CONTENTS

A—INTRODUCTION

These models, utilizing an electrically similar chassis, are four-track, two speed, mains-operated, tropicalized tape recorders, employing ten transistors and three diodes. Recording facilities include signal input mixing, loudspeaker or headphone monitoring and a meter-type recording level indicator. Provision is made for using the recorder as a microphone, radio, or pick-up amplifier and, when used in conjunction with the 'Stereo' pre-amplifier EL3787A/00A etc., Stereo playback/Multiplay/Duoplay is also possible.

B—SPECIFICATION

Recording/playback system	Monophonic, 4-track, left to right
Tape speeds	3¾ and 1⅞ i.p.s.
Maximum reel diameter	7 in.
Maximum playing time	Over 12 hrs. at 1⅞ i.p.s. (17 hrs. with D.P. tape)
Fast wind/rewind time	3 mins. for 1,200 ft. of tape
Modulation level indicator	Moving coil meter type
Microphone	Moving coil type N8301
Frequency response	3¾ i.p.s.: 60-14,000Hz
	1⅞ i.p.s.: 80-8,000Hz
Wow and flutter	±0.25% at 3¾ i.p.s.
Signal to noise ratio	Better than 45dB
Semi-conductors	T1 BC109B/BC148B
	T2 BC109B/BC148B
	T3 BC109B/BC148B
	T4 BC108/BC148A
	T5 BC108/BC148A
	T6 AC187/01
	T7 AD162
	T8 AD161
	T9 AC125
	T10 BC108A
	X1, X2 BY126/OF160
	X3 OA95
Input/output sockets	
Inputs: Skt1—Radio (diode)	Pins 1/4 and 2—2mV into 20KΩ (with EL3768/03 connecting lead—150mV via 1.5MΩ)
Pick-up	Pins 3 or 5 and 2—100mV into 1MΩ
Skt2—Microphone	Pins 1/4 and 2—0.2mV into 2kΩ
Outputs: Skt1—Line (diode)	Pins 3, 5 and 2—750mV across 20kΩ
Skt3—Stereo	For use with EL3787A/00A Stereo pre-amplifier
Skt4—Ext. L.S.	Impedance 4 or 8Ω, 4 watts
Skt5—Headphones	Pins 4 and 1/2
Power output	4 watts
Loudspeaker	6 in. × 4 in. elliptical, 8Ω
Mains voltage	110, 127, 200-250 volts a.c. 50Hz (adaptable to 60Hz)
Mains consumption	40 watts approx.
Weight	17¾ lb. (N4308) 17¼ lb. (ST9123A)
Dimensions	N4308—16½ in. × 11¾ in. × 5⅞ in.
	ST9123A—16 in. × 11½ in. × 6⅜ in.

C—ACCESSORIES

Recording lead with 5-pin DIN plug at each end ..	EL3768/14
Connection box/extension lead for two microphones	N6206
Slide synchroniser	EL1995
Stereo pre-amplifier	EL3787A/00A
Continuous tape loop	EL1907/52 or CE10
Tape splicing kit	SK10

D—OPERATION

1. Record

Depress on/off switch 205, and select the required speed and track. The level of recording may be controlled as follows. Depress Record key 207 and adjust the appropriate controls so that the modulation level indicator pointer almost reaches the red section of the scale during the loudest passages. To commence recording, hold the Record key fully depressed, then depress Play key 210. On completion of recording, depress Stop bar 212. When recording from a source other than a microphone, it may be necessary to include some form of attenuation in the connection to avoid overloading the input stages. The lead type EL3768/14 should be used whenever the input source employs a 5-pin DIN diode output socket. On all other occasions, the input signal should be applied to pin 3 or 5 of input socket Skt1, or the lead type EL3768/03 supplied with the recorder should be used. This lead incorporates a series resistor, 1.5MΩ, in the red conductor, but under certain conditions, depending on the amplitude of the input signal, the value of this resistor may be altered to obtain satisfactory recordings. The connections of this lead are: Red—recording input; White—line output; Black—common earth (screening), see Fig. 1.

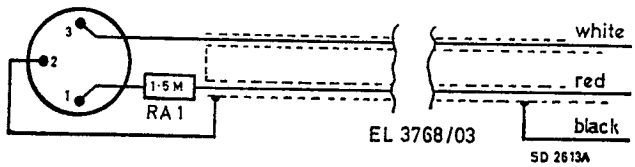

Fig. 1 Radio/Pick-up Connecting Lead

2. Monitoring

Monitoring during recording can be carried out using the internal loudspeaker or headphones, with the volume and tone controls operative. Acoustic feedback can be avoided by moving the microphone further away from the recorder or by reducing the volume.

3. Playback

Select the required track operation and depress Play key 210. The volume and tone controls can be adjusted as necessary. To terminate 'Playback' depress Stop bar 212.

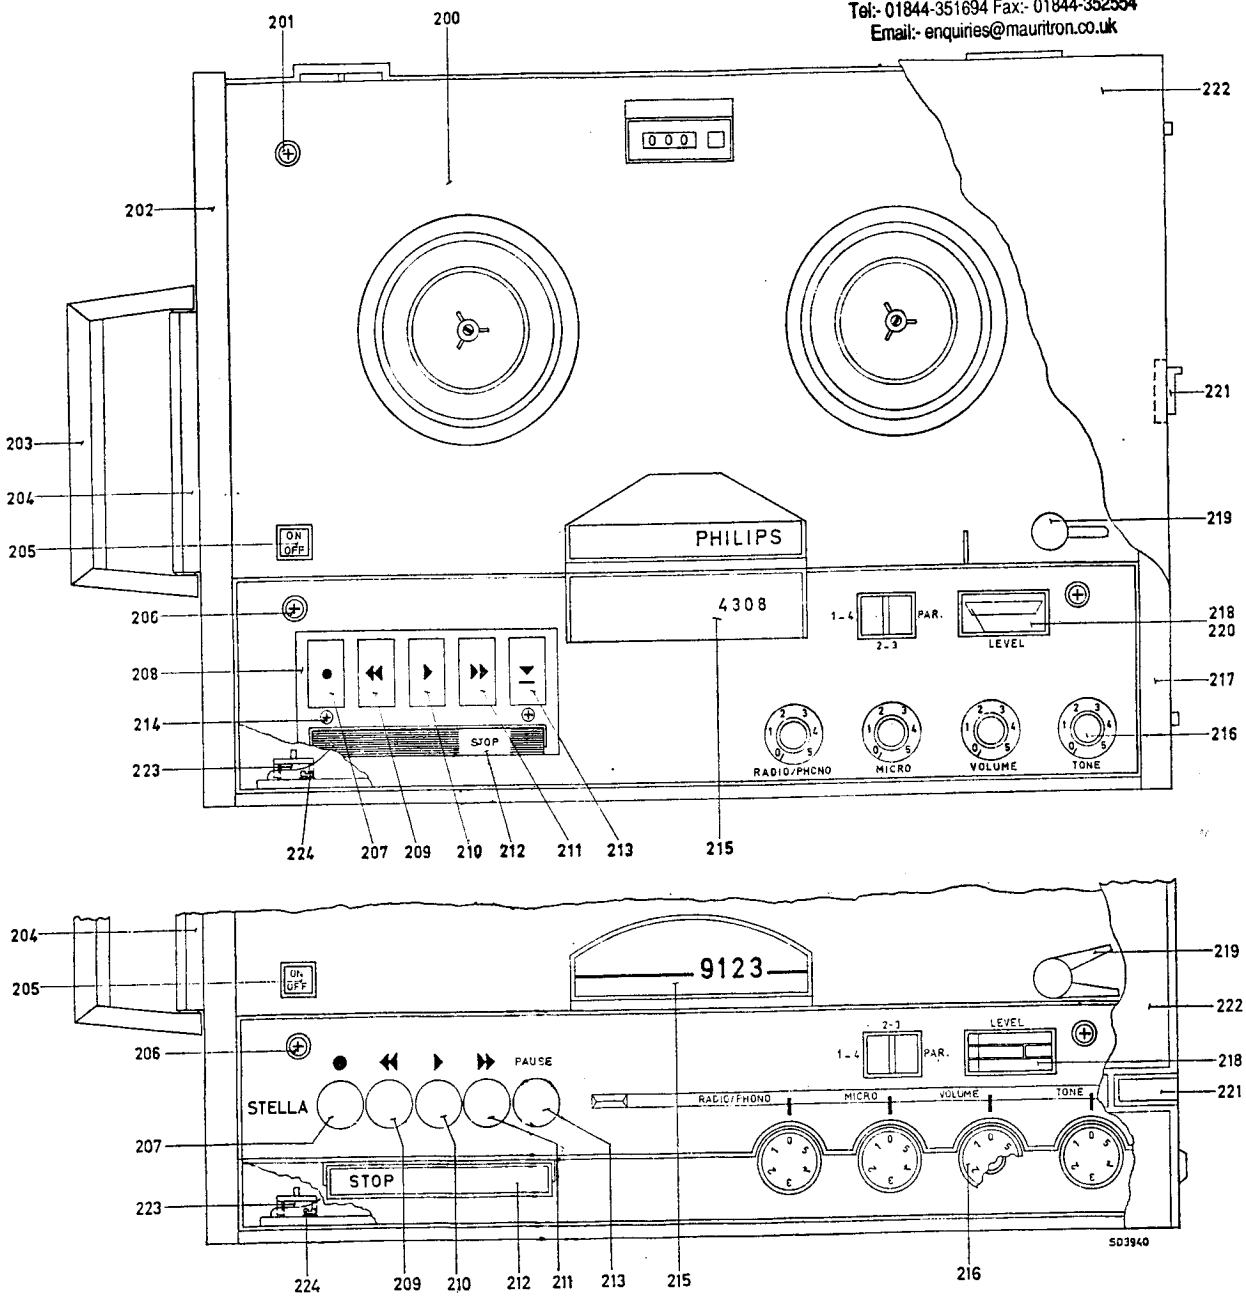

Fig. 2 Top View

4. P.A.
Set the tape speed to 3¾ i.p.s. and the track switch to '1—4' or '2—3' (not 'PAR'). Switch on the recorder, depress the Record key and adjust the modulation level as in para. D1 above, further control of volume being obtained by means of the volume control. Acoustic feedback can be avoided as stated in para. D2 above.

5. Pause
When Pause key 213 is depressed, the tape transport is interrupted. It can be resumed by depressing the Pause key again.

6. Forward wind and rewind
Depress the key indicated to give the required direction of tape transport. Stop with the Stop bar.

7. Resetting the rev. counter
This device may be reset at any time by depressing the button at the side of the viewing window.

E—DISMANTLING

1. Case removal (See Fig. 2)
Remove lid 222, pull off the four control knobs 216, speed change knob 219 and undo the four (some models have five) ornamental screws 201 and 206. Take off cover plate 200, disconnect the speaker leads and case screening lead (these are usually slide-on connectors but in some cases may be soldered) and lift out chassis. The chassis can be operated out of the cabinet, providing normal care is taken to keep the chassis level and a speaker of correct impedance is connected. Re-assemble in the reverse order.

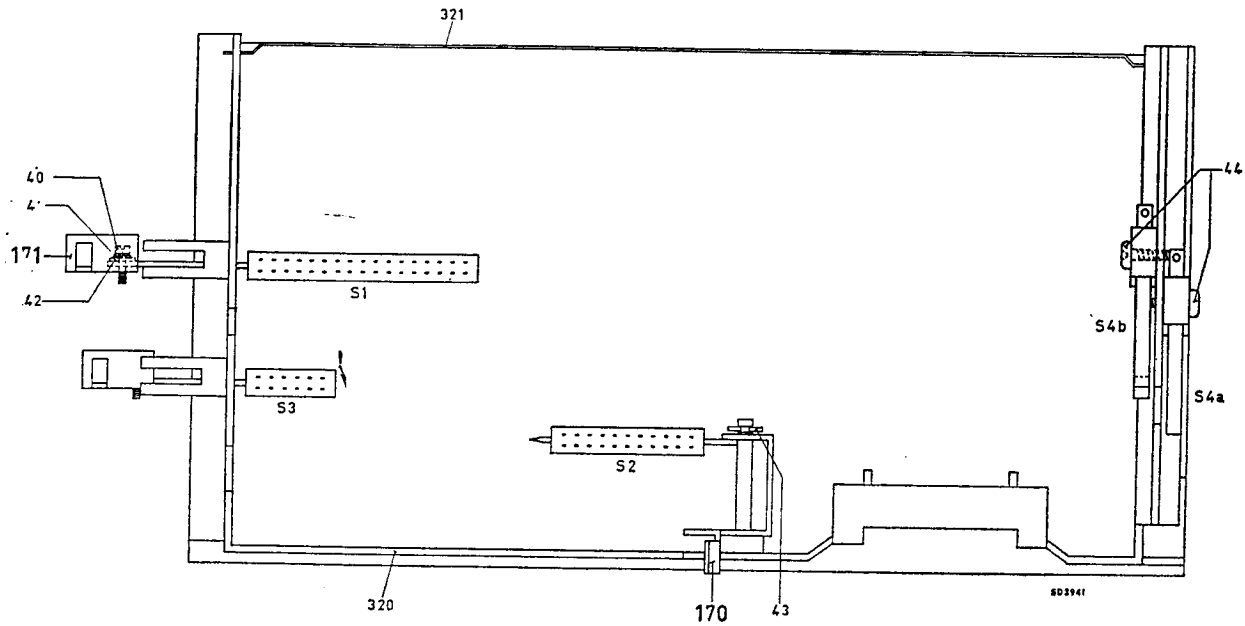

Fig. 3 Switch Location

2. Printed panel removal

Access to the printed panel may be obtained, after setting the track switch to the 'PAR' position and the tape speed to $1\frac{7}{8}$ i.p.s., by undoing the four screws securing the printed panel frame to the chassis. The frame and printed panel can be removed to the extent of the connecting leads, taking care not to bend or deform the switch blades of S4(b). When refitting the printed panel frame, ensure that the switch operating levers are correctly engaged with the switch sliders and that S4(a) and S4(b) operate properly.

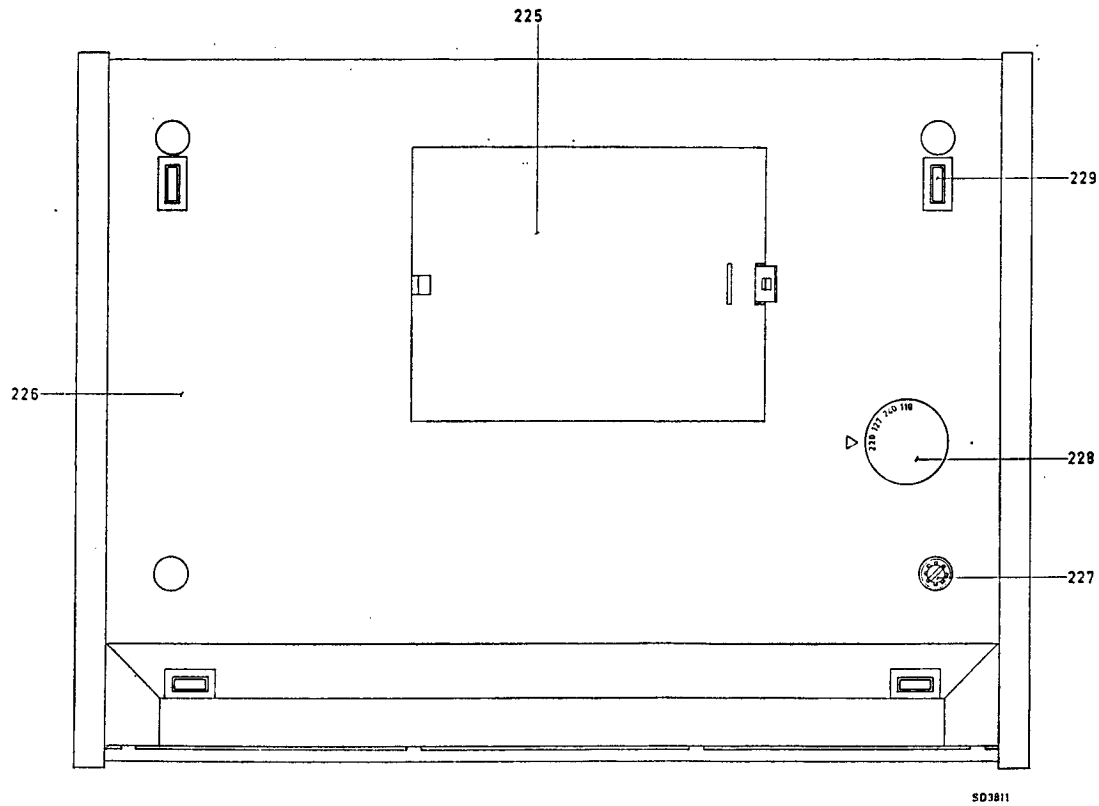

Fig. 4 Underside View

F—MECHANICAL DESCRIPTION

1. Drive mechanism (See Fig. 21 in pocket)
When the machine is switched on, the dual standard (50 or 60Hz) motor 144 drives the two pulleys 115 and pulley 124 (which is mechanically coupled to pulley 130) by means of main drive belt 118. Pulley 130 drives the flywheel with flywheel drive belt 112. The two pulleys 115, when engaged with either L.H. or R.H. turntable 52, provide a slipping drive for fast wind or rewind purposes. The flywheel speed is changed by moving speed selector knob 219 to its alternative position; quadrant 137 rotates derailing gear 129 which moves belt 112 into one or other of the two grooves in pulley 130. Protusions on quadrant 137 close contacts of S4(a) in the 3¾ i.p.s. and S4(b) in the 1⅞ i.p.s. positions.

2. Playback
When Play key 210 is depressed, play strip 113 moves backward, causing intermediate lever 63 to pivot and lever arm 64 moves pressure roller lever 62 towards the heads and capstan. A spring-loaded pressure felt, 67, on bracket 58, then presses the tape against the record/playback head 72 (inside screening cover 71). Brake bracket 101 and 'Z' bracket 116 are released by play strip 113 which also sets the Play/stop switch S3 to the 'Play' position by moving S3 operating arm 96.
Drive wheel 141 is driven by motor 144 via belt 139. Friction coupling from drive wheel 141 to friction disc 54 is achieved by the four friction blocks 55 and through felt ring 51, take-up drive to R.H. turntable 52 is provided.
Tape tension is maintained by the friction imposed by felt ring 51, fitted between L.H. turntable 52 and friction disc 54. This disc is held stationary by the action of the four friction blocks 55 inside friction wheel 56, which is pegged to the chassis. Drag is also imposed on the L.H. turntable in driving rev. counter 131 by belt 133.
Depressing Stop bar 212 releases the Play key and allows springs 143, 61 and 60 to return pressure roller lever 62 and bracket 58 to their rest position and brake bracket 101 and 'Z' bracket 116 to the 'on' position. S3 is also put in the 'Stop' position by spring 93.

3. Record
To record, Record key 207 and Play key 210 are depressed together. The action of the Play key is described in para. F2 above. Depressing the Record key moves switch S1, via S1 operating arm 95, to the 'Record' position. On depressing Stop bar 212, both Play and Record keys are released, spring 94 assisting in returning S1 to the 'Playback' position.

4. Pause
The Pause key provides a rapid stop (or start) facility during recording or playback. Depressing the Pause key moves pause strip 100 backward, bringing brake block 99 into contact with the L.H. turntable. At the same time, a projection on pause strip 100 engages the end of pressure roller lever 62, withdrawing slightly the pressure roller from the capstan and the pressure felt from the head. Pressing the Pause key again releases the pause strip and restores normal operation. Interlocks on wind actuator 98 prevent the Pause key operating in the Fast Wind positions and vice versa.

5. Forward wind
Depressing Forward wind key 211 moves forward wind strip 103 backward. Control bracket 114 pivots, moving wind actuator 98 and 'Z' bracket 116 to the right. R.H. pulley 115 is brought into contact with R.H. turntable 52 and both brakes are released. Tape tension during transport is maintained as described in para. F2 above. On depressing the Stop bar, the Forward wind key is released and the mechanism reverts to the 'Stop' position, assisted by springs 142 and 123.

6. Rewind
Depressing Rewind key 209 moves rewind strip 103 backward. Control bracket 114 pivots, moving wind actuator 98 and 'Z' bracket 116 to the left. L.H. pulley 115 is brought into contact with L.H. turntable 52 and both brakes are released. Tape tension during transport is maintained by felt ring 51 fitted between L.H. turntable 52 and friction disc 54. On depressing the Stop bar, the Rewind key is released and springs 142 and 123 assist in restoring the mechanism to the 'Stop' position.

7. Track selection
Track selector switch S2 is set to the required position by track selector knob 125 and S2 operating arm 170.

G—MECHANICAL REPLACEMENTS

1. R.H. turntable assembly (See Fig. 21 in pocket)
Loosen screw 50 to remove turntable 52. Remove the circlip and washer(s) from the bottom of the turntable spindle and withdraw the rest of the assembly from its bearing, at the same time slipping drive belt 139 from the end of the motor spindle. If friction blocks 55 are removed or replaced, ensure that they are replaced correctly, see Fig. 5. Re-assemble in the reverse order. Vertical play of the turntable should be between 0.1-0.3mm., adjusted by fitting washers between the underside of the turntable bearing and the retaining circlip.

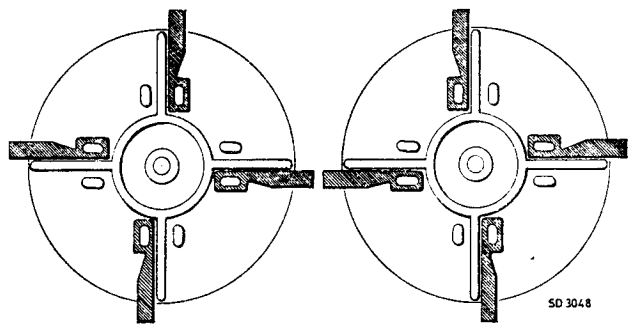

Fig. 5 Friction Blocks

2. L.H. turntable assembly (See Fig. 21 in pocket)
Detach rev. counter drive belt 133. Remove the circlip and pulley 109, then the second circlip and washer(s) from the bottom of the turntable spindle, after which the assembly can be withdrawn from its bearing. If necessary, friction blocks 55 should be replaced as shown in Fig. 5. Re-assemble in the reverse order.

N4308 ONLY

3. Keys 207, 209, 210, 211 (See Figs. 2, and 21 in pocket)
Remove bracket 85 of the Stop bar by first pressing it back, then lifting it up. Take care that springs 86 do not fall off the bracket prongs. Remove wire spring 84, straighten tag M on bracket and lift out key with bracket attached.

4. Pause key 213 (See Figs. 2, and 21 in pocket)
Bend the tags of the bracket on which the key is fitted slightly apart.

Remove springs 84 and 87. When pause strip 100 is pressed back, the pause key with bracket can be lifted out.
NOTE.—Code numbers given in the N4308 Spare Parts List are for keys complete with brackets.

ST9123A ONLY

5. All keys (207, 209, 210, 211; See Figs. 2, and 21 in pocket)
The moulded push-button part of the key is detachable by pushing downwards and lifting off towards the rear. Re-assemble in the reverse order.

6. Erase head 76 (See Fig. 21 in pocket)
In recorders with 'AH' factory coding, the erase head is a plug-in replacement and its socket is secured with a single screw on the L.H. side. In recorders with 'WR' factory coding and where a replacement erase head has been fitted, the erase head mounting lug is fitted underneath the L.H. tape guide. To remove, take off nut 8, L.H. tape guide 73, bracket 74 and L.H. pressure spring 75. Re-assemble in the reverse order. The height of the erase head can be adjusted with shims (code number 4822 532 30095) as described in para. H1.

7. Record/playback head 72 (See Fig. 21 in pocket)
Loosen screw 5 and remove head screening cover 71. Undo two screws securing the head to head mounting plate 79. Record/playback head 72 can be removed after unsoldering the connecting leads. Re-assemble in the reverse order. Adjustment is described in para. I1.

8. Flywheel 110 (See Fig. 21 in pocket)
Detach cable form support 301, undo two screws 22 and remove flywheel bearing bracket 303 together with operating arms 95 and 96, for S3 and S1. Take off flywheel drive belt 112 and remove flywheel 110. Re-assemble in the reverse order.

9. Switch replacement (See Fig. 6)
NOTE: All switch sliders must be withdrawn from the switch by the SQUARED end and reinserted POINT end first. Failure to observe this procedure will result in damage to the switch slider contacts.
Remove the slider of the switch to be replaced (see above). Prise apart the two sections of the stator with a screwdriver blade as shown in Fig. 6. The stator halves can be unsoldered and removed separately from the printed panel.

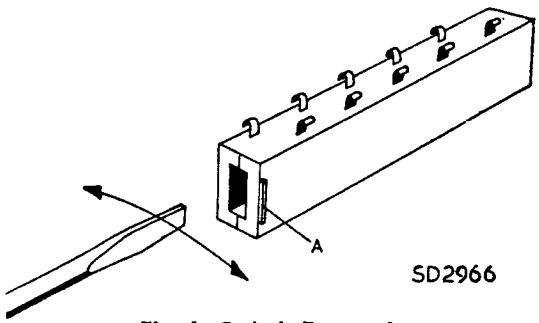

Fig. 6 Switch Removal

10. Socket mounting plate
The socket mounting plates incorporating Skt1 with Skt4 and Skt2 with Skt3 can be removed by squeezing in the springy tags on the inside of the mounting bracket and pressing out the socket mounting plates.

H—MECHANICAL ADJUSTMENTS

1. Erase head 76 (See Fig. 21 in pocket)
In recorders with 'AH' factory coding, the erase head mounting is such that the head cores are at a fixed distance from head mounting plate 77 and non-adjustable. In recorders with 'WR' factory coding and where a replacement erase head has been fitted, the head height can be adjusted by inserting or removing shims (code number 4822 532 30095) from underneath the head mounting lug. The distance between head mounting plate 77 and the top edge of the upper head core should be 19.8mm. (See Fig. 7).

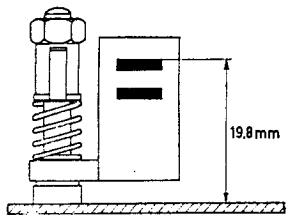

Fig. 7 Erase Head SD3819

2. Tape guides (See Fig. 21 in pocket)
(*a*) L.H. tape guide 73 should be adjusted so that the upper core of erase head 76 protrudes 0.1mm. above the top edge of the tape as shown in Fig. 8.
(*b*) R.H. tape guide 83 should be adjusted so that in the 'Play' position the tape leaves the capstan without catching or twisting.

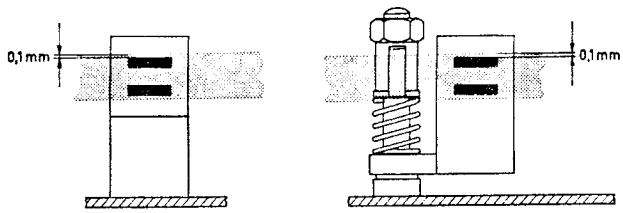

Fig. 8 SD3888

3. Record/playback head 72
For this adjustment, see para. I1.

4. Pressure roller lever 62 (See Fig. 21 in pocket)
In the 'Play' position, pressure roller lever 62 should be spaced at least 0.5mm. away from stop A; adjust by bending stop B on play strip 113, see Fig. 9. Pressure arm 58 should press against head

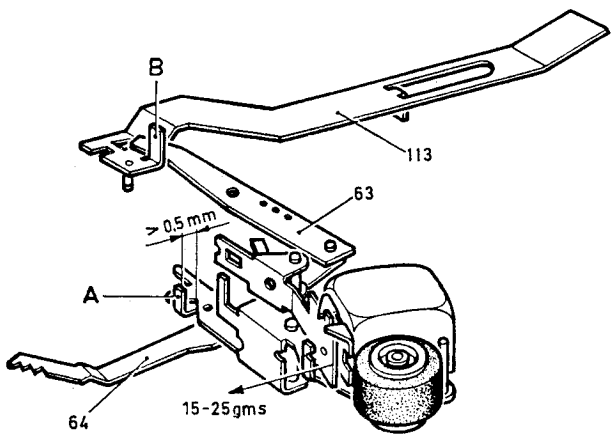

Fig. 9 SD3813

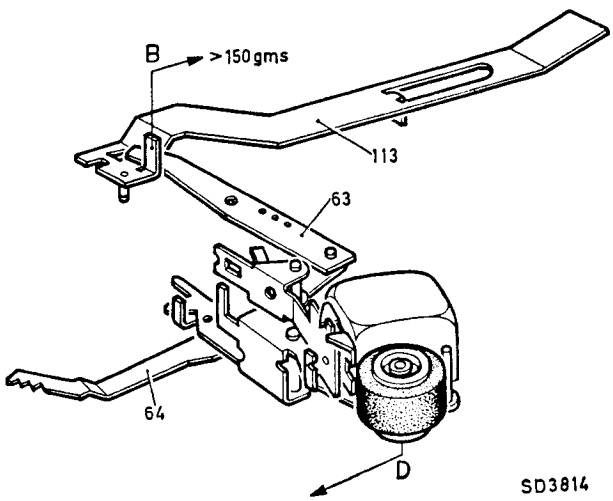

Fig. 10

screening cover 71 with a force of 15-25 grams; if necessary, replace spring 60. Pressure roller 70 should press against the capstan with a force of 700-900 grams, measured at D as shown in Fig. 10. If incorrect, replace spring 61. At the moment of switching from 'Play' to 'Stop', the residual force of the pressure roller lever, measured at B on play strip 113, should be at least 150 grams. If necessary, replace spring 61.

In the 'Pause' position, pressure roller 70 should lie parallel with the capstan and should be spaced 0.5-1.0mm. away from it. If necessary, adjust by bending tag C on pause bracket 88, shown in Fig. 11.

5. Pulleys 115 (See Fig. 21 in pocket)

In the 'Forward wind' or 'Rewind' positions, the lower edge of the contact surface of pulley 115 should be 0.1-0.5mm. above the lower edge of the relevant turntable. If necessary, insert shims underneath washer 122.

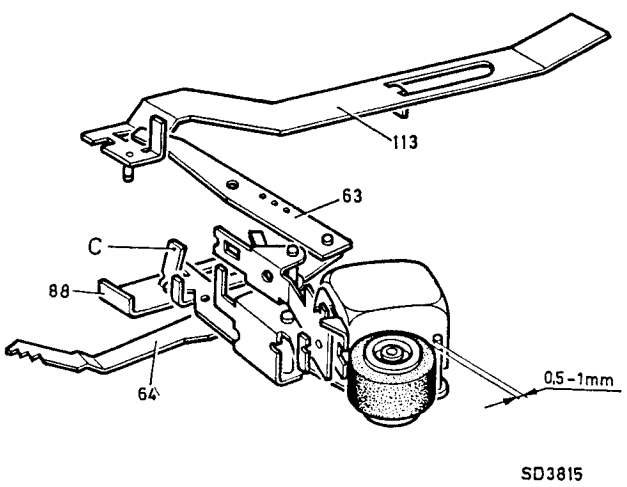

Fig. 11

6. Clutch assemblies (See Fig. 21 in pocket)

With the mains switch off and the Forward wind key depressed, the force necessary to overcome the friction in the L.H. turntable clutch assembly should be 15-25 grams. With the Rewind key depressed, the force necessary to overcome the friction in the R.H. turntable clutch assembly should also be 15-25 grams; both measurements are taken using an empty 5 in. spool, as shown in Fig. 12. The wind-on time for 1,200 ft. of L.P. tape should be 3 mins. or less. If necessary, the friction surfaces of the turntables and the friction blocks can be cleaned as described in para. J1(*b*) or the friction blocks can be replaced. To ensure that they are replaced correctly, refer to Fig. 5.

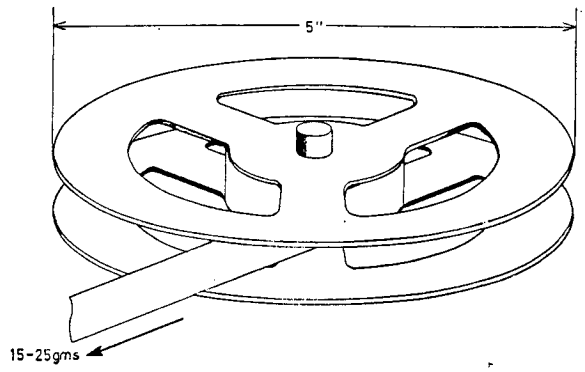

Fig. 12

7. Brakes (See Fig. 13)

Set the recorder to the 'Stop' position. Press the L.H. brake shoe 120 to the left, as in Fig. 13. Bend tag A so that in this position of brake shoe 120, the clearance between R.H. turntable 52 and R.H. brake shoe 117 is 0.5-1.0mm.

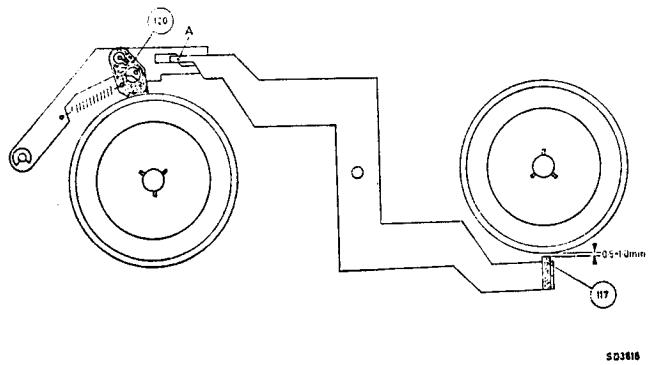

Fig. 13

8. Switches

Place the recorder upright on its front edge, protecting the printed panel from damage.

(*a*) Track selector switch S2 (See Fig. 3). If necessary, bend S2 operating arm at A so that in track position '2-3', the switch slider is positioned as shown in Fig. 14.

(*b*) Play/stop switch S3 (See Fig. 3). Depress the Record key and, if necessary, bend the tags of S3 operating arm 95 so that the switch slider is in the position shown in Fig. 15.

(*c*) Record/playback switch S1 (See Fig. 3). Set the recorder to the 'Stop' position and, if necessary adjust the tags on S1 operating arm 96 so that the switch slider is in the position shown in Fig. 15.

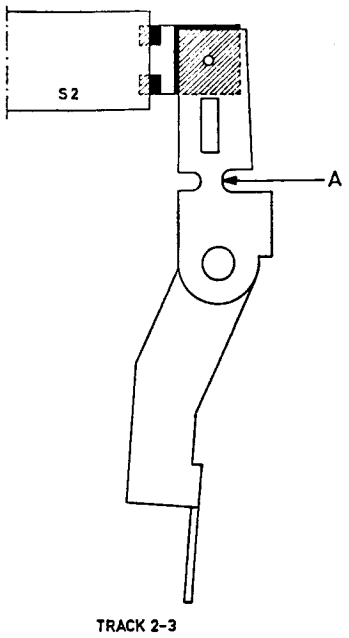

Fig. 14

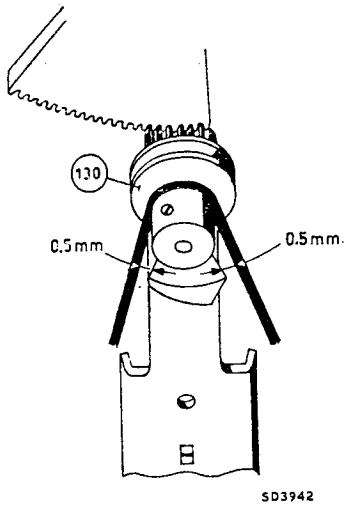

Fig. 16

9. **Speed change mechanism** (See Fig. 16)

In either position, derailing cam 129 should be at least 0.5mm. from belt 112. If necessary, adjust pulley 130 on its shaft.

10. **Conversion from 50Hz to 60Hz operation and vice versa**

To convert from 50 to 60Hz operation, transfer main drive belt 139 from groove A to groove B of the motor pulley, see Fig. 17. To convert from 60 to 50Hz operation, reverse the above procedure.

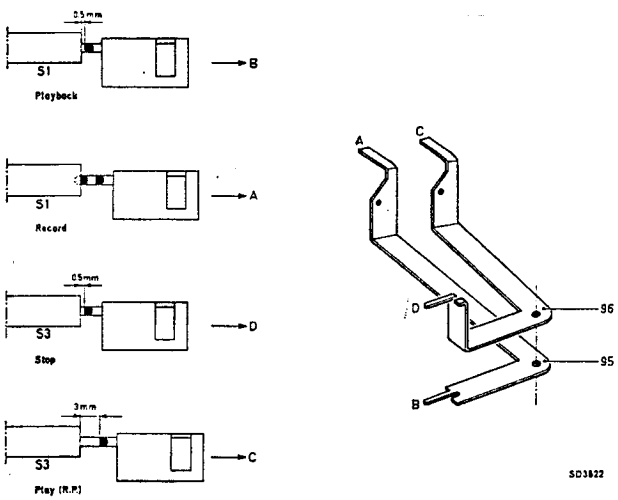

Fig. 15

I—ELECTRICAL ADJUSTMENTS AND MEASUREMENTS

All measurements should be carried out with a mains input voltage of 240V a.c., 50Hz.

1. **Record/playback head 72** (See Fig. 21 in pocket)

(*a*) *Height adjustment*

With the recorder in the 'Stop' position, remove head screening cover 71. Position the head with screws 9 and 10 so that the head face is parallel to the tape and the height is such that the tape will pass smoothly through the jaws of the head tape guide. Proceed by unhooking spring 60 and place a reel of new D.P. tape in the machine. Hold the tape taut across tape guides 73 and 83, then push pressure roller 70 towards head 72 by hand, checking that as the tape approaches the head it does not foul the jaws of the head tape guide. Pressure pad 67 should not touch the tape during this operation. Re-adjust the height of the head as necessary until this condition is met, ensuring that the head face remains parallel to the tape.

NOTE: The head tape guide is accurately manufactured and should this guide become misaligned, damaged or excessively worn, the record/playback head should be replaced.

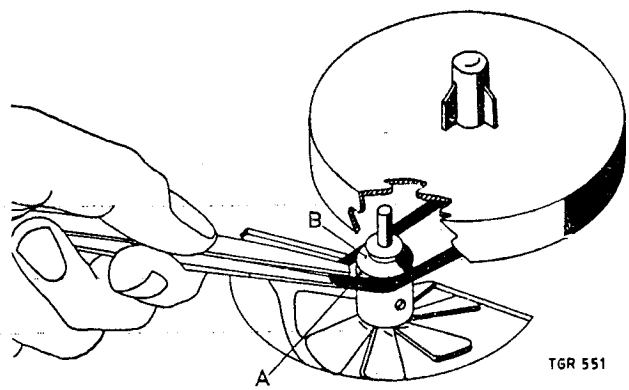

Fig. 17

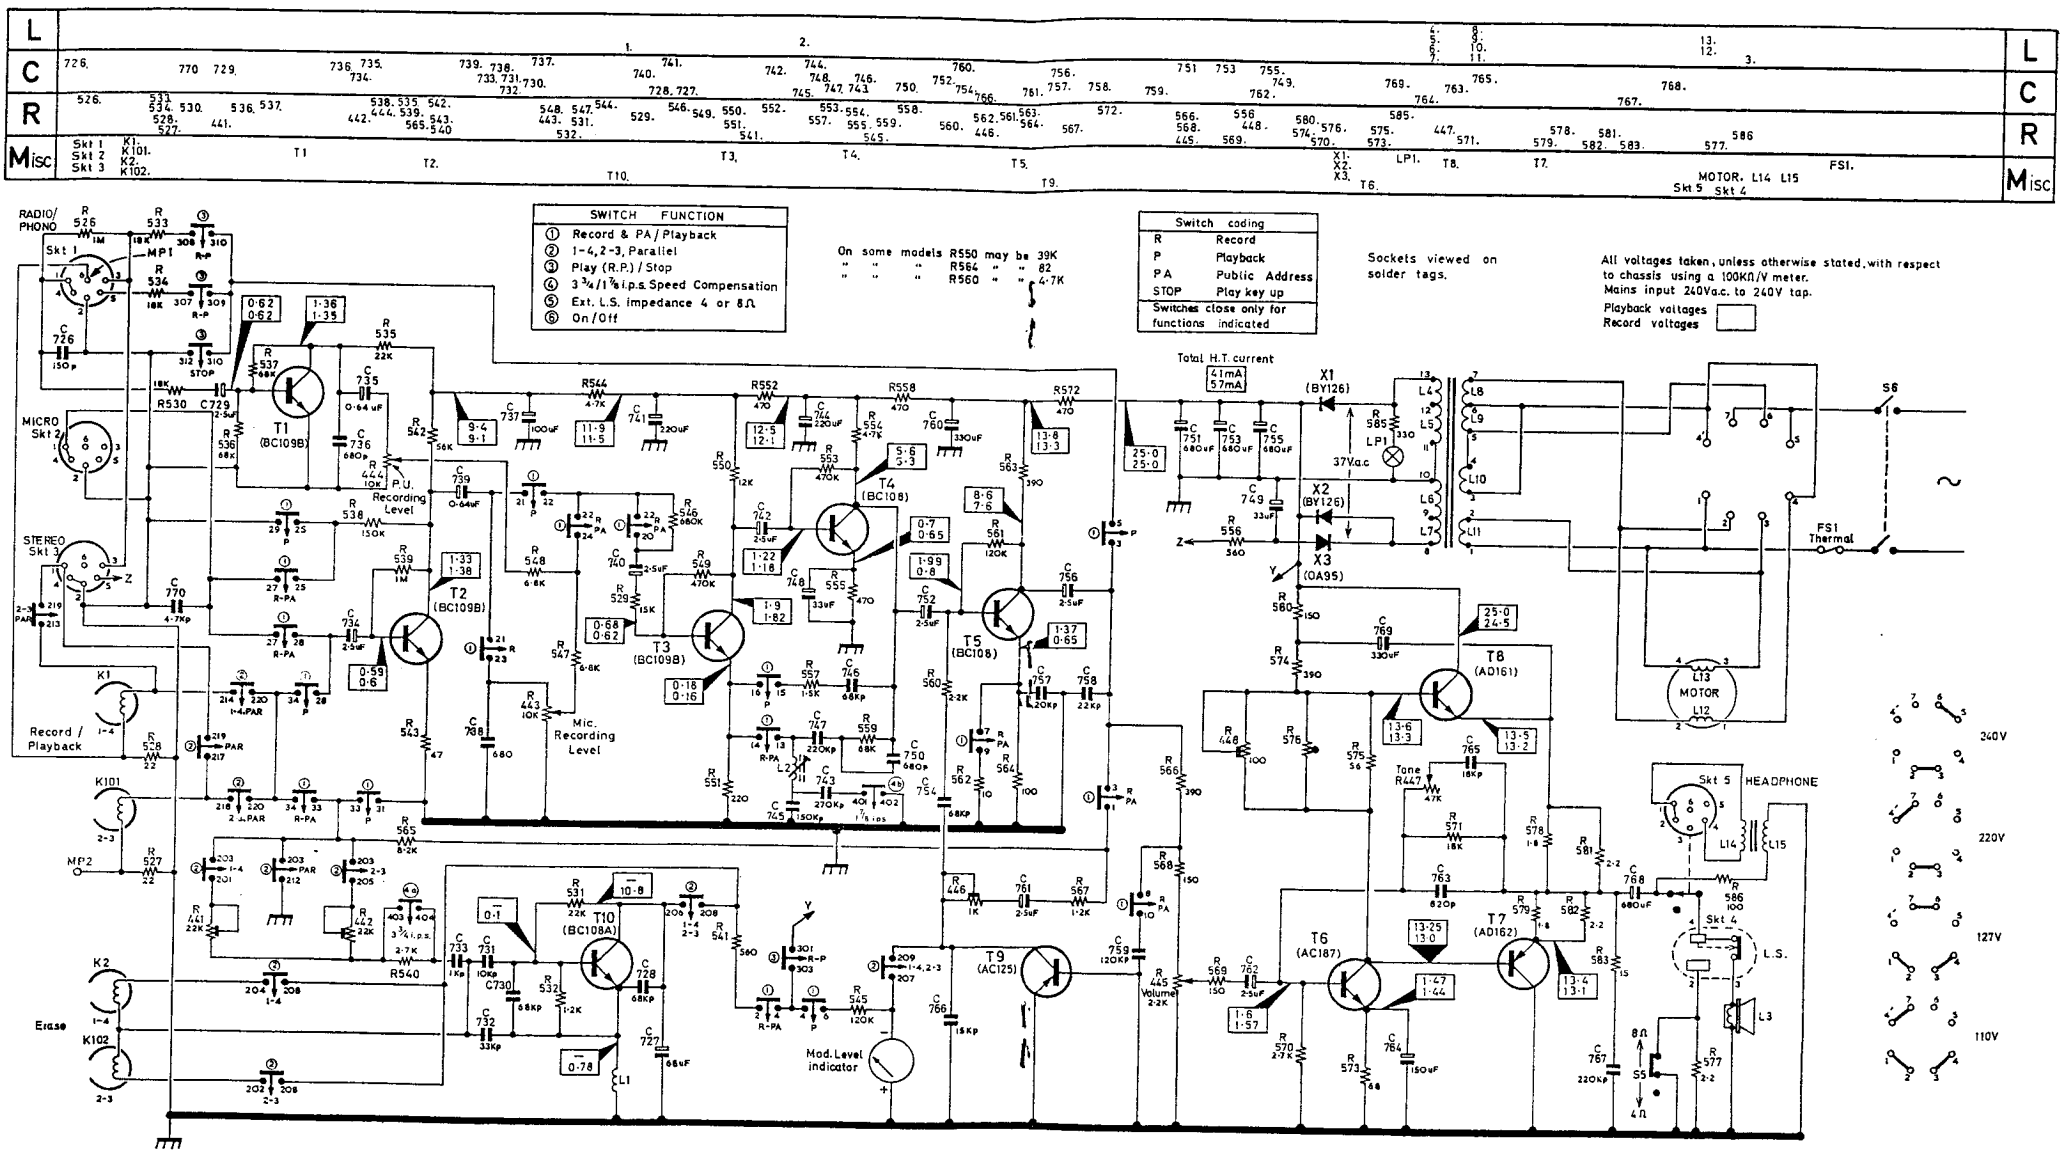

Fig. 18 CIRCUIT DIAGRAM

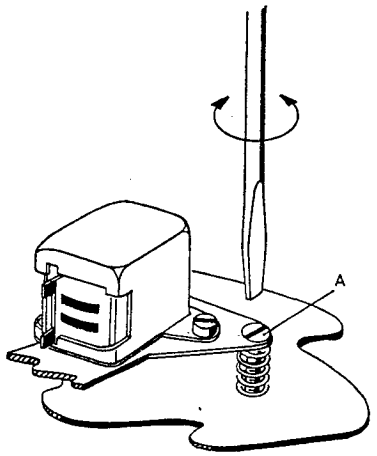

SD3817

Fig. 19

(*b*) *Azimuth adjustment* (See Fig. 19)

When the head has been set for correct height as above, the core gap must be adjusted perpendicularly using a FULL TAPE WIDTH azimuth test recording of 8kHz. A four-track recording made on another machine is NOT suitable. With head screening cover 71 in position, place the test tape in the machine and switch to 'Playback'. Connect an a.c. millivoltmeter to pins 3 (or 5) and 2 of Skt 1 and proceed as follows:

Track 1—adjust screw A for max. voltage and note the reading (Output 1).

Track 3—adjust screw A for max. voltage and note the reading (Output 11).

Track 1—without further adjustment note the reading (Output III).

If the difference between Outputs I and III is less than 2dB, the adjustment is in order; if not, proceed further:

Track 1—adjust screw A for max. voltage and note the reading (i.e. Output I).

Track 3—without further adjustment note the reading (Output IV).

If the difference between Outputs II and IV is less than 2dB, the adjustment is acceptable; if not, the head should be replaced and the height and azimuth setting repeated.

Finally, repeat the adjustment procedure given in para. 1(a) above to ensure that the tape does not foul the jaws of the head tape guide.

2. Playback amplifier

(*a*) *Adjusting d.c. bias of the output transistor pair*

With no signal input and volume control R445 turned to minimum adjust R448 so that the quiescent current through the output pair of transistors (T7/T8) is 5 - 7mA. This can be measured as a voltage of 6mV across either R578/R581 or R579/R582.

(*b*) *Sensitivity*

Replace loudspeaker L3 with an 8Ω 3W resistor and put the loudspeaker impedance switch S5 in the 8Ω position. Depress the Play key and apply a 1kHz signal at 30mV, via a 22kΩ resistor, to MP1 (for tracks 1-4) and MP2 (for tracks 2-3). Connect an a.c. millivoltmeter as indicated, for (i) and (ii) below.

(i) Loudspeaker output: with volume and tone controls fully clockwise, the voltage across the 8Ω resistor should be 470-800mV.
(ii) Line output: with volume and tone controls fully anti-clockwise, the voltage between tags 3 and 2 (5 and 2), Skt1 should be 45-80mV.

(*c*) *Frequency response*

(i) Loudspeaker output: connect an 8Ω resistor as given in para. 2(*b*) above and turn volume and tone controls fully clockwise. Apply a 1kHz signal, via a 22kΩ resistor, to MP1 and MP2 in turn (for tracks 1-4 and 2-3 respectively) at such a level that the voltage, measured with an a.c. millivoltmeter, across the 8Ω resistor is 244mV. When the frequency is varied (keeping the generator output constant), the voltages (±2dB) should be as given in the table below.

(ii) Line output: turn the volume control fully anti-clockwise and apply a 1kHz signal, via a 22kΩ resistor, to MP1 and MP2 in turn (for tracks 1-4 and 2-3 respectively) at such a level that the voltage, measured with an a.c. millivoltmeter, between tags 3 and 2 (5 and 2), Skt1 is 77.5mV. When the frequency is varied (keeping the generator output constant), the voltages (±2dB) should be as given in the table below.

Frequency (kHz)	L.S. Output (mV)	Line Output (mV)
0.125	975	387
1.0	244	77.5
6.3	153	52
12.5	136	47

3. Record amplifier

(*a*) *Sensitivity*

Set the track selector switch to '1-4' and depress the Record key only. Apply a 1kHz signal at 85mV direct to pin 3, Skt1, turn Radio/Phono record level control R444 to maximum and volume control R445 to minimum. The voltage measured with an a.c. millivoltmeter at MP1 should be 2.2-3.8mV. Repeat in track position '2-3', measuring the voltage at MP2.

(*b*) *Recording bias current*

The recording bias current should be 18mV, measured as a voltage, but may be set within the limits 10-25mV.
Switch to 'Record', set the track selector switch to '1-4' and adjust R441 so that a voltage of 18mV, measured with an a.c. millivoltmeter, is obtained at MP1. Similarly, in track position '2-3', the same reading should be obtained at MP2 by adjusting R442. Check the overall frequency response and if necessary make further adjustments to the bias current to obtain the response required. Reducing the bias current will increase the treble response; conversely, increasing the bias current will reduce the treble response. Should the value of bias current be below the lower limit specified, it will cause distortion at high modulation levels; if above the upper limit, it will result in poor treble response. If, after adjustment, the level of bias current is outside the range specified above, a defect in the record/playback head or in the amplifier circuitry should be suspected.

4. Modulation level indicator calibration

Set the track selector switch S2 to track '1-4' (or '2-3'), turn Radio/Phono record level control R444 to maximum and depress the Record key only. Apply a 1kHz signal to pin 3, Skt1, adjusting the level so that a voltage of 3mV, measured with an a.c. millivoltmeter, is present at MP1 (or MP2). The pointer of the modulation level indicator may be adjusted with R446 so that it registers on the division between the red and black sectors of the scale. Remove the input signal and switch to 'Record'; the meter pointer should be deflected up to a maximum of 1mm., due to bias current.

5. Overall frequency response

Depress the Record key only and apply a 1kHz signal, via a 22KΩ resistor, to pin 1, Skt1, so that the voltage at MP1 (MP2), measured with an a.c. millivoltmeter, is 0.3mV. Maintaining this voltage reading, switch to 'Record' and record some frequencies between 60Hz and 14kHz. When played back, the output voltages of the recorded frequencies, measured between pins 3 and 2 (5 and 2) Skt1, should not differ by more than 6dB.

6. Correction coil L2 (adjusted only on replacement)

Depress the Record key only and apply a 1kHz signal to pin 3, Skt1, so that a voltage of 0.775mV, measured with an a.c. millivoltmeter, is present at MP1, with the track selector switch S2 set to position '1-4'. Change the input signal frequency to 14kHz. The voltage at MP1 should now read 3.5mV; adjust correction coil L2 for this reading, then seal it with locking paint.

7. D.C. voltages

Switch to 'Record'

Stage	Collector	Base	Emitter
T1	1.35	0.62	—
T2	1.38	0.6	—
T3	1.82	0.62	0.16
T4	5.3	1.18	0.65
T5	7.6	0.8	0.65
T6	13.0	1.57	1.44
T7	—	13.0	13.1
T8	24.5	13.3	13.2
T10	10.8	0.1	0.78

Switch to 'Playback'

Stage	Collector	Base	Emitter
T1	1.36	0.62	—

T8	25	13.6	13.5
T10	—	—	—

8. Sensitivity checks

Set the track selector switch S2 to position '1-4'.

(*a*) Switch to 'Playback', apply a 1kHz signal at 30mV to MP1, via a 22kΩ resistor.

(*b*) Depress Record key only. Apply a 1kHz signal at 70mV to pin 1, Skt1, via a 1MΩ resistor.

Using an a.c. millivoltmeter, the following voltages (±2dB) should be obtained:

Stage	(a) Playback (mV)		(b) Record (mV)	
	Base	Collector	Base	Collector
T1	—	—	0.3	3.5
T2	0.34	4.5	—	—
T3	1.5	0.5	0.45	0.35
T4	0.5	20	0.35	96

T7	850	—	—	—
T8	830	60	—	—
T10	—	—	*7700	*6600
L.S.	690	—	—	—

* Switch to 'Record'

J—CLEANING AND LUBRICATION

1. Cleaning

(*a*) *Record/playback and erase heads, etc.*

The magnetic heads, tape guides and capstan should be cleaned at regular intervals if optimum performance is to be maintained. Remove cover 215, Fig. 2, for access to these parts, which can be cleaned with a soft cloth wrapped around a wooden stick and moistened with methylated spirits or industrial alcohol. Metal objects should not be allowed to come into contact with the magnetic head faces.

(*b*) *General*

After approximately 500 hours of service, it is advisable to clean the following parts with methylated spirits or industrial alcohol:

Magnetic head faces

Tape guides

Capstan and pressure roller

Drive belts

Grooves in flywheel and pulleys

All friction driven surfaces

Brake shoes and braking surfaces of turntables

Clean the inside of both turntables with a soft dry brush and if necessary clean or replace pressure felt 67.

2. Lubrication

All machines are fully lubricated during manufacture and further attention should normally be required only after a long period of service. If this is the case, or upon replacement of any mechanical component, lubrication may be applied SPARINGLY as indicated below. It is emphasised that excessive lubricant will hinder rather than help the operation of the instrument, particularly if grease or oil is accidentally deposited on any driving surface.

(*a*) Using a suitable motor bearing lubricant, lubricate the upper and lower bearings of the motor.

(*b*) Using a light oil, such as Shell Tellus 33, lubricate the following positions:

Turntable spindles

Pulley spindles

Pressure roller spindle

Upper and lower flywheel bearings

(*c*) Using a light grease, preferably containing graphite, lubricate the sliding surfaces of the various control strips, brackets and switch operating mechanisms.

(*d*) Using a light grease, such as Shell Alvania 2, lubricate the ball bearings 150 and brake bracket 116.

(*e*) A suitable lubricant, such as "Electrolube" No. 2A, should be applied to the sliders of switches S1, S2 and S3.

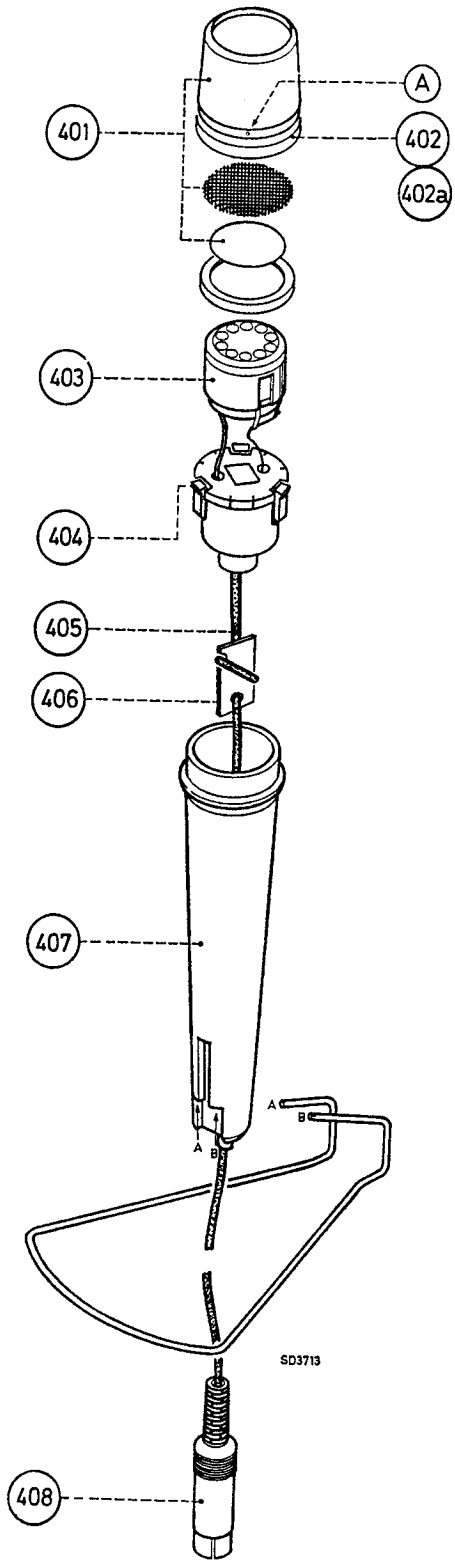

Fig. 20 Microphone — Type N8301/00

K — SPARE PARTS LIST

SUPPLY OF SPARE PARTS: To ensure correct interpretation of requirements please include the following information on orders for spare parts.

1. The full type number recorded on the type number plate, including any suffix. **Do not use any commercial abbreviation which may be misleading.**
2. Whenever possible, quote the serial number of the recorder. In some machines the components have been changed during production
3. **Always give a brief description** and colour where applicable.
4. Quote part number.

If it is necessary to return components, always include full identification on the accompanying advice note.

TAPE RECORDER

SERVICE INFORMATION FOR THE

PHILIPS

N4308/55

The N4308/55 is similar to the N4308, for which service information (CES 753) has been published, except for the following mechanical and electrical differences:

1. Belt drive system

The belt drive system is changed for greater efficiency. Drive wheel 141 is not now driven by belt 139 from motor pulley 134, instead a longer belt 139 couples pulley 124 to drive wheel 141, see diagram.

2. Electrical

On some models a voltage-dependent-resistor is connected across the output of the low-voltage secondary windings of the mains transformer; i.e. from the anode of X1 to the anode of X2.

Note: Due to the change in para. 1 above and the different motor pulley fitted, it is no longer possible to change from 50 to 60Hz operation and vice versa by fitting belt 118 in an alternative pulley groove. The motor and motor pulley should be changed for the required mains frequency operation.

SPARE PARTS LIST

SUPPLY OF SPARE PARTS: To ensure correct interpretation of requirements please include the following information on orders for spare parts.

1. The full type number recorded on the type number plate, including any suffix. **Do not use the commercial abbreviation which may be misleading.**
2. Whenever possible, quote the serial number of the recorder. In some recorders the components have been changed during production.
3. **Always give a brief description** and colour where applicable.
4. Quote part number.

If it is necessary to return components, always include full identification on the accompanying advice note.

PHILIPS
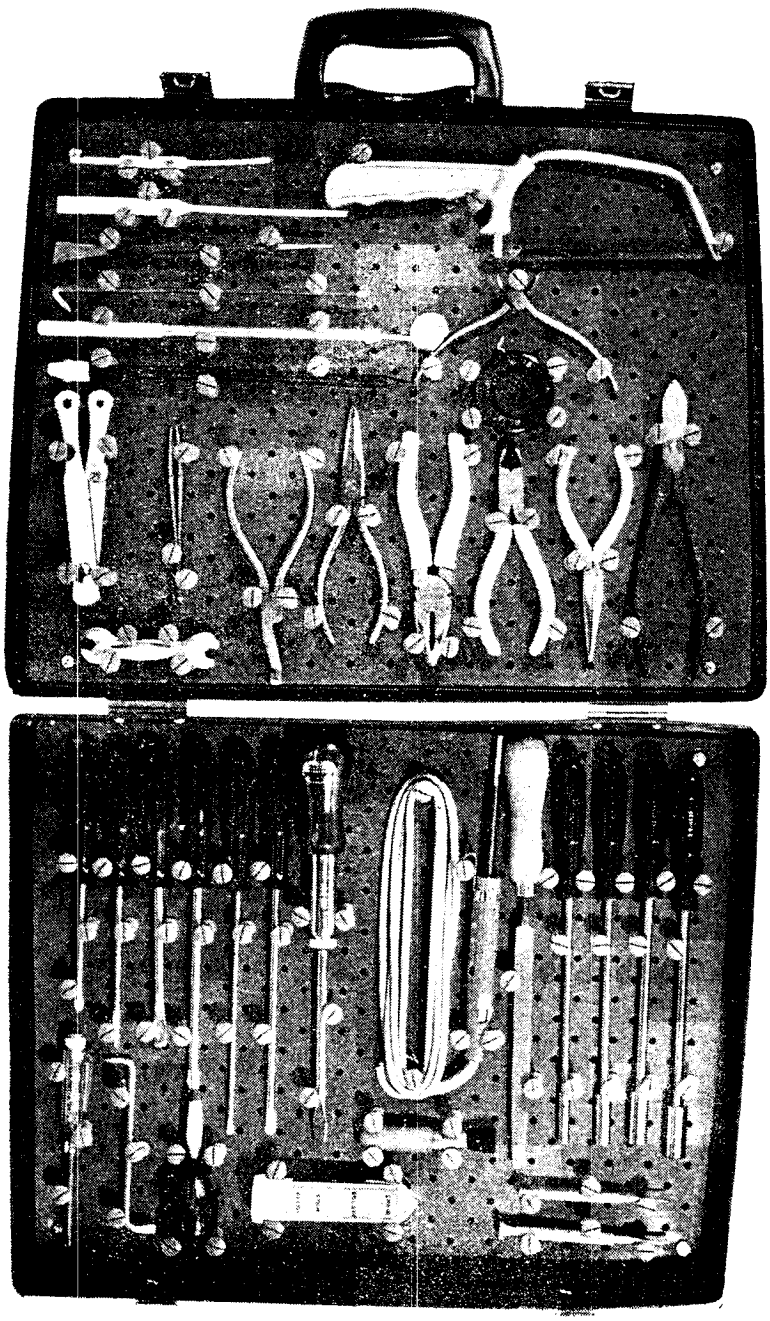
service aids

The Philips Universal Tool Case incorporates a special tool retention method which enables an extensive range of differing types of tools to be carried. The tools, which may be arranged in an almost infinite variety patterns, are held firmly for transit but can be easily extracted and replaced when required for use.

Provision is also made for the storage of manuals, Philips skin-packed components, etc. in a separate compartment.

case is available empty, enabling users' tools to be fitted, but an Electronic ool Set can also be supplied separately, required. This tool set, comprising 41 tools, is shown fitted into the case in the illustration.

ll details of these two products and all other Philips Service Aids will be forwarded, on request.



SPARE PARTS LIST

(For Cabinet and Mechanical spare parts, see overleaf)

ELECTRICAL ASSEMBLY

Mains voltage selector		272.10079
