

LUXMAN 1500

SERVICE MANUAL

R 1500 CIRCUIT DESCRIPTION

Power Supply

The mains input to the Receiver goes via a 2 pole power switch to the mains transformer which has four secondary windings:

1. A 11 volt winding for the panel lamps.
2. A 25 volt winding for the speaker protection circuit.
3. A 75 volt centre tapped winding providing after full-wave rectification \oplus and \ominus supplies for the audio power amp section.
4. A 30-0-30 volt winding to provide 45 volts DC for the preamp and tuner sections. A potential divider using a zener diode which is used to obtain from 45 volts a 12 volt DC supply for the AM and FM tuner sections. The 2SC1382 transistor is used as a ripple filter providing 40 volts to the audio preamps. There are fuses in all the secondaries for transformer protection. A fuse is used as well in the preamp.

POWER AMPS

PNP transistors are used as a differential comparator; the audio input is fed to the first transistor and the feedback to the other. NPN metal can transistors are used as active loads for the differential comparator, the one NPN has its collector to ground, the other being the voltage amplifier for the entire output stage, which uses a PNP driver and a PNP output in the negative side connected as a darlington emitter follower configuration, and an NPN driver and NPN output is used in the positive side. These 4 transistors form what is known as a fully complementary symmetrical output stage.

Their input bases are bias with a 3 diode device (SV03) and a bias trim pot for idling current set (50 mA), 2 resistors and a condenser form the boots-trap constant current load for the voltage amplifier to drive the output stage. The junction of the emitter resistors is as a feed point for the differential comparator, and at the same time goes via a relay to the speaker selector switch to the speaker terminals and headphone socket via 680 ohm.

The headphone socket is always active regardless of speaker selection. PNP and NPN transistors are used to sense output current and voltage and if the output is short circuited will limit the drive to the output devices, thereby protecting the amplifier from overload.

Input sensitivity of the power amp is defined by the ratio of R811, R813 which = 700 mv for full output, and the low frequency roll off is determined by the reactance of C806 to R811 which in this circuit is 10Hz.

PRE AMP

Phono RIAA equalization amplifier 2 phono inputs can be selected both with the same input sensitivity. The RIAA

amplifier uses a NPN, PNP and NPN direct coupled triplet of transistors which are selected low noise types, the equalization and DC feedback are taken from the emitter of the NPN back to the emitter of the input NPN transistor. This amp has a gain of 36 db (2.3mv - 150mv) at 1 KHz. The linearity of this direct coupled combination offers high overload capabilities (100 mv at 1 KHz). The 150mv nominal level is at the same level as the other functions. The **Mic** amplifier uses basically the same circuit without equalization, being flat from 20 - 50 KHz with 38 dB gain. The **Function Switch** selects AM, FM Aux 1 and 2 and Phono 1 and 2 the output of which can be mixed with the input from the mic amplifier. This audio then goes to the tape monitoring function switches.

There are two switches for the tape functions, these are mounted on the switch printed circuit board. The left switch enables in the "up" position dubbing from tape 1 - 2 and in the "lower" position from Tape 2 - 1, when "centre", it is off. The right-hand switch enables monitoring from Tape 1 in the up position, tape 2 in the lower and programme source in the centre position.

The switch for the loudness works in conjunction with the volume control so that its greatest effect is at low volume settings, the audio then passes on the tone control circuit.

LINEAR EQUALIZER and TONE CONTROL

The required selection will then go to the tone control printed circuit board which contains 2 NPN transistors direct coupled linear equalizer amp and 2 NPN transistor amp for tone control. The income signal is linear equalized by selecting the feedback components of this amp. The audio then passes on the tone control circuit. Two direct coupled NPN transistors are used in the Lux-type active bass and treble control, operating in a virtual earth mode with the input at the boost point of the controls and the base of the transistor fed from the slider of the bass control via C741 and C742, the emitter being the feedback point to the controls and providing the output which is at unity gain with respect to the input, to drive the active filter circuit. Included on the tone control board are two switches for changing to bass and treble turn over frequency points.

FILTER BOARD

The Sallen Keyes type filter circuit has components selectable by the front panel low and high cut switches to provide a 12 dB/oct. roll off. The output is sufficiently low impedance to drive the power amp circuit.

SPEAKER PROTECTION

Speaker protection relay is provided in this receiver to protect speakers from damage. Speaker output terminals must always have no significant residual DC voltage, but if some plus or minus voltage appears these terminals, the

relay operates and cuts speakers connection from output stage.

This circuit is mounted on the power supply board.

AM SECTION

A superhet design using a tuned RF amplifier, a mixer/local oscillator and two stages of IF amplification at 455 KHz. A ferrite rod antenna with 3 windings is used, the first winding is connected to the external antenna terminal, the second is connected to the first section of a 3 gang tuning condenser, the last winding feeding the base of the RF transistor amplifier. A tuned RF transformer is used to couple the collector to the base of the self-mixing oscillator. The oscillator operates at 455 KHz above the incoming signal to produce the intermediate frequency, which is passed through a first IFT and then amplified by two further transistor IF stages. The audio is then recovered by a germanium diode detector and passed on to the pre amp via noise filter and selector switch, and the signal strength meter is driven from the audio detector output. A silicon diode is used to provide an A.G.C. voltage which controls the gain of the first IF amplifier; the collector of this provides an amplified AGC back to the emitter of the RF transistor. This method used provides an audio output relatively constant with varying R.F. signal strength.

FM SECTION

An input balun transformer matches either 300 ohm or 75 ohm antenna input to the Front end, which has a 4 gang tuning capacitor and consists of a dual gate FET for the tuned RF amp feeding, via a two-section transformer, the bi-polar transistor mixer.

A bipolar transistor "Colpitts" oscillator operates at 10.7 mcs above the incoming signal. C116 is a negative temperature coefficient condenser to stabilize the oscillator to less than 25 KHz per 10 deg. Celsius. The output is then fed via a 1 pf condenser to the mixer, the resultant 10.7 MHz passes through a double tuned IFT included in the front end module.

The front end module is well shielded to prevent any spurious radiation, and to offer good image and selectivity responses.

IF

The IF strip is contained on the same printed circuit board as the stereo multiplex decoder and muting circuits.

The 10.7 MHz IF intermediate frequency is amplified by a transistor then passed through a ceramic filter with a side chain A.G.C. amplifier to provide a D.C. control voltage (A.G.C.) for the RF input FET to improve the front end overload capabilities. The main chain is again amplified by a further transistor and ceramic filter providing a wide pass band with steep sides.

A differential IC with a built-in constant current source provides partial limiting, this passing through an IF transformer into the final multistage I.C. which provides hard limiting characteristics for the ratio discriminator, which provides the composite audio output for the multiplex.

A second side chain amplifier and rectifier monitors the input to the first I.C. to provide a signal strength control command as well as driving the signal strength meter. At the audio output when the receiver is off-tuned from centre either a positive or negative D.C. will appear which is monitored both by a centre tune meter and a bi-phase detector using one NPN and one PNP transistor which with another NPN forms an "AND" gate for one of two "shmitt" trigger circuits. The other shmitt trigger receives a command from the signal strength circuit previously mentioned. The collectors of the final transistor in each circuit form a "wired OR" gate which via the muting "On-Off" switch on the front panel controls the gate on the FET audio mute circuit if it is enabled. The composite audio passes on to the I.C. multiplex, which will derive the L and R audio output, the IC also is connected directly to the stereo indicator lamp.

The Left and Right go through L.C. type rejection filters to remove the 19 KHz pilot. These are both in one moulding.

Finally, a one transistor amplifier is used in each channel to raise the level to 400 m volts for the audio pre amp. A de-emphasis switch has been incorporated on the P.C. board for selecting either 75 μ sec. (American) or 50 μ sec. time constant.

R-1500 ALIGNMENT PROCEDURE

The alignment procedure described in each chart may be performed independently, without affecting the others.

Warm up the signal generators for at least 15 minutes to make certain that they are stabilized at their operating temperature particularly generators containing vacuum tubes. Consult the instruction manual supplied with the particular test instrument for specific information concerning connection and operation.

The test equipment listed here is intended only as a guide, but alternate instruments should be of similar quality.

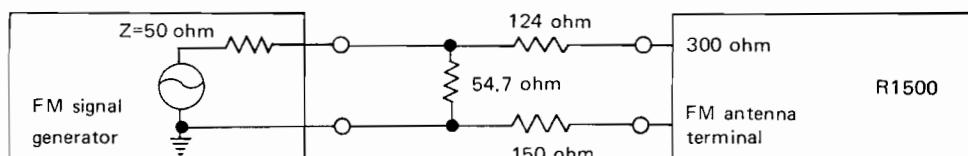

The following instruments are required for a complete alignment of the tuner.

1. Measurement instruments and tools

Signal source	1) FM signal generator (FMSG) 2) Sweep generator (SWG) 3) AM signal generator (AMSG) 4) FM stereo modulator (MPXSG) 5) Audio oscillator (AFO) 10-100KHz 0.2% accuracy, Dist. 0.1%	Meguro MSG-285A or equivalent JRC NJM-5217C or equivalent Meguro MSG-221C or equivalent Sound technology-1000A or equivalent Oscillation freq. range 10-100,000Hz, calibration error within 0.2%, distortion 0.1%
Output indicator	6) AM standard loop antenna 7) Oscilloscope (CRO) Mid bandwidth 5MHz 8) Distortion meter (HDM) 9) AC volt meter (ACVTVM) 10) DC volt meter (DCVTVM)	Meguro MLA-1001B or equivalent Iwatsu SS-5057V or equivalent Shibasoku 796E or equivalent Kikusui 164 or equivalent Kikusui 107A or equivalent
Tools	11) Hex head alignment tool 12) Thin plastic shaft alignment tool	

2. General alignment conditions

- 1) The normal test voltage is within 10% of what is indicated on the receiver with less than 2% harmonic distortion.
- 2) Unless otherwise specified, the normal ambient temperature is 15-25°C and humidity 55-75%. But if this is not possible, 5-35°C, 45-85% will provide acceptable results.
- 3) FM dummy antenna shall be as follows if not otherwise specified. The output voltage of the signal generator is 1/4 of the unloaded terminal voltage.

- 4) Connect the low side of signal source and the output indicator to the chassis ground as close as possible to the high side connection unless otherwise specified.
- 5) The 10.7MHz marker used in each section of the alignment should be the same.
- 6) Marker insertion and amplitude should not distort the oscilloscope trace.
- 7) The AM standard loop antenna should be set above the ferrite loopstick antenna.
- 8) The output level of the sweep generator is measured by the output attenuator regardless of its terminated impedance.
- 9) FM modulation is 100% with ±75 KHz
- 10) All tuner audio output measurement are at TAPEOUT 1.

Step.	Signal Source Connected to	Set signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for
1		Set selector switch to "FM", muting switch to "off", stereo only switch to "off" and turn power switch "on"				
2				DC VTVM PB351 (17)		Check that voltage is between 11.5 ~ 12.3V
3				Refer circuit diagram		Check each part voltage if necessary
4	Sweep generator PB353 (1)	±400KHz sweep centred at 10.7MHz generator output level 90–100dB	Quiet point on band	Oscilloscope PB353 TP-2		Due to the fixed frequency of the ceramic filters, find the centre frequency of a symmetrical band pass response. Make a note of it (for example 10.75MHz)
5	FM signal generator Across FM antenna terminals (300Ω) through matching network	Reduce the output level to zero (interstation receiving condition) 93MHz at 400Hz 100% modulation, output level 1mV	93MHz	Oscilloscope PB353 TP-3	T201 T202 core	Symmetrical response centred at the frequency noted by step 4
6				Oscilloscope PB353 TP-4	T204 core	
7				Oscilloscope PB353 (19)	T203 top core T203 bottom core	Maximum linearity and amplitude of "S" curve centred at the frequency noted by step 4
8	FM signal generator Across FM antenna terminals (300Ω) through matching network	Reduce the output level to zero (interstation receiving condition)	93MHz		T203 top core	Centre indication of the tuning meter
9		93MHz at 400Hz 100% modulation, output level 1mV		Oscilloscope Distortion meter AC VTVM TAPEOUT 1	T203 bottom core	Minimum distortion. At the minimum distortion setting, the output level must be within 1/2dB of peak output.
10	Repeat steps 8 and 9 as necessary to obtain maximum output level and minimum distortion at centre point of tuning meter and the meter must also shows centre at interstation state.					
11	FM signal generator Across FM antenna terminals (300Ω) through matching network	88MHz at 400Hz 30% modulation, generator output level 1mV 108MHz at 400Hz 30% modulation, generator output level 1mV 88MHz at 400Hz 30% modulation, generator output level 5 ~ 10µV	88MHz 108MHz 88MHz	Oscilloscope Distortion meter AC VTVM TAPE OUT 1	VR202	90% of full scale on signal meter reading
12					T204 core	The signal strength meter must indicate its maximum, at the same time as the centre tune meter indicates centre
13					L104	Accurate indication of pointer on dial to within ± 1 pointer width
14					TC104	
15					T101 top core T101 bottom core	Maximum indication of signal strength meter
16					L101	

Step.	Signal Source Connected to	Set signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for
17	FM signal generator Across FM antenna terminals (300Ω) through matching network	88MHz at 400Hz 30% modulation, generator output level 5 ~ 10μV	88MHz 108MHz	Oscilloscope Distortion meter AC VTVM TAPE OUT 1	L102	Maximum indication of signal strength meter
18		L103				
19		TC101				
20		TC102				
21		TC103				
22		Repeat steps 13 ~ 21 as necessary to obtain correct tuning on dial scale and the maximum indication of signal meter with uniform sensitivity throughout the band				
23	FM signal generator Across FM antenna terminals (300Ω) through matching network	Reduce the output level to zero (interstation receiving condition)	93MHz 88MHz 108MHz	Oscilloscope Distortion meter AC VIVM TAPE OUT 1	T203 top core	Center indication of the tuning meter
24		93MHz at 400Hz 100% modulation, output level 1mV			T203 bottom core	Minimum distortion. At the minimum distortion setting, the output level must be within 1/2 dB of peak output.
25		88MHz at 400Hz 100% modulation			IHF maximum usable sensitivity which is the minimum output level of FMSG required for distortion and noise to be -30dB of total output	
26		108MHz at 400Hz 100% modulation				
27	Set muting switch "on" & turn muting level to full clockwise					
28	FM signal generator Across FM antenna terminals (300Ω) through matching network	98MHz at 400Hz 100% modulation generator output level 4μV	98MHz	Oscilloscope AC VTVM TAPE OUT 1	VR201	Fix VR201 at the point where output signals appear
29		98MHz at 19KHz 3 ~ 4% modulation generator output level 1mV			T205 core	Maximum amplitude of oscilloscope trace
30		Oscilloscope PB351 CP--5		T207 core		
31				T206 core		
32	Repeat steps 29 ~ 31 as necessary for alignment of perfect tuning					
33	FM signal generator Across FM antenna terminals (300Ω) through matching network	98MHz at 19KHz 10% (L-R) 400Hz 45% output level 1mV	98MHz	Oscilloscope AC VTVM TAPE OUT 1	T206 core	To obtain peak output voltage
34		98MHz at 19KHz 10% L (or R) stereo 90% modulation output level 1mV			VR203	Maximum separation

Step.	Signal Source Connected to	Set signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for
35	Set selector switch to "AM"					
36	Connect TP2 and TP3 on PB460					
37	Sweep generator PB460 (1) through 1 μ F mylar capacitor	$\pm 20 \sim 25$ KHZ sweep centred at 455KHz generator output level 3 ~ 10mV	Quiet point on band near 1600KHz	Oscilloscope AC VTVM PB460 (7)	T403 top core T403 bottom core T404 top core T404 bottom core T405 core	Maximum symmetrical response centred at 455KHz
38						
39						
40						
41						
42	Disconnect TP2 and TP3 connected at step 36					
43	Adjust VR401 to mechanical center position					
44	AM signal generator Standard radiating loop antenna placed near AM built in antenna	600KHz at 400Hz 30% modulation, field strength 50dB/m	600KHz	Oscilloscope AC VTVM TAPE OUT 1	T402 core L001 core L401 core TC003 TC001 TC002	Accurate indication of pointer on dial to within \pm 1 pointer width Maximum reading on AC VTVM Accurate indication of pointer on dial to within \pm 1 pointer width Maximum reading on AC VTVM
45						
46						
47		1400KHz at 400Hz 30% modulation, field strength 50dB/m	1400KHz			
48						
49						
50	Repeat steps 44 ~ 49 as necessary to obtain exact tuning on dial scale and maximum sensitivity					
51	AM signal generator Standard radiating loop antenna placed near AM built in antenna	1000KHz at 400Hz 30% modulation, field strength 90dB/m	1000KHz	Oscilloscope AC VTVM TAPE OUT 1	VR401	To obtain 100mV at TAPE OUT 1

20. Stereo beacon
21. Dial scale cover
22. Tuning shaft and flywheel ass'y complete with mounting collect
23. Pully 13mm
24. Pully 20mm
25. Tuning pointer ass'y (Complete with lamps)
26. Cord dial
27. Spring (Tension for dial cord)
28. Drum (Tuning capacitor)
29. AM ferrite core antenna
30. Braket, antenna
31. Power amp. complete ass'y
32. Speaker terminals
33. Mains cord
34. Power transformer

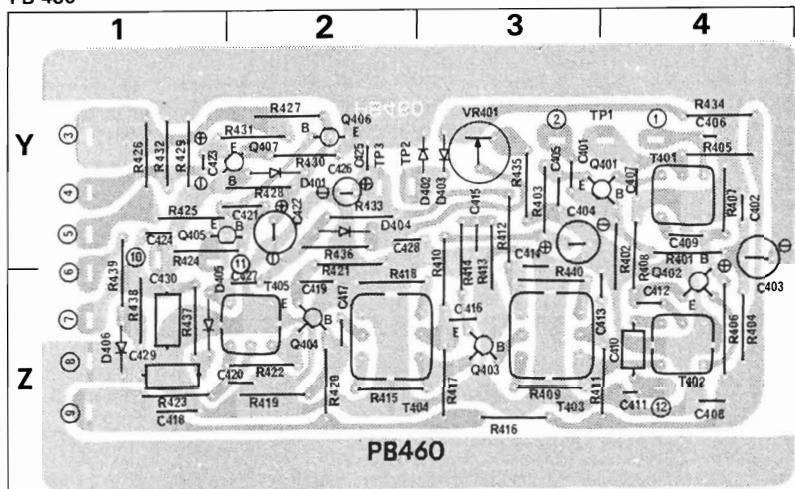

35. De-emphasis switch 50μ sec ↔ 75μ sec (E MODEL only)
36. Voltage selector 100-110-220-240V (E MODEL only)
37. Dial illumination lamps
38. Dial lamp holder
39. Antenna balun
40. Foot
41. Shield IF
42. Clamp, cable
43. Connector, power amp.
44. Connector, power supply
45. Chassis complete ass'y
46. Pin jack ass'y Female
47. Fuse holder (E & U MODEL only)
48. Microphone jack
49. Headphone jack
50. Panel back
51. Braket, power supply board
52. Mounting, transformer
53. Stand, pulley
