## FOR A.C. MAINS FEEDING

---

### WAVERANGES

Short wave 1: 13.5 — 45 m ( 22.2 — 6.67 mc)  
 Short wave 2: 45 — 165 m ( 6.67 — 1.8 mc)  
 Medium wave: 165 — 560 m (1800 — 535.6 kc).

### CONTROL KNOBS

From right to left:  
 1. Tuning.

2. Waveband switch.
3. Volume control with mains switch.
4. Tone control.

### DIMENSIONS

Width: 58 cm	knobs included.
Height: 31.5 cm	
Depth: 24.5 cm	

WEIGHT: 11.6 kg, tubes included.

### CIRCUIT DETAILS

#### TUNING INDICATOR.

Part of the I.F. voltage detected by the second diode (signal diode) of L3 is tapped from the potentiometer R18-R19 and applied to the control grid of the tuning indicator L8. On the signal becoming more powerful on the diode the negative bias on the grid of L8 increases, so that the anode current decreases. The voltage drop across R32 and R40 becomes smaller and therefore also the voltage difference between the screen and the two with each of the plates interconnected deflection plates.

The screening effect of the deflection plates diminishes, the light spots become wider. The two anodes and the corresponding part of the control grid are designed in such a way that the first part already reacts with weak signals and the second part not before powerful signals occur. The receiver is correctly tuned when the light spots are widest.

#### INVERSE FEED-BACK.

Inverse feed-back is provided in two ways:

- a. The I.F. voltage is fed back from the loudspeaker transformer-coil S30 via R29, R28, C49, R30, CS3 to the anode circuit of L4.
- b. A part of the I.F. voltage is fed back from the anode circuit of L4 to the grid circuit of this tube via C55, C45, C46, R25 and R26.

L4 is regulated by the automatic volume control (via R15), so that the amplification of L4 depends on the incoming signal. However, along with the amplification the degree of inverse feed-back is also controlled. By a proper choice of the resistances and condensers in the inverse feed-back circuit and combination of the two methods it has been possible to achieve that a suitable frequency trend is obtained for weak and strong signals.

## TRIMMING THE RECEIVER

Retrimming is necessary:

- a. When a coil or condenser in the I.F., H.F. or oscillator part has been renewed.
- b. When the receiver is not sensitive or selective enough. It is not necessary to take the receiver out of its cabinet; all trimmers become accessible after removal of the rear panel and the base plate. The positions of the trimmers are indicated in figs. 4 and 5. As regards the necessary trimming tools vide the list of parts and tools.
- On all wavebands the oscillator frequency is higher than the tuning frequency of the I.F. circuits.

The L.F. is 452 kc.

The I.F. bandwidth 1 : 10 is  $12^{2/3}$  kc.

The bandwidth at 1000 kc 1 : 10 is:  $11^{1/2}$ .

#### A. I.F. CIRCUITS.

1. Earth the set and switch to medium wave band. Turn the variable condenser to minimum position.
2. Connect the output indicator via a trimming transformer to the extension loudspeaker sockets. Short-circuit C33.
3. Apply a modulated signal of 452 kc via a condenser set of  $32,000 \mu\text{F}$  to the first grid of L2.
4. Detune the third circuit by connecting a condenser of  $80 \mu\text{F}$  in parallel with S25-S31.
5. Tune S26-S27 to maximum output.
6. Detune the second circuit in the same way by connecting a condenser of  $80 \mu\text{F}$  in parallel with S24.  
(From top L3 to chassis).
7. Tune successively S25-S31 and S23 to maximum output.
8. Remove the detuning condenser from S24 and detune the first circuit by connecting a condenser of  $80 \mu\text{F}$  in parallel with S23.
9. Tune S24 to maximum output.
10. Remove the detuning condenser and seal the coil cores.

#### B. H.F. AND OSCILLATOR CIRCUITS.

##### I. SHORT WAVE 1 (13.5—45 m).

1. Earth the set and switch to short wave 1.
2. Connect the output indicator to the set to be trimmed.
3. Apply to the aerial socket, via the short wave dummy aerial, a modulated signal of 20.5 mc.
4. Accurately tune the receiver to this frequency with the help of the variable condenser (first maximum starting from minimum capacity).

5. Tune C8, C15 to maximum output. Seal trimmers C8, C15.
- NOTE. C24 is tuned to a fixed capacity and may NOT be altered.

##### II. SHORTWAVE 2 (45—165 m).

1. Fit the  $15^\circ$  gauge (lowest capacity). Switch the set to short wave 2.
2. Apply a modulated signal of 6.1 Mc via the short-wave dummy. Tune the set to this frequency with the aid of C25, C16 and C9.
4. Seal the trimmers.

##### III. MEDIUM WAVES (165—560 m).

1. Fit the  $15^\circ$  gauge (lowest capacity). Switch the set to short wave 2.
2. Apply a modulated signal of 1740 kc to the aerial socket via the normal dummy aerial.
3. Accurately tune the set to this frequency with the aid of C26, C17 and C10.
4. Connect GM 2404 to the anode of L2, and the output indicator after the GM 2404. Short-circuit the oscillator (C5).
5. Apply to the aerial socket of the set to be trimmed via the normal dummy aerial, a modulated signal of 600 kc.
6. Accurately tune the set to this frequency with the tuning knob.
7. Take away GM 2404, connect the output indicator after the set to be trimmed. Remove the short-circuit of C5.
- DO NOT TURN THE VARIABLE CONDENSER.
8. Tune C30 to maximum output.
9. Turn the variable condenser against the  $15^\circ$  gauge (lowest capacity).
10. Apply to the aerial socket of the set to be trimmed, via the normal dummy aerial, a signal of 1740 kc.
11. Tune C26, C17 and C10 to maximum output. Seal C10, C17, C26 and C30.

##### C. ADJUSTING THE DIAL.

1. Switch the receiver to the medium wave band. Connect the output oscillator.
2. Apply to the aerial socket, via a normal dummy aerial, a modulated signal of 857 kc.
3. Accurately tune the receiver to this frequency.
4. Slightly loosen the screw on the pointer and set the pointer exactly to 350 m.
5. Tighten the screw again.

## REPAIR AND RENEWAL OF PARTS.

For various kinds of repairs it is not necessary to take the receiver out of the cabinet and often removal of the rear panel and the base plate suffices.

## TAKING OUT OF THE CABINET.

- Take off the knobs and remove the rear panel.
- Unsolder the connections to the loudspeaker.
- Unscrew the tuning indicator holder (1 screw).
- Unscrew the connection with the base screening of the chassis.
- Slightly loosen the screw on the pointer for fixing the string so that the string is released.
- Turn out the base screws.
- Slide the chassis out of the cabinet, take the string for the waveband indication off the lever on the chassis. Returning to the cabinet is effected in the reverse order of sequence, after which correctly adjust the pointer (vide sheet 2 "Adjusting the dial").

## RENEWING THE DIAL.

For renewing the dial it is not necessary to take the receiver out of its cabinet.

- Loosen the fixing braces on the right of the dial (2 screws).
- Loosen the fixing brace on the left of the dial with which the waveband indicator is also secured (2 screws). Be careful not to bend the waveband indicator.
- Slide the dial with station names upwards between the ornamental window and the guide shaft of the pointer. Mounting is effected in the reverse order.

## RENEWING THE POINTER.

- Slightly loosen the screw on the pointer for gripping the string.
- Undo the guide shaft for the runner by loosening the two 3 mm nuts near the end of this shaft. (Take care the small springs do not jump away).
- Loosen the pointer from the pointer runner (1 screw), screw on a new pointer.

NOTE. The new pointer must be covered at the extremities with silk yarn; the length of the covered part is  $\pm 8$  mm. The silk covering serves for obtaining the correct distance between the luminous line pointer and the station name dial. The guide shafts must be adjusted in such a way that the pointer can easily be moved without play between the station name dial and these shafts.

## MICROPHONIC EFFECT.

To avoid microphony, the variable condenser with the driving mechanism is fixed resiliently to the chassis by means of rubber ducts. This combination must therefore always be set up freely. The following faults may lead to microphony.

- Ducts dried out.
- Fixing strip with pertinax between the brace on the variable condenser and the brace on the chassis riveted too firmly to these braces.
- Connections at the variable condenser too stiff or too taut.

## VERNIER UNIT.

Slipping of the vernier unit may be caused by too weak springs (fig. 6) or greasy strips 36 between the springs 35 and the vernier drum 34. Bend the springs or clean the strips. Proceed as follows for renewing the whole unit:

- Take the receiver out of its cabinet.
- Take the driving strings of the large drum.
- Turn the driving drum in such a way that the large hole in the drum is just before the left-hand fixing screw of the mounting plate of the driving mechanism. Loosen this screw.
- Loosen the right-hand fixing screw for the mounting plate of the driving mechanism.
- Unscrew the cogwheel on the condenser shaft (2 screws).
- Remove the brace of the vernier unit.
- Remove the clamping ring on the shaft of the vernier unit.
- Take out the vernier unit and renew it.
- Mount in the reverse order; make sure the strings are properly fitted and that the two halves of the cogwheel engage in the teeth of the large cogwheel in such a way that the springs 38, fig. 6 between these two halves are slightly compressed.

## DRIVING CABLES.

The way the driving cables have to run is indicated in fig. 6.

## Lengths:

string for the pointer of the station name dial	920 mm
string for the waveband indicator	520 mm
outer cable for waveband indicator	360 mm
driving string for the variable condenser	460 mm

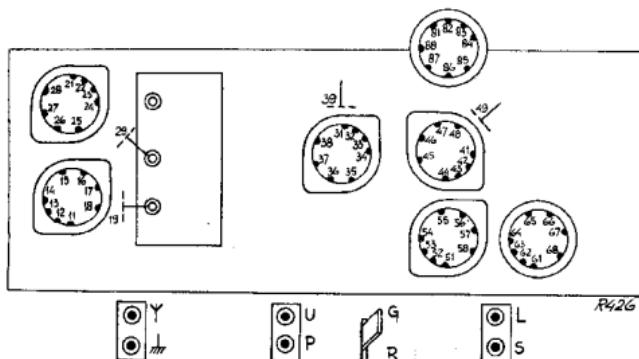

The length of the driving strings is measured from fixing point to fixing point. To allow for the loops the strings must be cut slightly longer.

## COILS

	Value	Code number	Price
Z1	34 ohm (245 V)		
S1	200 ohm	A1 055 44.0
