C I R C U I T D E S C R I P T I O N

Equalizer Stage

A Cascoded Differential Direct Coupled Amplifier is adopted. This differential circuitry at the top stage stabilized the direct coupled stage and helps obtain better linearity. Also this shields the NF amp immune from being unstabilized by the exterior effect such as cartridges to be connected to the input. Good linearity, stability and SN ratio are ensured thanks to the Cascoded Amplifier adopted for this differential stage and the following stage.

As for the output stage, the adoption of the transistor of T0-5 type at the final stage together with the push-pull circuit by Class A Inverted Darlington Configuration permits to accept the low impedance loads.

This is designed for the professional use because current standard control amp cannot stand the severe load condition at equalizer stage when a lot of lines of recording output is used frequently with professional equipment.

Constant Current Circuits are adopted at important points to improve the linearity of the transistor itself, the open loop gain and the differential function, all of which contribute to lower the distortion. The permissible input voltage at PHONO terminals is 450mV at 1KHz (R.M.S. Input Sensitivity 0dB).

R.I.A.A. equalization is within $\pm 0.2\text{dB}$, which is realized by careful selection of components used in this equalizer stage. Other function related to this stage are Input Sensitivity Adjuster, Input Impedance Adjuster and Linear Equalizer.

Intermediate Amp & Tone Control Circuit

These two stages adopt cascoded direct-coupled amp to improve linearity especially at high frequency range, and stability and SN ratio are just the same with that of the equalizer stage.

Constant Current Circuitry is adopted in the output stage to improve linearity of the transistor itself and the open loop gain. Phase compensation for NF stabilization is just one, and the aggravation of the distortion at high frequency range is almost nil.

Tone Control Circuit of LUX original NF type improves the distortion together with the above mentioned amplifying circuit. Tone control function is provided with independent frequency selector with 3 points for both bass (150Hz, 300Hz, 600Hz) and treble (1.5KHz, 3KHz, 6KHz) together with the tone defeat switch. This circuit allows low boost at the same time. Thus wider tonal adjustment is feasible.

Further a detent-volume of 21 points bype is adopted for both bass and treble level control. This is just the same type with the high-grade attenuator, which prevents gang error between right and left channel.

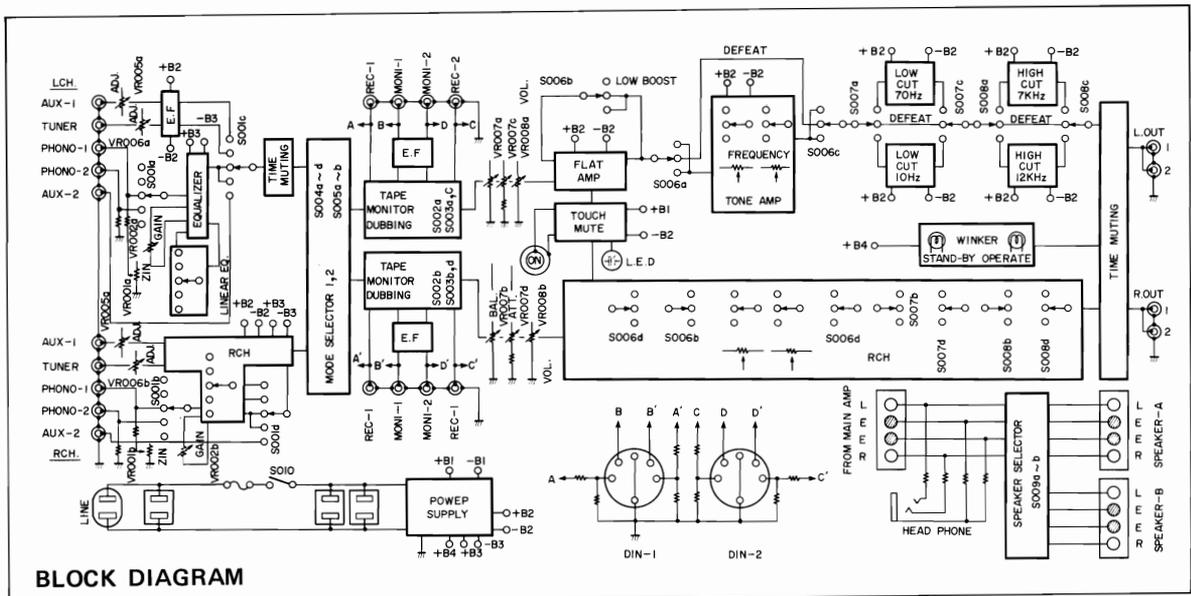

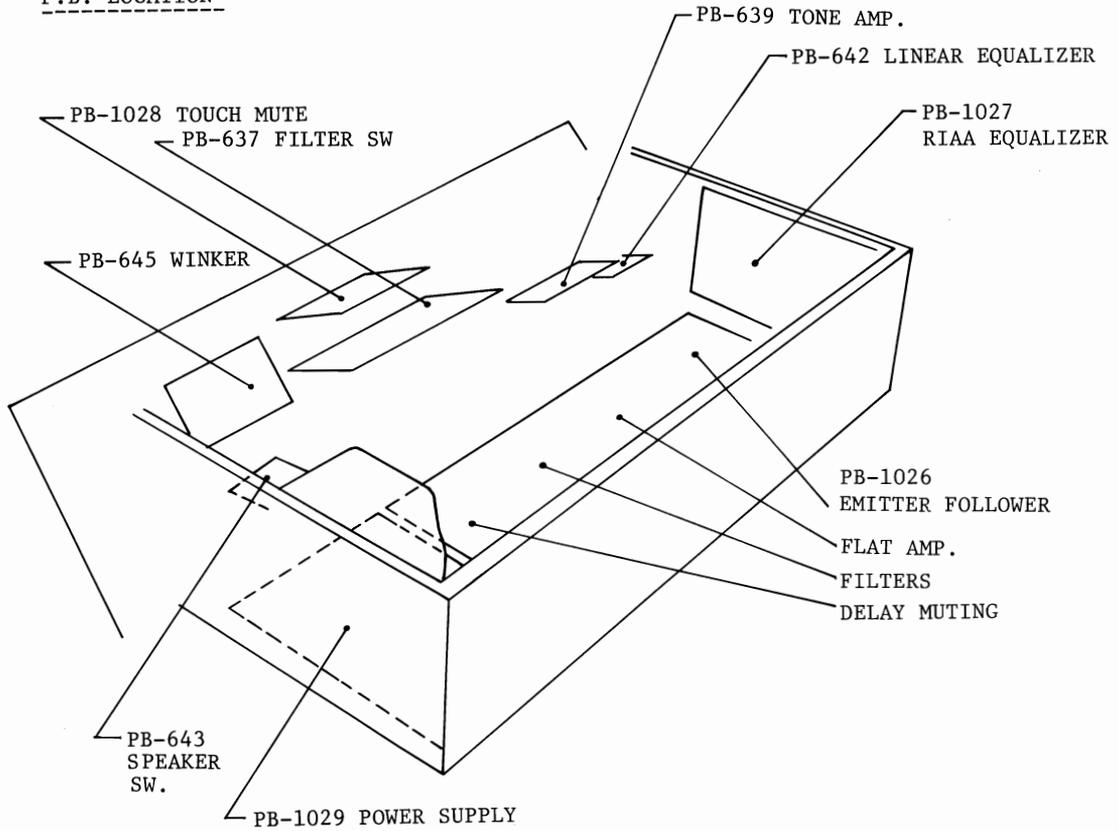

Buffer Circuit

Emitter follower circuit is adopted for this stage. But this is somewhat different from the ordinary one. Here two transistors are used; one is for the emitter follower and the other for the constant current circuit to the emitter follower stage. This constant current driving circuit not only keeps good linearity of the transistor itself but suppresses the distortion lowest for wide frequency range by means of its high open gain.

Filter Circuit

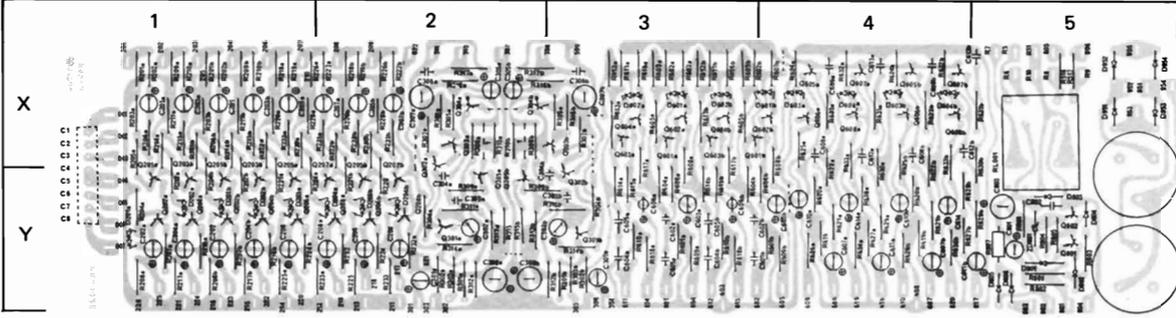

This stage is an NF type utilizing emitter follower. The constant drive system is adopted likewise the Buffer stage. Cut off frequency can be selected either at 10Hz (-18dB/oct.) or 70Hz (-12dB/oct.) for Bass cut and 7KHz (-12dB/oct.) or 12KHz (-12dB/oct.) for Treble cut. Independent filter circuits for each cut off frequency are provided, and these cut off points can be selected by the whole switching of the circuit. Of course no signals will go through these circuits when the filter switch is off.

MODEL: C-1000 REPLACEMENT PARTS LIST

All resistors are carbon 1/4 watt resistor unless noted otherwise. Unit of resistance is OHM.

(Class "SG" --- low noise, Class "J" --- $\pm 5\%$, Class "G" --- $\pm 1\%$)

The resistors marked (■) are all non-flamable type.

009	100K - B X 2	bass control
010	50K - B X 2	treble control

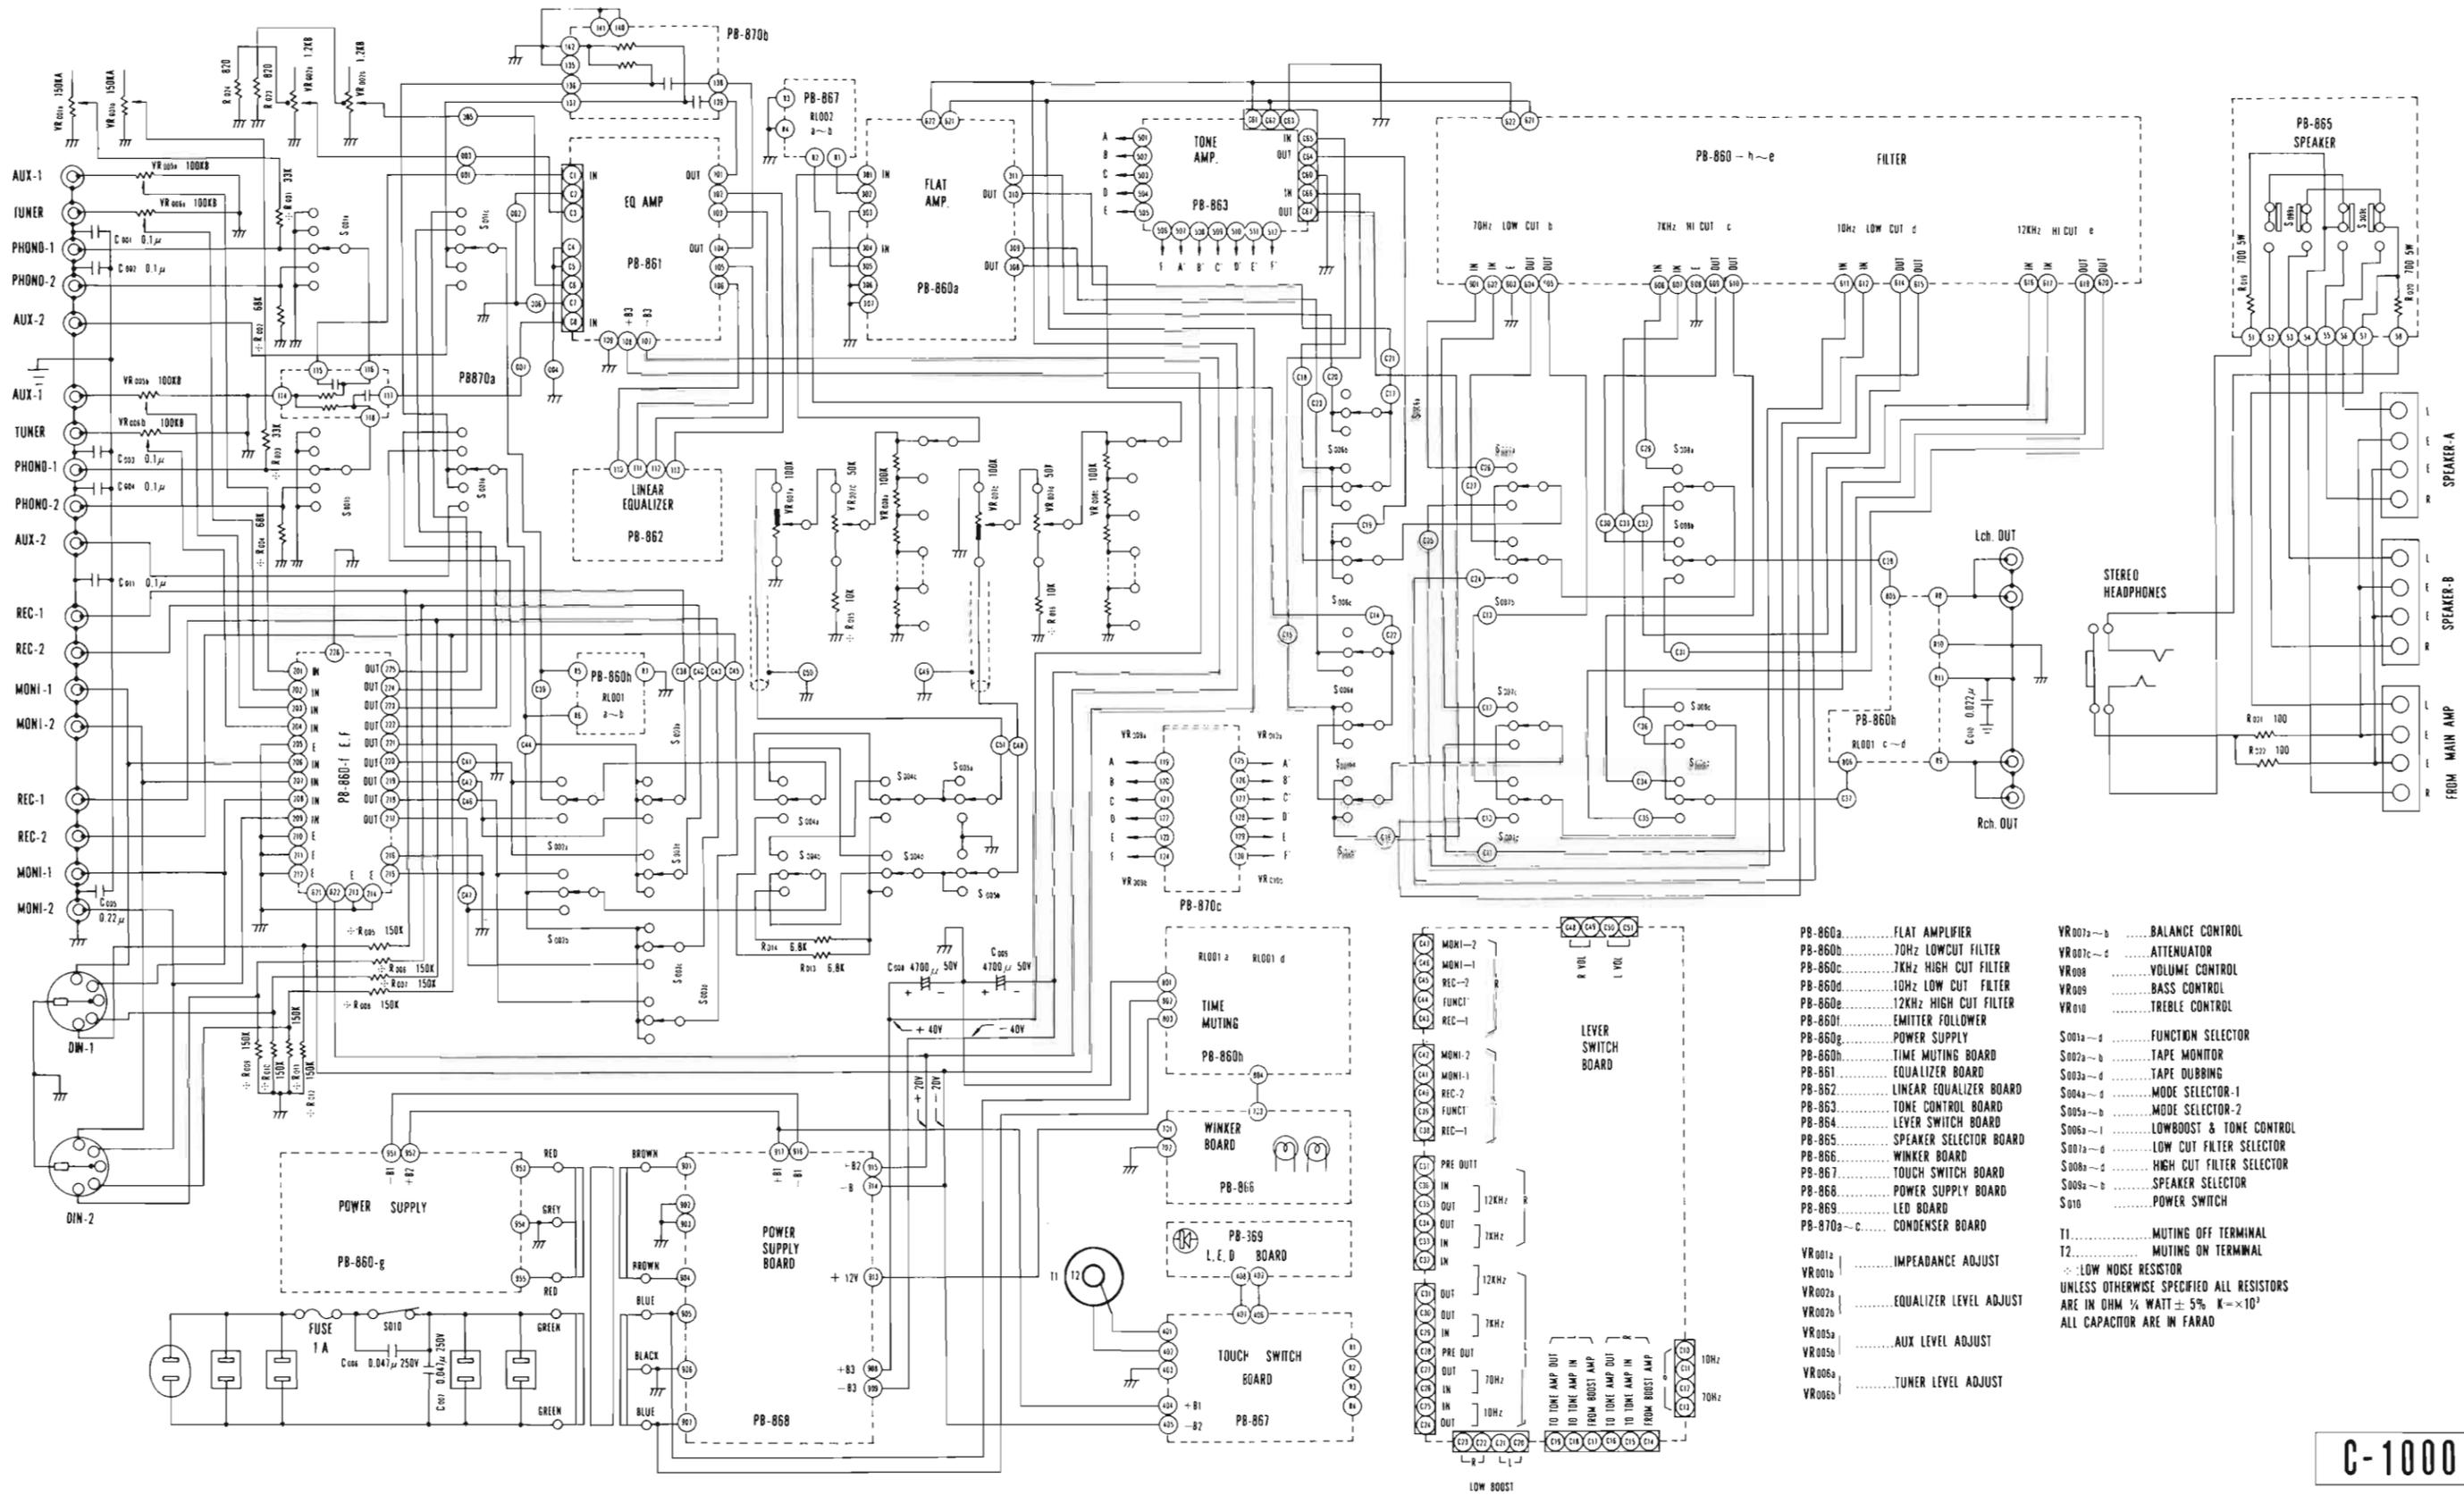

SYMBOL NO. (SWITCHES)

S001	rotary switch	4-circuit, 5-contact	function
002	lever switch	2-circuit, 3-contact	tape monitor
003	lever switch	4 3	tape dubbing
004	lever switch	2 3	mode selector - 1
005	lever switch	2 3	mode selector -2
006	lever switch	6 3	lowboost & tone control
007	lever switch	4 3	low cut filter
008	lever switch	4 3	high cut filter
009	push switch	2 2	speaker selector
010	push switch	1 1	power switch
	rotary switch	4 3	bass
	rotary switch	4 3	treble
	rotary switch	4 5	linear equalizer

MISCELLANEOUS

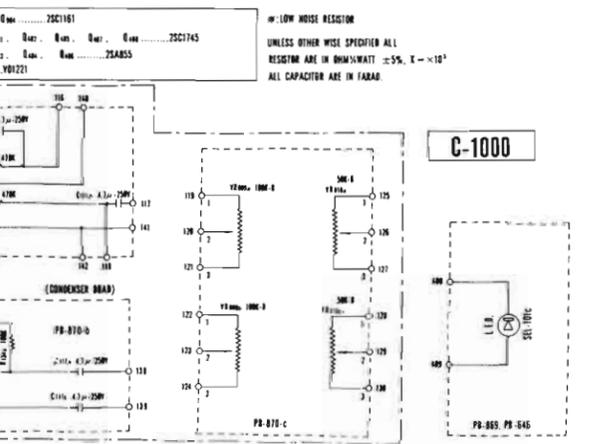

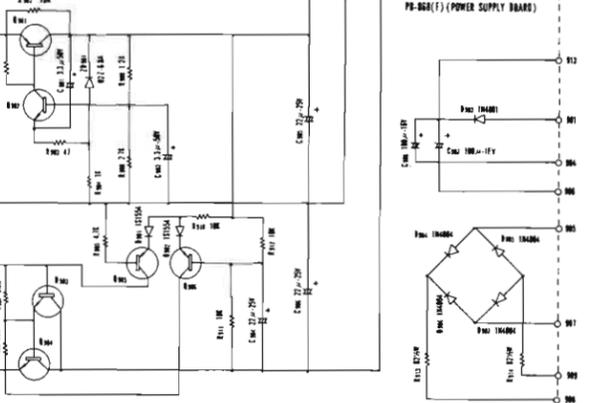

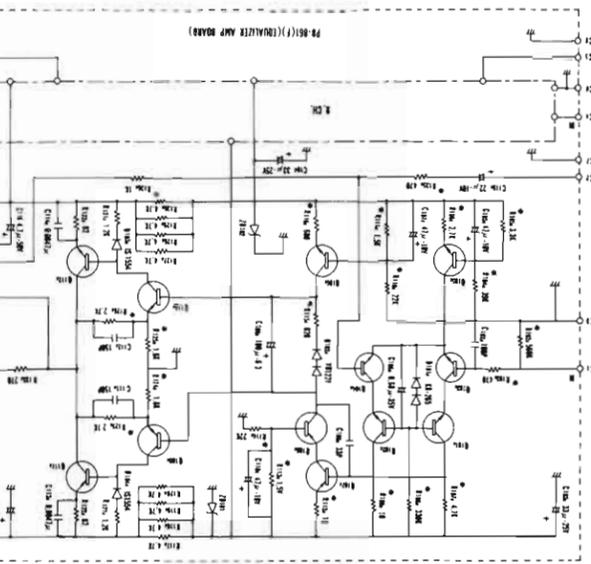

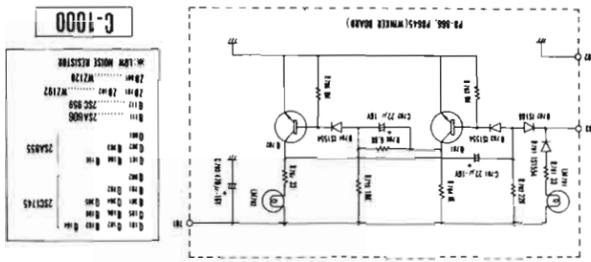

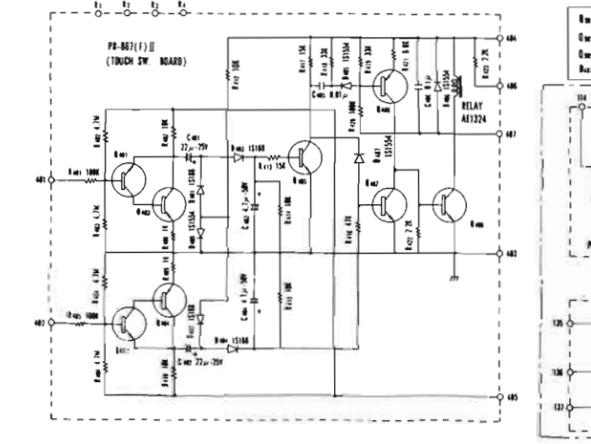

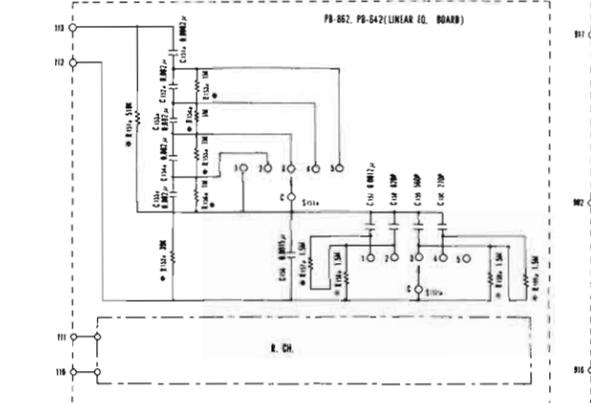

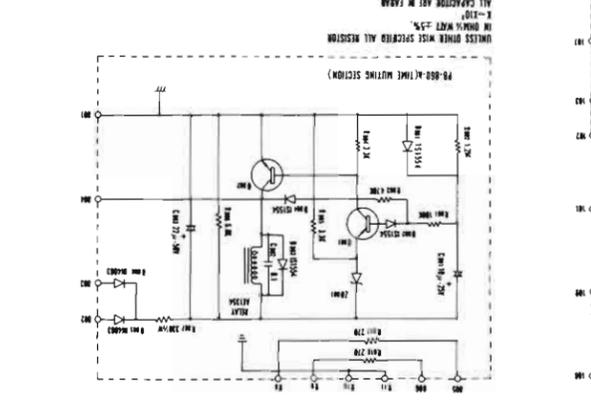

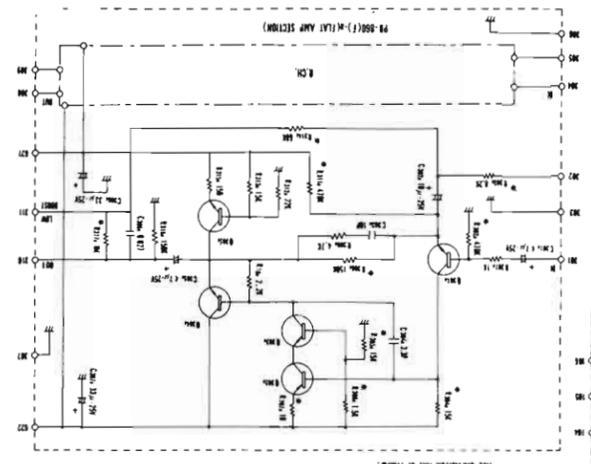

SYMBOL NO. (PRINTED CIRCUIT BOARDS)

PB637	P.C. Board	for lever switch
639		tone control
642		linear equalizer
643		speaker selector
645		winker
646		L.E.D.
1026		flat amp, filter, emitter follower & delay-time muting
1027		equalizer
1028		touch switch
1029		power supply
P-2038		power transformer (UL)
P-2023		power transformer (A)

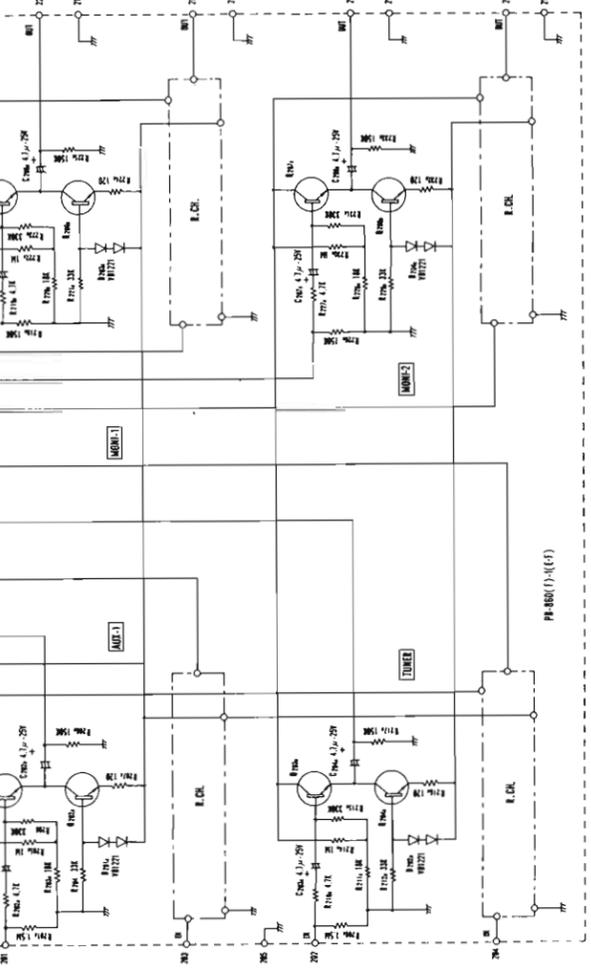

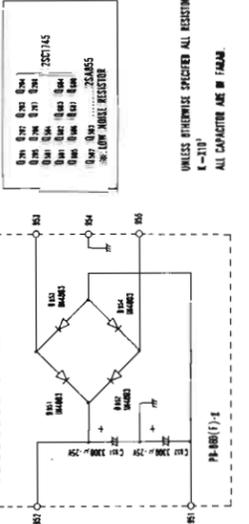

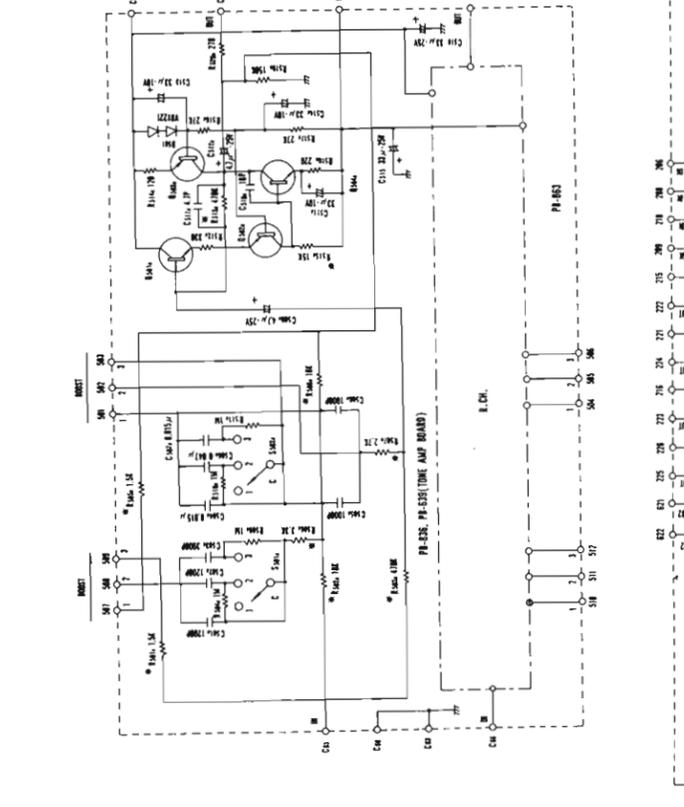

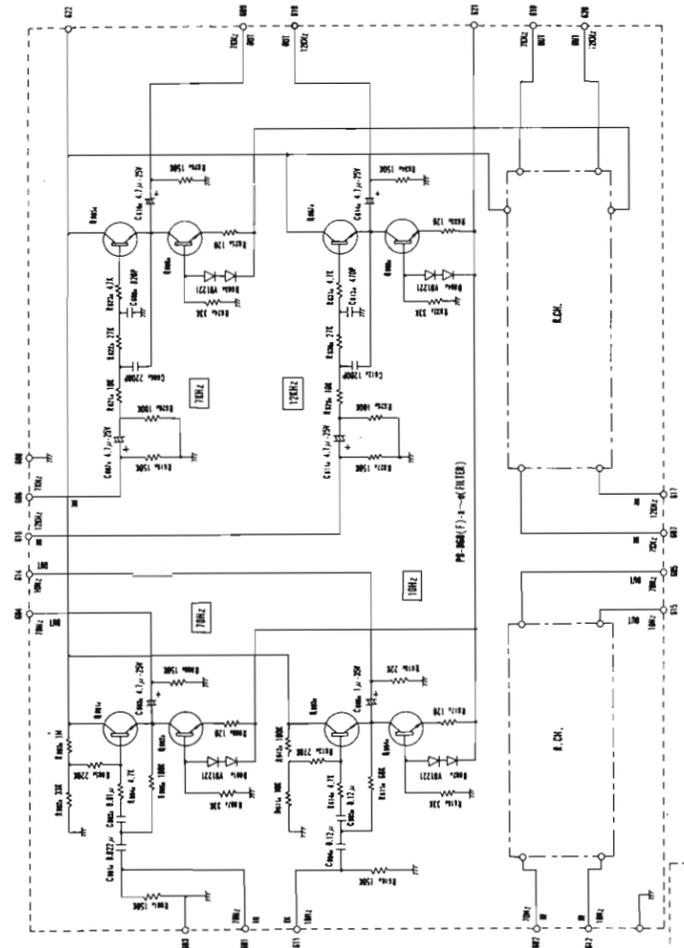

- PB-860a..... FLAT AMPLIFIER
- PB-860b..... 70Hz LOWCUT FILTER
- PB-860c..... 7KHz HIGH CUT FILTER
- PB-860d..... 10Hz LOW CUT FILTER
- PB-860e..... 12KHz HIGH CUT FILTER
- PB-860f..... EMITTER FOLLOWER
- PB-860g..... POWER SUPPLY
- PB-860h..... TIME MUTING BOARD
- PB-861..... EQUALIZER BOARD
- PB-862..... LINEAR EQUALIZER BOARD
- PB-863..... TONE CONTROL BOARD
- PB-864..... LEVER SWITCH BOARD
- PB-865..... SPEAKER SELECTOR BOARD
- PB-866..... WINKER BOARD
- PB-867..... TOUCH SWITCH BOARD
- PB-868..... POWER SUPPLY BOARD
- PB-869..... LED BOARD
- PB-870a-c..... CONDENSER BOARD

- VR001a..... IMPEDANCE ADJUST
- VR001b..... ATTENUATOR
- VR002a..... EQUALIZER LEVEL ADJUST
- VR002b..... TREBLE CONTROL
- VR003a..... AUX LEVEL ADJUST
- VR003b..... TUNER LEVEL ADJUST
- VR003c..... BALANCE CONTROL
- VR003d..... BASS CONTROL
- VR004..... VOLUME CONTROL
- VR005..... SPEAKER SELECTOR
- VR006..... LOW BOOST & TONE CONTROL
- VR007a-d..... FUNCTION SELECTOR
- VR007b..... TAPE MONITOR
- VR007c..... TAPE DUBBING
- VR007d..... MODE SELECTOR-1
- VR008a-b..... MODE SELECTOR-2
- VR008c..... LOW BOOST & TONE CONTROL
- VR008d..... HIGH CUT FILTER SELECTOR
- VR008e..... SPEAKER SELECTOR
- VR009..... POWER SWITCH

MODEL: C-1000 MODIFICATION (EQUALIZER SECTION)

This servicing procedure should be applied to the models whose serial NO. is marked with C at the top, which is limited to March, 1976 production.

Such capacitors as C101 and C117 which are placed at the input and output respectively should be modified as per the following procedure.

- a) Reverse the connection of the C101 as per the drawing, since the silk-prints on the PB1027 are reversed.
(⊕ for the input side, ⊖ for the amp. side)
- b) As for the C117, connect two capacitors in series on the PB1027, adding another same type, to realize electrically non-polar capacitor.

Parts Required

C101:	2.5V	4.7uF x 1/ch tantalum	total 2 pcs.
C117:	25V	4.7uF x 2/ch tantalum	total 4 pcs.

REMARKS: It is recommended in any case to apply the modification to C101 and C117, as these capacitors are in danger of breakage (mainly leakage) even if they remain functioning as they are.
