**PHILIPS**

**SERVICE DOCUMENTATION**  
for receiver

**313 A**

**FOR A.C. MAINS FEEDING.**

**WAVERANGES**

Short wave 1 : 13.5 — 45 m ( 22.2 — 6.67 mc)  
Short wave 2 : 45 — 165 m ( 6.67 — 1.8 mc)  
Medium wave : 165 — 560 m (1800 — 535.6 Kc).

**CONTROL KNOBS**

From right to left:

1. Tuning.
2. Waveband switch.

3. Volume control with mains switch.
4. Tone control.

**DIMENSIONS.**

Width: 50 cm  
Height: 29 cm } knobs included.  
Depth: 22.5 cm

**WEIGHT:** 10.75 kg, tubes included.

**TRIMMING THE RECEIVER.**

Retrimming is necessary:

- a. When a coil or condenser in the I.F., H.F. or oscillator part has been renewed.
- b. When the receiver is not sensitive or selective enough. It is not necessary to take the receiver out of its cabinet; all trimmers become accessible after removal of the rear panel and the base plate. The positions of the trimmers are indicated in figs. 4 and 5. As regards the necessary trimming tools vide the list of parts and tools.

On all wavebands the oscillator frequency is higher than the tuning frequency of the H.F. circuits.

The I.F. is 452 kc.

The I.F. bandwidth 1 : 10 is 11.5 kc.

The bandwidth at 1000 kc 1 : 10 is 10 kc.

**A. I.F. CIRCUITS.**

1. Earth the set and switch to medium wave band. Turn the variable condenser to minimum position.
2. Connect the output indicator via a trimming transformer to the extension loudspeaker sockets. Short-circuit C33.
3. Apply a modulated signal of 452 kc via a condenser of 32000  $\mu\mu F$  to the first grid of L2.
4. Detune the third circuit by connecting a condenser of 80  $\mu\mu F$  in parallel with S25.
5. Tune S26-S27 to maximum output, then remove detuning condenser from S25.
6. Detune the second circuit by connecting a condenser of 80  $\mu\mu F$  in parallel with S24.
7. Tune S25 to maximum output.
8. Remove the detuning condenser from S24 and detune the first circuit by connecting a condenser of 80  $\mu\mu F$  in parallel with S23.
9. Tune S24 to maximum output.
10. Remove the detuning condenser and detune the second circuit by connecting a condenser of 80  $\mu\mu F$  in parallel with S24.
11. Tune S23 to maximum output. Remove detuning condenser and seal the cores.

**B. H.F. AND OSCILLATOR CIRCUITS.**

**I. SHORT WAVE 1 (13.5—45 m).**

1. Earth the set and switch to short wave 1.
2. Connect the output indicator to the set to be trimmed.
3. Apply to the aerial socket, via the short wave dummy aerial, a modulated signal of 20.5 mc.
4. Accurately tune the receiver to this frequency by means of the variable condenser (first maximum starting from minimum capacity).

5. Tune C8, C15 to maximum output. Seal trimmers C8, C15.
- NOTE: C24 is tuned to a fixed capacity and may not be altered.

**II. SHORT WAVE 2 (45-165 m).**

1. Fit the 15° gauge (lowest capacity). Switch the set to short wave 2.
2. Apply a modulated signal of 6.1 mc via the short wave dummy aerial to the aerial socket.
3. Accurately tune the set to this frequency with the aid of C25, C16 and C9.
4. Seal the trimmers.

**III. MEDIUM WAVES (165-560 m).**

1. Fit the 15° gauge (lowest capacity). Switch the set to medium waves.
2. Apply a modulated signal of 1740 kc to the aerial socket via the normal dummy aerial.
3. Accurately tune the set to this frequency with the aid of C26, C17 and C10.
4. Connect GM 2404 to the anode of L2, and the output indicator to the GM 2404. Short-circuit the oscillator (C5).
5. Apply to the aerial socket of the set to be trimmed via the normal dummy aerial, a modulated signal of 600 kc.
6. Accurately tune the set to this frequency with the tuning knob.
7. Take away GM 2404, connect the output indicator to the set to be trimmed. Remove the short-circuit of C5.

**DO NOT TURN THE VARIABLE CONDENSER.**

8. Tune C30 to maximum output.
9. Turn the variable condenser against the 15° gauge (lowest capacity).
10. Apply to the aerial socket of the set to be trimmed, via the normal dummy aerial, a signal of 1740 kc.
11. Tune C26, C17 and C10 to maximum output. Seal C10, C17, C26 and C30.

**C. ADJUSTING THE DIAL.**

1. Switch the receiver to the medium wave band. Connect the output oscillator.
2. Apply to the aerial socket, via a normal dummy aerial, a modulated signal of 857 kc. (350 m).
3. Accurately tune the receiver to this frequency.
4. Slightly loosen the screw on the pointer for attaching the string and move the pointer until it points exactly to 350 m.
5. Tighten the screw.
