

## 2nd ADDENDUM FOR MODEL 250

This manual is applicable to units bearing serial numbers above 6549 and is the same as the original service manual except for the following:

(Note: Units bearing serial numbers 1001 through 3500 are described in the original manual. Units bearing serial numbers 3501 through 6549 are described in the first addendum for the Model 250).

Throughout the original manual, replace "A," "B," "Channel A" and "Channel B" with "L," "R," "L Channel" and "R Channel," respectively.

- Page 1— Replace entire section labeled "Amplifier," under Circuit Description heading, with Circuit Description contained herein.
- Page 2— Replace Figure 1 (Amplifier Simplified Schematic) with Figure 1 contained herein.
- Page 4— Replace entire section labeled "Rectifier-Relay Board" with section labeled "Relay Board and Power Supply" contained herein.
  - Replace Figure 2. (Rectifier/Relay Board Simplified Schematic) with Figure 2. (Relay Board Simplified Schematic) contained herein.
  - Replace Figure 3. (Metering Circuit Simplified Diagram) with Figure 3 contained herein.
- Page 5— Replace 100, 220-VOLT AC CONVERSION with:

### 220-VOLT AC CONVERSION

To convert the Model 250 to 220-volt operation, perform the following steps:

1. Remove the top cover.
2. Orient the Model 250 so that the rear panel is facing toward the viewer.
3. Locate TB1, the strip located on the power transformer half shell facing the rear panel, which terminates the power transformer primary wires.
4. Unsolder all jumpers from TB1.
5. Solder a jumper (18 AWG) to TB1 connecting the grey and violet transformer wires.
6. Re-attach the top cover.
7. Replace the 6-amp, 250V fuse in the unit with the 4-amp, 250V fuse, part number 451-1003, supplied with the 220-volt conversion kit, part number 105-1007-1.
8. Affix labels, supplied in conversion kit, in the appropriate locations on the unit cover, and adjacent to the line cord, fuse holder and accessory outlets.

The Model 250 is now ready for 220-volt operation.

### 100-VOLT AC CONVERSION

To convert the Model 250 to 100-volt operation, follow the procedure outlined for 220-volt conversion except for items 4, 5, 7, and 8. Item 7 is eliminated. These items will read:

4. Unsolder the black and white power lead-in wires and all jumpers from TB1.
5. Solder two jumpers (18 AWG) to TB1, one connecting the orange and violet transformer wires, and one connecting the grey and white transformer wires. Solder the black and white power lead-in wires to the white and orange transformer wires, respectively, at TB1.
8. Affix labels, supplied in the 100-volt conversion kit, part number 105-1008-1, in the appropriate locations on the unit cover, and adjacent to the line cord and accessory outlets.

The Model 250 is now ready for 100-volt operation.

### Page 6— TECHNICAL SPECIFICATIONS

- For "Frequency Response" replace "+0 -1.5db 2 Hz to 100KHz" with "+0, -3.5dB 2 Hz to 60KHz."

- Page 7— In Table 1, for "AC Power Control Box," replace "Fabricate in accordance with Figure 3." with "Fabricate in accordance with Figure 4.,"; for "Amplifier Output Load Box," replace "Fabricate in accordance with Figure 4." with "Fabricate in accordance with Figure 5."

- RECOMMENDED TEST EQUIPMENT
- To "Manufacturer and Model Number" for Output Load Resistors (8 $\Omega$  and 4 $\Omega$ ), Add: "(Non-inductive)."
- In "Manufacturer and Model Number" for Shorting Plug, replace "600" with "10K."

In "PERFORMANCE VERIFICATION TEST PROCEDURE," replace as indicated:

- Page 8— In paragraph C. (DC Balance Test), sub-paragraph 3—replace "R504" with "R502."
  - In paragraph D. (Total Hum and Noise Test), sub-paragraph 2—replace "0.25mv" with "0.4mv."
  - In paragraph E. (Bias Adjustment Test), sub-paragraph 6—replace "10 watts" with "7 watts."
  - In paragraph E. (Bias Adjustment Test), sub-paragraph 7—replace "R536" with "R526" and replace "10 watts" with "7 watts."
- Page 9— In paragraph F. (Maximum Power Output), sub-paragraph 7—replace "analyzer" with "oscillator."
- In paragraph G. (Relay Operation), sub-paragraph 1—replace "2 minutes" with "30 seconds."

- Page 9— In paragraph G. (Relay Operation), subparagraph 3—add "Drive both channels."  
 — In paragraph G. (Relay Operation), delete subparagraph 4.

Page 10— Replace Figure 4. (AC Power Control Box Simplified Schematic) with Figure 4. contained herein.

- Replace Figure 5. (Amplifier Output Load Box Simplified Schematic) with Figure 5. contained herein.

In "TROUBLE ANALYSIS," replace as indicated:

- Page 11— In SYMPTOM 1.—Replace "(100 watts or more)" with "(80 watts or more)."  
 — In SYMPTOM 1. PROCEDURE a.— Replace "... CR301 through CR304,..." with "...CR1 through CR4,..."  
 — In SYMPTOM 1. PROCEDURE b.— Replace "Check for open control R224, 215-1005-1 bias assembly" with "Check for open bias circuit components; Q801, Q521, C513."  
 — In SYMPTOM 2. PROCEDURE a.— Replace "... 215-1005-1 bias assembly" with "... bias circuit components; Q801, Q521, C513."  
 — In Symptom 2. PROCEDURE b.— Replace "... CR301 through CR304..." with "...CR1 through CR4,..."  
 — Replace SYMPTOM 3 with "Transient DC voltages at loudspeaker terminals before time delay circuit is deactivated."  
 — In SYMPTOM 3. Add PROCEDURE b.—"Check for non-opening relay contacts."  
 — In SYMPTOM 4. Add PROCEDURES b. through d.—"b. Check for open transistors Q507, Q508, Q510, or Q511." "c. Check for open DC Balance control, R526." "d. Check for leaky or shorted transistors Q516 or Q517."

Page 11— In SYMPTOM 5.—Add PROCEDURE c.—"Check C502 for leakage."

- In SYMPTOM 7. PROCEDURE a.— Replace "Check for defective C506, C509, C516, and C505." with "Check for defective C505, C506, C508, C509, C510, C516, C518, C519, C520, and C526."

Page 12— In SYMPTOM 8. PROCEDURE b.— Replace "Check for transistors Q802 through Q805." with "Check transistors Q505, Q506, Q516, Q517, Q802 through Q805."

- In SYMPTOM 9.—Replace PROCEDURE b. with "Check output for proper clipping into 4 ohm load with 25.5 volts AC output (positive and negative levels must not vary more than 1 volt at 2KHz)."

- Add SYMPTOM 11.—"No Output" and add PROCEDURE a. "Check R529, Q510, Q511, Q802, Q803, Q804, and Q805."

Pages 13—PARTS LIST—The Parts List contained and 14 herein identifies all parts which differ from those used in units prior to serial number 3501.

Page 15— Replace Figure 7. (Power Amplifier Board Component Assembly Diagram) with Figure 7. contained herein.

Page 16— Replace Figure 8. (Rectifier/Relay Board Component Assembly Diagram) with Figure 8. (Relay Board Component Assembly Diagram) contained herein.

Page 17— Replace Figure 9. (Meter Board Component Assembly Diagram) with Figure 9. contained herein.

Pages 18—Replace Figure 10. (Model 250 Schematic) and 19 with Figure 10. contained herein.

## CIRCUIT DESCRIPTION

### AMPLIFIER

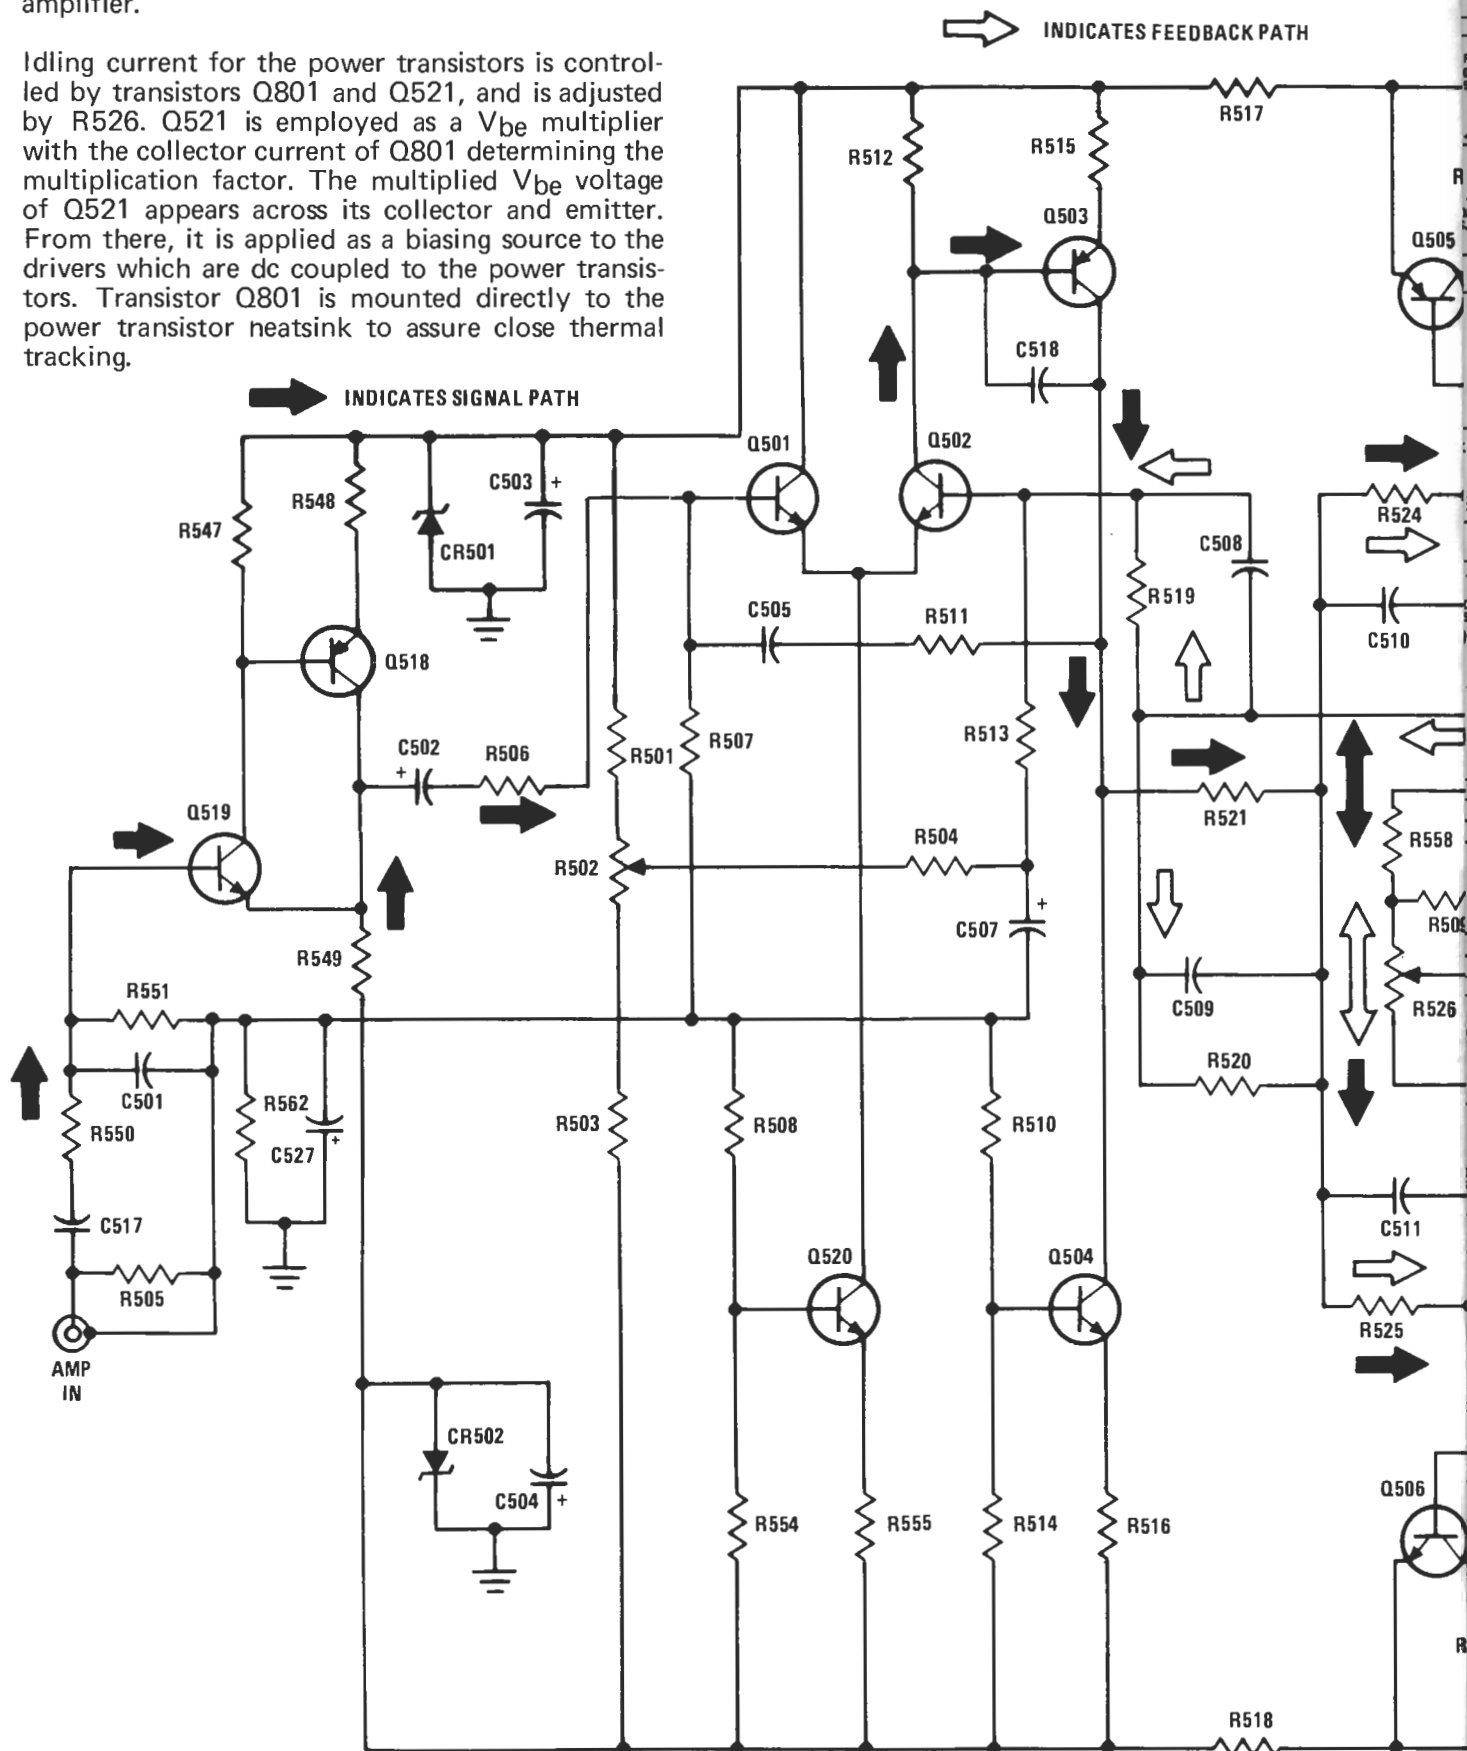

The input of the power amplifier, Figure 1, is an RF filter comprised of R550 and C501, followed by transistors Q518 and Q519 which are coupled together as a conjugate paired amplifier with 100% feedback. The output of the conjugate pair is coupled through C502 and R506 to the differential amplifier, Q501-Q502, which drives a high gain inverter, Q503. Q504 is the current source for the inverter, and Q520 serves as a current source for the differential amplifier to enhance its common mode signal rejection. The inverter is coupled to complementary pre-drivers, Q507-Q508. The output of the pre-drivers is applied to the respective drivers, Q510-Q511, which feed their respective power transistors, Q802-Q804 and Q803-Q805.

Open loop phase and gain stabilization is provided by a Miller capacitor, C518, connected between the collector and base of the inverter (Q503). Further open loop stabilization is provided by Miller feedback at driver Q510 by C525 and R561, and at driver Q511 by C524 and R560.

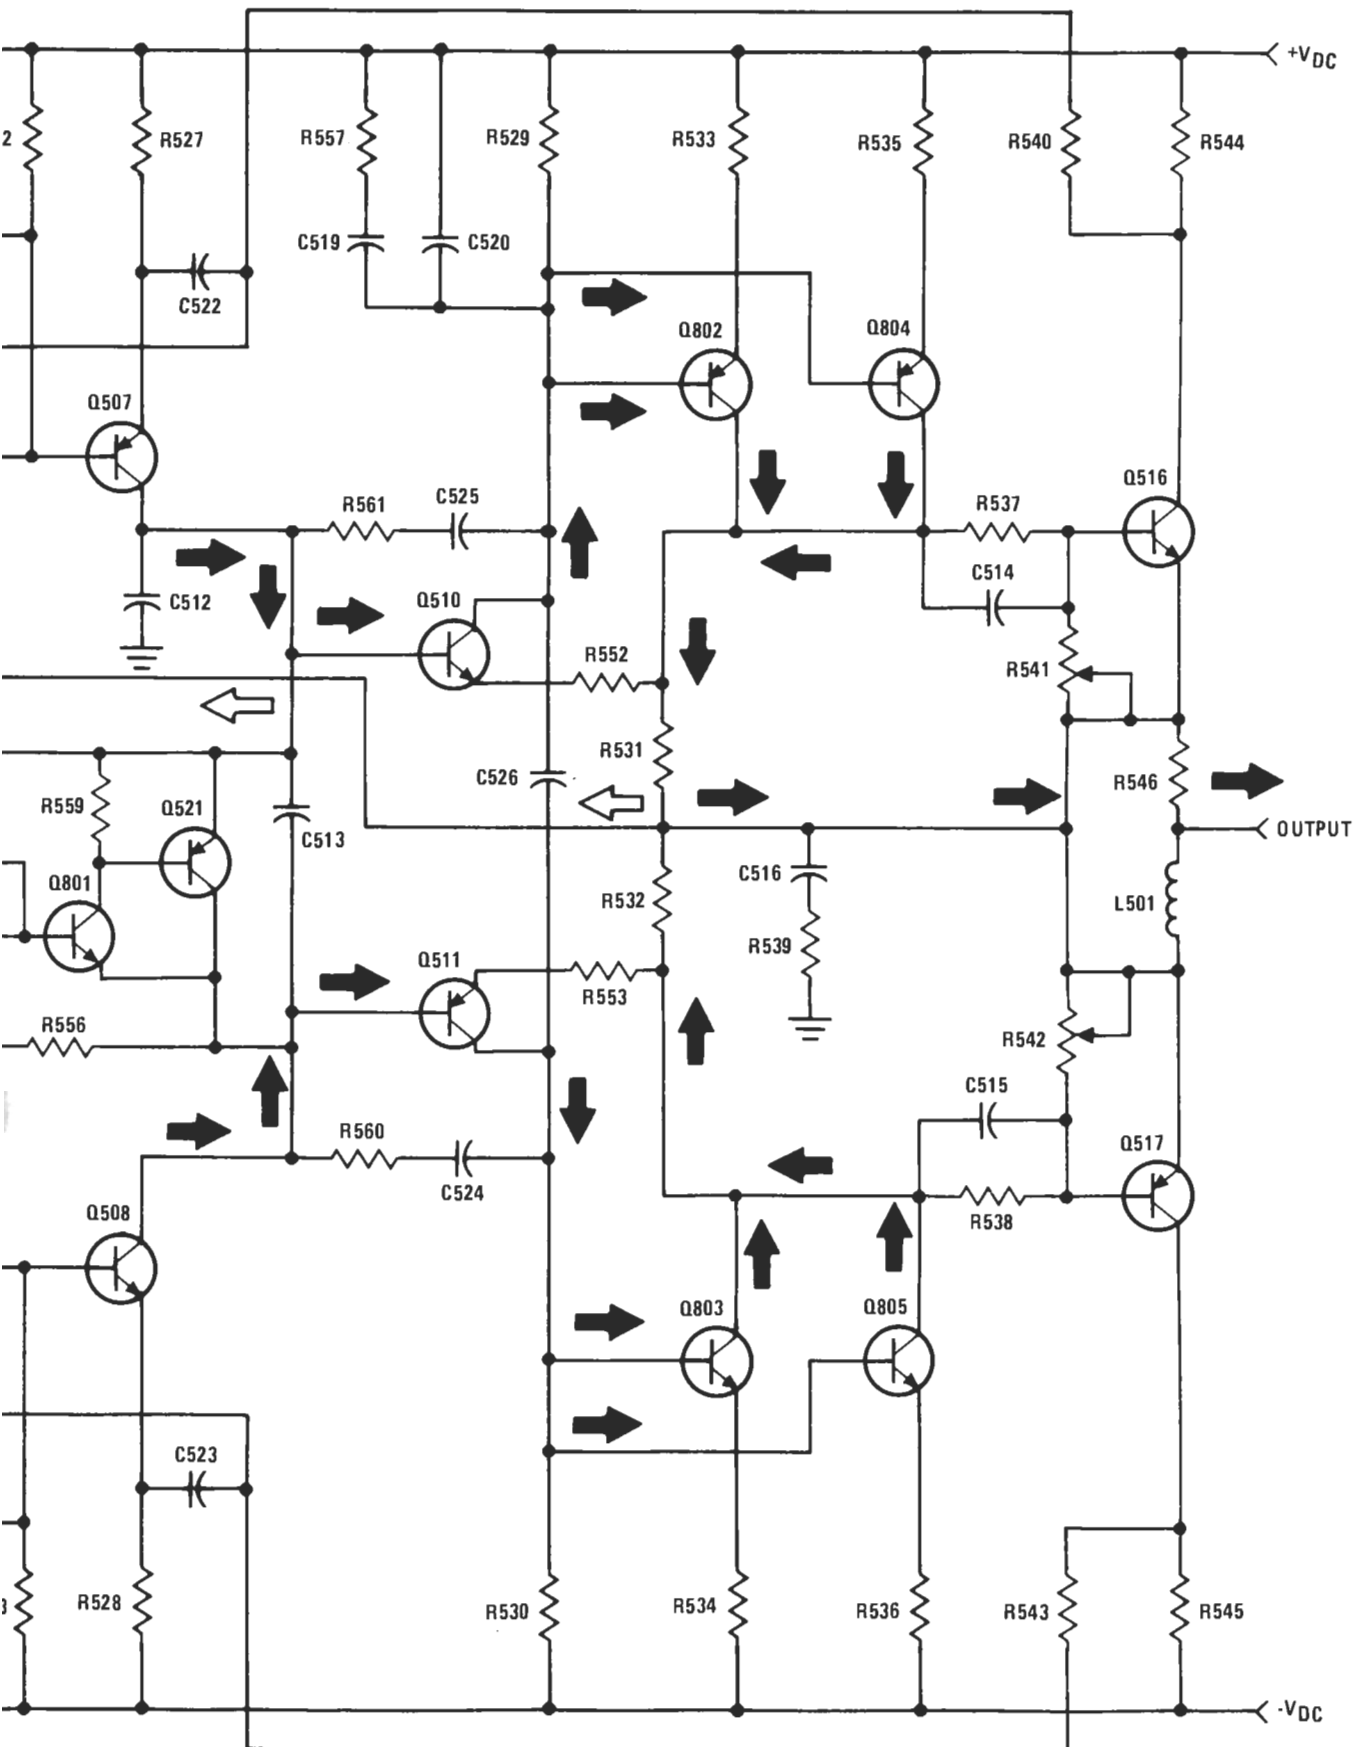

Output current regulation is accomplished through a current-sensing network. Excessive current levels are detected by resistors R531 and R532. Voltages developed across these resistors are applied to current sensors Q516 and Q517. When excessive current levels are detected, Q516 and Q517 develop peak-limiting signals which are applied to Q505 and Q506, respectively. These transistors disable the pre-drivers on excessive output current peaks, thus limiting peak output current to the level determined by the adjustment of R541 and R542, respectively.

Feedback for the amplifier is developed at the junction of R531 and R532, and is applied across

Idle current for the power transistors is controlled by transistors Q801 and Q521, and is adjusted by R526. Q521 is employed as a  $V_{be}$  multiplier with the collector current of Q801 determining the multiplication factor. The multiplied  $V_{be}$  voltage of Q521 appears across its collector and emitter. From there, it is applied as a biasing source to the drivers which are dc coupled to the power transistors. Transistor Q801 is mounted directly to the power transistor heatsink to assure close thermal tracking.

**Figure 1. Amplifier Simplified Schematic**

## CIRCUIT DESCRIPTION (Continued)

### RELAY BOARD AND POWER SUPPLY

The output of the power amplifier circuit is applied to the wipers of relay K301 of the relay board circuit, Figure 2. The relay energizes after a minimum delay of two seconds after AC power is applied to the unit. The duration of the delay is a factor of the time constant of R306, R309, and C302. This delay at turn-on is to prevent any transient surges from reaching the output terminals. Additionally, resistors R302 and R305 sample the audio output signals. Should a constant DC level greater than +4.5V, or a high amplitude signal below 10Hz be present, Q301 will turn on, shorting the base of Q303 to ground. C302 begins to discharge and K301 de-energizes. Should a constant DC level more negative than -4.5V be present, the voltage drop across R304 bucks the voltage present at the base of Q303 and K301 de-energizes. When the relay is energized, the audio output is applied to the speaker terminals.

The DC power supply voltage for the power amplifier circuit and the metering circuit is  $\pm 58.5V$ . 86.5VAC is developed across the secondary of T1, which is rectified by the full-wave bridge comprised of CR1 through CR4. The rectified positive and negative voltages are each filtered by a 20,000ufd capacitor (C1 and C2). Resistors R1 and R2 are bleeder resistors.

The DC voltage for the relay circuit is +58V. The AC voltage from the transformer secondary is rectified by CR305 and CR306 (contained on the relay board) and filtered by C303.

The filament winding of T1 provides 5.7VAC to the meter lamps DS1 through DS4. In the event of a short-circuit, fuse F2 will open when the current exceeds 2A, thereby protecting the transformer.

NOTES:

1. VOLTAGES ARE DC VOLTS TO GROUND, MEASURED ON A TYPICAL UNIT.
  2. CONFIGURATION SHOWN IS APPLICABLE TO CIRCUIT BOARDS FABRICATED FROM A/W 115-1071, REV N/C.
  3. TRANSISTOR PAIR Q501-Q502 ARE TO BE EQUALLY SPACED OFF THE BOARD WITH THEIR ENTIRE FLAT SURFACES IN INTIMATE CONTACT.
  4. P/N 562-1005-000 THERMAL RETAINER TO BE INSTALLED ON THE PAIR.
  5. P/N 562-1000-000 HEAT DISSIPATOR TO BE INSTALLED ON Q507 AND Q508.
  6. P/N 372-1000-000 INSULATOR TO BE INSTALLED UNDER Q507 AND Q508.
- RESISTORS R533, R534, R535 AND R536 TO BE INSTALLED 1/8" MINIMUM OFF BOARD.

## Notes:

1. C401 and C404 may be a "tear-drop" tantalum capacitor. Positive lead is on right-hand side when viewing black dot with leads down.
2. Configuration shown is applicable to circuit boards fabricated from A/W 115-1030, Rev A.

- Notes: Unless otherwise specified:  
 1. All capacitor values are in micro-farads; 100 WVDC.  
 2. All resistor values are in ohms; 1/4W.  
 3. All diodes are IN967B.  
 4. Voltages specified are DG volts to ground, measured on a typical unit.  
 5. Transistor pairs indicated below to be matched in the same beta range:
- Q507 and Q508      • Q510 and Q511
  - Q802 and Q803      • Q804 and Q805

REF. DES.	BETA (h <sub>FE</sub> ) RANGE	COLOR CODE
Q507	90 to 200	Blue
Q508	200 to 300	Grey
Q510	50 to 80	Orange
Q511	80 to 110	Red
Q802	110 to 150	Yellow
Q803	25 to 50	Orange
Q804		
Q805	50 to 100	Yellow
