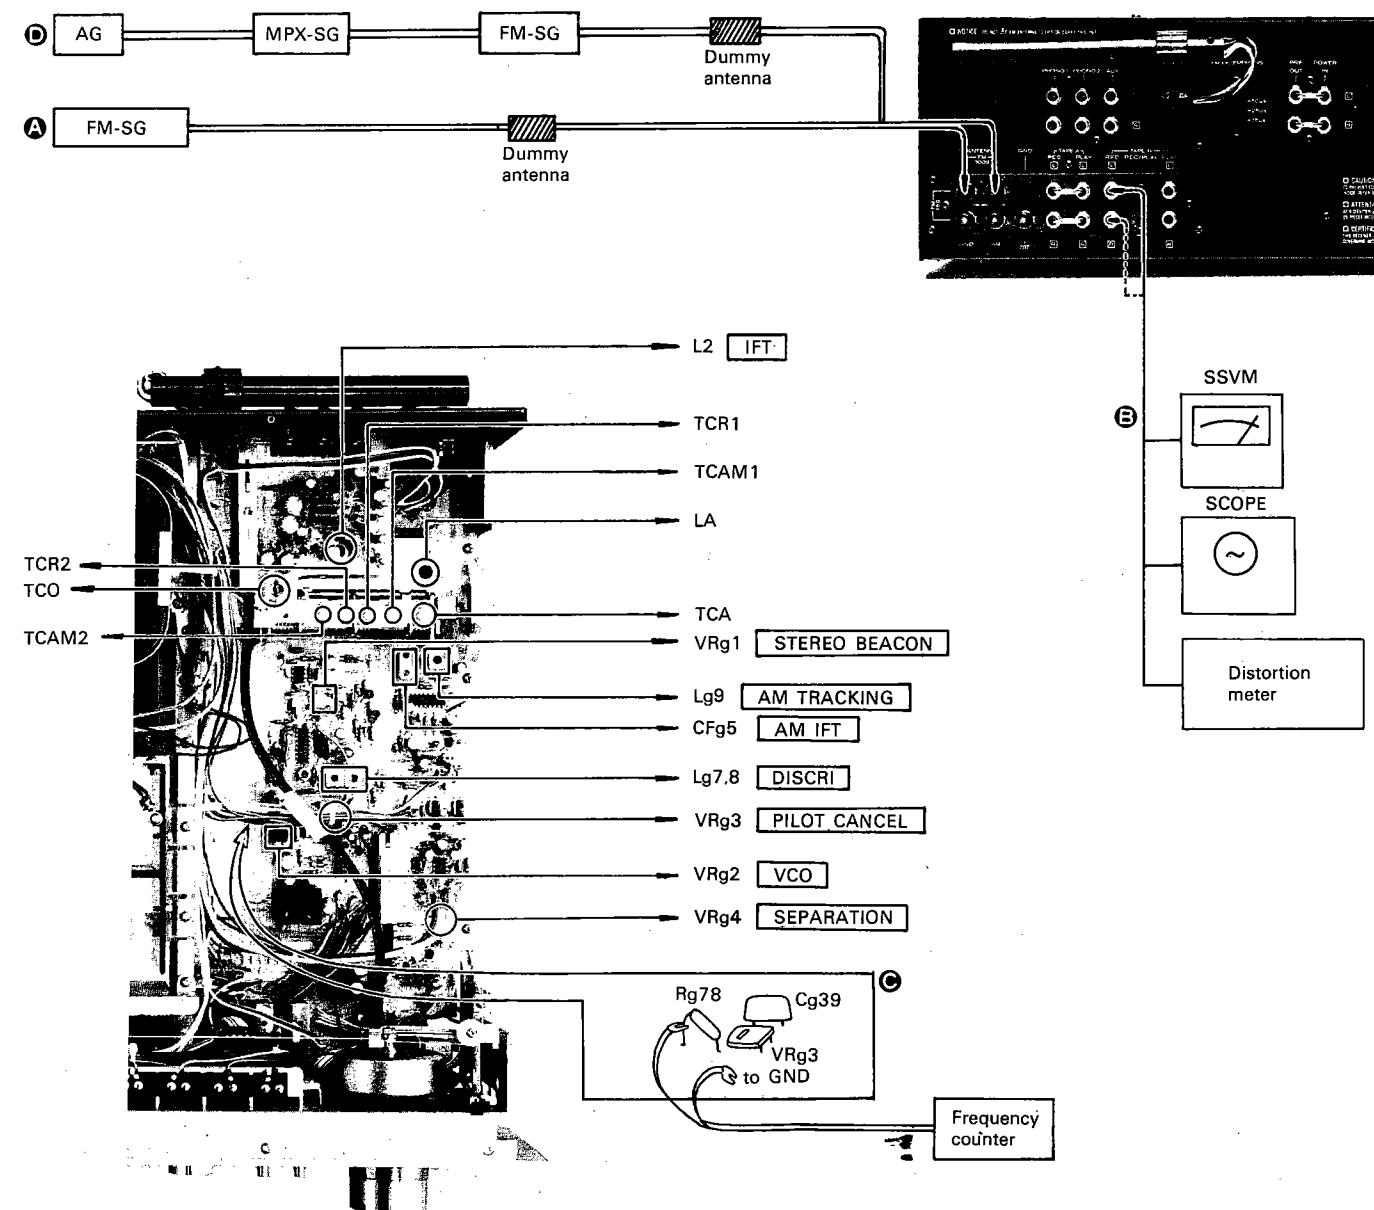

INSTRUMENTS USED

Oscilloscope SCOPE
 AM signal generator AM-SG
 FM signal generator FM-SG
 Audio generator AG
 Solid state voltmeter SSVM
 FM multiplex generator FM-MPX
 Frequency counter

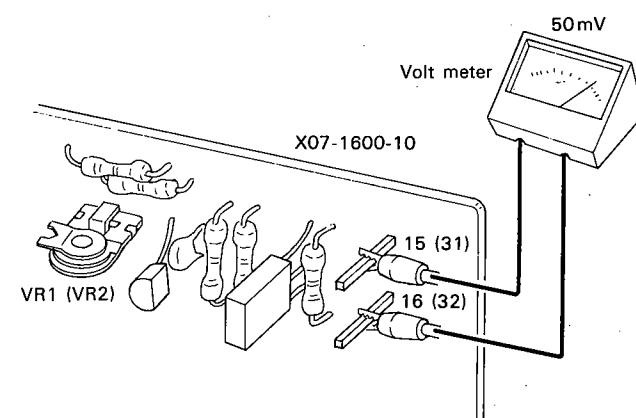

NOTES FOR ADJUSTMENTS

- * Use moderate instrument outputs at all times.
- * The output level of RF-SG means ANT input level.
- * 0 dB = 1 μ V

OR- DER	ITEM	INSTRUMENT		RECEIVER SETTING	OUTPUT	ADJUSTMENT POINTS	ADJUSTMENT METHOD		
		CONNECTION	SETTING						
FM SECTION									
1	DISCRI	-	-	FM MODE: MONO Noise (between local stations)	T meter	Lg7	Meter indication in the center.		
2		A	95 MHz 60 dB (ANT INPUT) 1 kHz (Mod) 75 kHz (Dev)	FM 95 MHz MODE: MONO	B	Lg8	Minimum distortion.		
Repeat the alignments of 1 and 2 a few times.									
3	VCO	A	95 MHz 60 dB (ANT INT) 0 (Dev)	FM 95 MHz MODE: STEREO MUTING LEVEL: 1	C Frequency counter to VCO CHECK (Rg78)	VRg2	Adjusted to 76 kHz ± 200 Hz		
4	19 KHz CANCEL	D	FM-MPX: PILOT SIGNAL FM-SG: 60 dB (ANT INPUT)	- ditto -	SSVM to Pin 5 or Pin 6 of ICg4	VRg3	Minimum output. If any difference is found, the output levels should be adjusted to the average value.		
5	SEPARATION	D	FM-MPX: SELECTOR L or R 1 kHz (Mod) PILOT (6.75 kHz Dev) FM-SG: 95 MHz 60 dB 68.25 kHz (Dev)	- ditto -	B R out (SELECTOR-L) L out (SELECTOR-R)	VRg4	Minimum output. L and R are reversed and the same adjustment is performed. If any difference is found, the output levels should be adjusted to the average value.		
6	STEREO BEACON	D	FM-MPX: SELECTOR L+R 1 kHz (Mod) PILOT (6.75 kHz Dev) FM-SG: 95 MHz 23.5 dB (15 μ V) 68.25 kHz (Dev)	- ditto -	Stereo indicator	VRg1	Stereo indicator lights.		
7	IFT	D	FM-MPX: SELECTOR L+R 1 kHz (Mod) PILOT (6.75 kHz Dev) FM-SG: 95 MHz 60 dB 68.25 kHz (Dev)	FM 95 MHz MODE: STEREO	B	L2	Minimum distortion. Adjust slightly.		
8	S METER	A	FM-SG: 95 MHz 100 dB 0 (Dev)	FM 95 MHz	S meter	-	Pointer within meter scale. If it overswings, remove Rg18.		
REFERENCE: FM FRONT END This section is exactly adjusted. You had better not readjust except L2. If you move trimmer capacitors or coils by any reasons, follow the next procedure.									
a. When you have moved trimmer capacitor	<ul style="list-style-type: none"> (1) Set the receiver to 108 MHz. (2) Connect FM-SG {108 MHz, 1 kHz (Mod), 75 kHz (Dev)} to the antenna terminal. (3) Adjust TCO so that T meter points the center. (4) Adjust TCA, TCR1 and TCR2 so that the maximum output is derived. 								
b. When you have moved coils	<p>Since OSC coil is fixed type, it cannot be readjusted. If 88 MHz signal cannot be received when the dial pointer is almost 88 MHz position, replace OSC coil. After the receiver is adjusted to receive the signal, adjust the gaps of LA, LR1 and LR2 by a screwdriver so that the maximum output is derived. If this does not solve the trouble, replace coils.</p>								
c. When you have replaced front end PC board ass'y	<ul style="list-style-type: none"> (1) Connect FM-SG {90 MHz, 1 kHz (Mod), 75 kHz (Dev)} to the antenna terminal. (2) Set the receiver so that 90 MHz signal can be received. (3) Mount the dial pointer. (4) Adjust TCA and L2 								
AM SECTION

±12 dB at 15 kHz
s Control (Vol. -30 dB) +10 dB at 100 Hz
Filter 18 Hz 6 dB/oct.
er 5 kHz 6 dB/oct.

level/Impedance
IEC (Pin) 150 mV/300Ω
REC (DIN) 30 mV/80 kΩ
ut 1.0V/1 kΩ

FM TUNER SECTION

Usable Sensitivity 9.8 dBf (1.7 μV)
50 dB Quieting Sensitivity
Mono 14.1 dBf (2.8 μV)
Stereo 36.3 dBf (36 μV)
Signal to Noise Ratio at 65 dBf
Mono 80 dB
Stereo 72 dB
75 dB at 10 mV
Total Harmonic Distortion
Mono 0.1%
Stereo 0.15%
Frequency Response 20 Hz to 15,000 Hz + 0.2,
-2.0 dB
30 Hz to 15,000 Hz + 0.2,
-0.5 dB
Capture Ratio 1.0 dB
Image Rejection Ratio 85 dB
Spurious Response Ratio 105 dB
IF Response Ratio 90 dB
Alternate Channel Selectivity 85 dB
AM Suppression Ratio 60 dB
Stereo Separation Ratio 45 dB at 1,000 Hz
30 dB at 50 Hz to 15,000 Hz
Sub Carrier Product Ratio 67 dB
Antenna Impedance 300Ω balanced and 75Ω
unbalanced
FM Frequency Range 88 MHz to 108 MHz

AM TUNER SECTION

Usable Sensitivity 10 μV (250 μV/m)
Signal to Noise Ratio 50 dB
Image Rejection 50 dB
Selectivity 35 dB
GENERAL
Power Consumption 850W at full power
AC Outlet Switched 1, Unswitched 2
Dimensions W 21-1/32" (534 mm)
H 6-19/32" (167.5 mm)
D 18-1/16" (459 mm)
Weight (Net) 40.3 lb (18.3 kg)
(Gross) 47.4 lb (21.5 kg)
