ONKYO®
AUDIO COMPONENTS

SPECIFICATIONS

Track Format:	4 track, 2 channels
Erase System:	AC erase
Tape Speed:	4.8 cm/sec
Wow & Flutter:	0.055% (WRMS) <i>A NEW UNIT GIVES 0.06%</i>
Fast Forward and Rewind Time:	90 sec (C-60)
Frequency Response:	30 ~ 15,000 Hz Normal tape (30 ~ 14,000 Hz \pm 3 dB) 30 ~ 18,000 Hz CrO ₂ tape (30 ~ 17,000 Hz \pm 3 dB) 30 ~ 20,000 Hz Metal tape (30 ~ 18,000 Hz \pm 3 dB)
Signal-to-Noise Ratio:	60 dB (Metal tape; Dolby NR out) A noise reduction of 10dB above 5 kHz and 5 dB at 1 kHz is possible with the Dolby NR IN
Transistors:	40
SCR:	1
IC:	4
Diodes:	25 diodes, 3 LEDs
Input Terminals:	Microphone jacks-2 Minimum input level: 0.3 mV Input impedance: 50 k Ω Optimum mic impedance: 200 Ω ~ 50 k Ω Line in jacks-2 Minimum input level: 50 mV Input impedance: 50 k Ω

DIN Jacks-1	Minimum input level: 0.1 mV/k Ω Input impedance: 5 k Ω
Output Jacks:	Line out jacks-2 Standard output level: 0.775 V (0 VU) Optimum load impedance: over 50 k Ω DIN Jack-1 Standard output level: 0.775 V (0 VU) Optimum load impedance: over 50 k Ω Headphones: 8 Ω ~ 200 Ω PLL Servo DC
Motor:	AC 120V/60 Hz
Power Supply:	13 W
Power Consumption:	Dimensions: 418(W) x 158(H) x 297(D) mm 16-1/2" x 6-1/4" x 12"
Weight:	6 kg (13.2 lbs)
Accessories:	Pin-Pin type connecting cords - 2

- * Specifications and design are subject to modification without prior notice for product improvements.
- * Cabinet Composition: Embossed vinyl over metal.

FEATURES

High Quality Long Life "S & S" Sendust Head

Onkyo's recently developed "S & S" Sendust head (made from a highly robust silicon/iron/aluminum alloy of outstanding magnetic properties) plays a very big role in achieving the high quality of sound reproduction in the TA-630DM. Extended frequency response (20 Hz ~ 18,000 Hz with chrome tapes) and an exceptionally wide dynamic range make your recordings sound professional-like.

Built-in Accu-Bias Control

Optimum bias level is essential for really top grade recordings. But since the magnetic characteristics of different types of tape vary from brand to brand, the conventional bias settings are only approximates. The Onkyo TA-630DM Accu-Bias control eliminates the "approx", and ensures you of superb results with every tape used, especially in the high frequency region.

Dolby NR System with Switchable MPX Filter

Now a regular feature in all high grade cassette tape decks, the Dolby NR system eliminates much of the annoying tape hiss from your recordings. And by also incorporating the Dolby circuit in a highly reliable single-chip 2-channel monolithic IC, outstanding channel balance is achieved. Furthermore, a built-in MPX filter removes the pilot signal from FM broadcasts for brilliant high quality recordings.

Built-in Dolby FM Decoder

With the TA-630DM you will be right up to date for recording of the increasingly popular Dolby FM broadcasts. No need for an extra adaptor, or a new tuner/receiver especially designed for Dolby FM. The improved S/N ratio makes noise practically non-existent.

Timer Switch for Automatic Recording or Morning Alarm

By simply connecting up to an audio timer, the TA-630DM will record those "not-to-be-missed" programs even in your absence. Or then you may wish to substitute your morning alarm with some of your favorite symphonies and recording artists.

One-Touch Rec Muting for Clean Editing

This simple switch will make a big difference to your tape recording and editing. Since tape transport will continue in a "no-signal" recording mode, the interval between tunes will be completely silent. Editing out of commercials will also be swift and clean-cut.

Memory Rewind for Rapid Replay

After presetting the tape counter and memory rewind at a particular section of the tape, a simple push of the rewind rewind button will return the tape back to that point quickly and accurately, saving considerable time and bother.

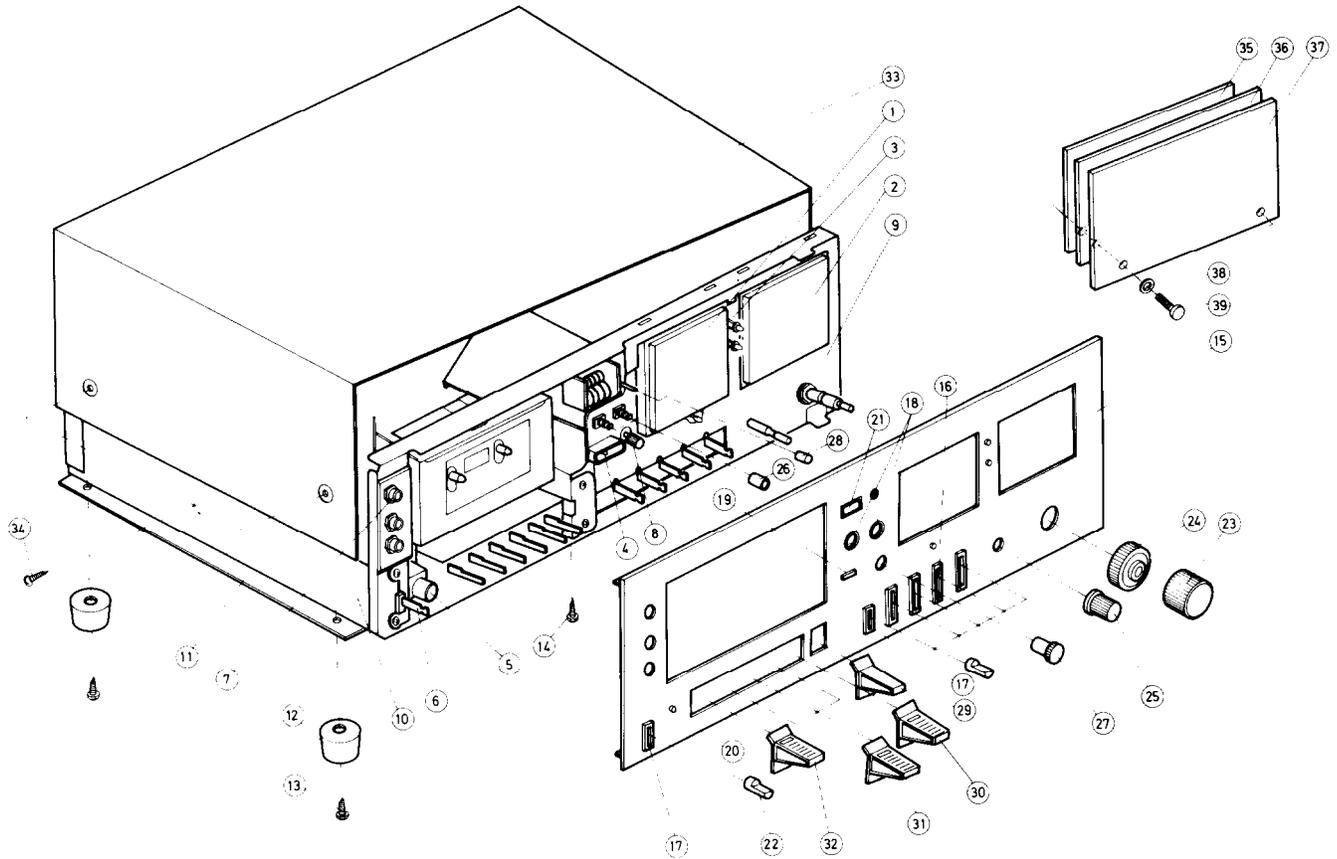

Separate 3-Way Bias and Equalization Selectors

The TA-630DM is designed to handle all major types of cassette tapes available on the market today. And in combination with the Accu-Bias control, optimum bias levels are assured for every tape used.

Full Auto-Stop Mechanism

Full automatic stop at the end of the tape safeguards both tapes and tape transport from undue strain. The TA-630DM is also equipped with an electronically controlled full auto-stop mechanism to ensure that no strain whatsoever is applied to either tape or tape transport system.

CIRCUIT DESCRIPTION

1. Accurate Bias Circuit

Optimum bias current varies according to the type of tape being employed. Too little bias current will result in increased distortion, while too much bias current will result in deterioration of the frequency response. For this reason, the TA-630D has been equipped with an Accu Bias Control (front panel) which permits optimum bias currents to be set accurately for different tapes.

A major feature of the TA-630D is the Accu-Bias circuit which permits optimum bias adjustments for every individual cassette tape used, thereby ensuring recordings of very flat frequency responses.

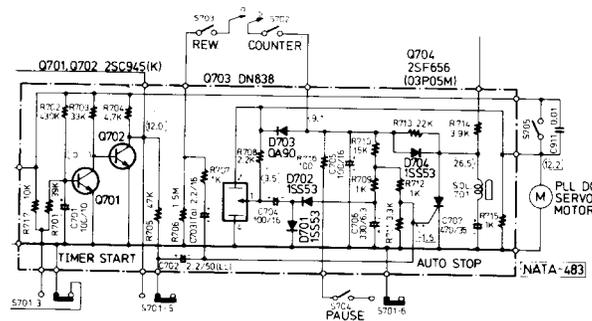

1. Insert a blank tape into the cassette compartment, and set the Tape Selectors accordingly.
2. For Accu-Bias adjustments, the Dolby NR switch must always be in the Out position.
3. When starting at the beginning of a new tape, press the ►► FF key to advance the tape by 20 ~ 30 in the Tape Counter. (This will ensure optimum bias adjustment).
4. Press the ■■ Pause key, and then the ● Rec and ► Play keys to prepare the deck for recording mode.
5. Press the Memory push-button (On position).
6. Reset the Tape counter to 000.
7. Press the Accu-Bias push-button (On position). The Accu-indicator lamp will consequently light up.
8. Turn the Accu-Bias Adjust control to the "0" (click-stop) position.
9. Check that the meter pointers deflect across to around the 0 VU position. Since the internal oscillator generates alternate 400 Hz and 10 kHz (-20 VU) signals.
10. Release the ■■ Pause key, and record for a count of 5 to 10.
11. Press the ◀◀ Rew key. The tape will rewind back to 000 and stop automatically.
12. Press the ► Play key to playback the tape.
13. Turn the Accu-Bias Adjust control around in either direction to find the position where the meter pointers again swing back and forth with minimum amplitude. This adjustment will now correspond to the optimum bias setting for that particular tape.
14. Leaving the Accu-Bias Adjust control in the adjusted position, press the Accu-Bias push-button a second time to disengage the Accu-Bias circuit. Now proceed with the regular recording.

During recording: Q611, C610 ~ C612, R631, R632 and R634 constitute a 10 kHz CR oscillator circuit, while Q614, C615 ~ C617, R644, R645, and R647 constitute a 400 Hz oscillator circuit. By using a non-stable multivibrator, Q612 and Q613 switch the 10 kHz and 400 Hz signals back and forth at approximately 2 second intervals (Q613 is turned OFF when Q612 is turned ON, and vice versa). When Q612 is turned ON, the collector voltage drops, resulting in Q615 being cut OFF. And since Q613 has already been cut OFF, Q616 will be turned ON, resulting in the 10 kHz signal passing out through the ACCU OSC output. When Q613 is then turned ON, Q612 is cut OFF immediately, resulting in the 400 Hz signal appearing at the output. These output signals (alternate 10 kHz and 400 Hz signals of equal levels) are then passed to the recording amplifier (Q111) prior to being recorded on tape.

During playback: The recorded signals are passed via a playback equalizer amplifier, a preamplifier, and a line amplifier. The 400 Hz signal is passed via the R623/C629 low-pass filter and Q609, on to the meter drive circuit. The 10 kHz signal, on the other hand, is passed via the C632/R628 high-pass filter and Q610, on to the Accu Bias Level VR (coupled to the front panel Accu Bias Control) before being mixed in the meter drive circuit. Then optimum bias is selected for that particular tape by adjusting the Accu Bias Control to make the levels of the 400 Hz and 10 kHz signals equal.

2. Timer Start

- (1) Set the time of the timer unit plugged into the AC mains.
- (2) Press the record key and/or the play key, and also the pause key. Then turn the power switch on.
- (3) The power supply will thus come on at the preset time.
- (4) C701 will consequently be charged up via R702, resulting in Q701 being turned ON some 4 seconds later.
- (5) Q702 will therefore turn OFF.
- (6) The signal will pass via S701 and C702, on to the gate of Q704.
- (7) Q704 will thus be turned ON.
- (8) The charge on C707 will then be discharged through solenoid and Q704, which is thereby activated.
- (9) The pause key is released by this solenoid action, resulting in the start of the recording, or playback, mode.

3. Memory Rewind

- (1) Press the reset button to return the counter to 000.
- (2) Then press the memory button.
- (3) Then commence operation in playback or record modes, but not rewind.
- (4) After reaching any desired position on the tape, press the rewind key.
- (5) Since the deck is now in memory rewind mode, S703 and S704 will be ON. And when the tape exceeds the original starting position (counter at 999) the counter switch S702 will also turn ON.
- (6) The voltage at point (3) in the circuit diagram will then increase from 0 to 12V, this signal being applied to the gate of Q704 via R707 and C703.
- (7) Q704 will thus be turned ON.
- (8) The charge on C707 will then discharge via the solenoid and Q704, thereby activating the solenoid.
- (9) The depressed keys are thus released by the activated solenoid.
- (10) Upon completion of the C707 discharge, Q704 will be turned OFF. C707 will then commence to charge up again via the SOL701 solenoid to be prepared for subsequent operations.

4. Auto Stop

- (1) A magnet connected to a counter, which in turn is connected to the take-up reel via a counter belt, is rotated during tape transport.
- (2) This rotating magnet consequently results in the generation of square wave output signals from the Q703 Hall IC (4).
- (3) These signals are rectified by D701 and D702, smoothed by C706, and then applied to the gate of Q704 (5) which is thus kept at a negative potential.
- (4) Once the tape stops, the Q703 output signals will cease.
- (5) C706 will thus be charged up via R714, R713, R710, and R709, resulting in an increase in voltage.
- (6) Q704 will consequently turn ON if the gate (5) potential exceeds 0.6V (approx.)
- (7) The charge on C707 will then discharge via Q704 and the solenoid. The solenoid is thus activated, releasing the depressed keys, and bringing tape transport to a halt.
- (8) After C707 has completely discharged, Q704 will turn OFF. C707 will then recommence to charge up again via the R714 solenoid in order to be ready for the next auto-stop operation. This charge up time is approximately 3 seconds.

MECHANICAL OPERATIONS

1. Drive System

Play Drive

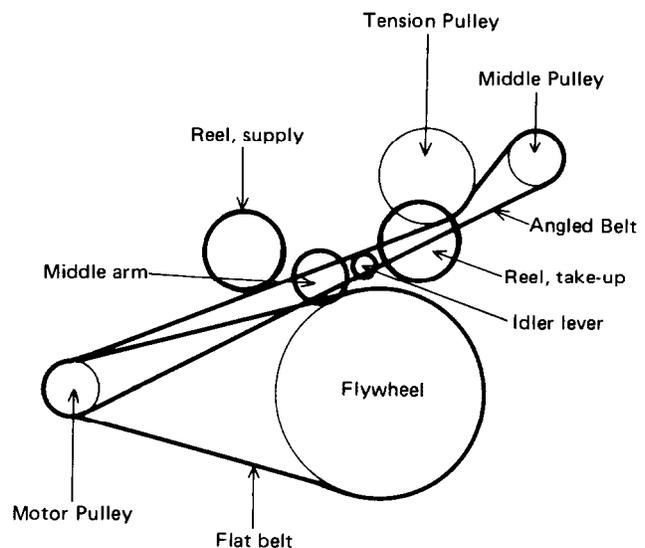

Direct flywheel drive via flat belt passing around the motor pulley.

Take-up reel driven by an angled belt passing around the motor pulley and a tension pulley.

Note that because the motor and tension pulleys rotate in opposite directions, the belt is also passed around an intermediate pulley.

FF and REW Drive

The flywheel driven by a flat belt passing around the motor pulley, presses against an idler which in turn drives the reel bases.

2. Auto-Stop

When tape transport stops, the counter pulley driven by a round belt passing over the reel base, and the 12-polar ring magnet connected to the counter pulley, also stop. This is detected by the Hall IC, resulting in the activation of the auto-stop circuit. The solenoid plunger is consequently pulled in, thereby moving the stop plate, and releasing the depressed keys.

3. Memory Rewind

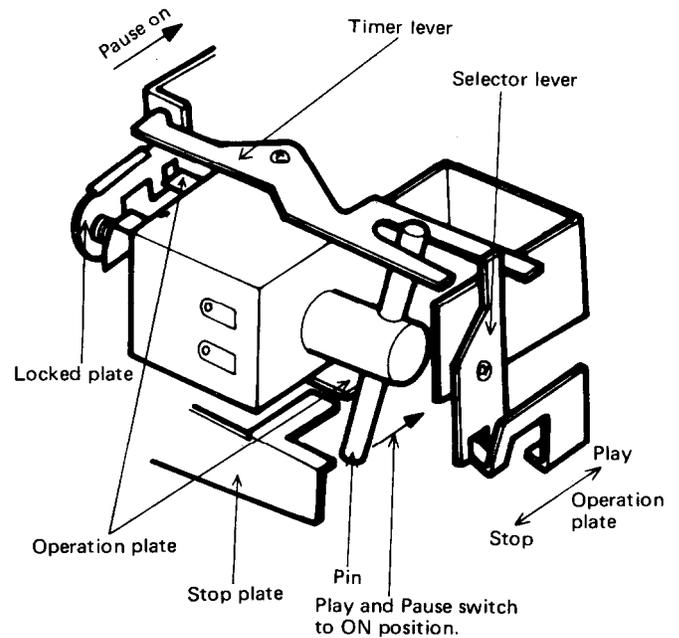

When the counter returns to 999 during rewind mode, and the solenoid thereby activated, a pin inserted in the core of the solenoid acts against the stop plate, thereby releasing the depressed key.

The position of this pin is determined by the timer lever. Consequently, only the stop plate is moved.

Although the timer lever is also coupled to the pause key, it will not be moved unless the play key is also depressed. The timer lever is held in check by the selector lever.

4. Timer Start

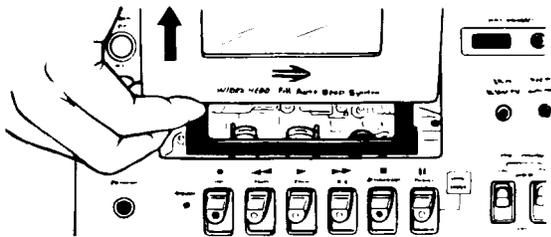

When the record key (and/or play key) and pause key are pressed, the selector lever is moved forwards. And since the timer lever is coupled to the pause key, the pin is moved away from the stop plate, but is in contact with the operation plate. When the power supply is turned on, and the solenoid activated, the operation plate is moved across to the lock plate (which holds the pause key in the pause position), thereby releasing the lock.

DISASSEMBLING INSTRUCTIONS

1. Removal the cassette door

Press the STOP/EJECT key to open the cassette door, then lift the door up and out to remove as illustrated below.

2. Removal the front panel

Remove four screws which hold the top cover to side bracket and lift the top cover up. Pull out the input, output and adjust knobs.

Pull out six lever knobs. Remove six screws which hold the front panel to the front bracket.

3. Removal the cassette chassis

- (1) Remove the top cover and front panel.
- (2) Remove a screw which hold the shielded plate to deck bracket (L).
- (3) Remove four screws which hold the deck bracket to the front bracket.
- (4) Remove two screws which hold the deck bracket to the top of front bracket.
- (5) Remove the spring from the recording lever (A).

4. Replacing the take-up and supply reel

- (1) Remove a screw which hold the door arm (L) to the cassette chassis.
- (2) Remove a screw which hold the door arm (R) to the cassette chassis.
- (3) Remove two spring from the door arm (R).
- (4) Remove the mylar washer to remove the reel.

Note: Once the mylar washer been removed, it cannot be used again. Replace with a new washer.

5. Replacing the motor

- (1) Remove two screws which hold the muting switch to motor bracket.
- (2) Remove two belts from the motor pulley and hang to pin.
- (3) Remove two screws (B).

6. Replacing the belts

6-1. Motor belt (motor pulley—tension pulley)

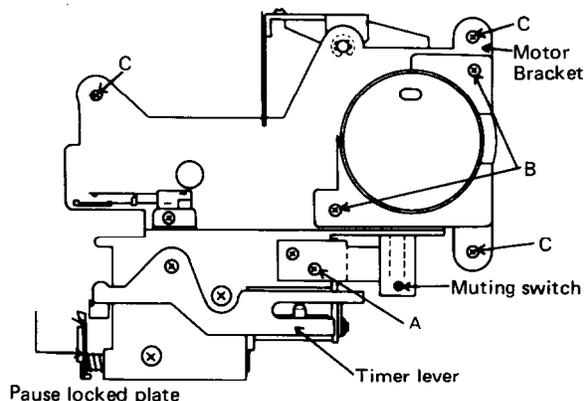

- 1) Remove two screws (A).
- 2) Remove the belt with a pair of tweezers.

6-2. Counter belt

- 1) Remove two screws which hold the auto-stop p.c.b. to counter bracket.
- 2) Remove the belt from the counter pulley.
- 3) Open the cassette door and remove the belt from the take-up reel with a pair of tweezers.

6-3. Motor belt (motor pulley—flywheel)

- 1) Remove three screws (C).
- 2) Remove the belt.

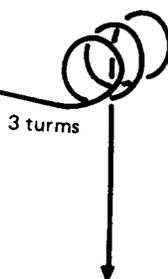

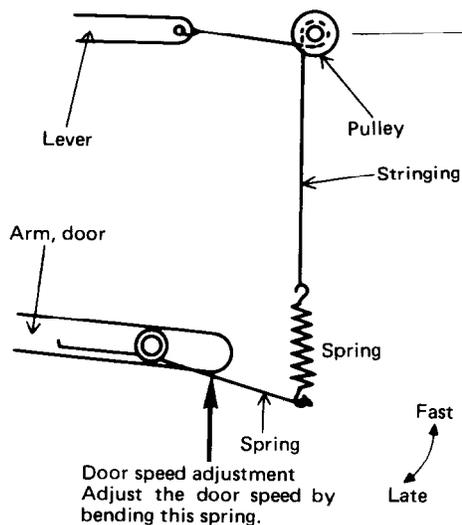

7. Replacing the flywheel

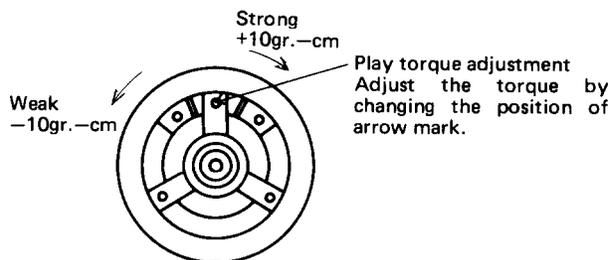

- (1) Remove two screws (A).
- (2) Remove two belts from the motor pulley and hang the belt to pin.
- (3) Remove three screws (C).
- (4) Remove the flywheel.

MECHANISM ADJUSTMENTS

1. Door speed adjustment

2. Play torque adjustment

Current consumption (motor)

Playback:	80 – 120 mA
Recording:	80 – 120 mA
Fast forward:	100 – 180 mA
Rewind:	105 – 180 mA
Auto-Stop	
Playback-Stop:	90 – 110 mA
Rewind-Stop:	280 – 380 mA
F.F.-Stop:	280 – 380 mA

Mechanism specifications

- 1) Tape speed: 4.8cm/sec. (3kHz +10Hz, -0Hz)
Use a standard test tape, MTT-111 (3kHz) or equipment.
- 2) Wow and Flutter: Less than 0.055% (WRMS)
- 3) Take-up torque: 35 – 70 gr-cm
- 4) F.F. torque: 55 – 130 gr-cm
- 5) Rewind torque: 55 – 130 gr-cm
- 6) Rewind time: Less than 90 sec. (use a C-60 cassette tape)
- 7) Automatic shut-off time: Less than 5 sec.
- 8) Timer start time: 3.5 sec. – 7 sec.

ELECTRICAL ADJUSTMENT PROCEDURES

PRECAUTIONS

1. Tape required:

- (1) Blank tape
 MAXELL UD-XL/I (Normal)
 UD-XL/II (CrO₂)
 MX (Metal)
- (2) Test tape
 VICTOR VTT-658 10 kHz, -15 dB
 TEAC MTT-111 3 kHz, -10 dB
 MTT-150 Dolby level calibration tone.

2. Instrument required:

- (1) AC VTVM
 (2) Frequency counter
 (3) AF oscillator
 (4) Attenuator

3. The switches and controls should be set as follows unless otherwise specified.

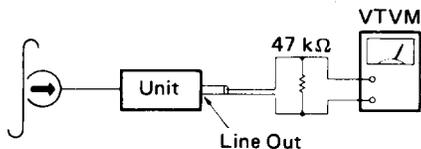

Accu bias adjust control:	Center
Accu bias switch:	Off
Tape selector bias switch:	Normal
Tape selector equalizer switch:	Normal
Dolby NR switch:	Out
Input selector switch:	Line
Output level control:	Maximum
Input level control:	Maximum
FM de-emphasis switch:	25 μ sec.

1. PLAYBACK MODE ADJUSTMENT

1-1. Head azimuth adjustment

PROCEDURES:

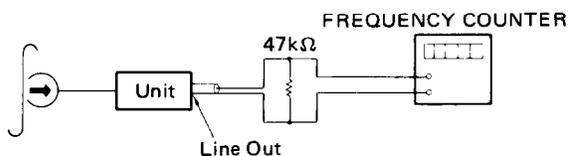

- 1) Play the 10 kHz portion of the test tape VTT-658 back. Adjust the head azimuth adjusting screw for maximum V.T.V.M. read.
- 2) If the peak output reads of the right and left channels are different, set the screw to obtain the mechanical center between the peaks.
- 3) After adjustment, lock the screw with bond.

1-2. Tape speed adjustment

PROCEDURES:

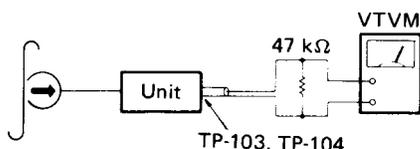

Play the 3 kHz portion of the test tape MTT-111 back. Adjust the tape speed adjusting semi-fixed resistor in the motor for 3,000 to 3,010 Hz counter indication.

1-3. Playback output adjustment

PROCEDURES:

- 1) Play the test tape MTT-150 back, adjust R 135 and R136 for 775 mV V.T.V. M. read.
- 2) Proceed both for the left and right channels in the same manner.

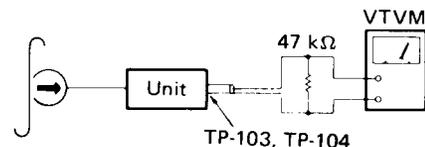

1-4. VU meter adjustment

PROCEDURES:

- 1) Play the test tape MTT-150 back.
- 2) Adjust R 243 and R244 until the VU meter pointer deflects to the Dolby mark (∞ , +3dB) on the meter.

1-5. Playback frequency response adjustment

Connect the AC VTVM to the TP-103 and TP-104 test point. Play the test tape VTT-658 back. Adjust the voltage to 150 mV with R133 and R134.

2. RECORDING MODE ADJUSTMENT

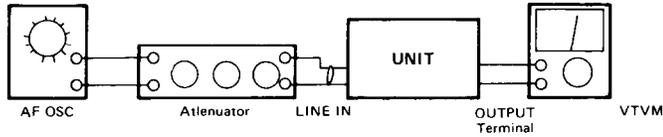

2-1 Bias trap coil adjustment

- 1) Set the tape deck in the recording mode of operation.
- 2) Set the Bias selector switch to Metal position.
- 3) Connect the AC VTVM to TP-105 and TP-106 test point.
- 4) Adjust L111 and L112 for minimum VTVM read.

2-2. 19 kHz filter adjustment

PROCEDURES:

- 1) Connect the 19kHz, 1mV input signal to the line in terminal.
- 2) Turn the Dolby NR (MPX Filter) switch to the IN position.
- 3) Connect the VTVM to the MODE terminal.
- 4) Adjust L103, and L104 for minimum VTVM read.

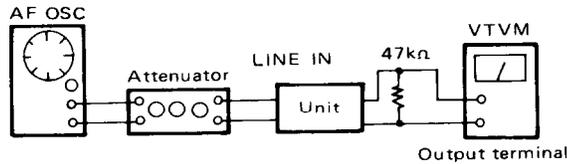

2-3. Dolby circuit adjustment

PROCEDURES:

- 1) Connect the 5kHz, 10mV input signal to the line in terminal.
- 2) Connect the VTVM to the TP-103 terminal.
- 3) Set the tape deck in the recording mode of operation.
- 4) Adjust the input level volume for 23.5mV VTVM read.
- 5) Turn the Dolby NR (MPX Filter) switch.
- 6) Adjust R167 for 60mV VTVM read.

2-4. Record bias adjustment

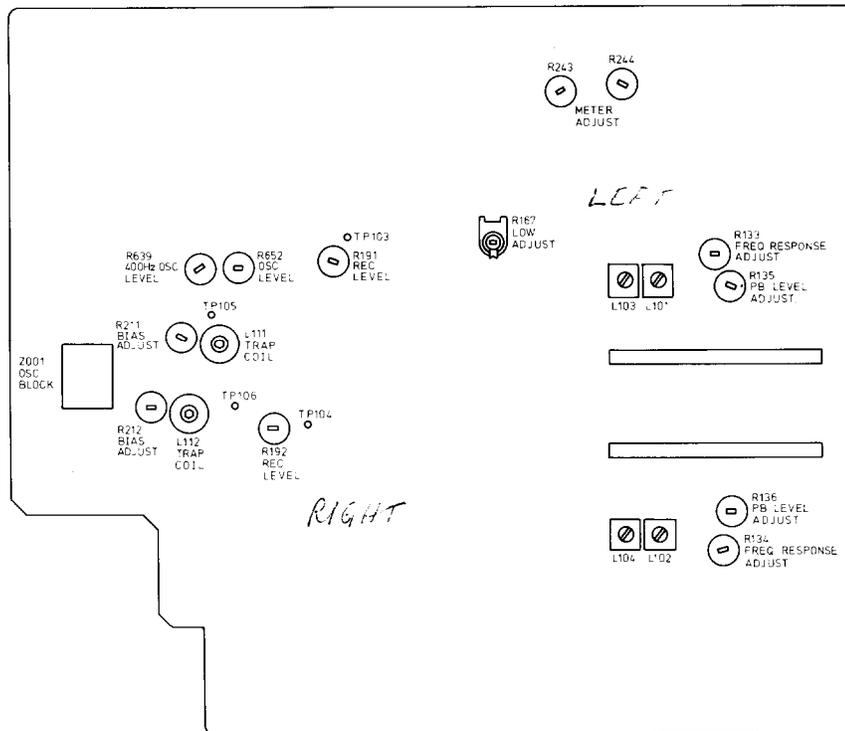

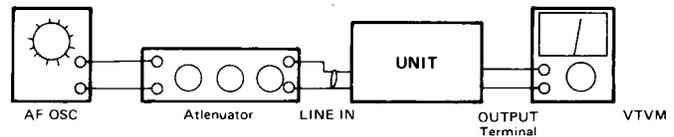

- 1) Press the pause key, and put the tape deck into recording mode. Apply a 400Hz signal to the Line input terminals, and adjust the AF oscillator output so that the VU meter reads 0VU.
- 2) Then set the input level to -20dB, and release the pause switch to record on the tape. Read the output level when this recording is played back again.
- 3) Next change the frequency of the oscillator to 8kHz, and record again as described above. During playback of this recording, obtain the same output level as with the 400Hz recording by readjusting R211 and R212.

2-5. Record-playback output level adjustment

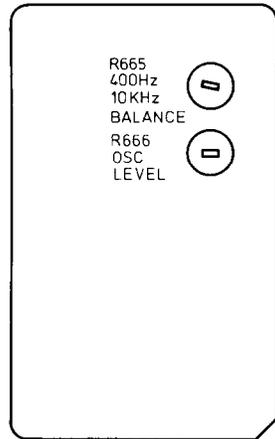

PROCEDURES:

- 1) Connect the 1kHz input signal to the line in terminal.
- 2) Set the Tape Selector to Normal.
- 3) Connect the VTVM to the output terminal.
- 4) Set the tape deck in the recording mode of operation.
- 5) Adjust the attenuator for 775mV VTVM read.
- 6) Set the deck in the playback mode of operation.
- 7) Adjust the R191 and R192 for 775mV ± 0.5dB VTVM read.

3. ACCU. BIAS CIRCUIT ADJUSTMENT

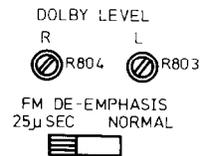

- 1) Set up the tape deck in the recording mode of operation and press the pause key to "ON" position.
- 2) Press the accu. bias switch to "ON" position, and turn the adjusting volume to the center position.
- 3) Connect the AC VTVM to the line output terminal (L channel).
- 4) Adjust the 400Hz and 10kHz oscillator signal to the same level with R639.
- 5) Adjust the line output voltage to 110mV with R652.
- 6) Adjust the VU meter calibration of 400Hz and 10kHz to same manner with R666.
- 7) Adjust the VU meter calibration to the 0 position with R666.

4. DOLBY FM LEVEL ADJUSTMENT

- 1) Set the input selector switch to the DOLBY FM.
- 2) Set the de-emphasis selector switch to 25 μ sec.
- 3) Connect the AF oscillator to the line input terminal and the AC VTVM to the line output terminal.
- 4) Set the AF oscillator to 400Hz, 250mV.
- 5) Adjust the output voltage to 1.1V with R803 and R804 on the back panel.
