

STEREO AMPLIFIER

SA-8500II

SERVICE MANUAL

 PIONEER

MODEL SA-8500II COMES IN FOUR VERSIONS DISTINGUISHED AS FOLLOWS:

Type	Voltage	Remarks
KU	120V only	UL (U.S.A.) approved
KC	120V only	CSA (Canada) approved
HG	220V and 240V (Switchable)	SEMKO (Sweden), NEMKO (Norway), DEMKO (Denmark) and EI (Finland) approved
S	110V, 120V, 220V and 240V (Switchable)	General export model

This service manual is applicable to the KU-type. When repairing the KC-type, HG-type or S-type, please see the additional service manual.

2. CONNECTION DIAGRAM

3. FRONT PANEL FACILITIES

BASS TURN OVER SWITCH

Selects the frequency below which the BASS control tone adjustments apply. Set switch to 100Hz, 200Hz or 400Hz according to listening room and speaker system characteristics or personal preference.

TONE SWITCH

In the ON position, tone adjustments can be performed with the BASS and TREBLE controls. When set to the upper (OFF) position, the tone control circuits are disengaged and frequency response is flat. This function is convenient for checking phono cartridge and speaker tone quality and listening room acoustics.

POWER SWITCH

Set to ON position to energize SA-8500II. After setting to ON, there is a brief delay before sound is obtained. This is due to the operation of the muting circuit which prevents noise when the POWER is switched. This function does not indicate difficulty and normal operating condition is attained in a few seconds. The POWER switch also controls the rear panel SWITCHED convenience outlets.

PHONES JACK

When listening with stereo headphones, connect them to this jack.

NOTE:

Set **SPEAKERS** switch to OFF when listening only with headphones.

SPEAKERS SWITCH

Selects speaker system operation.

- OFF: Sound not obtained from speakers (when using headphones).
- A: Sound obtained from speakers connected to A speaker terminals.
- B: Sound obtained from speakers connected to B speakers terminals.
- A + B: Sound obtained from speakers connected to both A and B speaker terminals.

NOTE:

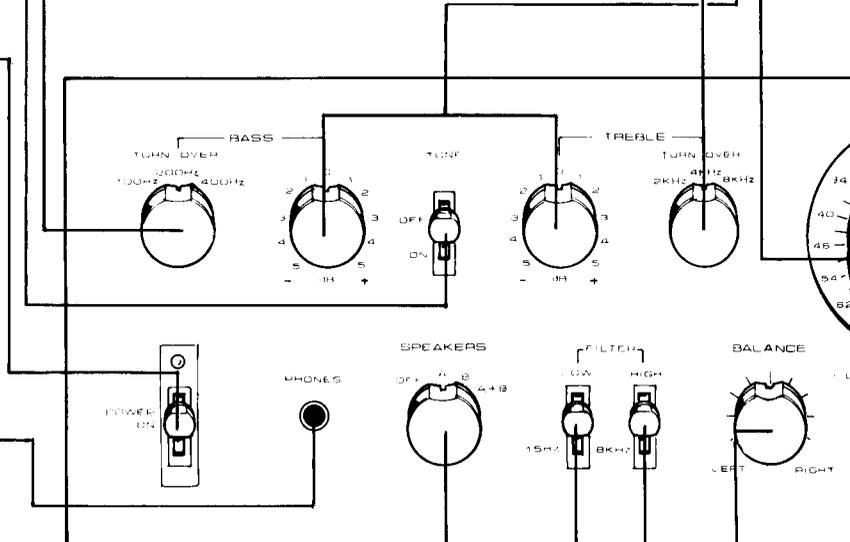

When listening with headphones or to temporarily interrupt the speaker sound, set switch to OFF or to an unused speaker position.

BASS AND TREBLE CONTROLS

Controls for adjusting low and high frequency tones. With the TONE switch set to ON, turning the BASS control clockwise from center enhances the frequency band below the point selected by the BASS TURN OVER switch, while counter-clockwise rotation attenuates this band. In a similar manner, the TREBLE control adjusts the frequency range above the point selected by the TREBLE TURN OVER switch.

TREBLE TURN OVER SWITCH

Selects the frequency above which the TREBLE control tone adjustments apply. Set to 2kHz, 4kHz or 8kHz according to listening room and speaker system characteristics or personal preference.

LOW FILTER SWITCH

Set to 15Hz position in the event that turntable rumble, recording cutting noise or other low frequency noise becomes objectionable. Attenuation in the frequency band below 15Hz is 6dB/octave.

HIGH FILTER SWITCH

Set to 8kHz position if record scratch noise or other high frequency noise becomes objectionable. Attenuation in the frequency band above 8kHz is 6dB/octave.

BALANCE CONTROL

Control for adjusting stereo balance between left and right speaker systems or headphones. Turn clockwise from center to increase right (R) channel volume and counter-clockwise from center to increase left (L) channel volume in order to obtain a balance.

VOLUME

Adjusts volume level. Turn clockwise to increase volume and counter-clockwise to decrease volume.

CART

Switch for selecting the cartridge.

MUTE

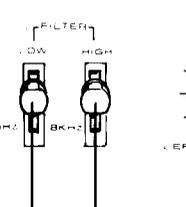

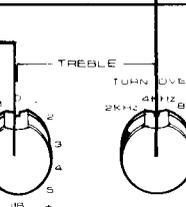

Switch for muting the audio signal.

LOW

When listening with headphones, turn clockwise to increase volume and counter-clockwise to decrease volume.

ne and counter-
channel volume

VOLUME CONTROL

Adjusts speaker and headphone volume. Scale indicates attenuation in dB with maximum volume assigned an arbitrary value of 0dB. Control can also be used in combination with the MUTING switch to provide a finer and wider range of adjustment.

CARTRIDGE LOAD SWITCH

Switch for selecting phono circuit input capacitance to match the load capacitance of the employed cartridge.

PIONEER STEREO AMPLIFIER SA-8500II

MUTING SWITCH

Switch for reducing volume by 20dB from the VOLUME control setting. Convenient for temporarily reducing the volume when changing records of tapes, since it eliminates the need for continually readjusting the VOLUME control.

LOUDNESS SWITCH

When listening at low volume settings, set switch to ON to enhance low and high frequencies. The response of the human ear to sound differs according to loudness. This switch compensates for this effect at low volumes.

FUNCTION SWITCH

Selects desired playback program source.

- PHONO 2: To play records on a turntable connected to the PHONO 2 jacks.
- PHONO 1: To play records on a turntable connected to the PHONO 1 jacks.
- TUNER: To listen to broadcasts with a tuner connected to the TUNER jacks.
- AUX: To play a component connected to the AUX jacks.

TAPE MONITOR SWITCH

Employ for tape playback or to monitor a recording in progress.

- 1: Playback or monitoring of a tape deck connected to the TAPE 1 jacks.
- SOURCE: Be sure to set to this position when not using the tape deck for playback.
- 2: Playback or monitoring of a tape deck connected to the TAPE 2 jacks.

NOTE:

When listening to records or broadcasts, be sure to set this switch to SOURCE. Sound will not be obtained from speakers if set to 1 or 2.

TAPE DUPLICATE SWITCH

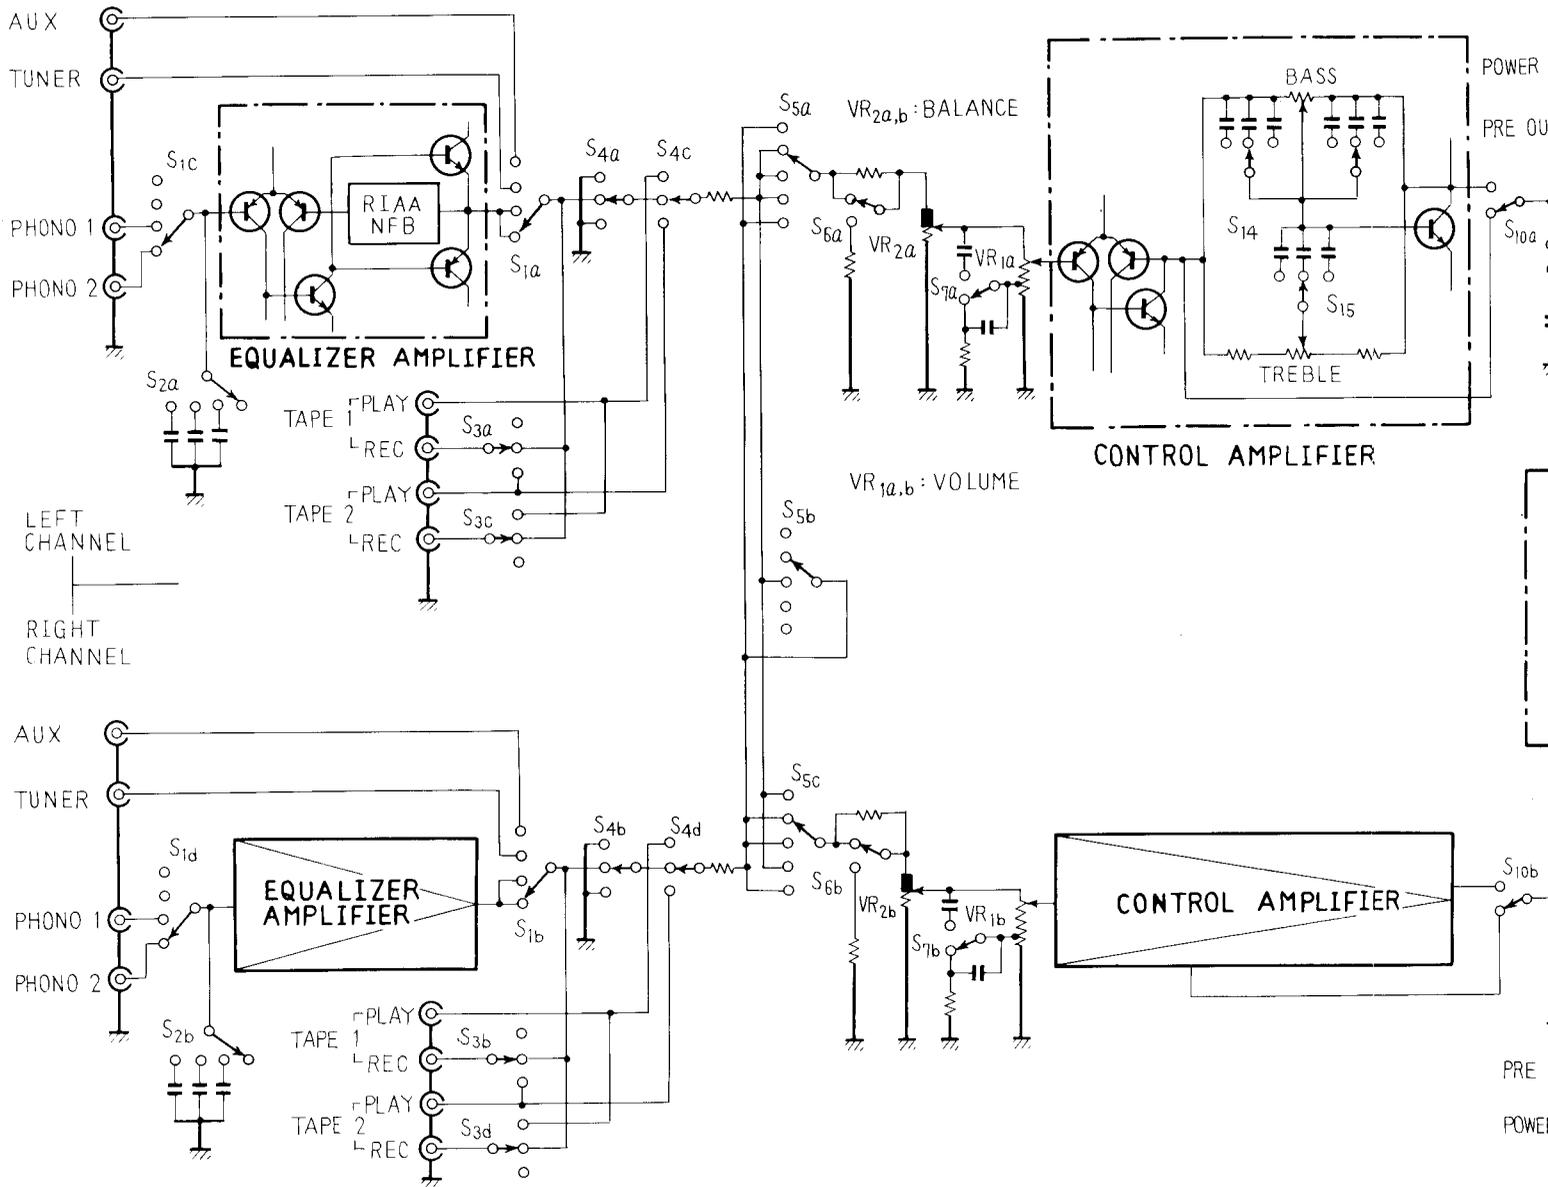

Employ when using two tape decks for duplication or editing. Be sure to set to the OFF position at other times.

- 1 → 2: Duplication of tape from TAPE 1 (playback mode) to TAPE 2 (recording mode).
- OFF: Set to this position when not using the duplication feature (this includes simultaneous recording with two tape decks and tape playback).
- 2 → 1: Duplication of tape from TAPE 2 (playback mode) to TAPE 1 (recording mode).

MODE SWITCH

- REV: Reverses left and right channel stereo signals and reproduces them stereophonically.
- STEREO: Set to this position for normal stereo reproduction.
- L + R: Mixes left and right channel signals and reproduces them monophonically.
- L: Left channel signal is reproduced monophonically from both speakers.
- R: Right channel signal is reproduced monophonically from both speakers.

5. CIRCUIT DESCRIPTIONS

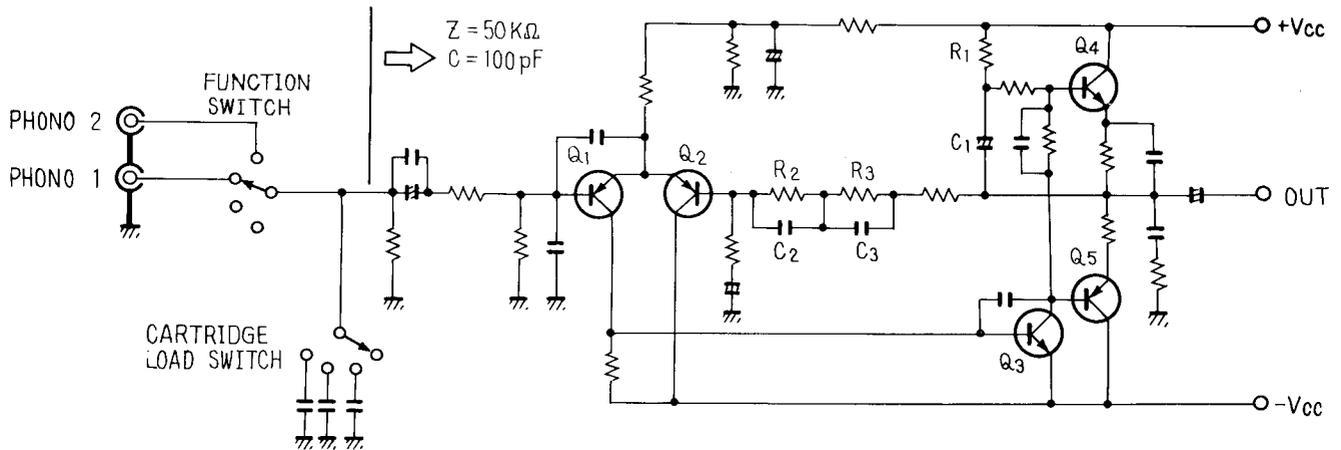

Fig. 1. Schematic diagram of equalizer amplifier

5.1 EQUALIZER AMPLIFIER

The circuit diagram for the equalizer amplifier is shown in Fig. 1. The two separate phono inputs are selected by the FUNCTION selector on the front panel. The input capacitance on the PHONO terminals can be adjusted to 4 different levels (100pF, 200pF, 300pF, and 400pF) by means of the CARTRIDGE LOAD control knob which switches in, or out, additional capacitors in parallel with the input terminal. Hence, the load capacitance of the phono cartridges can be changed, greatly effecting the cartridge's frequency response in the high frequency range, and thus providing considerable variation in its characteristics.

The first stage of the equalizer amplifier (Q_1 & Q_2) is a differential amplifier using PNP transistors. The next stage (Q_3) is a bootstrap circuit employing C_1 , R_1 to provide high voltage gain. The output stage (Q_4 & Q_5) is a complementary-symmetrical SEPP circuit, whose high voltage utility factor results in a high output voltage. This gives the equalizer amplifier a very wide dynamic range, and an overload input level of 250mV (RMS at 1kHz) with no more than 0.05% distortion.

The equalizer elements (C_2 , C_3 , R_2 and R_3) consist of polypropylene film capacitors (tolerance $\pm 2\%$), and metal film resistors (tolerance $\pm 1\%$). Phono equalizer RIAA deviation has been reduced to less than $\pm 0.2\text{dB}$ (20Hz ~ 20kHz).

5.2 TONE CONTROLS

Incoming signals are amplified to the required level by the 2 stage amplifier which uses a differential amplifier at first stage. The tone control circuit is a collector-base negative feedback circuit (NFB) and features 3 turnover frequencies for both bass and treble.

The basic principles of the NFB type tone control circuit are outlined in Fig. 2.

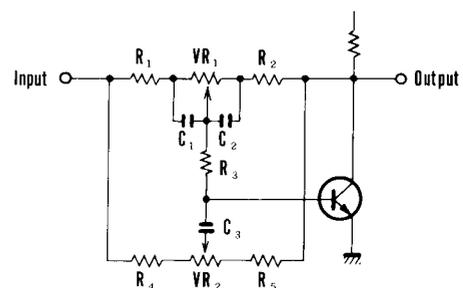

Fig. 2. Basic circuitry of NFB type tone control circuit

Midrange Operation

The C_1 and C_2 reactances are considerably smaller than VR_1 at frequencies above midrange, effectively shorting VR_1 . At frequencies below midrange, C_3 reactance becomes large and in effect, opens the circuit. Consequently, the circuit becomes equivalent to that shown in Fig. 3 with respect to the midrange. In this figure, the circuit parameters are not changed by any change in position of the VR_1 and VR_2 sliders. The NFB amount is therefore fixed and the circuit gain is also fixed without regard to VR_1 and VR_2 slider positions.

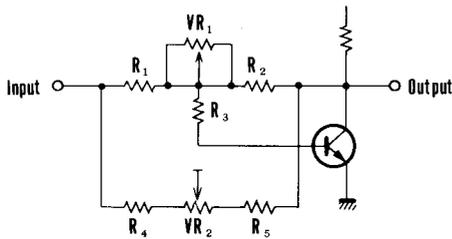

Fig. 3. Midrange operation of NFB type tone control circuit

Low Frequency Operation

The reactance of C_1 and C_2 increases at low frequency to form a circuit as shown in Fig. 4. This reactance increases in proportion to the frequency declines. Also, the NFB amount varies greatly according to VR_1 slider position. The circuit gain at low frequencies can therefore be varied by VR_1 . Capacitance of C_1 and C_2 is changed by BASS TURNOVER switch (by adding a capacitor to each in parallel). This allows selection of the frequency at which VR_1 begins to take effect.

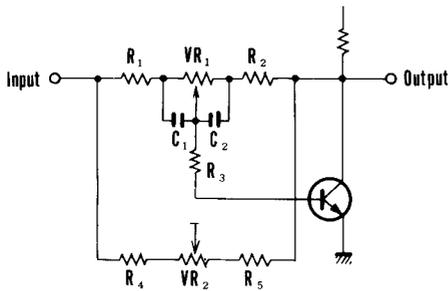

Fig. 4. Low frequency operation of NFB type tone control circuit

High Frequency Operation

The considerably smaller reactance of C_1 and C_2 at high frequency in comparison with VR_1 effectively shorts VR_1 to form an equivalent circuit such as

that shown in Fig. 5. C_3 reactance decreases in the same degree that the frequency increases and the NFB amount is now mainly controlled by the VR_2 slider position. Consequently, the gain at high frequencies can be varied by VR_2 .

C_3 capacitance is changed by TREBLE TURN-OVER switch (by adding another capacitor in series) to provide selection of the frequency at which VR_2 begins to take effect.

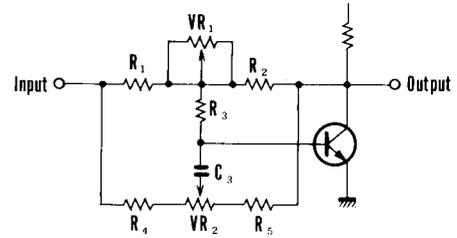

Fig. 5. High frequency operation of NFB type tone control circuit

5.3 POWER AMPLIFIER

The circuit diagram for the power amplifier section is shown in Fig. 6.

The input stage (Q_1) constitutes a differential amplifier, employing a dual transistor (a 2-in-1 transistor "package" possessing the functions of 2 separate transistors). The second stage (Q_2, Q_3) is also a differential amplifier, but with the inclusion of a current mirror (D_1, Q_4). Since the Q_4 base-emitter junction corresponds to a diode, the potential on the anode of D_1 and the emitter of Q_4 will be the same. Consequently, the potential drops across R_1 and R_2 will also be equal. So if the resistance of these 2 resistors is the same, the same current will flow through both sections. And if the h_{FE} of the transistor is sufficiently large, the base current can be neglected. That is, the Q_2 collector current and the Q_4 collector current will be the same. Since Q_2 and Q_3 operate out of phase with each other, Q_3 and Q_4 will operate as a push-pull amplifier. The bias voltage for the power stage is supplied by the potential difference produced across $VR_1 - D_3 - D_2$, where VR_1 is the variable resistor used to set this potential difference. D_2 is a varistor which compensates for thermal differences. The power stage ($Q_5 - Q_{10}$) includes a 2-stage Darlington connection, with the final stage ($Q_7 - Q_{10}$) forming two complementary symmetrical parallel circuits. The output mid-point is maintained at 0V by a balanced plus and minus power supply and a 100% DC NFB circuit.

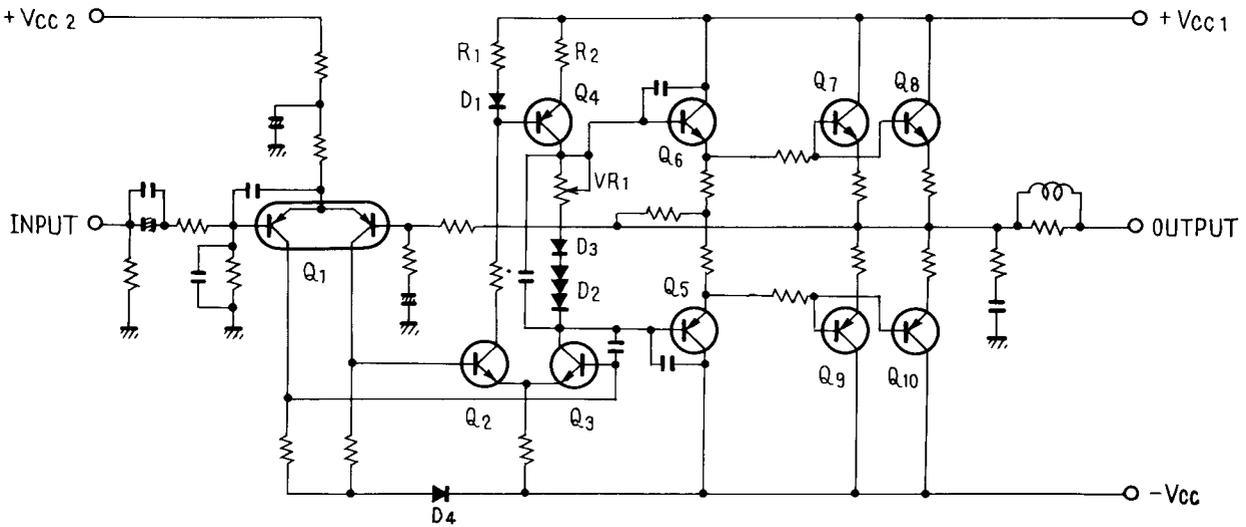

Fig. 6. Schematic diagram of power amplifier

5.4 PROTECTION CIRCUIT

This circuit protects the power transistors in case of overload, the speakers in case of power amplifier malfunction, and also performs a muting function when the power supply is turned ON or OFF. The protection circuit is composed of three sections (Fig. 7).

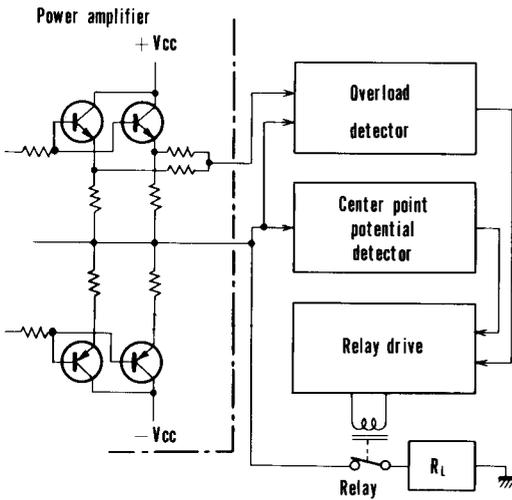

Fig. 7. Block diagram of protection circuit

1. Relay Driver Circuit (Fig. 8)

The relay which connects the output circuits is driven by this circuit. It also performs a muting function to prevent unpleasant noise during ON-OFF operation of the power supply as well as opening the output circuit on command from the detector circuits.

Muting Operation

When the power supply is turned ON, Q₆ base is reverse biased, through D₆ and R₂₀, turning Q₆ OFF. Q₇ base potential rises as C₄ charges through R₂₂ & R₂₃, and Q₇ turns ON several seconds later. The collector current of Q₇ then flows through the relay coil, operating the relay to turn on the power amplifier output circuit. The reverse bias of Q₆ base from D₆ & R₂₀ disappears when the power supply is set from ON to OFF. Q₆ remains ON however, due to the residual power supply voltage. C₄ very rapidly discharges, Q₇ base potential drops and Q₇ turns OFF. The relay releases and the power amplifier output circuit turns OFF.

Note:

Q₅ is normally OFF due to base bias and does not participate in the muting operation.

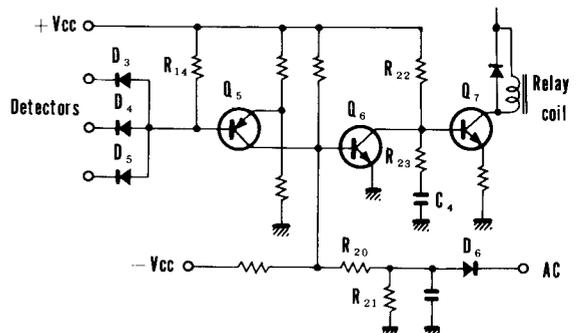

Fig. 8. Schematic diagram of relay driver circuit

Operation by Detector Circuit Command

Command from the detector circuits pass through one of D_3 , D_4 or D_5 and are applied in the form of a current flow. Q_5 is normally reverse biased through R_{14} , but when a large current flows through on of these diodes, Q_5 base potential declines according to the voltage drop at R_{14} . Q_5 then becomes ON, Q_6 base potential rises and Q_6 becomes ON. C_4 rapidly discharges and Q_7 base potential drops, turning Q_7 OFF. The relay releases and the power amplifier output circuit becomes cut off.

2. Overload Detector Circuit

Shorting of the power amplifier load or a load impedance below the specified value causes a command to be sent to the relay drive circuit. This is illustrated in Fig. 9.

Q_a emitter is connected to Q_1 base through R_1 and the junction point to Q_1 emitter. When R_L is extremely small, large current flows in Q_a , Q_1 turns ON due to the RE_1 voltage drop, and current flows in D_3 . C_1 prevents faulty operation due to external noise.

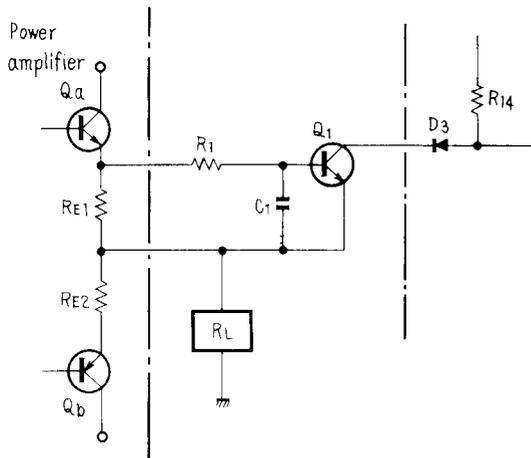

Fig. 9. Basic circuitry of overload detector

3. Center Point Potential Detector Circuit

If a DC potential is produced at the junction point of the power amplifier, a command is sent to the relay drive circuit. Fig. 10 shows this operating principle.

Q_3 and Q_4 compose a differential amplifier. When the same input is applied to both input terminals (Q_3 and Q_4 bases), no output is present. However, if there is a difference between the terminal inputs, the difference is amplified and becomes the output between the two collectors. During normal operation, an AC signal only is present at the junction

point. As C_2 reactance is sufficiently low, the signal is not applied to Q_3 , resulting in an absence of output at the collector sides.

When a DC potential is produced at the junction point, it becomes the input of Q_3 only. If the voltage is negative, Q_3 collector current declines. And at Q_4 the collector current increases and the potential drops, causing current to flow through D_4 .

If the DC voltage is positive, Q_3 collector current increases and the potential drops, while at Q_4 the collector current decreases and the potential rises. Current therefore flows through D_5 .

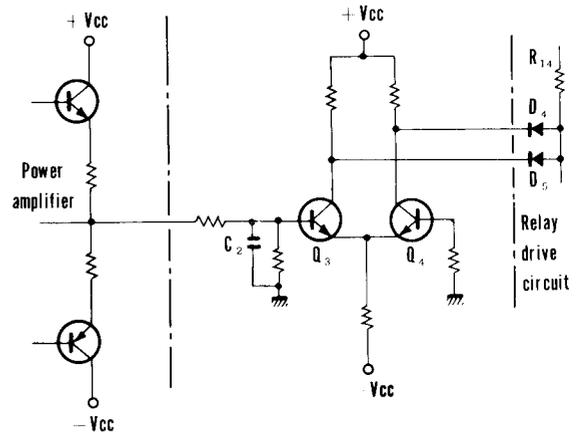

Fig. 10. Basic circuitry of center point potential detector

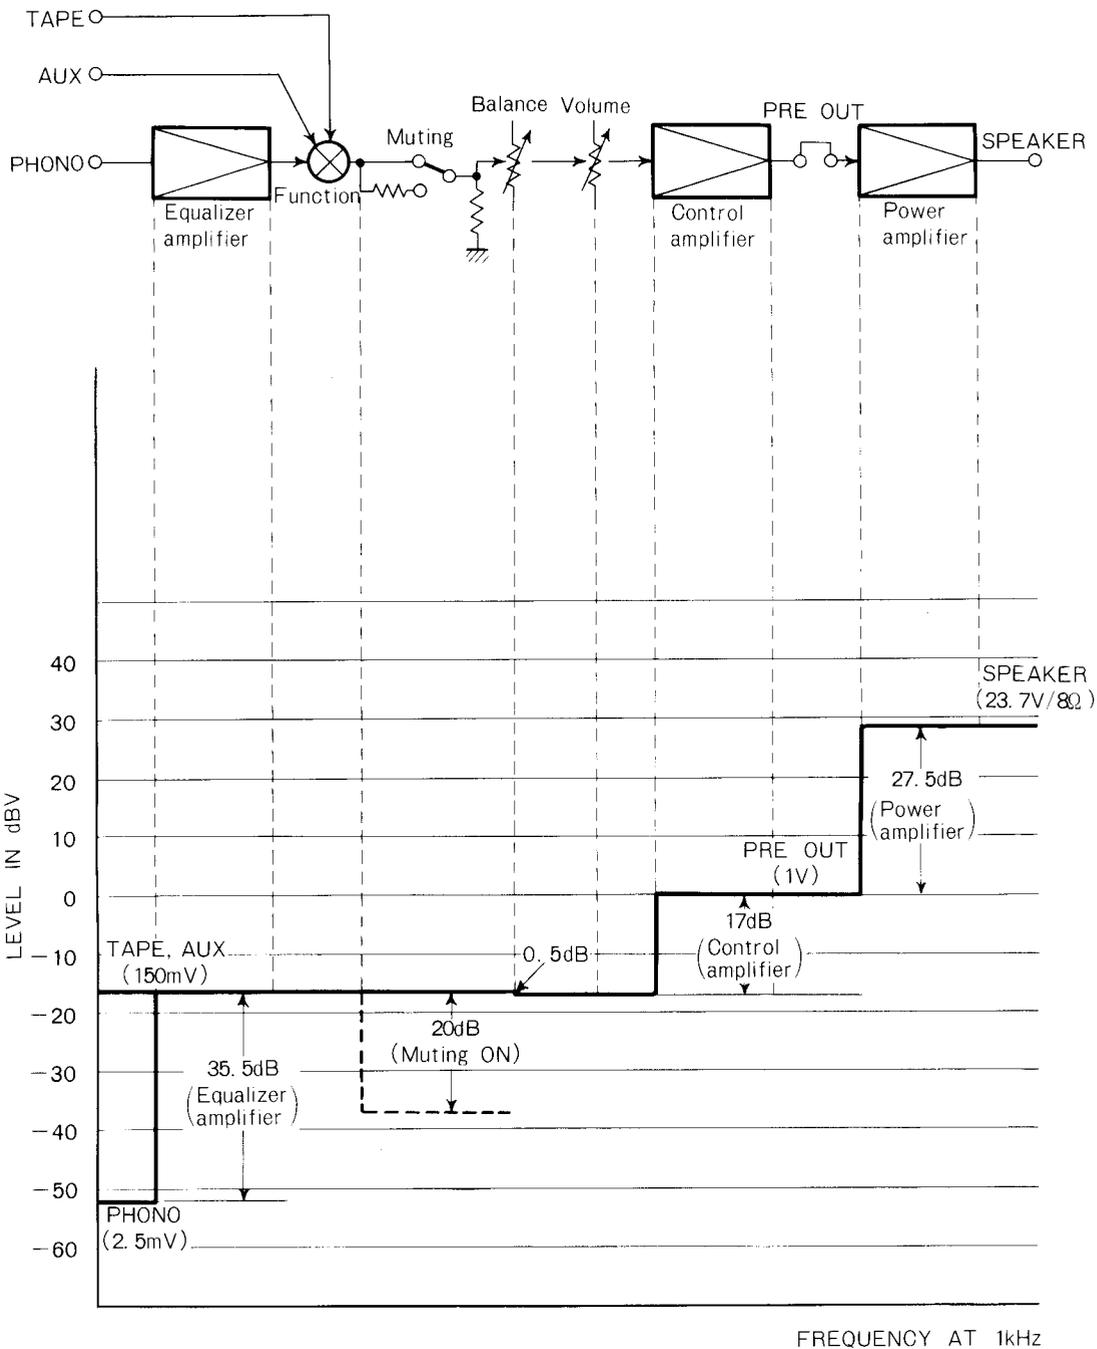

5.5 POWER SUPPLY CIRCUIT

The power stage provides voltage independently to both left and right channels, using 2 separate power transformers. Separate bridge rectifiers (one for each channel) and $10,000\mu F$ ($\times 2$) capacitors provide the plus and minus voltages. Positive voltage for other sections is provided by full-wave rectification from the same winding on the power transformer that is used for the left channel, and a negative voltage from the corresponding winding of the right channel transformer. Both are supplied via voltage regulator circuits.

Note:

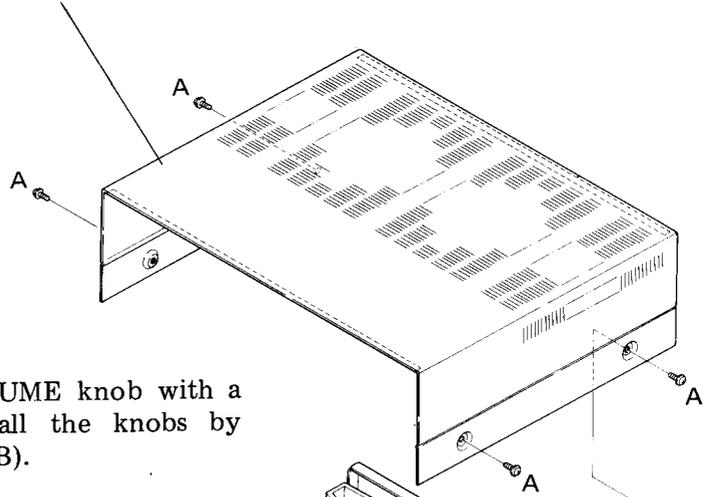

There is only one pair of secondary windings in each the left and right channel power transformers.

9. ADJUSTMENT

The SA-8500 II amplifier employs the same type of power amplifier assembly in both left and right channels. Any adjustment will thus have to be identical in both channels, and is limited to adjustments of the idler current.

1. Disconnect the jumper plugs, and terminate the POWER IN terminals with $5.1k\Omega$ resistors.
2. Connect 8Ω resistors to the SPEAKERS A terminals, and set the SPEAKERS switch to A.
3. Turn VR_1 in a fully counter-clockwise.
4. Turn the POWER switch ON, and then readjust VR_1 so that the voltage between terminals No. 3 (+) and No. 9 (-) reads $30mV$.
5. Now check that the voltage between terminals No. 6 (+) and No. 12 (-) reads $30mV \pm 10mV$ (in order to check the current distribution, since the final stages are in parallel).
6. Leave the amplifier ON for about 30 minutes, then repeat steps 4 and 5.
7. Finally, apply an actual signal, and check for no crossover distortion.

11. SCHEMATIC DIAGRAMS, P. C. BOARD PATTERNS AND PARTS LIST

11.1 MISCELLANEA

Miscellaneous Parts

SEMICONDUCTORS

Symbol	Description	Part No.
Q1	Transistor	2SD587A/A/-R or Q
Q2	Transistor	2SD587A/A/-R or Q
Q3	Transistor	2SB617A/A/-R or Q
Q4	Transistor	2SB617A/A/-R or Q
Q5	Transistor	2SD587A/A/-R or Q
Q6	Transistor	2SD587A/A/-R or Q
Q7	Transistor	2SB617A/A/-R or Q
Q8	Transistor	2SB617A/A/-R or Q

LAMP, FUSES

Symbol	Description	Part No.
PL1	Lamp with leads 8V, 50mA	AEL-081
FU1	Fuse 3A	AEK-101
FU2	Fuse 3A	AEK-101

SWITCH

Symbol	Description	Part No.
S13	Lever switch (POWER)	ASK-124

TRANSFORMERS

Symbol	Description	Part No.
T1	Power transformer (L)	ATT-366
T2	Power transformer (R)	ATT-367

RESISTOR

Symbol	Description	Part No.
VR1	Variable resistor 100k 32-step (VOLUME)	ACV-171

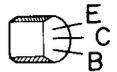

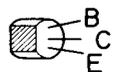

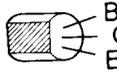

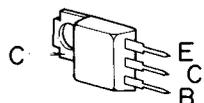

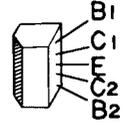

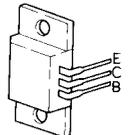

NOTE:

- Capacitors: in μF unless otherwise noted p:pF
- Resistors: in Ω , $\frac{1}{4}W$ unless otherwise noted k:k Ω , M:M Ω

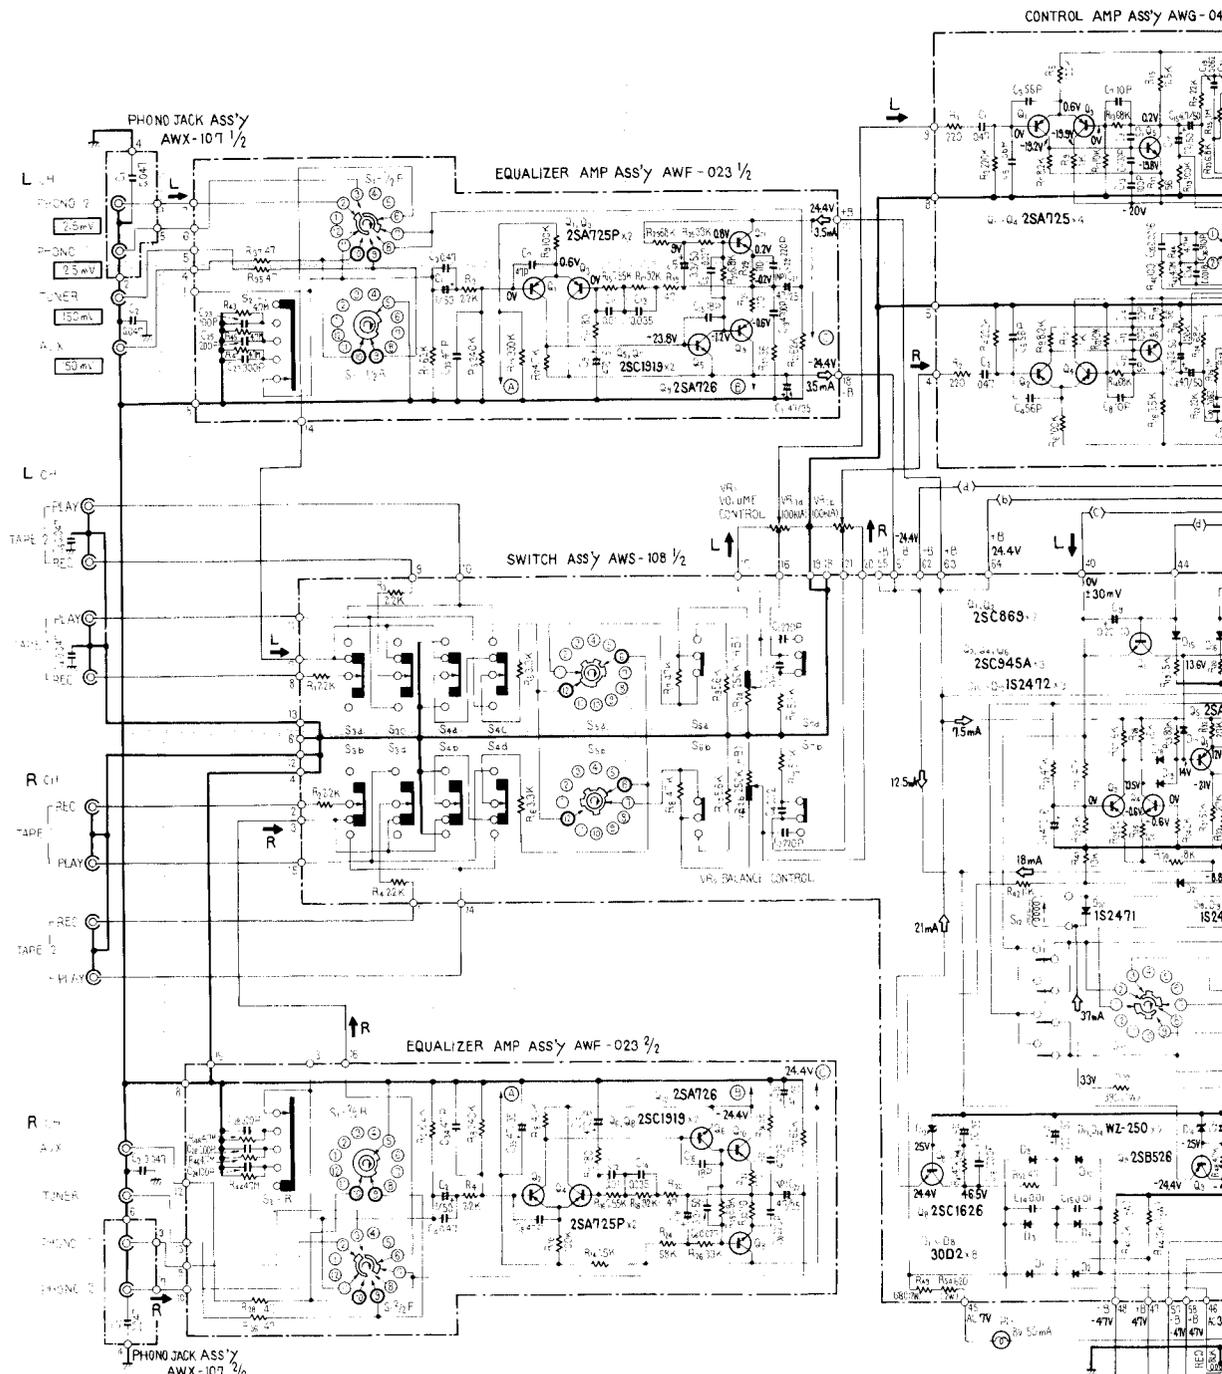

CAPACITORS

Symbol	Description	Part No.
C2	Ceramic 0.047 50V	CKDYF 473Z 50
C3	Ceramic 0.047 50V	CKDYF 473Z 50
C4	Ceramic 0.047 50V	CKDYF 473Z 50
C5	Ceramic 0.047 50V	CKDYF 473Z 50
C6	Ceramic 0.047 50V	CKDYF 473Z 50
C7	Electrolytic 10,000 50V	ACH-064
C8	Electrolytic 10,000 50V	ACH-064
C9	Electrolytic 10,000 50V	ACH-064
C10	Electrolytic 10,000 50V	ACH-064
C11	Ceramic 0.01 250V	ACG-001
