

AM / FM STEREO TUNER

T-88V
SERVICE MANUAL

T-88V CIRCUIT DESCRIPTION

Power Supply

The mains input to the tuner goes via power switch to the mains transformer which has two windings:

1. A 12 volt winding for the panel lamps.
2. Q225 (2SD235) transistor is used as a regulator to obtain from 17 volt to a 12 volt DC supply for AM and FM tuner section.

AM Section

A superhet design using a mixer/local oscillator and two stages of IF amplifications at 455KHz. A ferrite rod antenna with 3 windings is used, the first winding is connected to the external antenna terminal, the second is connected to the first section of a 2 gang tuning condenser, the last winding feeding the base of the mixer transistor.

The oscillator operates at 455KHz above the incomming signal to produce the intermediate frequency, which is passed through a ceramic filter and then amplified by two further transistor IF stages. The audio is then recovered by a D216 germanium diode detector and passed on to the pre-amp via selector switch, and signal strength meter is driven from a D215 germanium diode detector. An AGC voltage which is detected at the D217 and D218 controls the gain of the first IF amplifier, two diodes D213 and D214 are used for increasing the AGC effect. This method used provides an audio output relatively constant with varying RF signal strength.

FM Front-end

An input balun transformer matches either 300-ohm or 75-ohm antenna input to the front-end, which has a 4 gang tuning capacitors and consists of a FET for the tuned RF amp feeding, via a two section transformer, the bi-polar transistor "Colpitts" oscillator operates at 10.7MHz above the incomming signal. C115, C116, C117 and C118 are negative temperature coefficient condensers to stabilize the oscillator to less than 25KHz per 10 deg. Celsius. The output is then fed via 3pF condenser to the mixer, the resultant 10.7MHz passes through a double tuned IFT included in the front-end module. The front-end module is well shielded to prevent any spurious radiation, and to offer good image and selectivity response.

FM IF and MPX Sections

The IF strip is contained on the same printed circuit board as the AM, the stereo multiplex decoder and muting circuit. The 10.7MHz IF intermediate frequency is amplified by a transistor Q214 then passed through a ceramic filter with a side chain AGC amplifier to provide a DC control voltage for the RF input FET to improve the front-end overload capabilities. The main chain is again amplified by a further transistor and ceramic filter providing a wide pass band with steep sides.

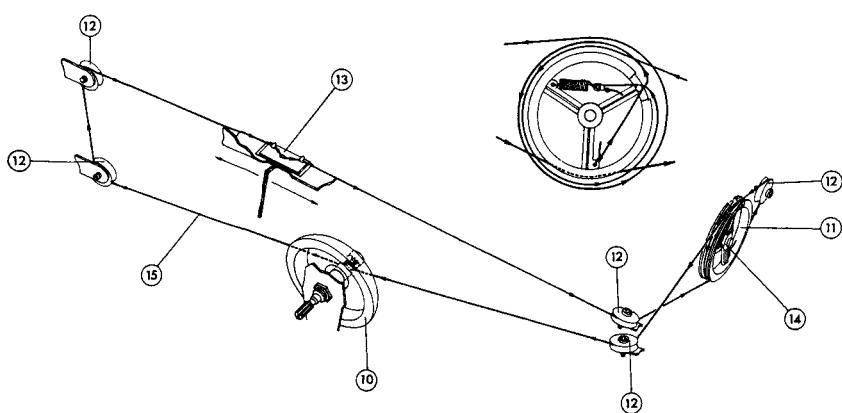

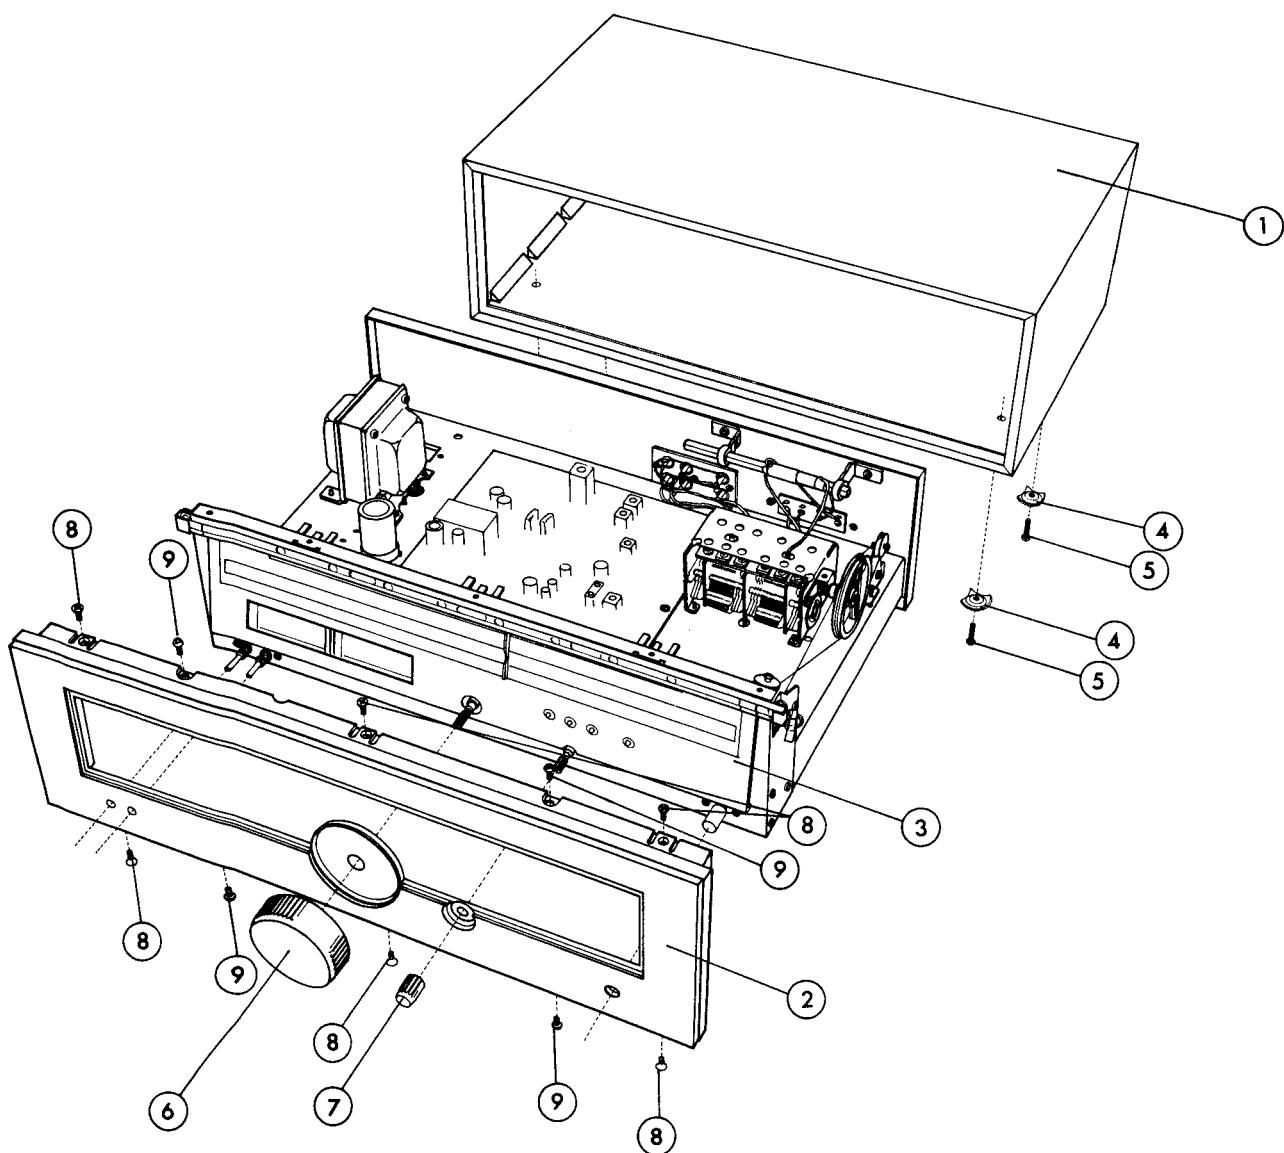

At the audio output when the receiver is off-tuned from centre either a positive or negative DC will appear which is monitored both by a centre tune meter and a bi-phase detector using one NPN and one PNP transistor which with another NPN forms an "AND" gate for one of two "shmitt" trigger circuits. The other shmitt trigger receives a command from the signal strength circuit previously mentioned. The collectors of the final transistor in each circuit form a "wired OR" gate which via the muting "on-off" switch on the front panel controls the gate on the FET audio mute circuit if it is enabled. The composite audio passes on to the PLL stereo demodulator, which will derive the L and R audio output, the PLL stereo demodulator also is connected directly to the stereo indicator lamp.

The Left and Right go through L.C. type rejection filters to remove the 19KHz pilot. These are both in one moulding. Finally, a one transistor amplifier is used in each channel to raise the level to 1.6V for the audio preamp.

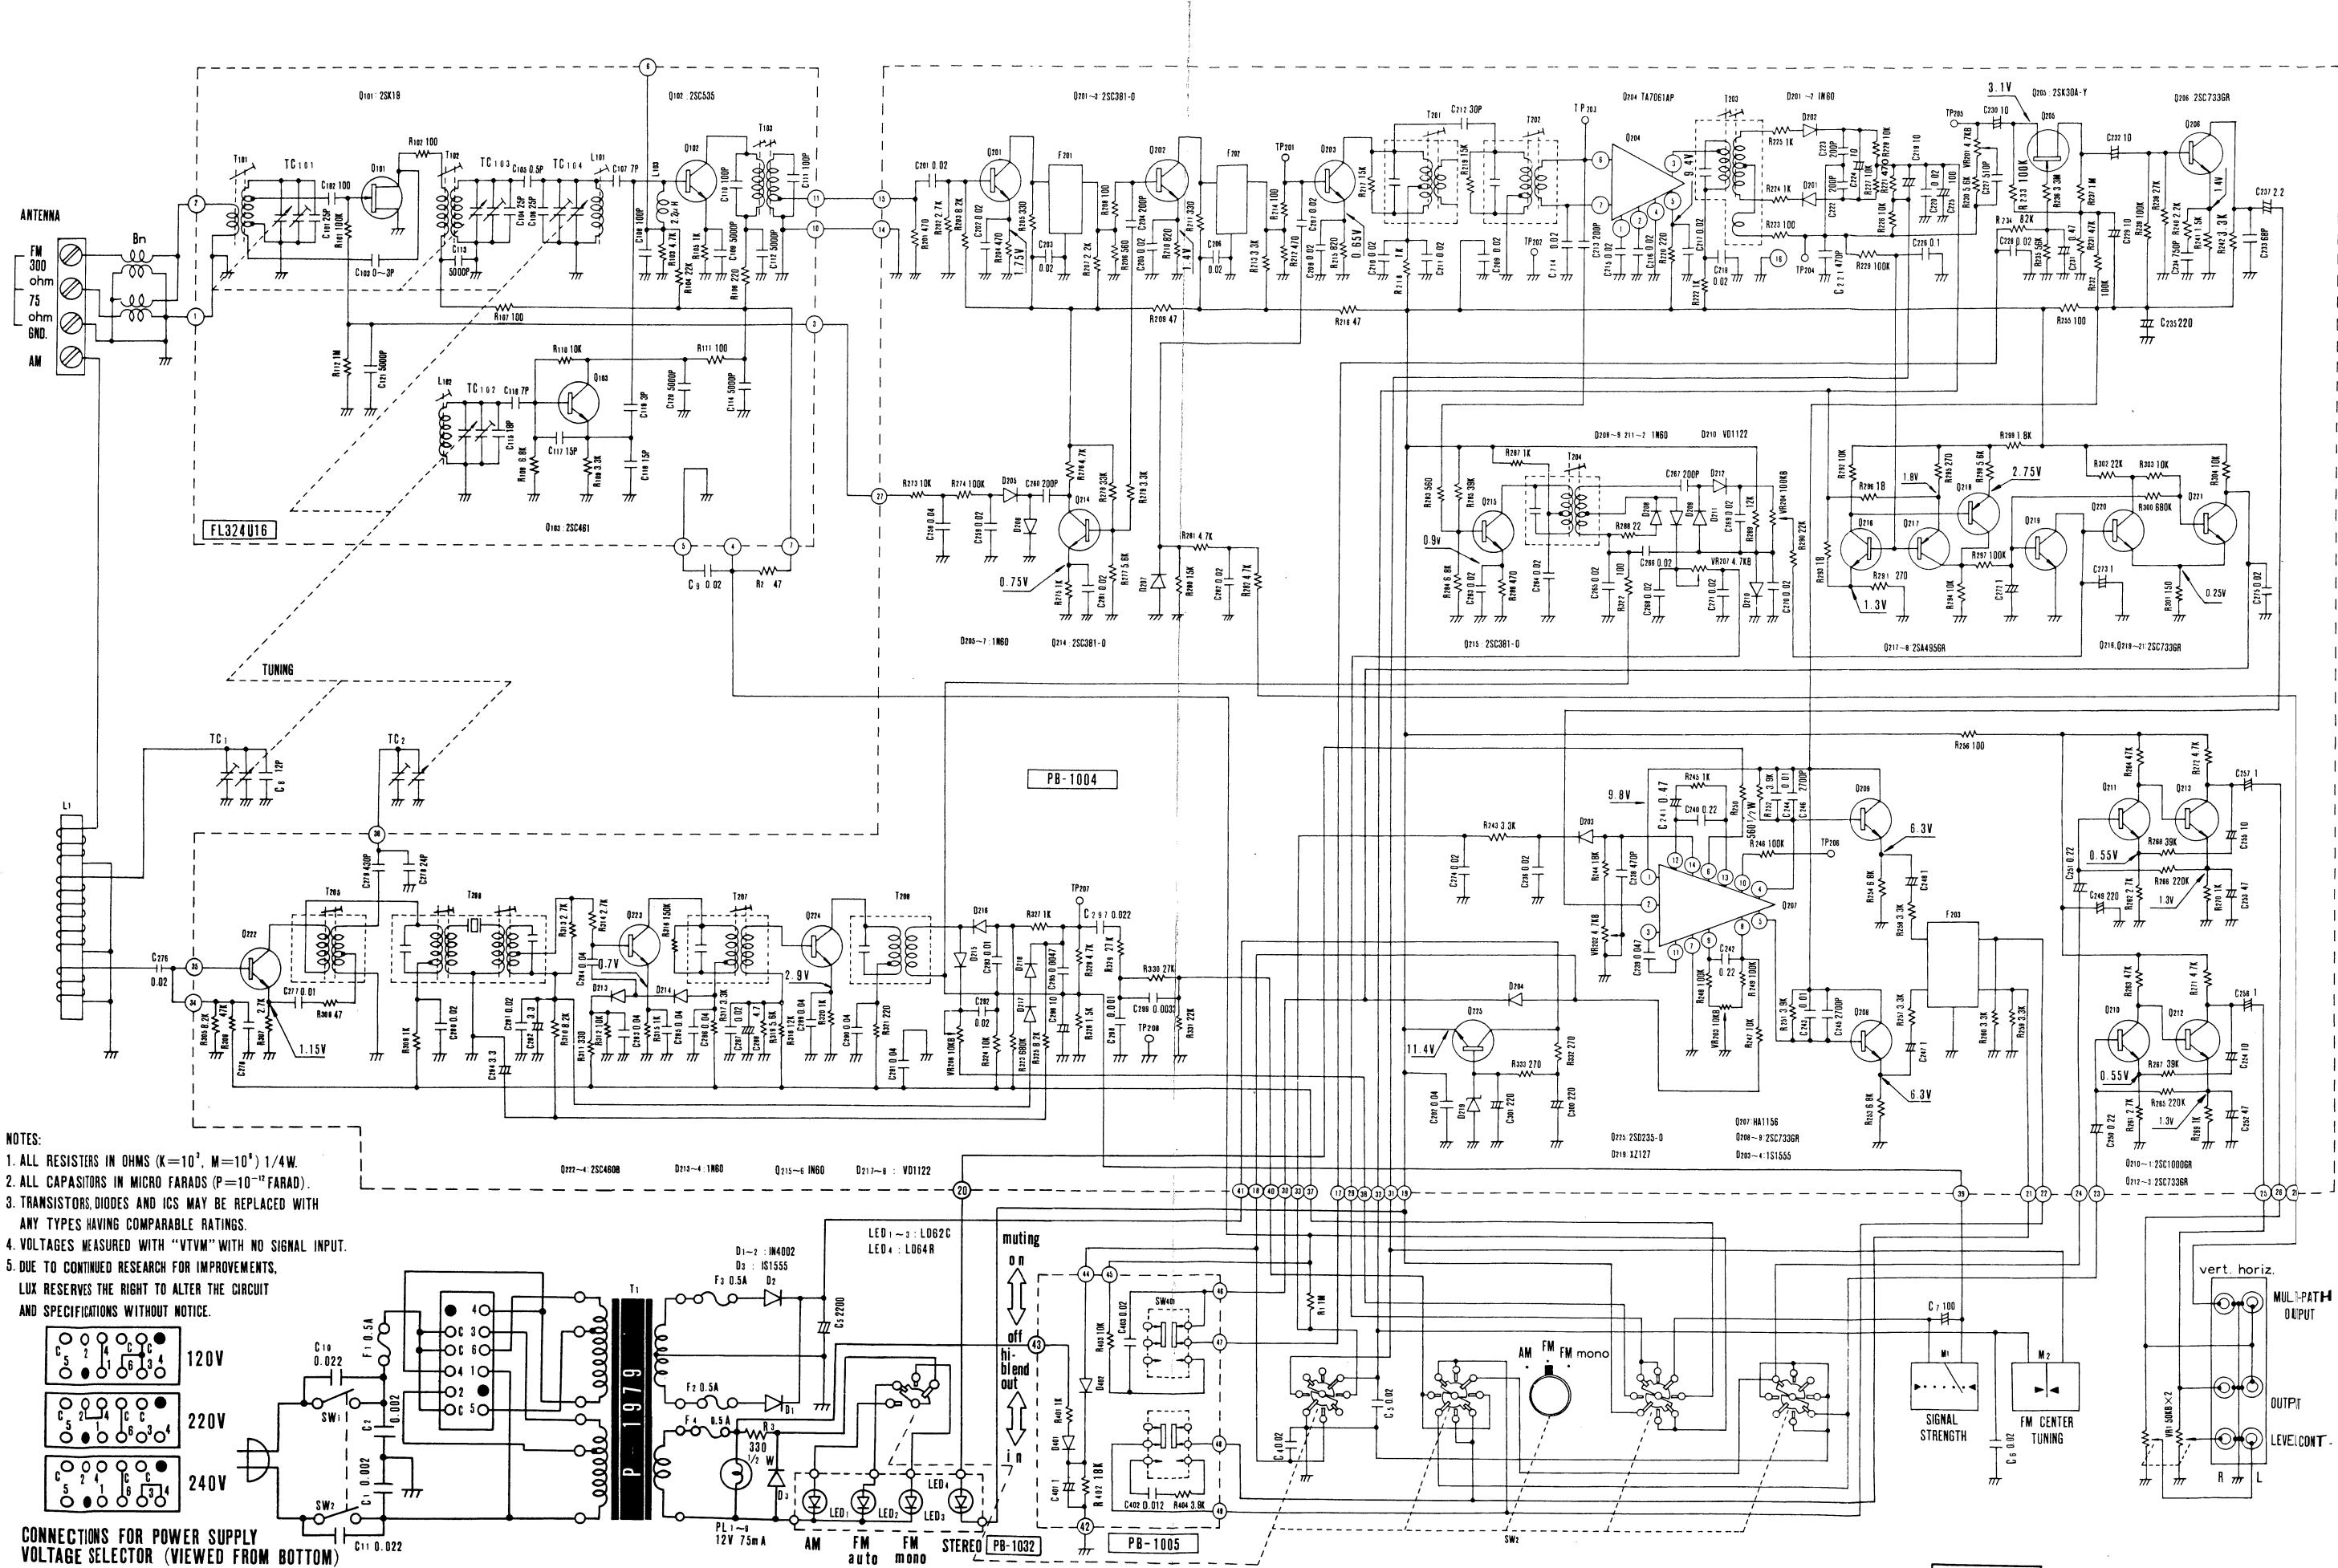

STEP	Signal Source Connected to	Set Signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for
1		Set selector switch to "FM", muting switch to "off", and turn power switch "on".				
2				DC VTVM PB1004 (19)		Check that voltage is between 11.2 - 12.0V
3						Check voltage at each part
4	<u>Sweep Generator</u> PB1004 (15)	+400KHz sweep centered at 10.7MHz Generator output level 90 - 100dB	Quiet point on band	<u>Oscilloscope</u> PB1004 TP201		Due to the fixed frequency of the ceramic filters, find the center frequency of a symmetrical band pass response. Make a note of it (for example 10.75MHz)
5				<u>Oscilloscope</u> PB1004 TP203	T201 T202 core	Symmetrical response centered at the frequency noted by step 4.
6				<u>Oscilloscope</u> PB1004 TP205	T203 top core T203 bottom core	Maximum linearity and amplitude of "S" curve centered at the frequency noted by step 4
7	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm) through matching net work	Reduce the output level to zero (interstation receiving condition)	93MHz		T203 top core	Center indication of the tuning meter
8		93MHz at 400Hz 100% modulation, output level 1mV		<u>Oscilloscope</u> <u>DistortionMeter</u> AC VTVM OUT	T203 bottom core	Minimum distortion. At the minimum distortion setting, the output level must be within 1/2dB of peak output.
9		Repeat steps 8 and 9 as necessary to obtain maximum output level and minimum distortion at center point of tuning meter and the meter must also shows center at interstation state.				
10	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm) through matching network	88MHz at 400Hz 100% modulation, generator output level 1mV	88MHz	<u>Oscilloscope</u> <u>DistortionMeter</u> AC VTVM OUT	T204 core	The signal strength meter must indicate its maximum, at the same time as the center tune meter indicates center.
11					L102	Accurate indication of pointer on dial to within <u>±1</u> pointer width
12		108MHz at 400Hz 100% modulation, generator output level 1mV	108MHz		TC102	
13		88MHz at 400Hz 100% modulation, generator output level 5-10uV	88MHz		T103 top core T103 bottom core T101, T102	Maximum indication of signal strength meter
14					L101	

STEP	Signal Source Connected to	Set Signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for
15	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm)	108MHz at 400Hz 100% modulation generator output level 5 - 10uV	108MHz	Oscilloscope DistortionMeter AC VTVM OUT	TC103 TC104 TC101	Maximum indication of signal strength meter
16						
17	through matching network					
18	Repeat steps 10 - 17 as necessary to obtain correct tuning on dial and the maximum indication of signal meter with uniform sensitivity throughout the band					
19	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm)	Reduce the output level to zero (interstation receiving state)	93MHz	Oscilloscope DistortionMeter AC VTVM OUT	T203top core T203 bottom core	Center indication of the tuning meter
20	through matching network	93MHz at 400Hz 100% modulation, output level 1mV				Minimum distortion. At the minimum distortion setting, the output level must be within 1/2dB of peak output
21		88MHz at 400Hz 100% modulation	88MHz			IHF maximum usable sensitivity which is the minimum output level of FMSG required for distortion and noise to be -30dB of total output
22		108MHz at 400Hz 100% modulation	108MHz			
23	Set muting switch at "on"					
24	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm)	98MHz at 400Hz 100% modulation, generator output level 1mV	98MHz	Oscilloscope AC VTVM OUT	VR205 VR204	Adjust to read 90% of full scale of meter Fix VR204 at the point where output signals appear (muting adjustment)
25	through matching network	98MHz at 400Hz 100% modulation output level 7 uV				
26	Set selector switch to "FM auto", muting switch to "off"					
27	<u>FM Signal Generator</u> Across FM antenna terminals(300-ohm)	98MHz at 400Hz 100% modulation, generator output level 1mV	98MHz	Frequency Counter	VR202	Adjust VR202 until 19.00KHz is read at TP206 on the frequency counter
28	through matching network	98MHz at 19KHz 10% L(or R) stereo 90% modulation output level 1mV	98MHz	Oscilloscope AC VTVM OUT	VR201	Maximum separation
29		98MHz at 19Khz 5% L (or R) stereo 90% modulation output level 1mV			VR203	Adjust VR203 until the stereo indicator lamp lights up
30	Set selector switch to "AM" position					
31	Adjust VR206 at its extreme counter-clockwise position					

STEP	<u>Signal Scource</u>	Set Signal to	Set Radio Dial to	Output Indicator Connected to	Adjust	Adjust for	
	Connected to						
32	<u>Sweep Generator</u> TC1, through 1uF mylar capacitor	+20 - 25KHz sweep centered at 455KHz generator output level 3mV	Quiet point on band near 1600KHz	Oscilloscope PB1004 TP207	T206	Maximum amplitude Do not adjust for two humps Symmetrical response with flat top	
33	<u>AM Signal Generator</u> Standard radiating loop antenna placed near AM built-in antenna	600KHz at 400Hz 30% modulation field strength 50dB/m 1400KHz at 400Hz 30% modulation, field strength 50dB/m	600KHz	Oscilloscope AC VTVM OUT	T205 core	Accurate indication of pointer on dial to within \pm 1 pointer width	
34			1400KHz		L1 core	Maximum reading on AC VTVM	
35					TC 2	Accurate indication of pointer on dial to within \pm 1 pointer width	
36					TC 1	Maximum reading on AC VTVM	
37	Repeat steps 33 - 36 as necessary to obtain exact tuning on dial scale and maximum sensitivity						
38	<u>AM Signal Generator</u> Standard radiating loop antenna placed near AM built in antenna	1000KHz at 400Hz 30% modulation, field strength 100dB/m	1000KHz		VR206	Adjust to read 90% of full scale of meter
