TX-101

Adjustment Procedures

NOTE

Do not adjust this unit unless absolutely necessary. The following adjustments should NOT be performed unless the technician (This means you!), has a thorough understanding of the circuitry and principals involved AND has proper test equipment.

If these conditions are not met, it is quite likely any adjustments made will degrade performance and potentially affect reliability.

1. Unit should be connected to an AC power source. Push power switch on and allow unit to warm up for 5 minutes.

AM ALIGNMENT

2. In order to properly align the AM section of the TX101, an AM sweep generator is necessary. If you do not have this type of test equipment, please do not attempt to align the unit.
 - a. Activate the AM function button.
 - b. Connect the output of the AM sweep generator to the AM antenna terminal on the TX101, Connect the input of the sweep generator to CP5. The output of the sweep generator should be between 20-50dBf.
 - c. Adjust L107 and L108 maximum symmetrical single peak response of the 450KHz signal.
 - d. Connect DC voltmeter to CP6 and ground.
 - e. Set the AM signal generator for 600KHz (603KHz for european version), 400Hz tone at 30% modulation, 60dB/m output. Set the TX101 for 600KHz (603KHz for european version). Adjust L106 to obtain 2.0 volts.
 - f. Change frequency on the generator and the TX101 to 1400KHz (1404KHz for european version). Adjust VC102 to obtain 7.0 volts.
 - g. Because these controls interact with each other, steps e and f should be repeated to obtain the desired voltages. Remove the voltmeter.
 - h. Change the frequency on the generator and the TX101 to 600KHz (603KHz for european version). Adjust L105 for maximum output.
 - i. Again change the frequency on the generator and the TX101 to 1400KHz (1404KHz for european version). Adjust VC101 for maximum output.
 - j. Because these controls interact with each other, steps h and i should be repeated several times for best performance.
 - k. Set the AM signal generator for 1000KHz (999KHz for european version), 400Hz tone at 30% modulation and 80dB/m output. Set the TX101 at 1000KHz (999KHz for european version). Adjust VR105 so the signal strength fluorescent display is fully lighted (all 5 segments). The 5th segment should just be lighted.
 - l. Confirm the tuning operation in 10KHz (9KHz in european models) increments using the up/down tuning buttons from 530KHz (522KHz for european version) to 1620KHz (1611KHz for european version).
 - m. Set the AM signal generator for 1000KHz (999KHz for european version), 400Hz tone at 30% modulation and 70dB/m output.
 - n. Push the auto tuning switch in and verify that the auto seek function works in both directions.
 - o. Operate the tuner in the AM mode and confirm good sound quality and proper operation.

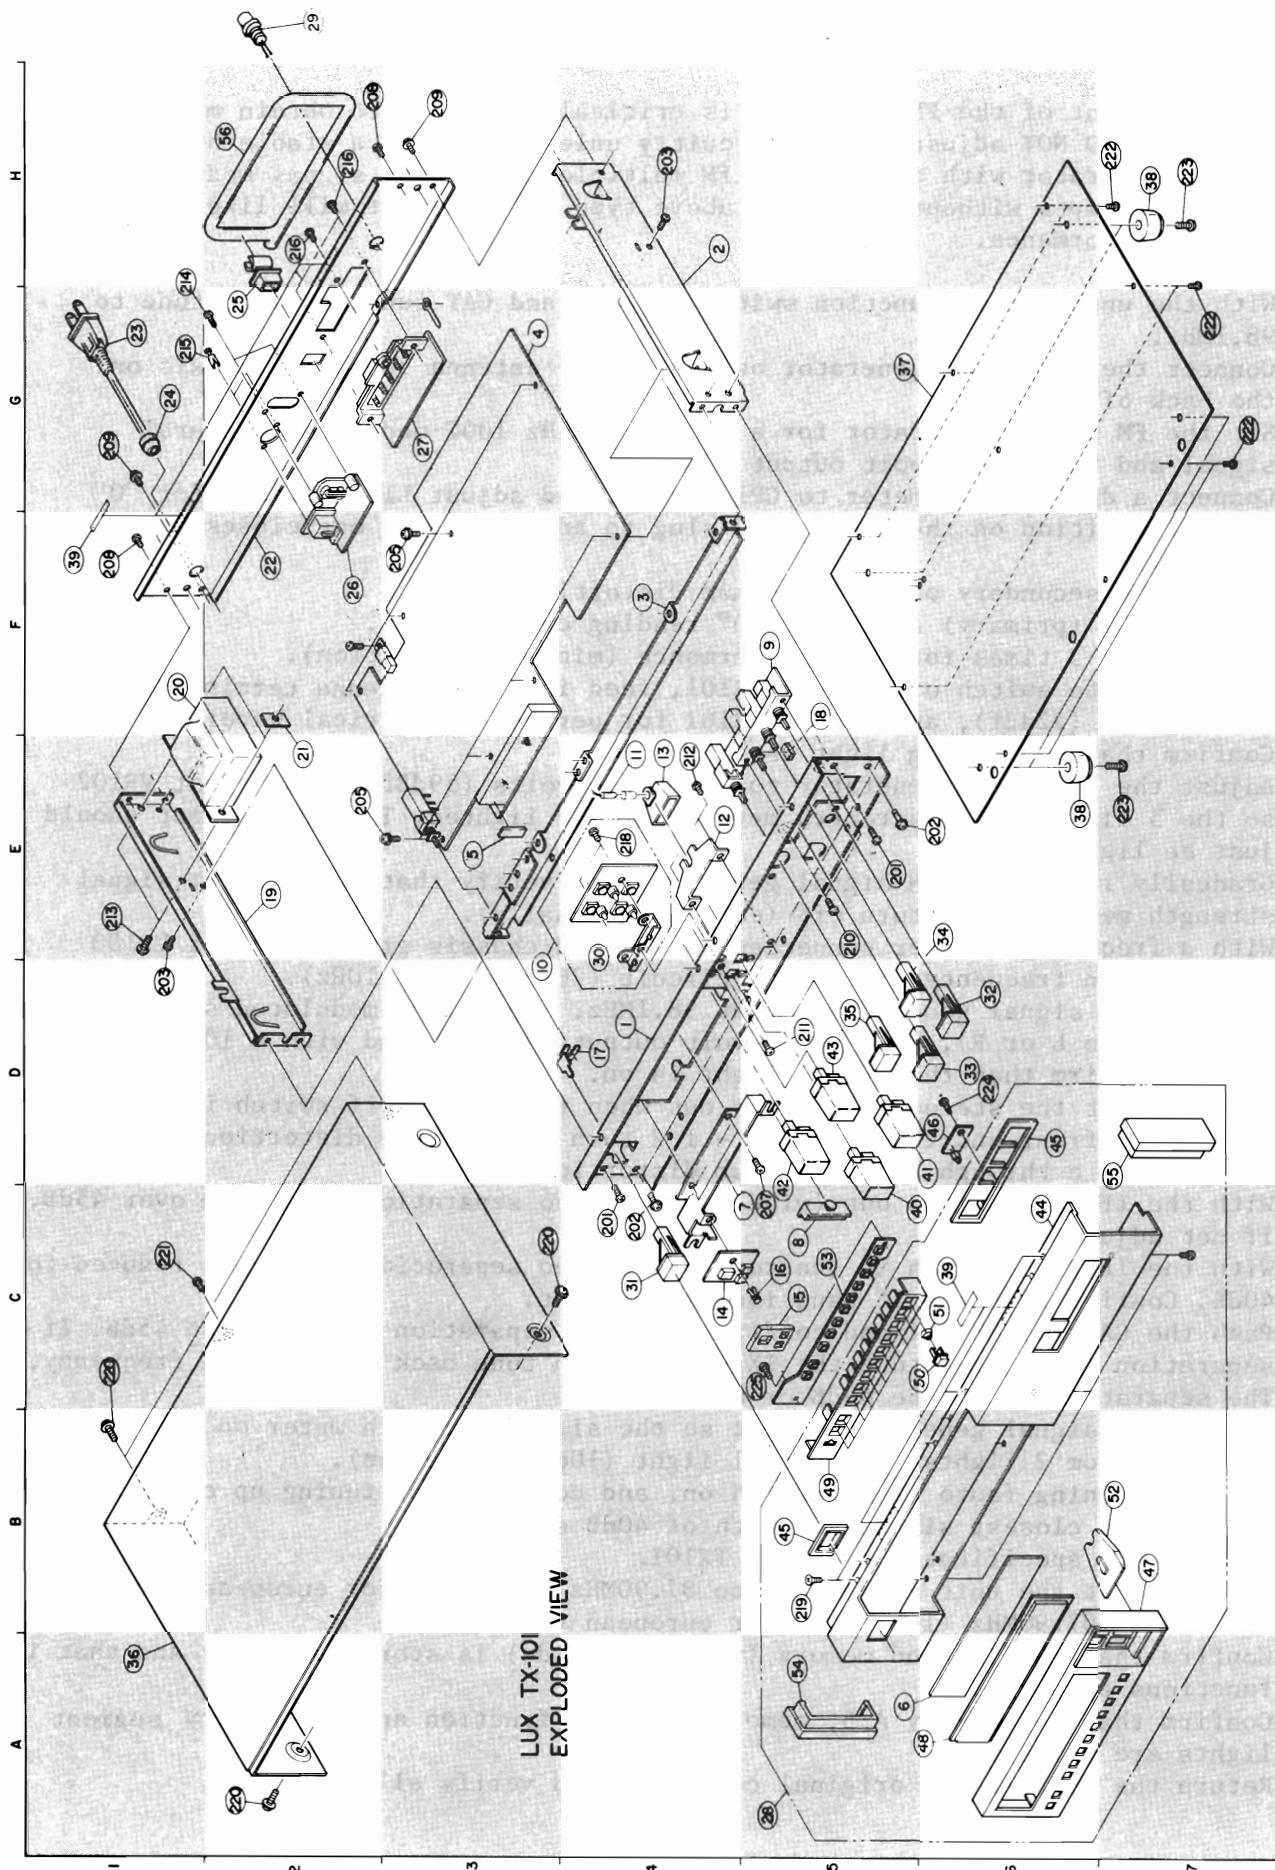

TX-101

3. FM ALIGNMENT

Proper alignment of the FM circuitry is critical. In order to obtain maximum performance, DO NOT adjust any FM circuitry unless you have a stable high quality FM signal generator with an external FM multiplex composite signal modulator. alignment attempts without using the above type of equipment will likely degrade the units performance.

- a. With the unit on, FM function switch pushed, and CAT function off, tune to 98.1MHz.
- b. Connect the FM signal generator output to the antenna 300ohm terminals on the back of the TX101.
- c. Set the FM signal generator for a 98.1MHz, 1KHz 100% modulated monaural signal and 3000 micro-volt output (75dBf).
- d. Connect a digital voltmeter to CP1 and CP2 and adjust L101 primary for "0" reading position on the meter, The slug to adjust is the one closest to IC (LA1235).
- e. Adjust the secondary of L101 minimum distortion.
- f. Adjust L101 (primary) again for "0" reading on the meter.
Repeat 2 or 3 times for best performance (minimum distortion).
- g. With the mute switch off on the TX101, feed into the antenna terminals 7 micro-volts (22dBf), and adjust VR101 for perfect symmetrical waveform.
- h. Confirm that the tuning light is lit.
- i. Adjust the FM signal generator to 500 micro-volts (59dBf), and adjust VR102 so the 5 light signal strength meter is fully lighted. The 5th segment should just be lighted.
- j. Gradually reduce the FM signal generator and verify that the 5 light signal strength meter lights turn off (each individually).
- k. With a frequency counter connected to CP4 and chassis ground, adjust VR103 for free run frequency of the PLL circuit (76KHz + or - 10Hz).
- l. With the FM signal generator set at 98.1MHz, 1KHz, 100% modulated stereo signal (mode L or R), 3000 micro-volt output (75dBf), and with a 10% pilot level, confirm that the stereo light is on.
- m. Confirm that the stereo light goes out when the muting off switch is pushed.
- n. Adjust the front end IF coil + or - 1/2 turn for minimum distortion.
Repeat step e through h for minimum distortion.
- o. With the IF band switch out (wide), the stereo separation should be over 45dB, if not adjust VR104.
- p. With the IF band switch in (narrow) the stereo separation should be reduced to 40dB. Confirm that the IF band indicator light.
- q. Push the CAT switch off and confirm that the separation is more than 45dB. If separation is 30dB, detune the TX101 and then tune back to original frequency. The separation should be 45dB or more.
- r. Reduce the signal generator output so the signal strength meter on the TX101 decrease from 2 lights (45dB) to 1 light (10dB separation).
- s. Push the tuning (auto seek) switch on, and confirm that tuning up or down will stop at the closest signal strength of 40dB or more.
- t. Confirm all specifications of the TX101.
- u. Confirm that the unit reads down to 87.90MHz (87.50MHz for european version) and up to 107.90MHz (108.00MHz for european version).
- v. Confirm that the IF band memory (narrow or wide) is stored properly and that it functions properly.
- w. Confirm that the memory A/B, memory scanning function and the memory segment lights are working.
- x. Return the unit to its original condition and verify all functions.

Remarks

Resistor : Rd...Carbon, Rm...Metal Film

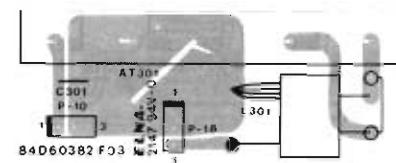

Capacitor: E1...Electrolytic, Ce...Ceramic, My...Mylar, Pp...Polypropylene

(UZ) : 120V for U.S.A. , Canada

(SK) : 220V for Europe , etc

IC Handling Guide

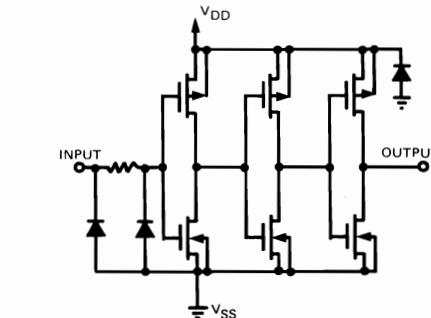

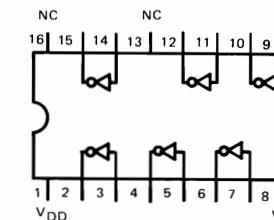

LA-1235 (MONOLITHIC LINEAR IC)

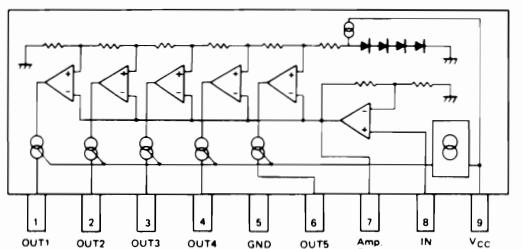

HA-12016 (FM STEREO MULTIPLEX DECODER)

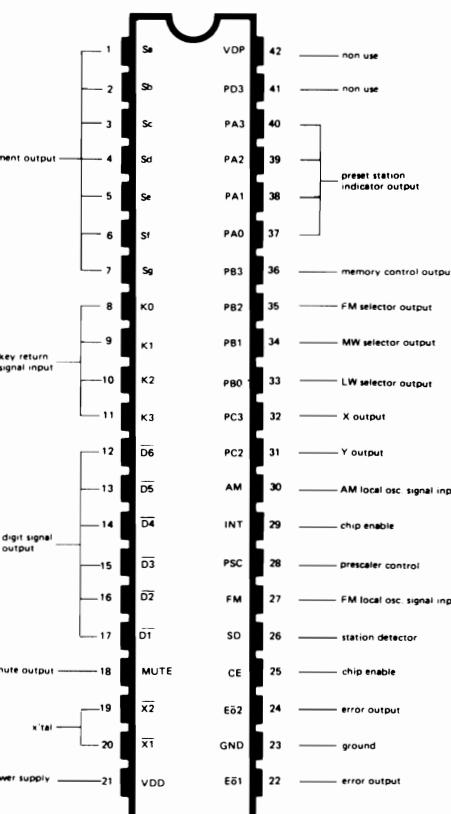

TC4049BP (HEX BUFFER/CONVERTER INVERTING TYPE)

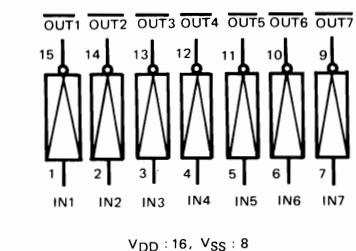

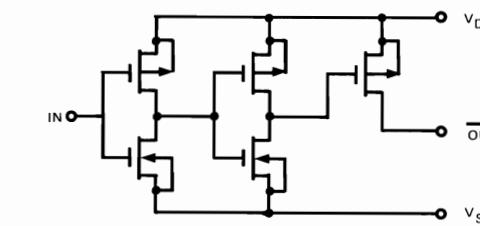

BA-6125 (LED LINEAR LEVEL METER DRIVE)

μ PC1704 (SYNTHESIZER IC)

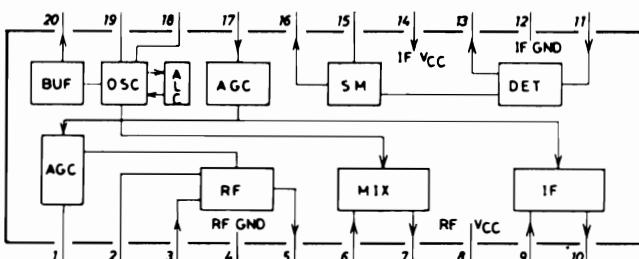

TC5067BP (7-HIGH VOLTAGE BUFFER/INVERTING TYPE)

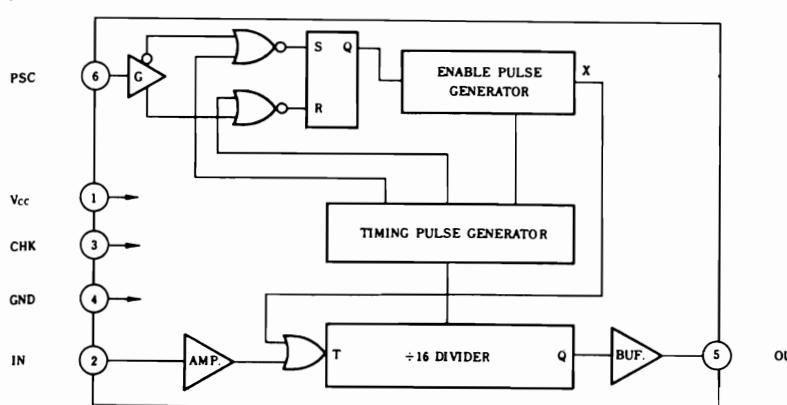

V_{DD} : 16, V_{SS} : 8

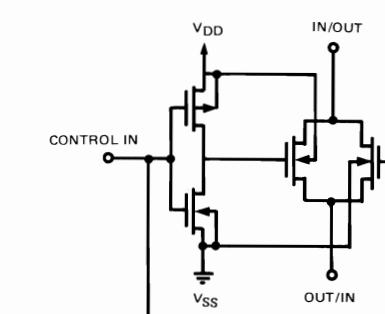

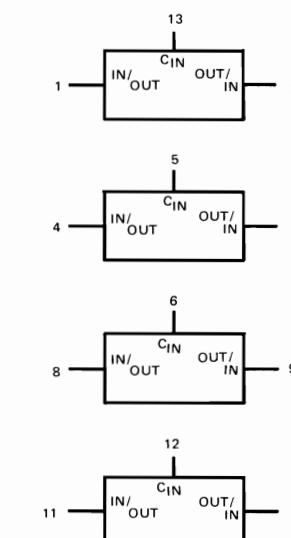

LA-1245 (AM IC)

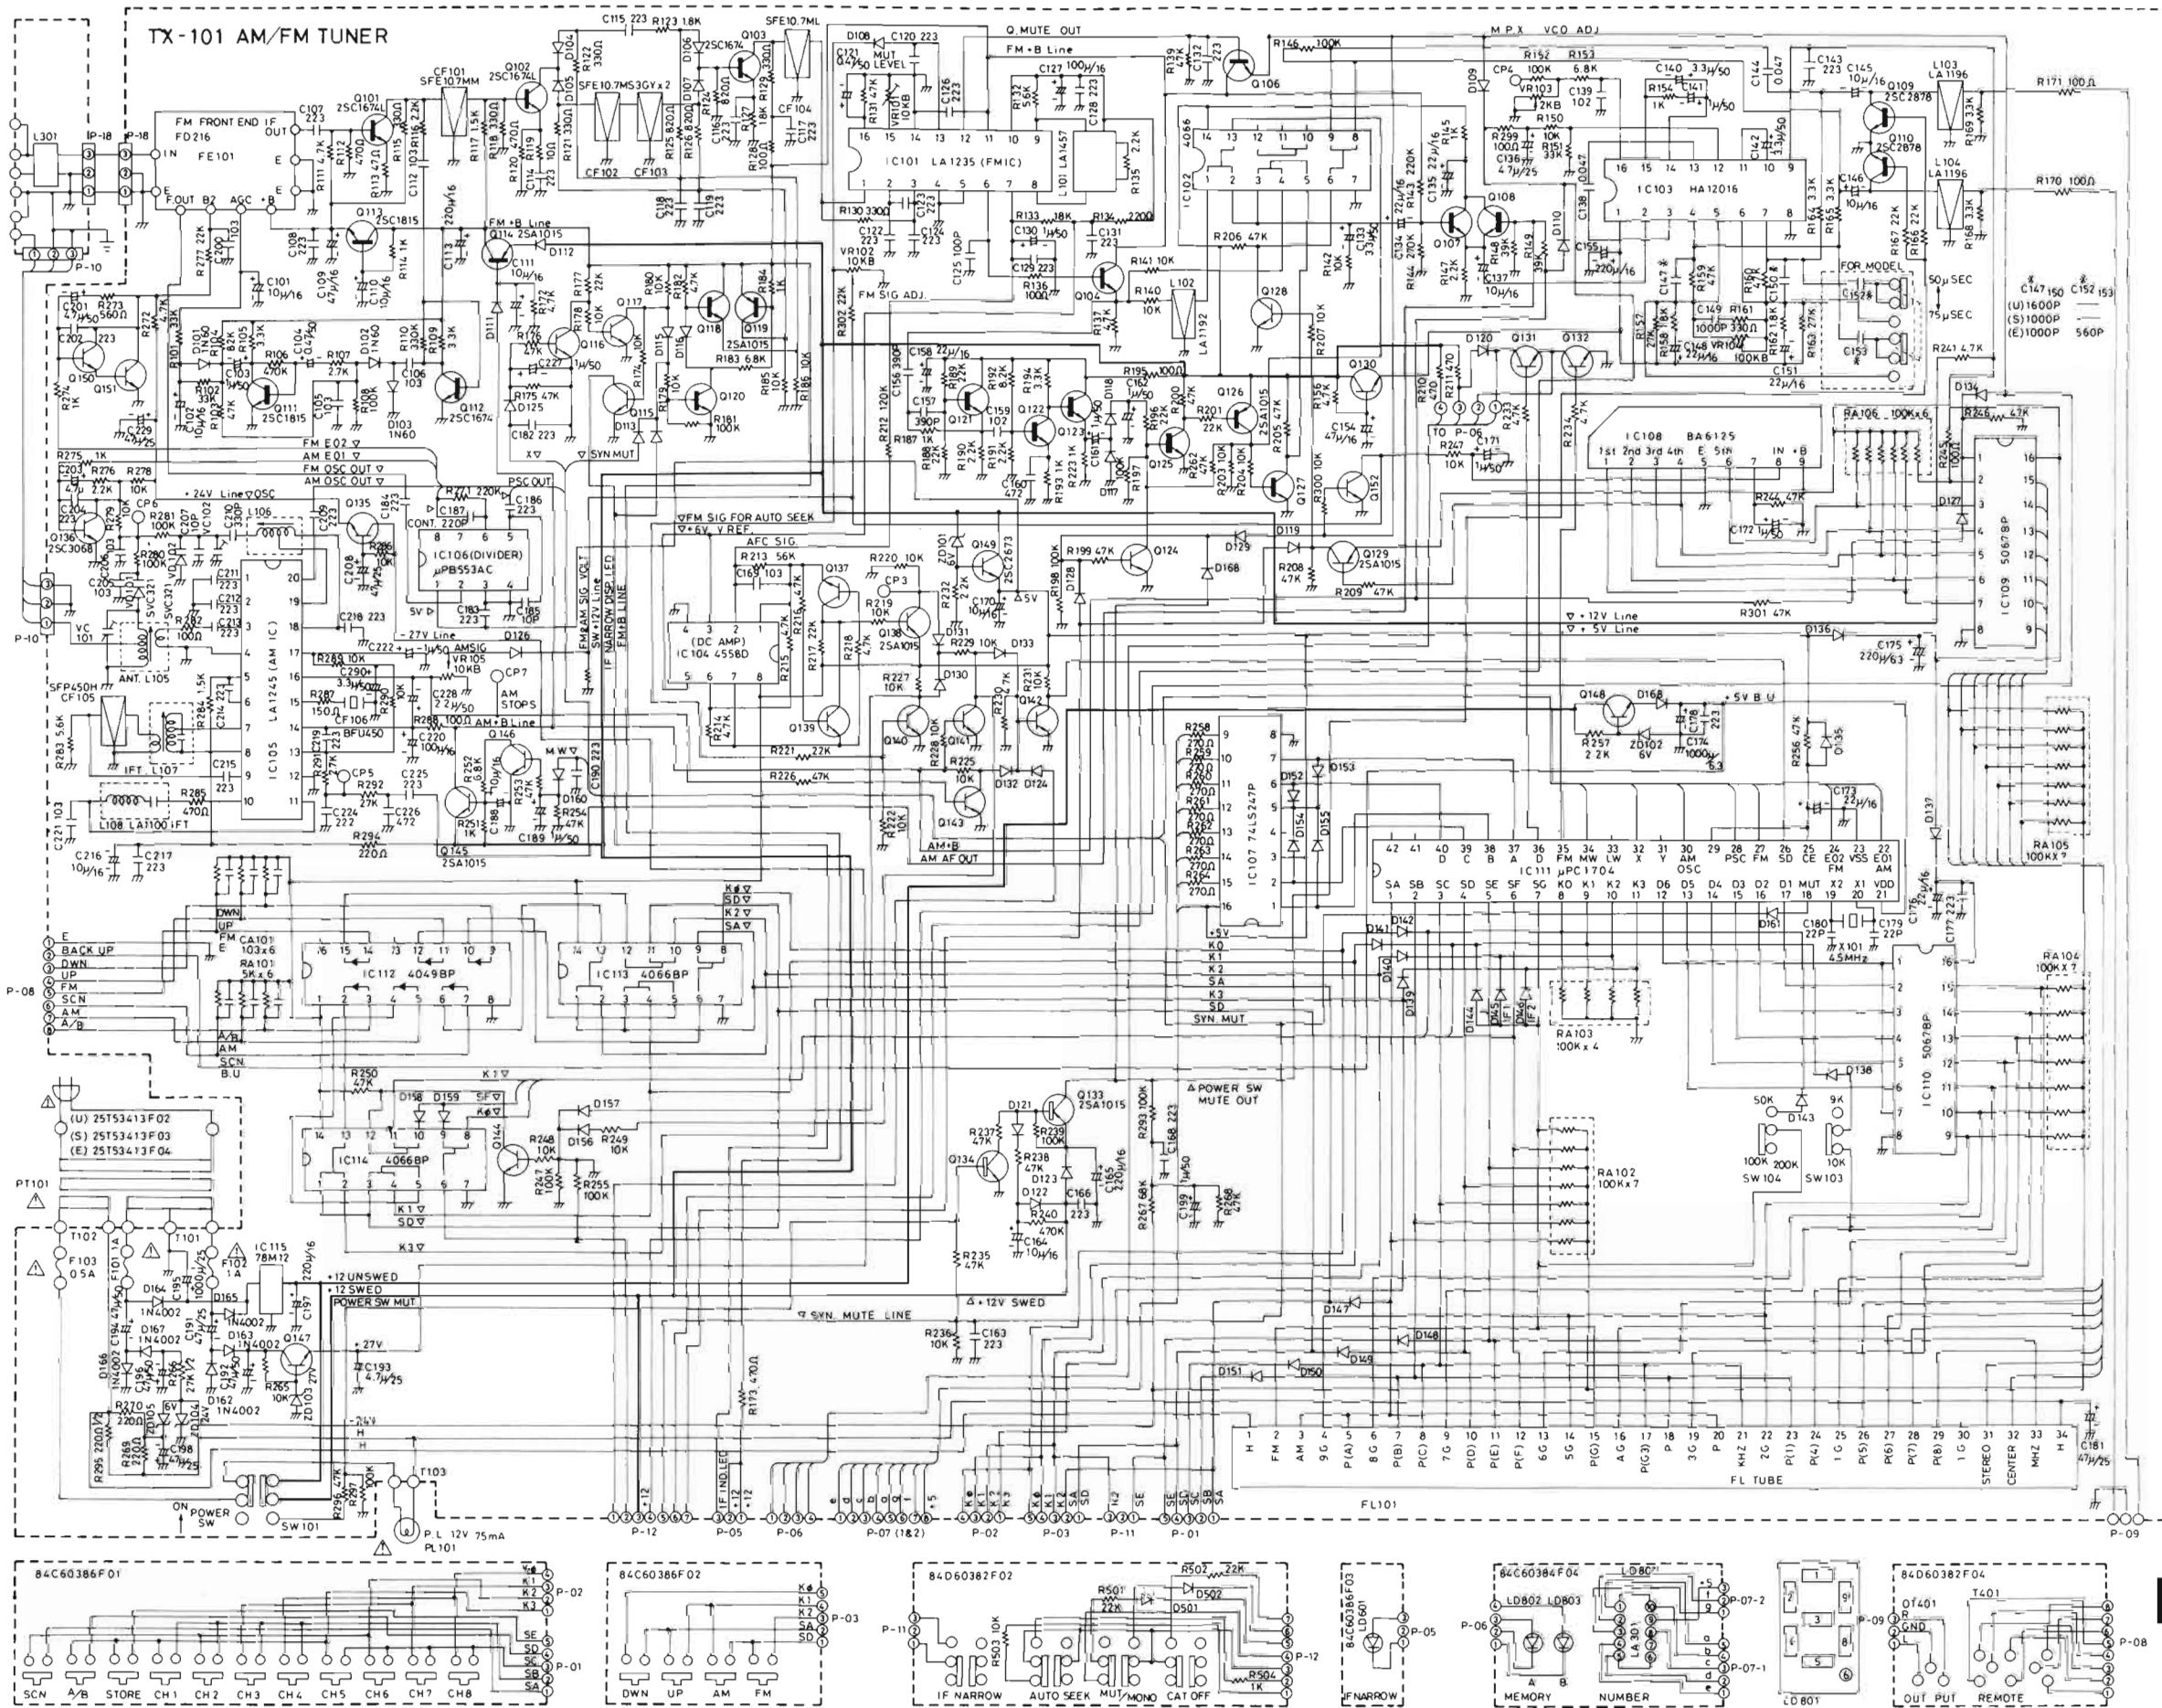

μ PB553AC (150MHz PRESCALER)

TC4016BP (QUAD BILATERAL SWITCH)

Schematic Diagram

⚠ INDICATES SAFETY CRITICAL COMPONENTS.
FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURE'S RECOMMENDED PARTS.
AFTER SERVICING THIS APPLIANCE AND BEFORE RETURNING TO THE CUSTOMER, CONFIRM THE INSULATION RESISTANCE BETWEEN EACH BLADE (OR PIN) OF POWER CORD PLUG AND CHASSIS IS MORE THAN 10 MEGOHMS.

NOTES:
1. UNLESS OTHERWISE SPECIFIED,
ALL DIODES ARE
1S1555 OR MA150
ALL TRANSISTORS ARE
2SC1815.

2. DUE TO CONTINUED RESEARCH FOR IMPROVEMENTS, LUX RESERVES THE RIGHT TO ALTER THE CIRCUIT AND SPECIFICATIONS WITHOUT NOTICE.

AM/FM TUNER

Specifications

[FM SECTION]

(IEEE/IHF Standard)	
Usable Sensitivity	10.3dBf 1.8uV
50dB Quieting Sensitivity	13.2dBf 2.5uV
Alternate Channel Selectivity (Narrow)	80dB
S/N (Signal to Noise Ratio)	78dB
Stereo Separation at 1.000Hz (Wide)	50dB
Capture Ratio (Wide)	1.2dB
Image Rejection	75dB
IF Rejection	100dB
Spurious Response Ratio	85dB
Frequency Response	30 to 15KHz \pm 1dB
Distortion at 65dBf (Wide)	1.000Hz : Mono 0.06% 1.000Hz : Stereo 0.07%
Subcarrier Product Ratio	60dB
SCA Rejection Ratio	60dB
Output Level	700mV

[AM SECTION]

Usable Sensitivity at 1MHz, 400Hz 30% Modulation	700uV/m
Image Response Ratio at 1MHz	40dB
IF Response Ratio at 1MHz	50dB
Signal to Noise Ratio at 1MHz	50dB
Distortion at 1MHz 10uV/m 400Hz/ 30% Modulation	0.3%

[GENERAL]

Dimensions	17-13/16" (W) x 3-3/16" (H) x 12-3/8" (D) 453mmx81mmx315mm
Weight (Net)	4.4kg 9 lb 7 oz
