STEREO CASSETTE DECK

SPECIFICATIONS

Recording System: 4-track 2-channel stereo

Fast-forward and
Rewind Time: Approx. 80 sec. (with C-60 cassette)

Bias Frequency: 105 kHz

Signal-to-noise Ratio:

AEP, E model:

DOLBY NR OFF

- With TYPE IV cassette (Sony METALLIC)
60 dB at peak level (NAB)
58 dB (DIN)
- With TYPE III cassette (Sony FeCr)
60 dB at peak level (NAB)
58 dB (DIN)
- With TYPE II cassette (Sony CD- α)
58 dB at peak level (NAB)
- With TYPE I cassette (Sony BHF)
56 dB at peak level (NAB)

DOLBY NR ON

Improved by 5 dB at 1 kHz,
10 dB above 5 kHz

US, Canadian model:

DOLBY NR OFF

- With TYPE IV cassette (Sony METALLIC)
60 dB at peak level
- With TYPE III cassette (Sony FeCr)
60 dB at peak level
- With TYPE II cassette (Sony EHF)
58 dB at peak level
- With TYPE I cassette (Sony HFX)
56 dB at peak level

DOLBY NR ON

Improved by 5 dB at 1 kHz,
10 dB above 5 kHz

Handling Precautions for MOS ICs

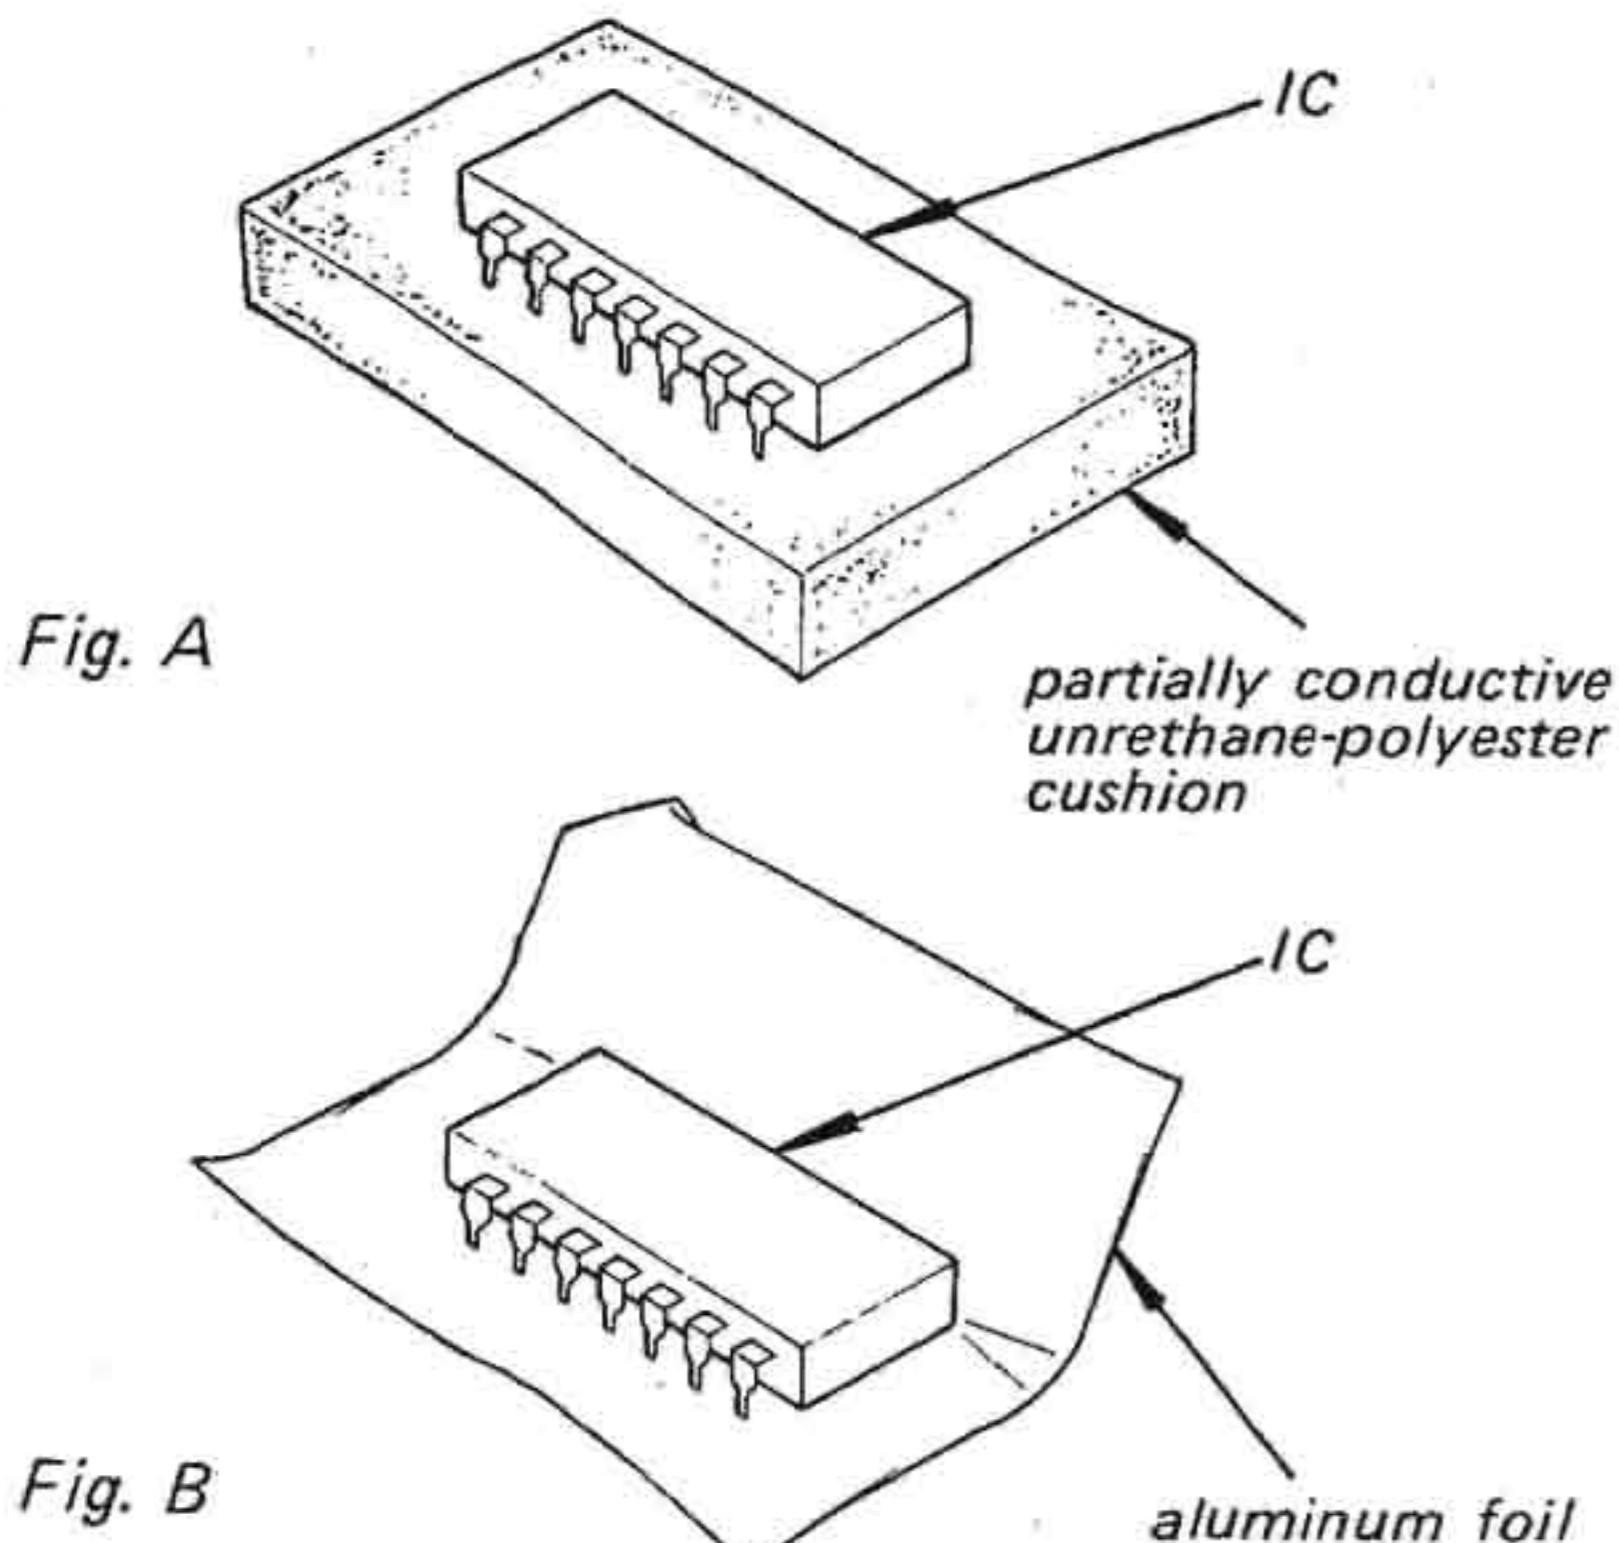

Generally, the insulation resistance of the oxide layer in MOS IC structures is very high, and the oxide layer is very thin. Because of this, it is possible that the static voltages usually present on clothes and the human body will be enough to generate a potential difference across the insulator, high enough to cause a breakdown of the insulating layer.

The following precautions should be taken while handling these ICs.

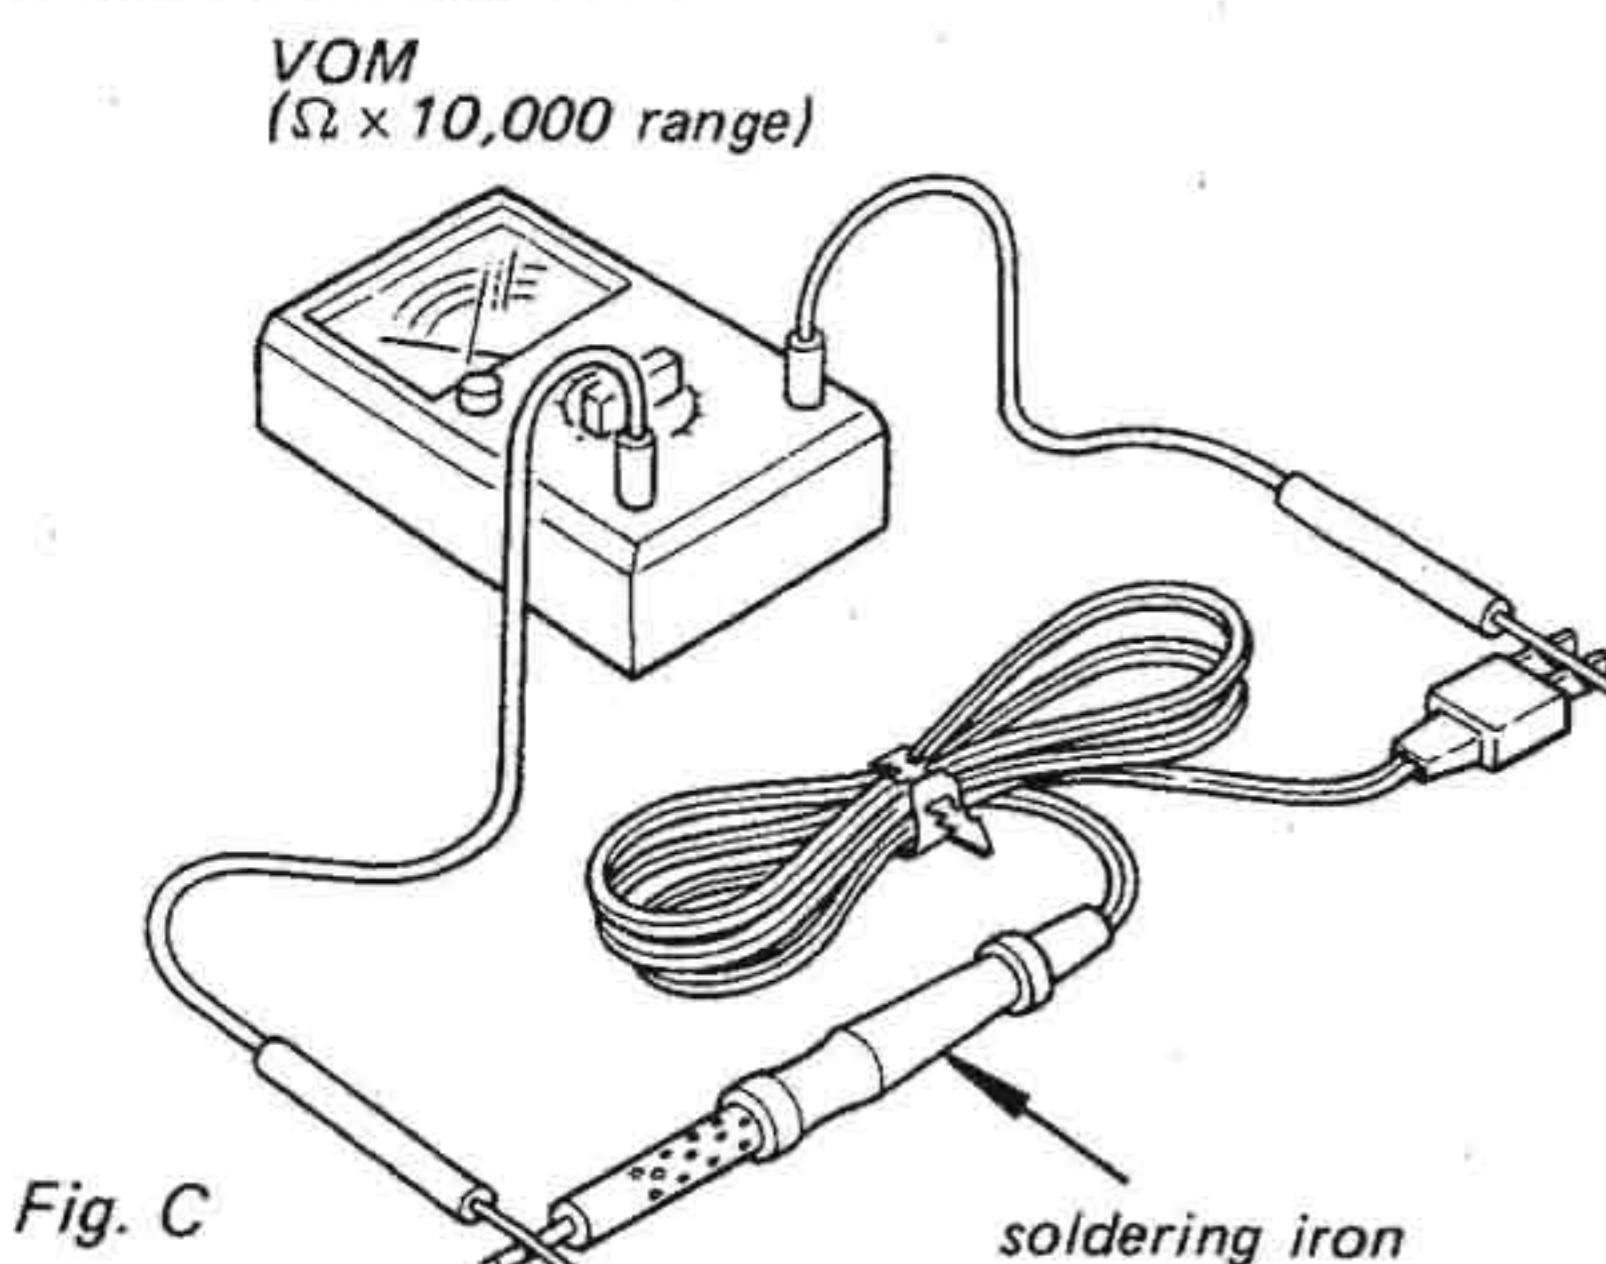

(Particular care should be taken under conditions of low humidity.)

Precautions in Replacing MOS ICs

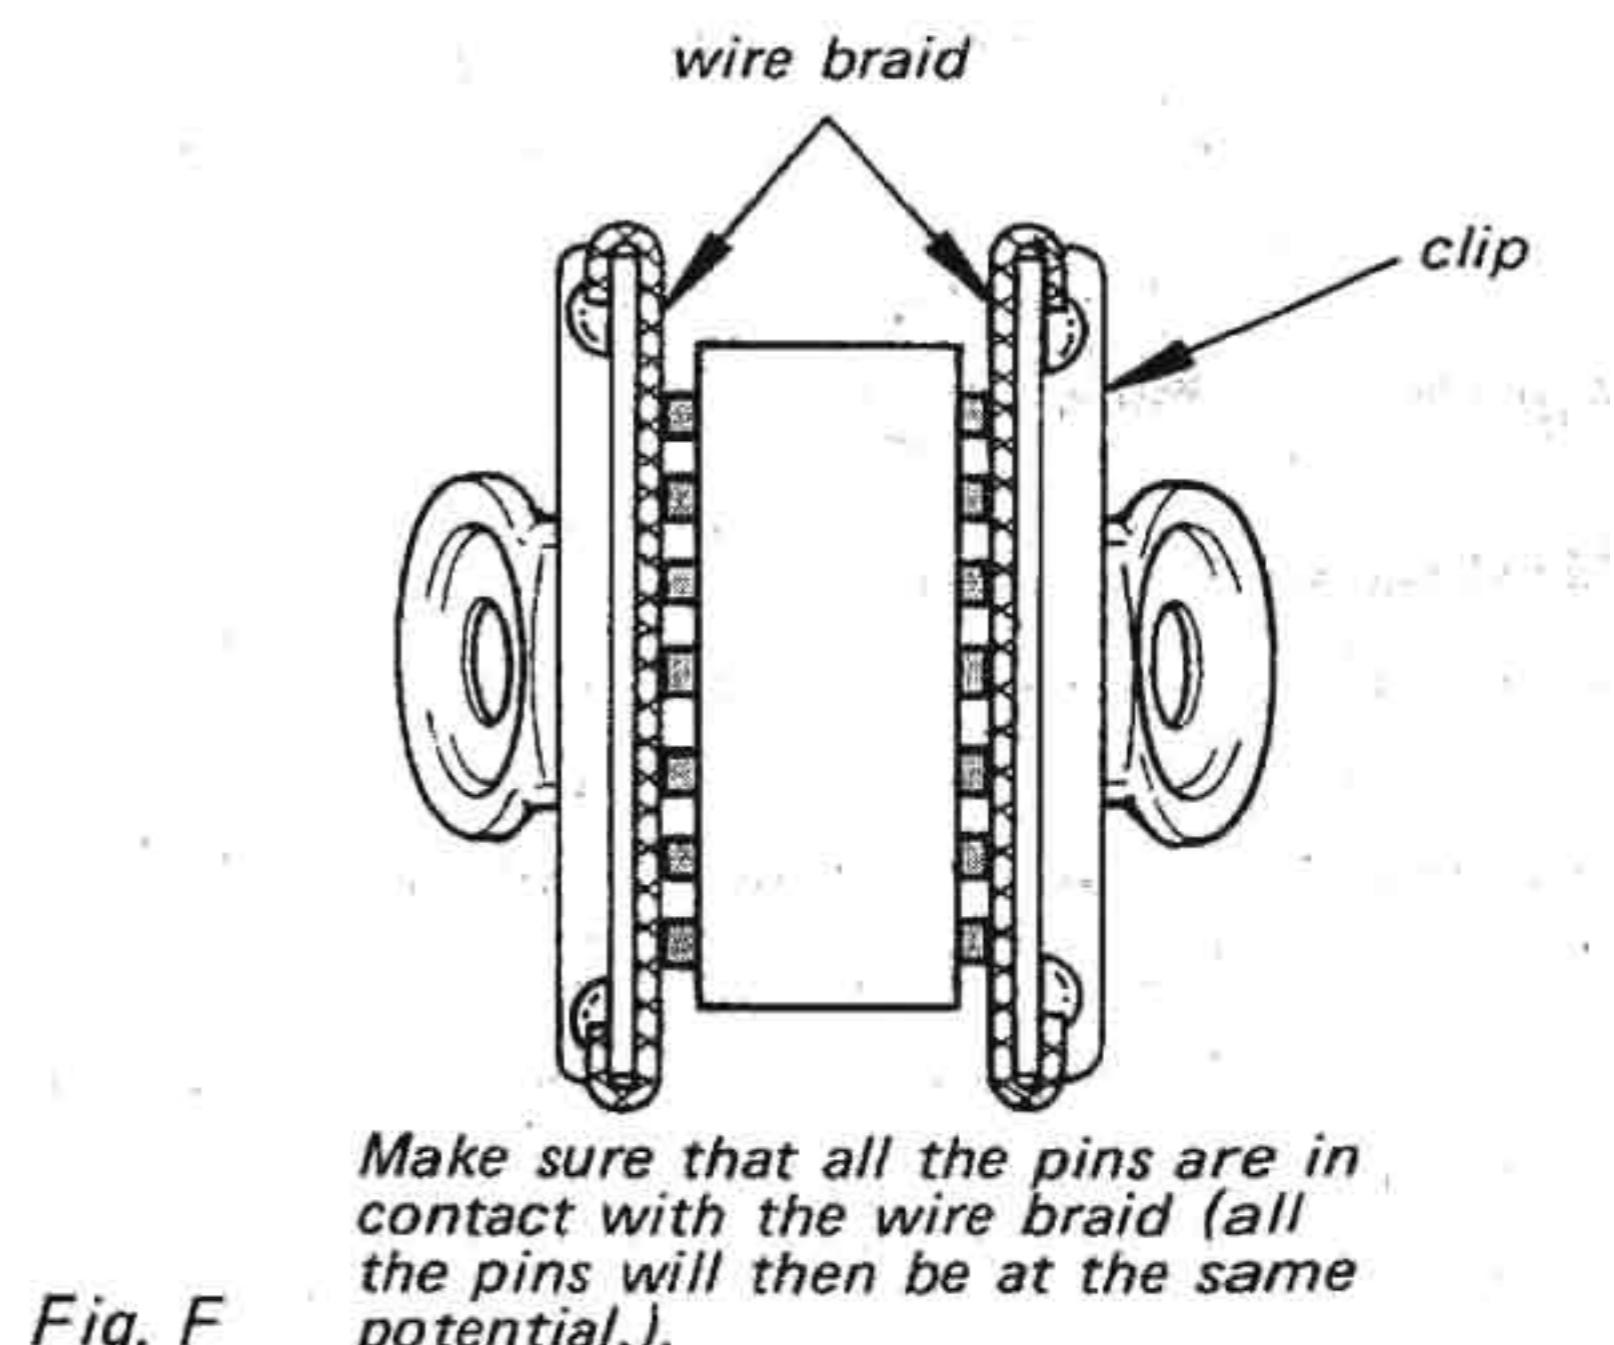

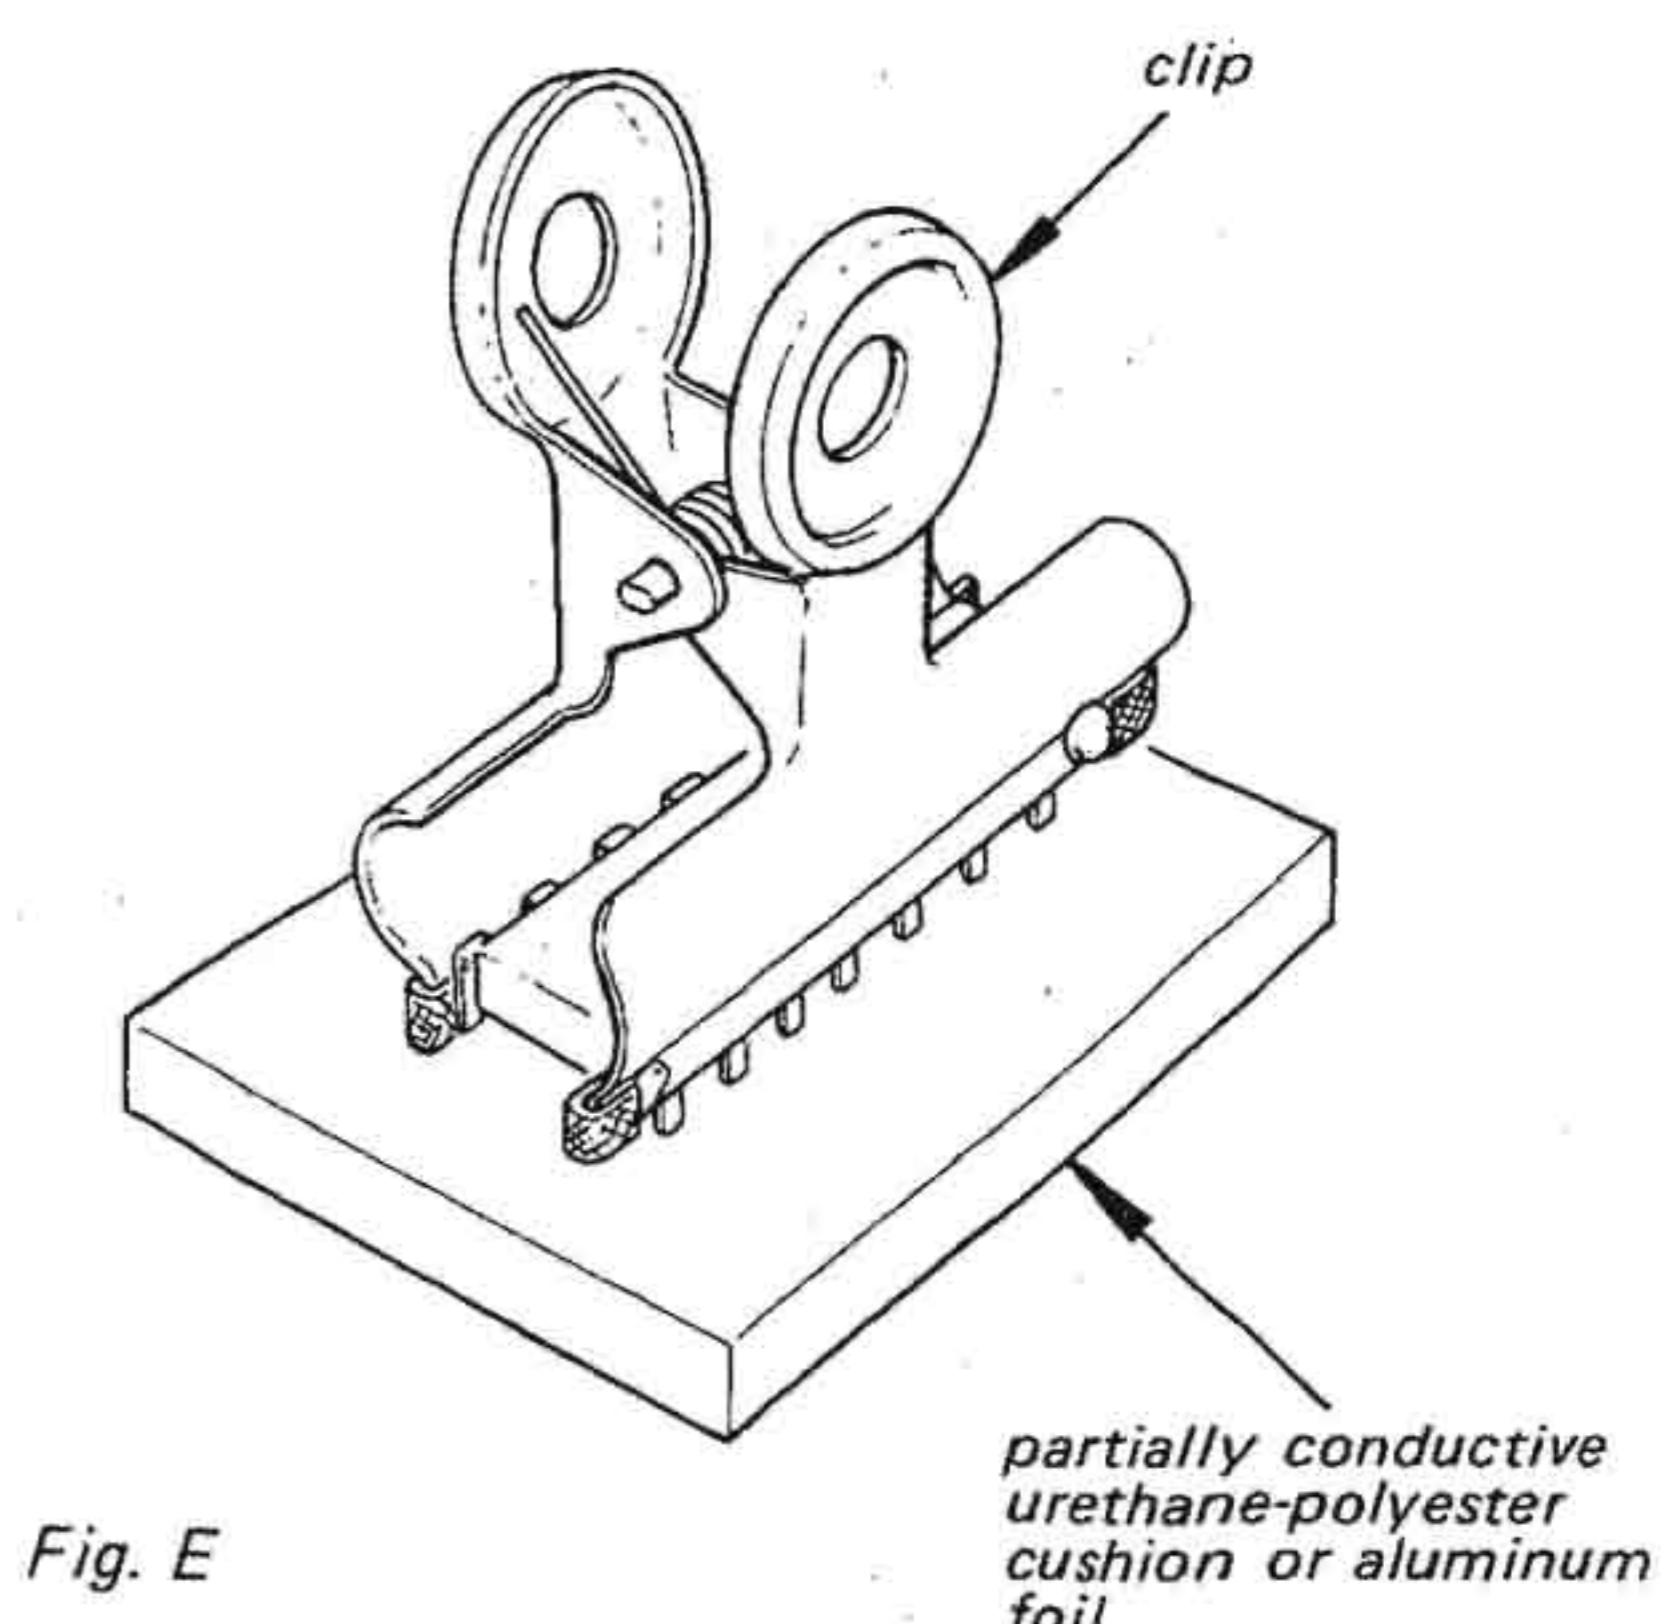

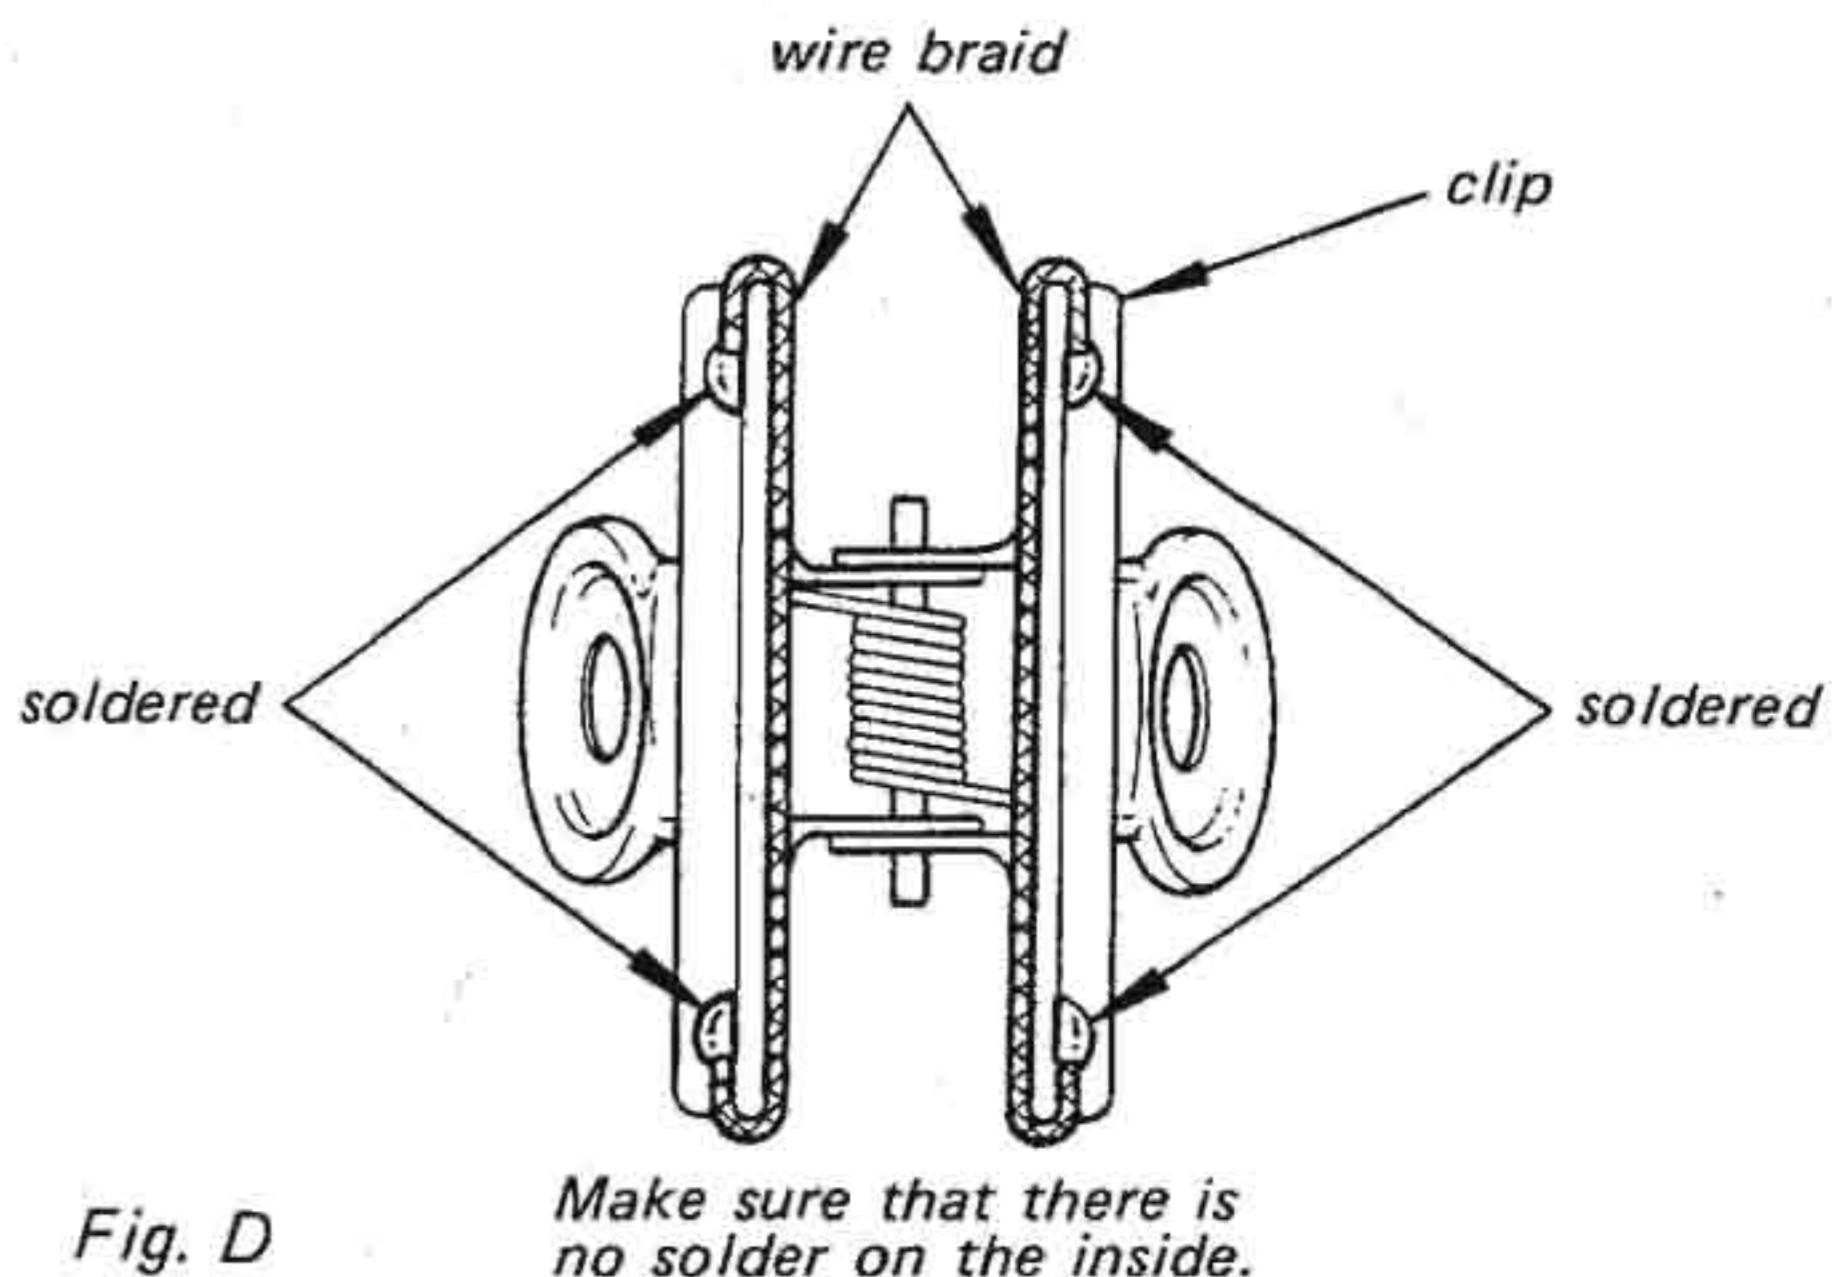

1. Store new ICs by inserting them into a urethane-polyester cushion (which is somewhat conductive), or wrapping it in aluminum foil, so that all the pins are at the same potential.
(The ICs should be stored in that manner until mounted on the circuit board.)

2. Check the soldering iron for possible power-line leakage current. Make sure that there is no leakage path by connecting an ohmmeter to the tip of the soldering iron and the plug as shown in Fig. C. If there is a leakage path, use some other soldering iron.

3. Equalize any potential difference between the clothes, the tools in use, the work bench, the set being worked on, and the packaged IC by touching them all in succession with the hands or a conductive wire or tool.
4. The following are effective methods for handling ICs that remove the potential difference across the oxide layer.
 - Use a paper clip modified by soldering in a wire braid insert.

- Take a short length of fine bare wire and wind it around the IC so that it shorts all the pins of the IC, while it is still in the urethane-polyester cushion or aluminum foil. This ensures that all the pins are at the same potential.

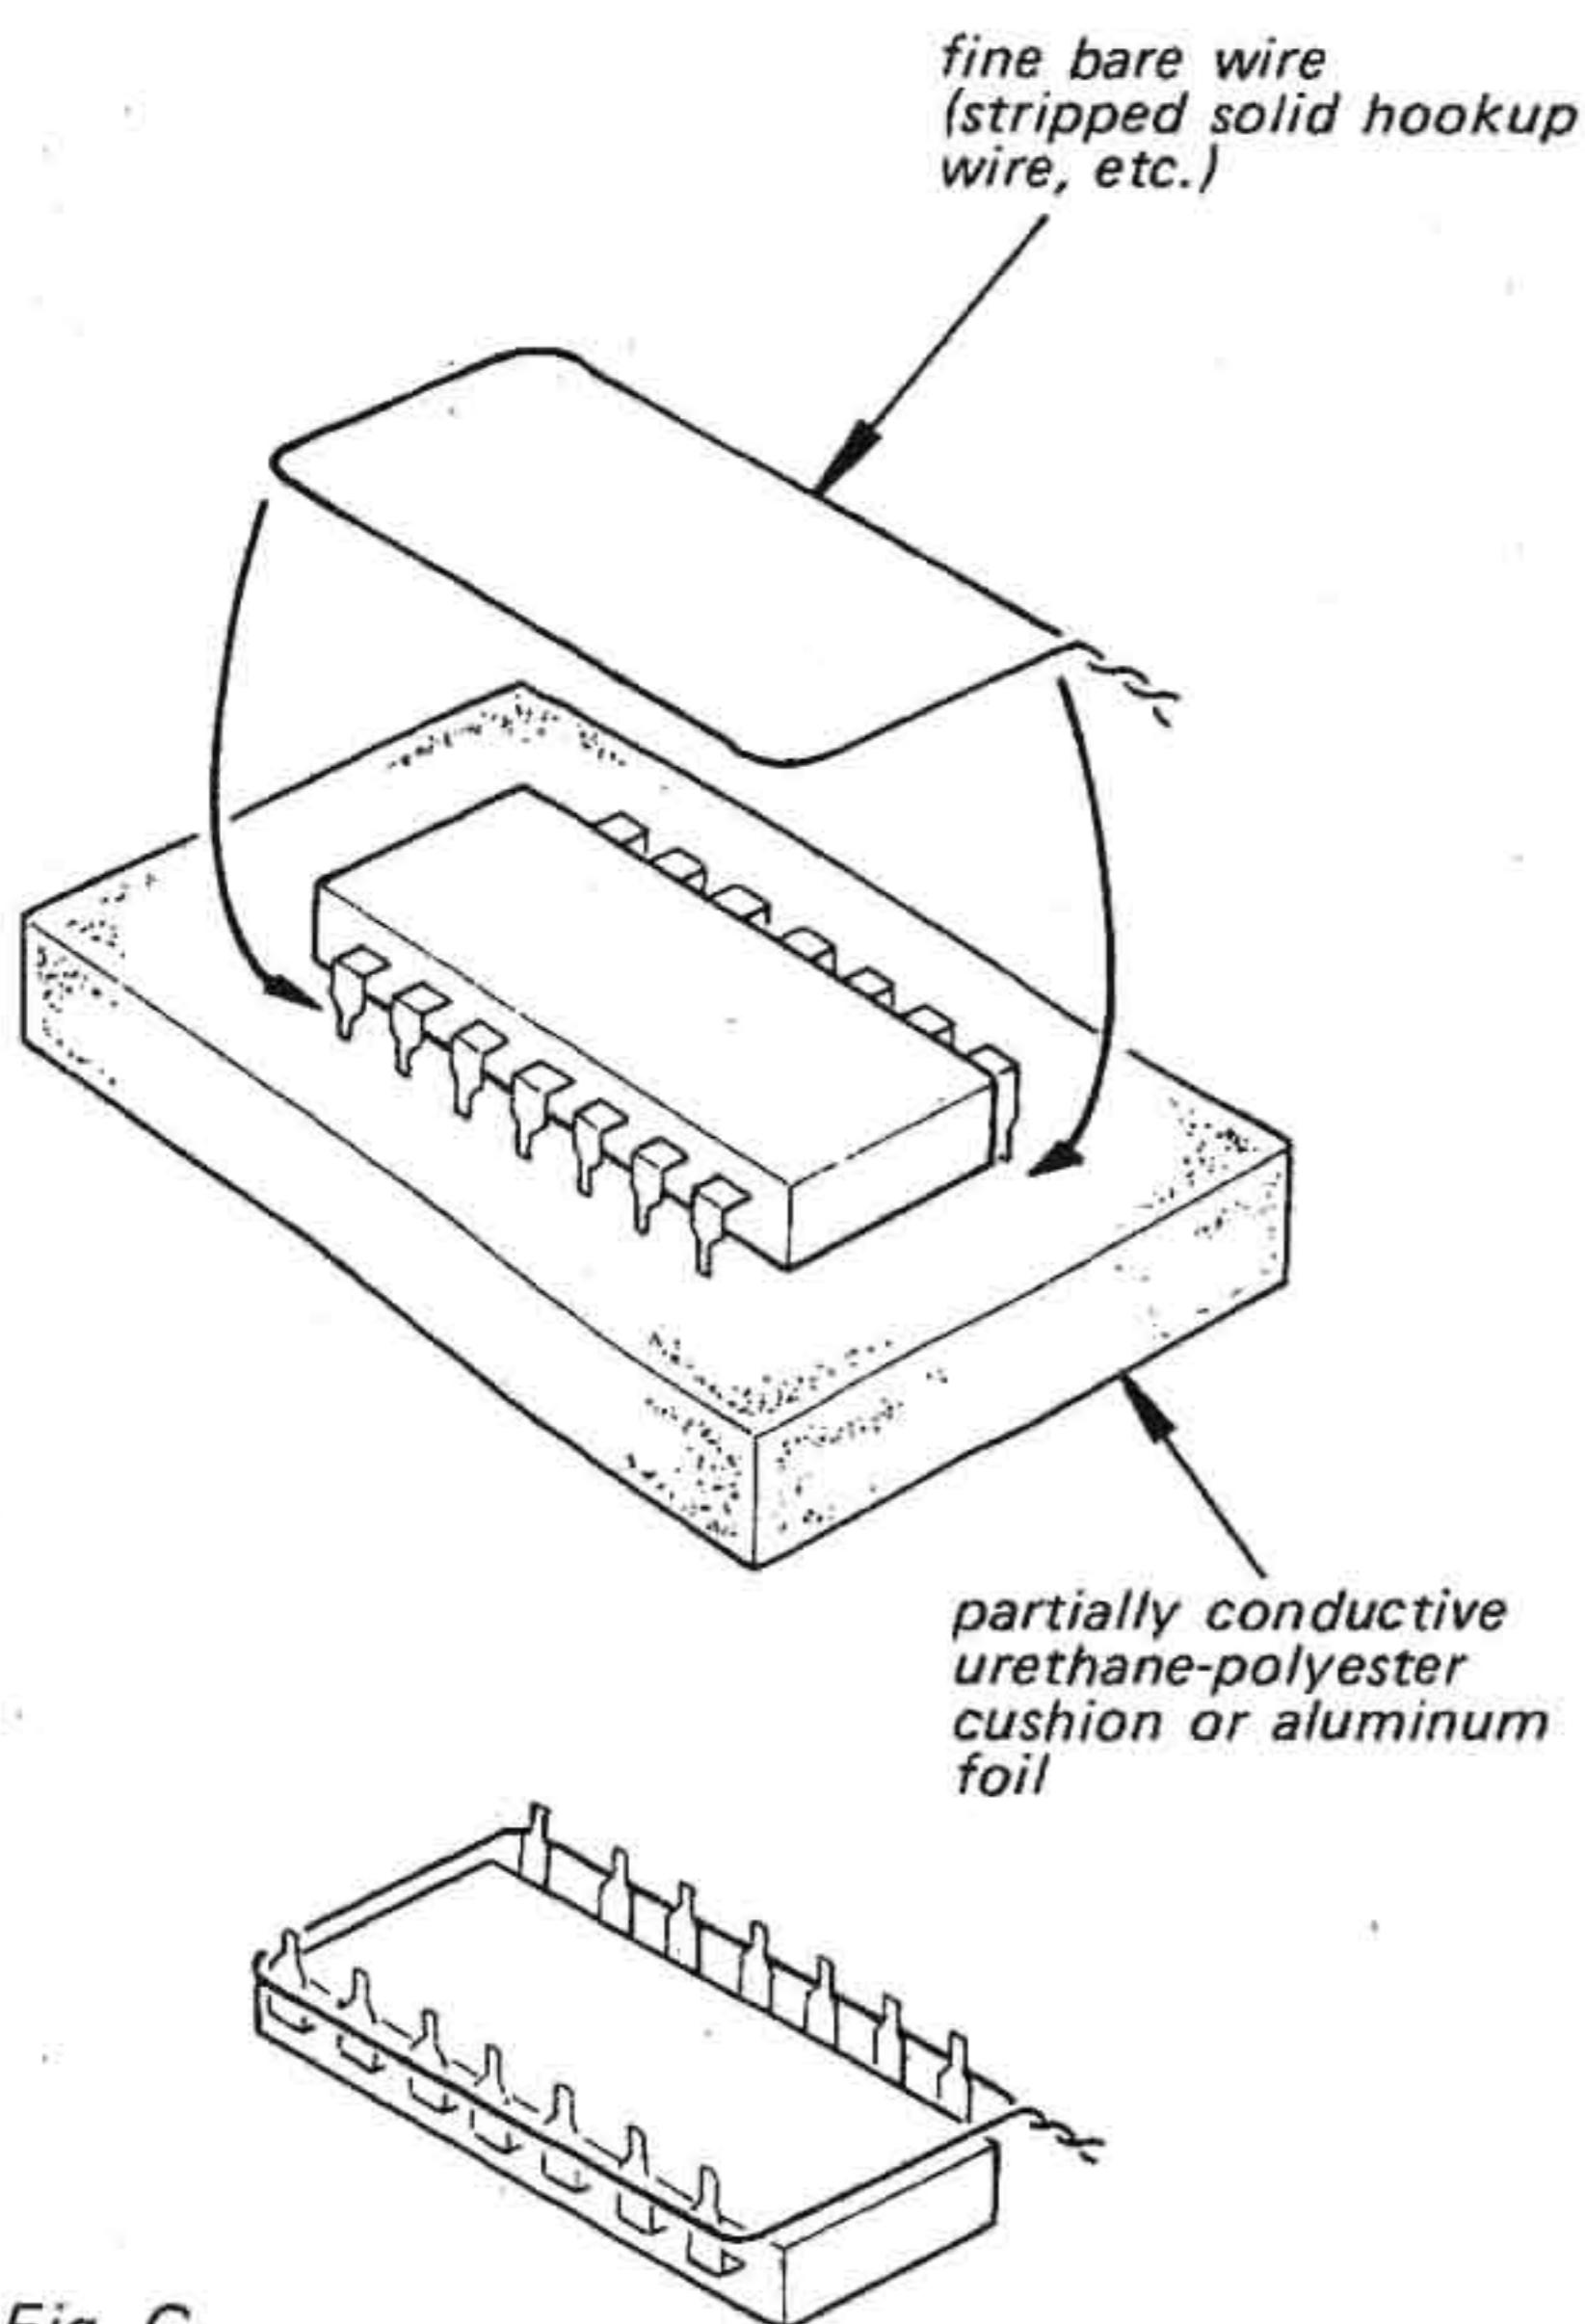

Fig. G

- When it is necessary to handle the IC with the fingers, do not touch any pin, and hold the IC at the ends of its plastic-package case as shown in Fig. H.

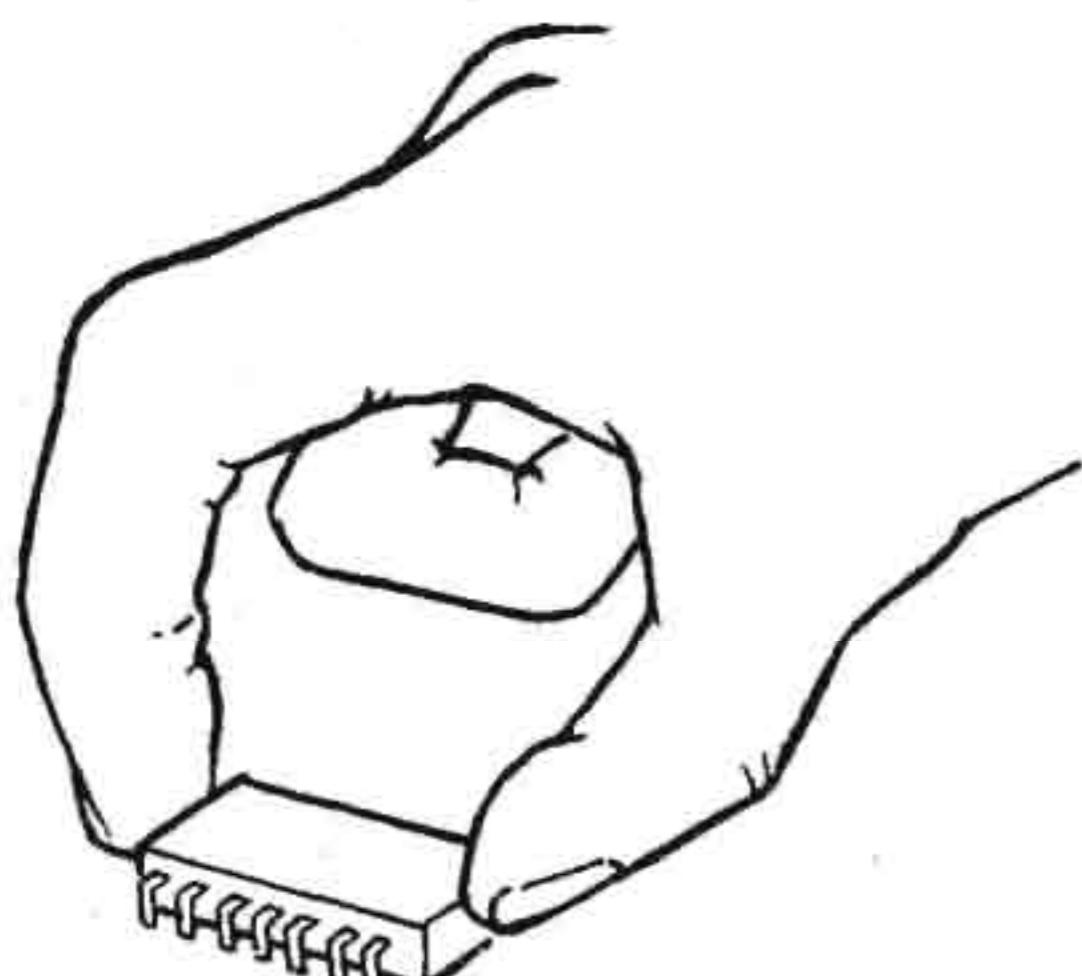

Fig. H

5. Method of Mounting

Insert the IC while holding it with the modified clip, and solder all the pins with the clip still shorting the pins. (Similarly, solder all the pins while the bare shorting wire is still wound around them.). Remove the clip or the bare shorting wire only after all the pins have been soldered.

Precaution while Checking C-MOS ICs

The C-MOS ICs (Complementary MOS) are MOS ICs that have their output sections made up of N-channel and P-channel push-pull stages to increase their speed of operation. If the output terminal of these ICs comes into contact with B+ or B- voltage, then the FET which is ON at that time will either become shorted or open.

This is valid for all the output sections that are connected together by the interconnections. Even the circuits that are physically separated (and not on the same board) can be destroyed simultaneously.

Example:

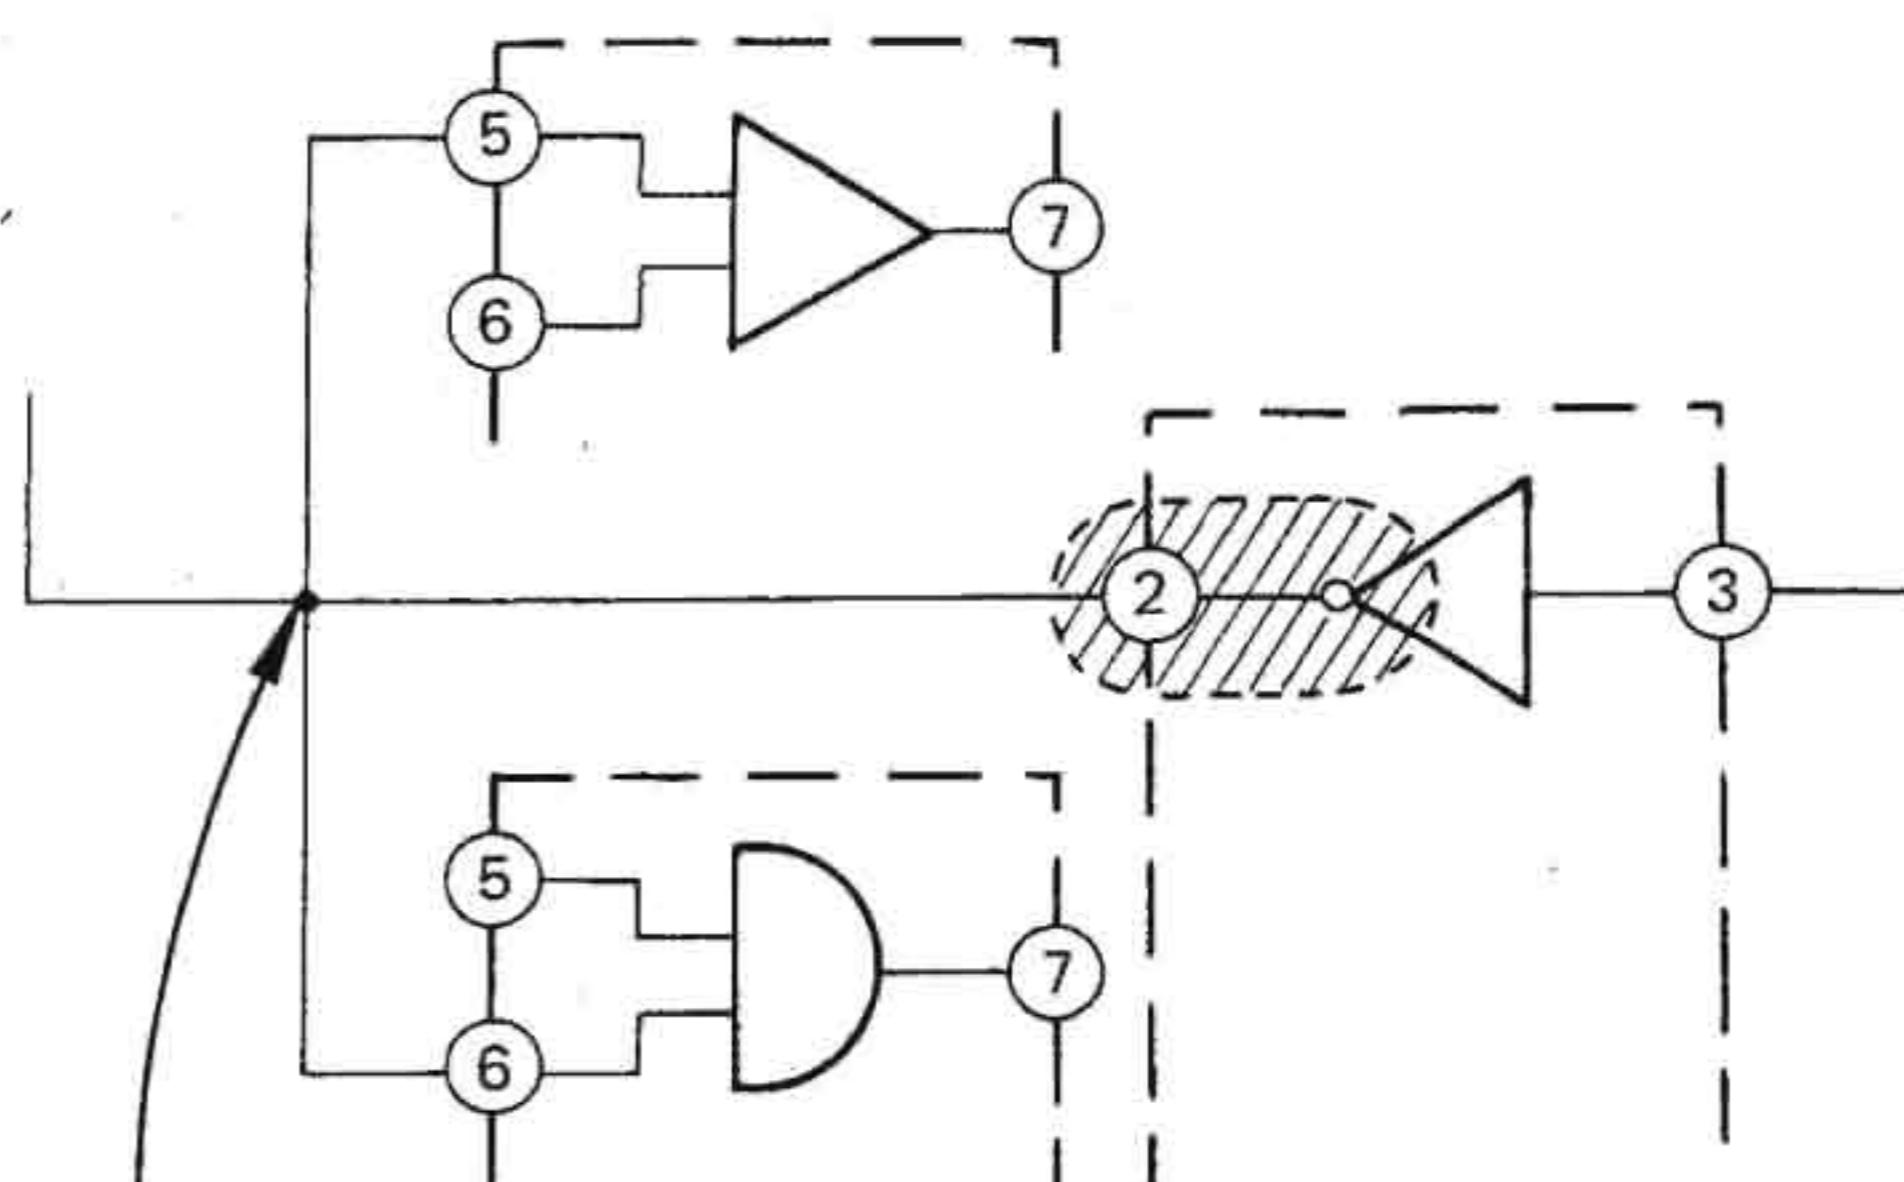

Fig. I

SECTION 1

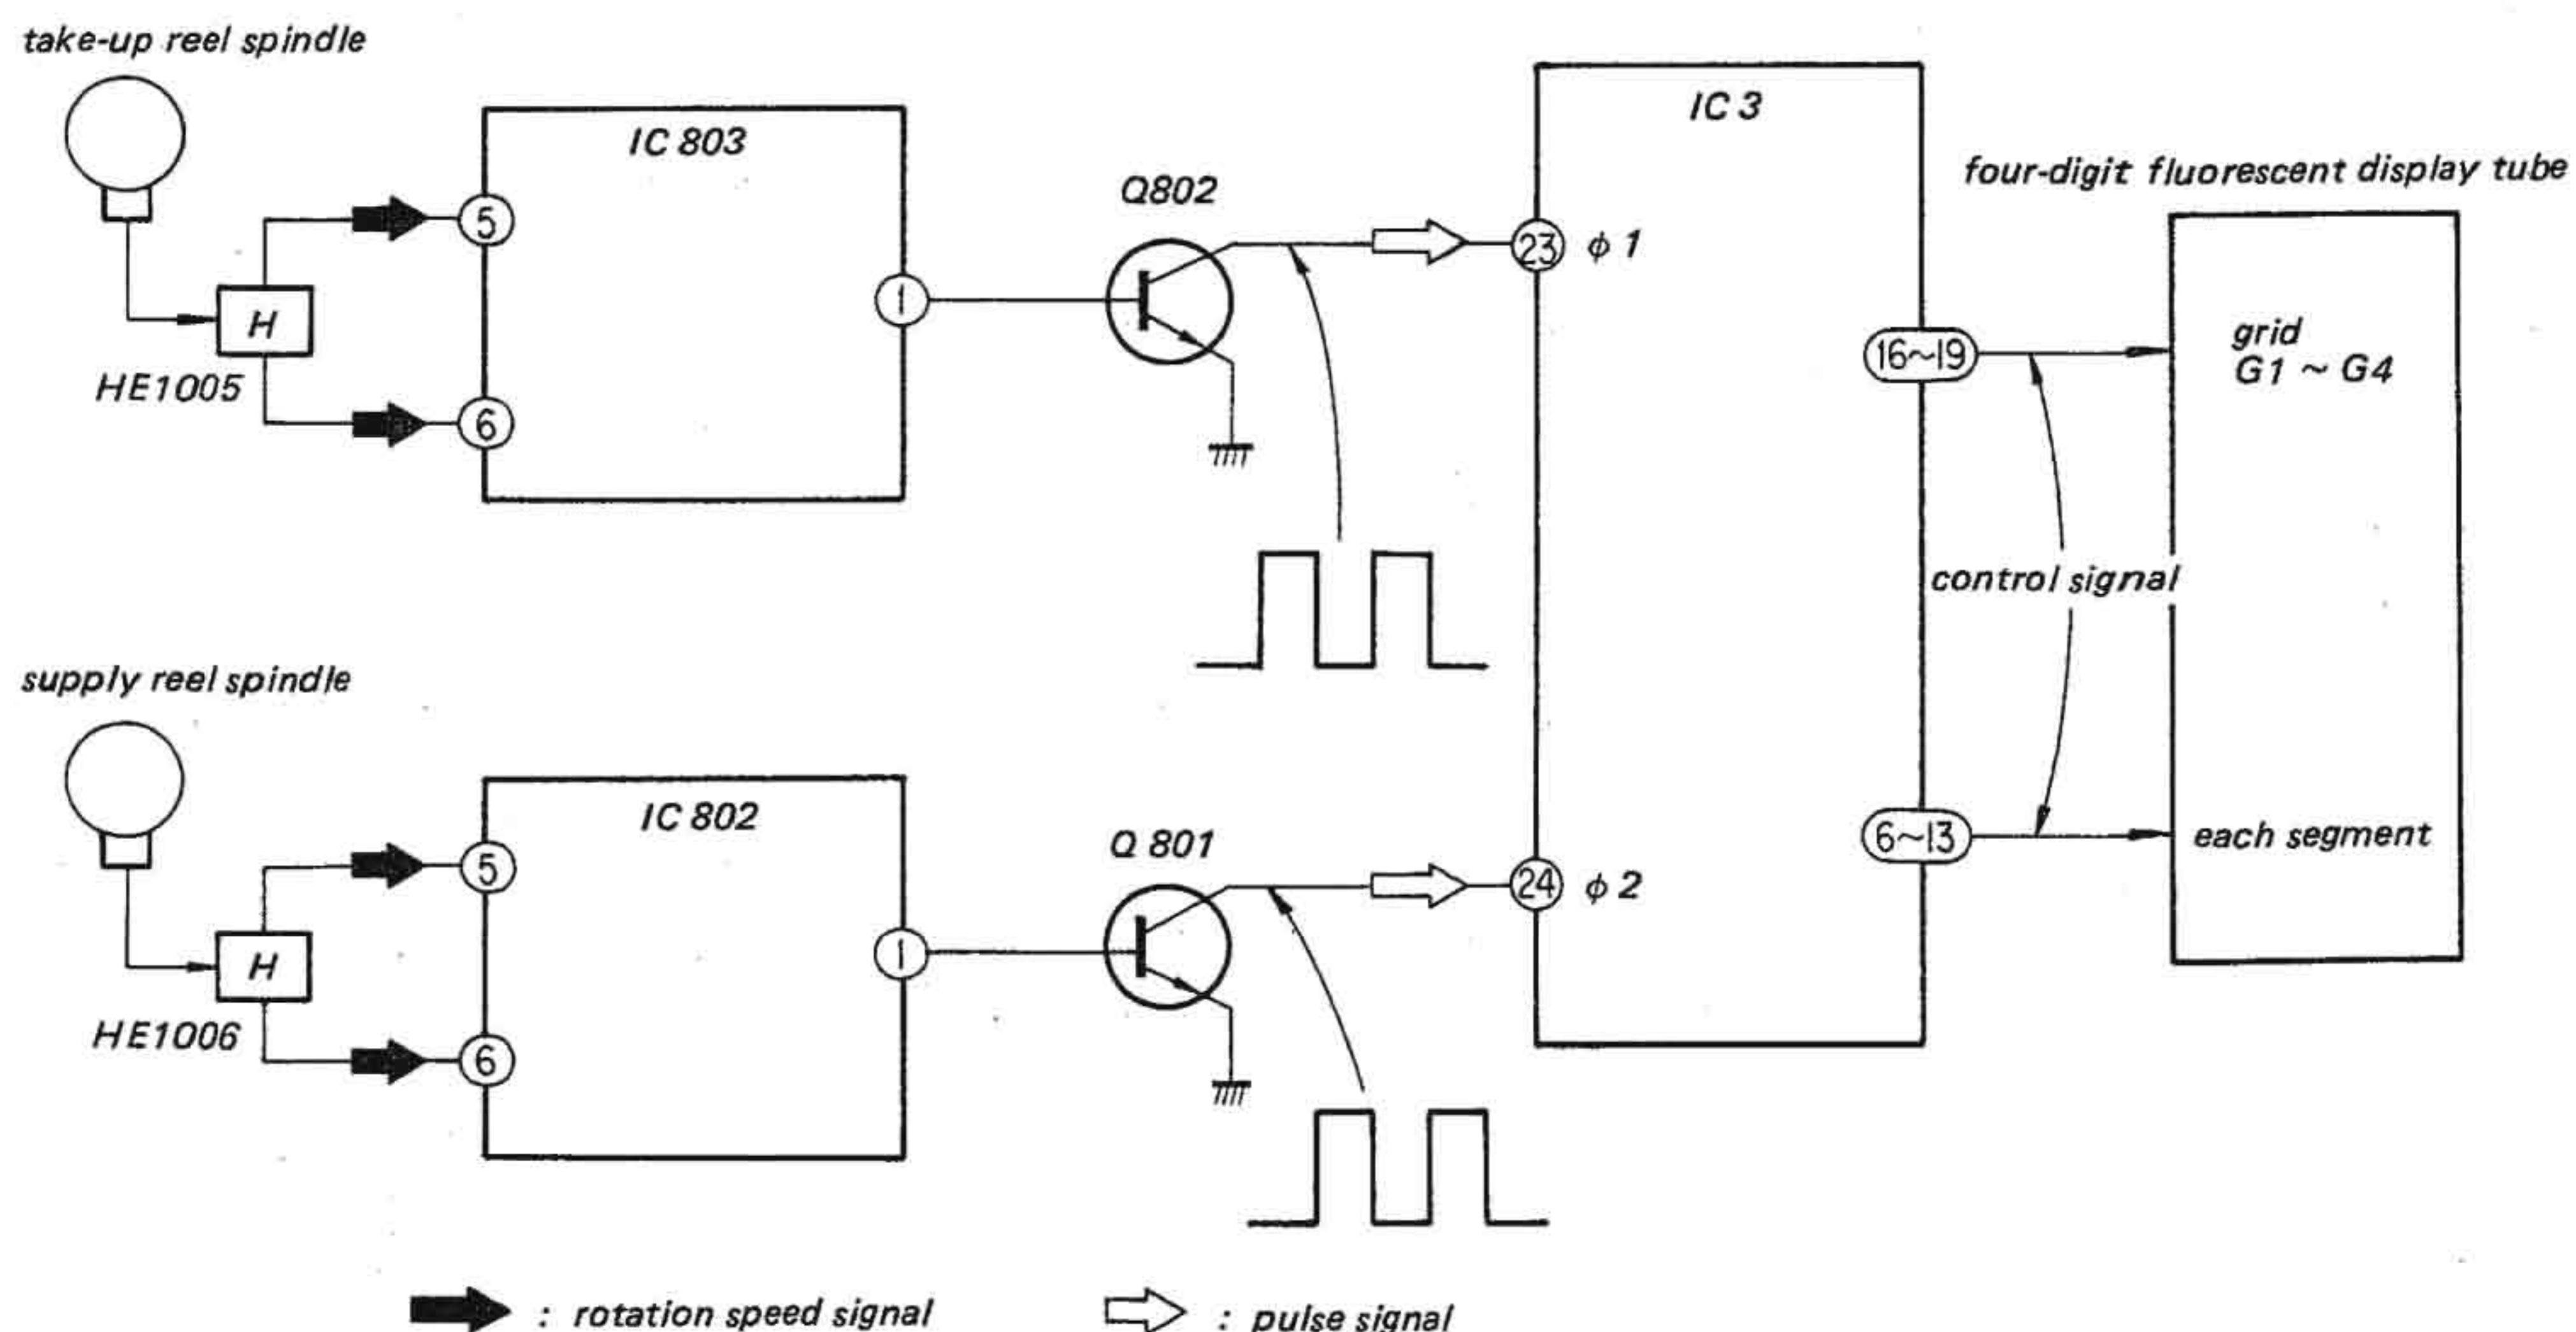

OUTLINE

1-1. CIRCUIT DESCRIPTION

Linear Counter

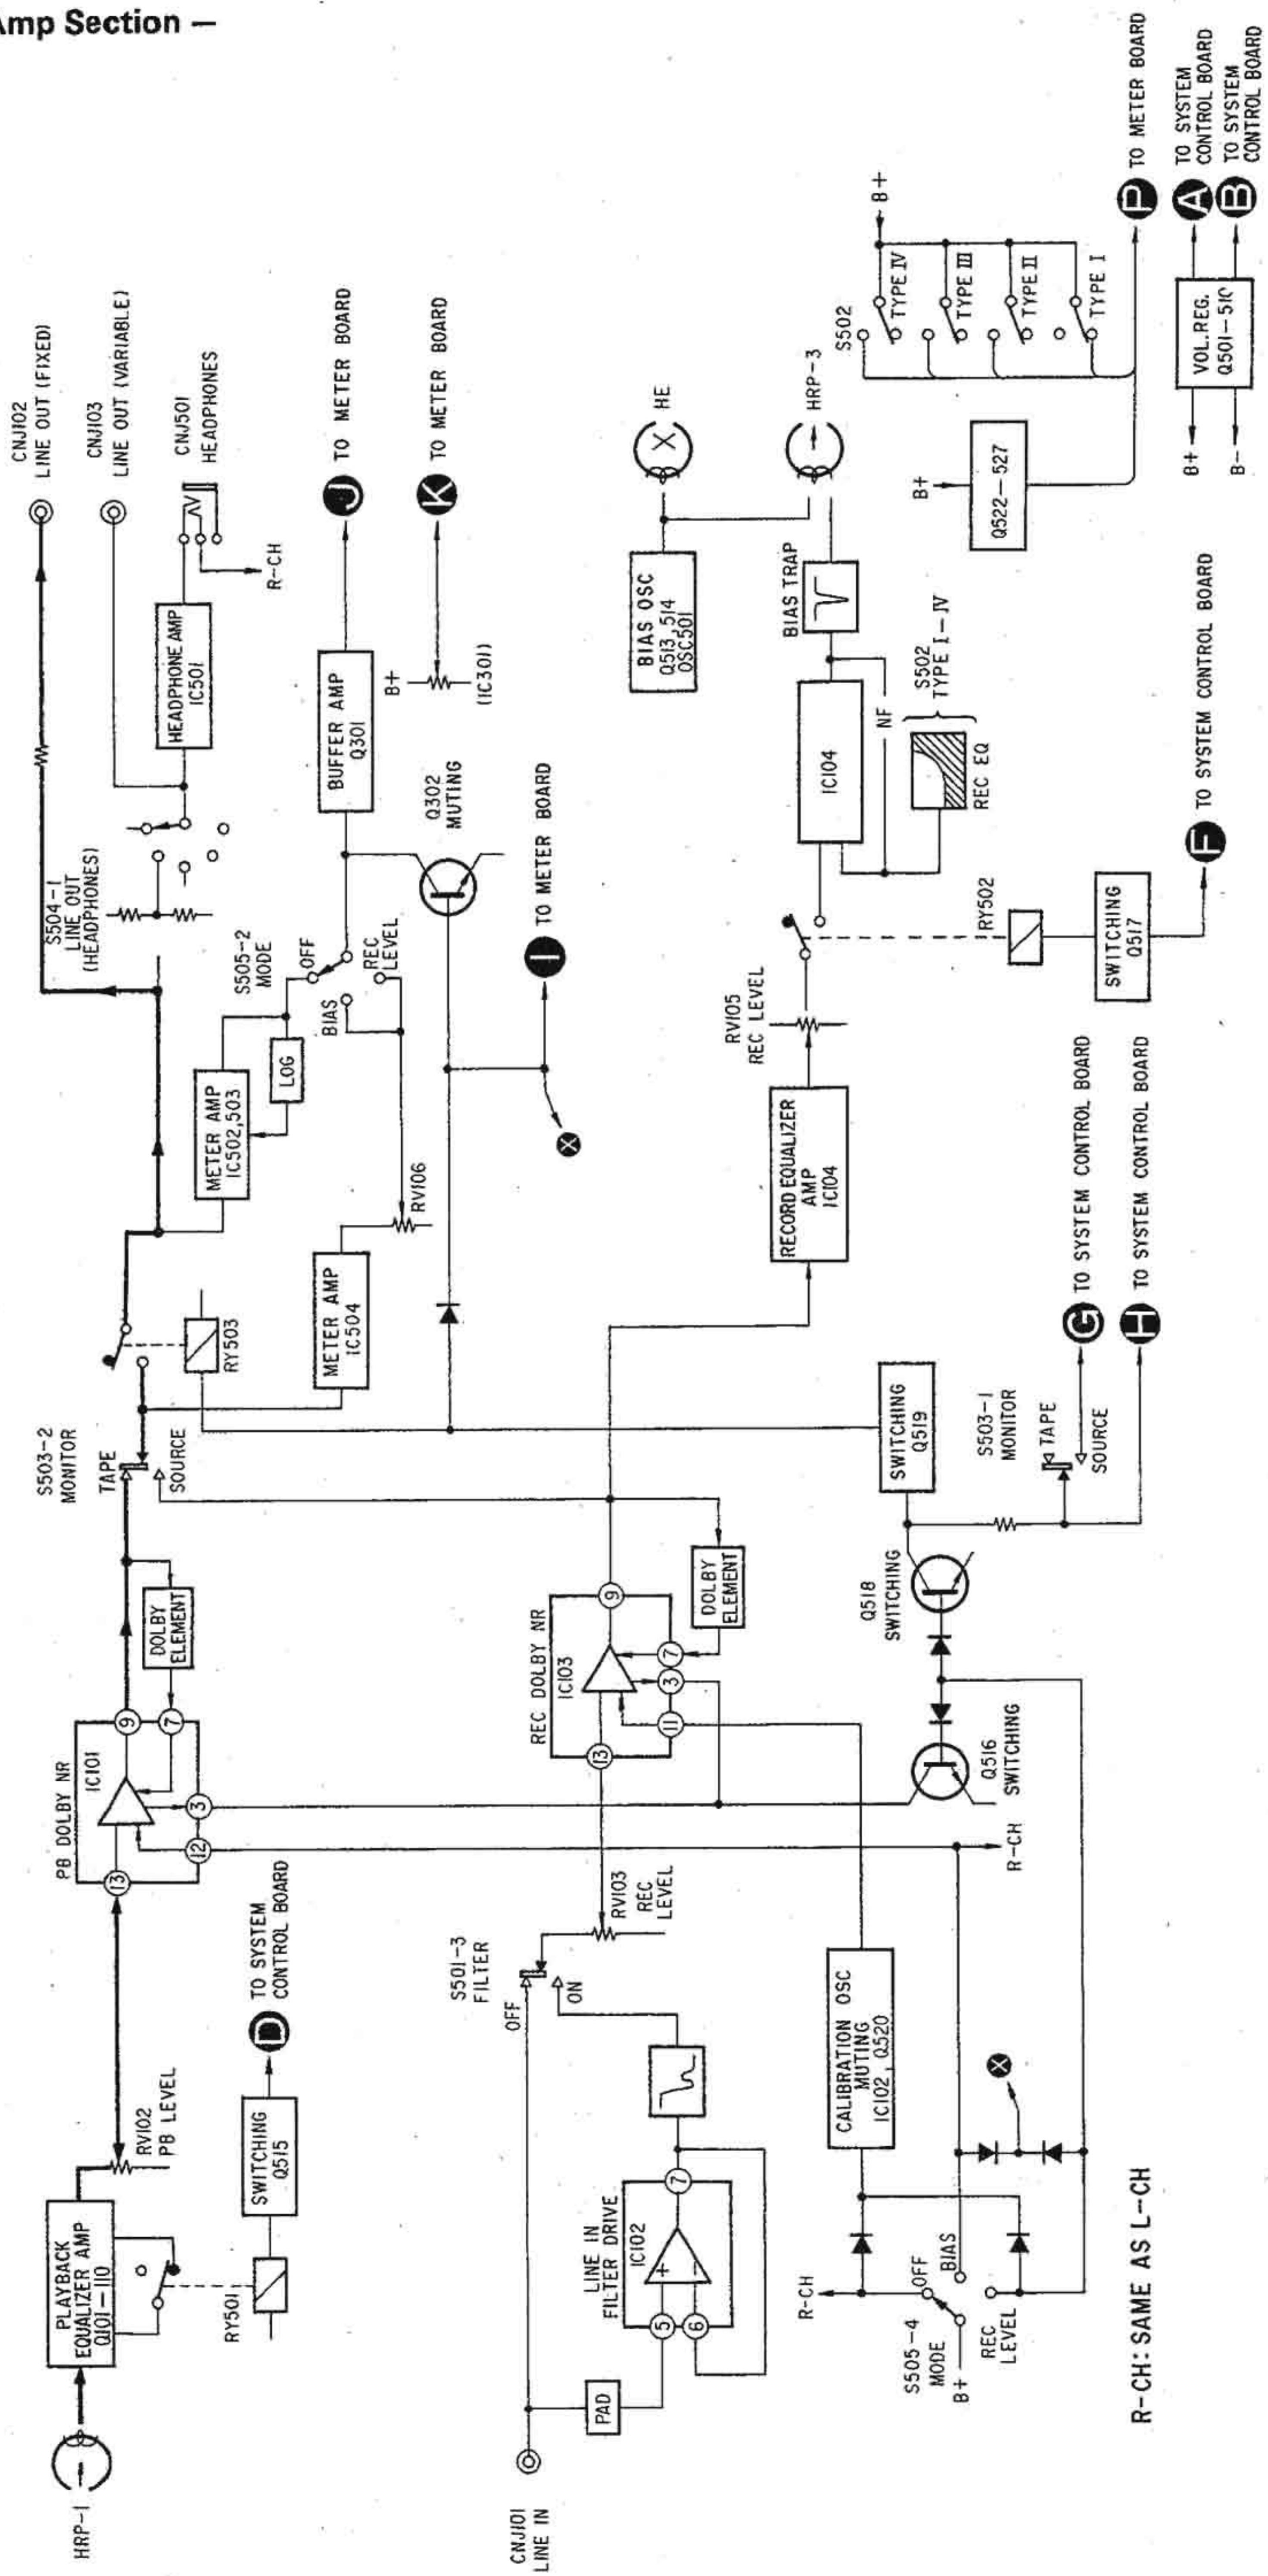

This set uses a new type electrical tape counter, instead of the conventional belt-driven mechanical tape counter, by adopting a microcomputer. This tape counter displays the tape-travelling time linearly in actual time in continuous record and playback modes. The tape-travelling time is calculated by the microcomputer IC3 by determining the rotational speeds of the reel spindles. This is done by detecting various factors such as the diameters of the remaining and wound tapes in the supply and take-up reel spindles, diameter of fully-wound tape, diameter of the reel hub, and the tape-travelling speed. This linear tape counter is intended for cassette tapes C-60, C-90 and C-120. The tape counter can not be used with cassette tapes C-46 and C-30. However, the display of the counter also runs linearly when using cassette tapes C-30 and C-46.

In the supply and take-up reel spindles, there is a magnet magnetized at the plural poles, which detects the rotation at the hall elements (HE1005, 1006), then obtains signals as to the rotation speed of supply and take-up reel spindles. These signals are applied to IC803, IC802 and amplified. The pulse output generated here is applied to terminals ②3 and ②4 of IC3 (microcomputer). IC3 processes and corrects the operation to make the pulse counting for one count per second, and processes carry and decarry operations. Terminals ⑥ to ⑬ output signals for each segment. Terminals ⑯ to ⑲ output grid-drive signals for the fluorescent display tube. Due to these output signals, the display tube displays four-digit digital minutes/seconds figures in a linear (time-wise) manner.

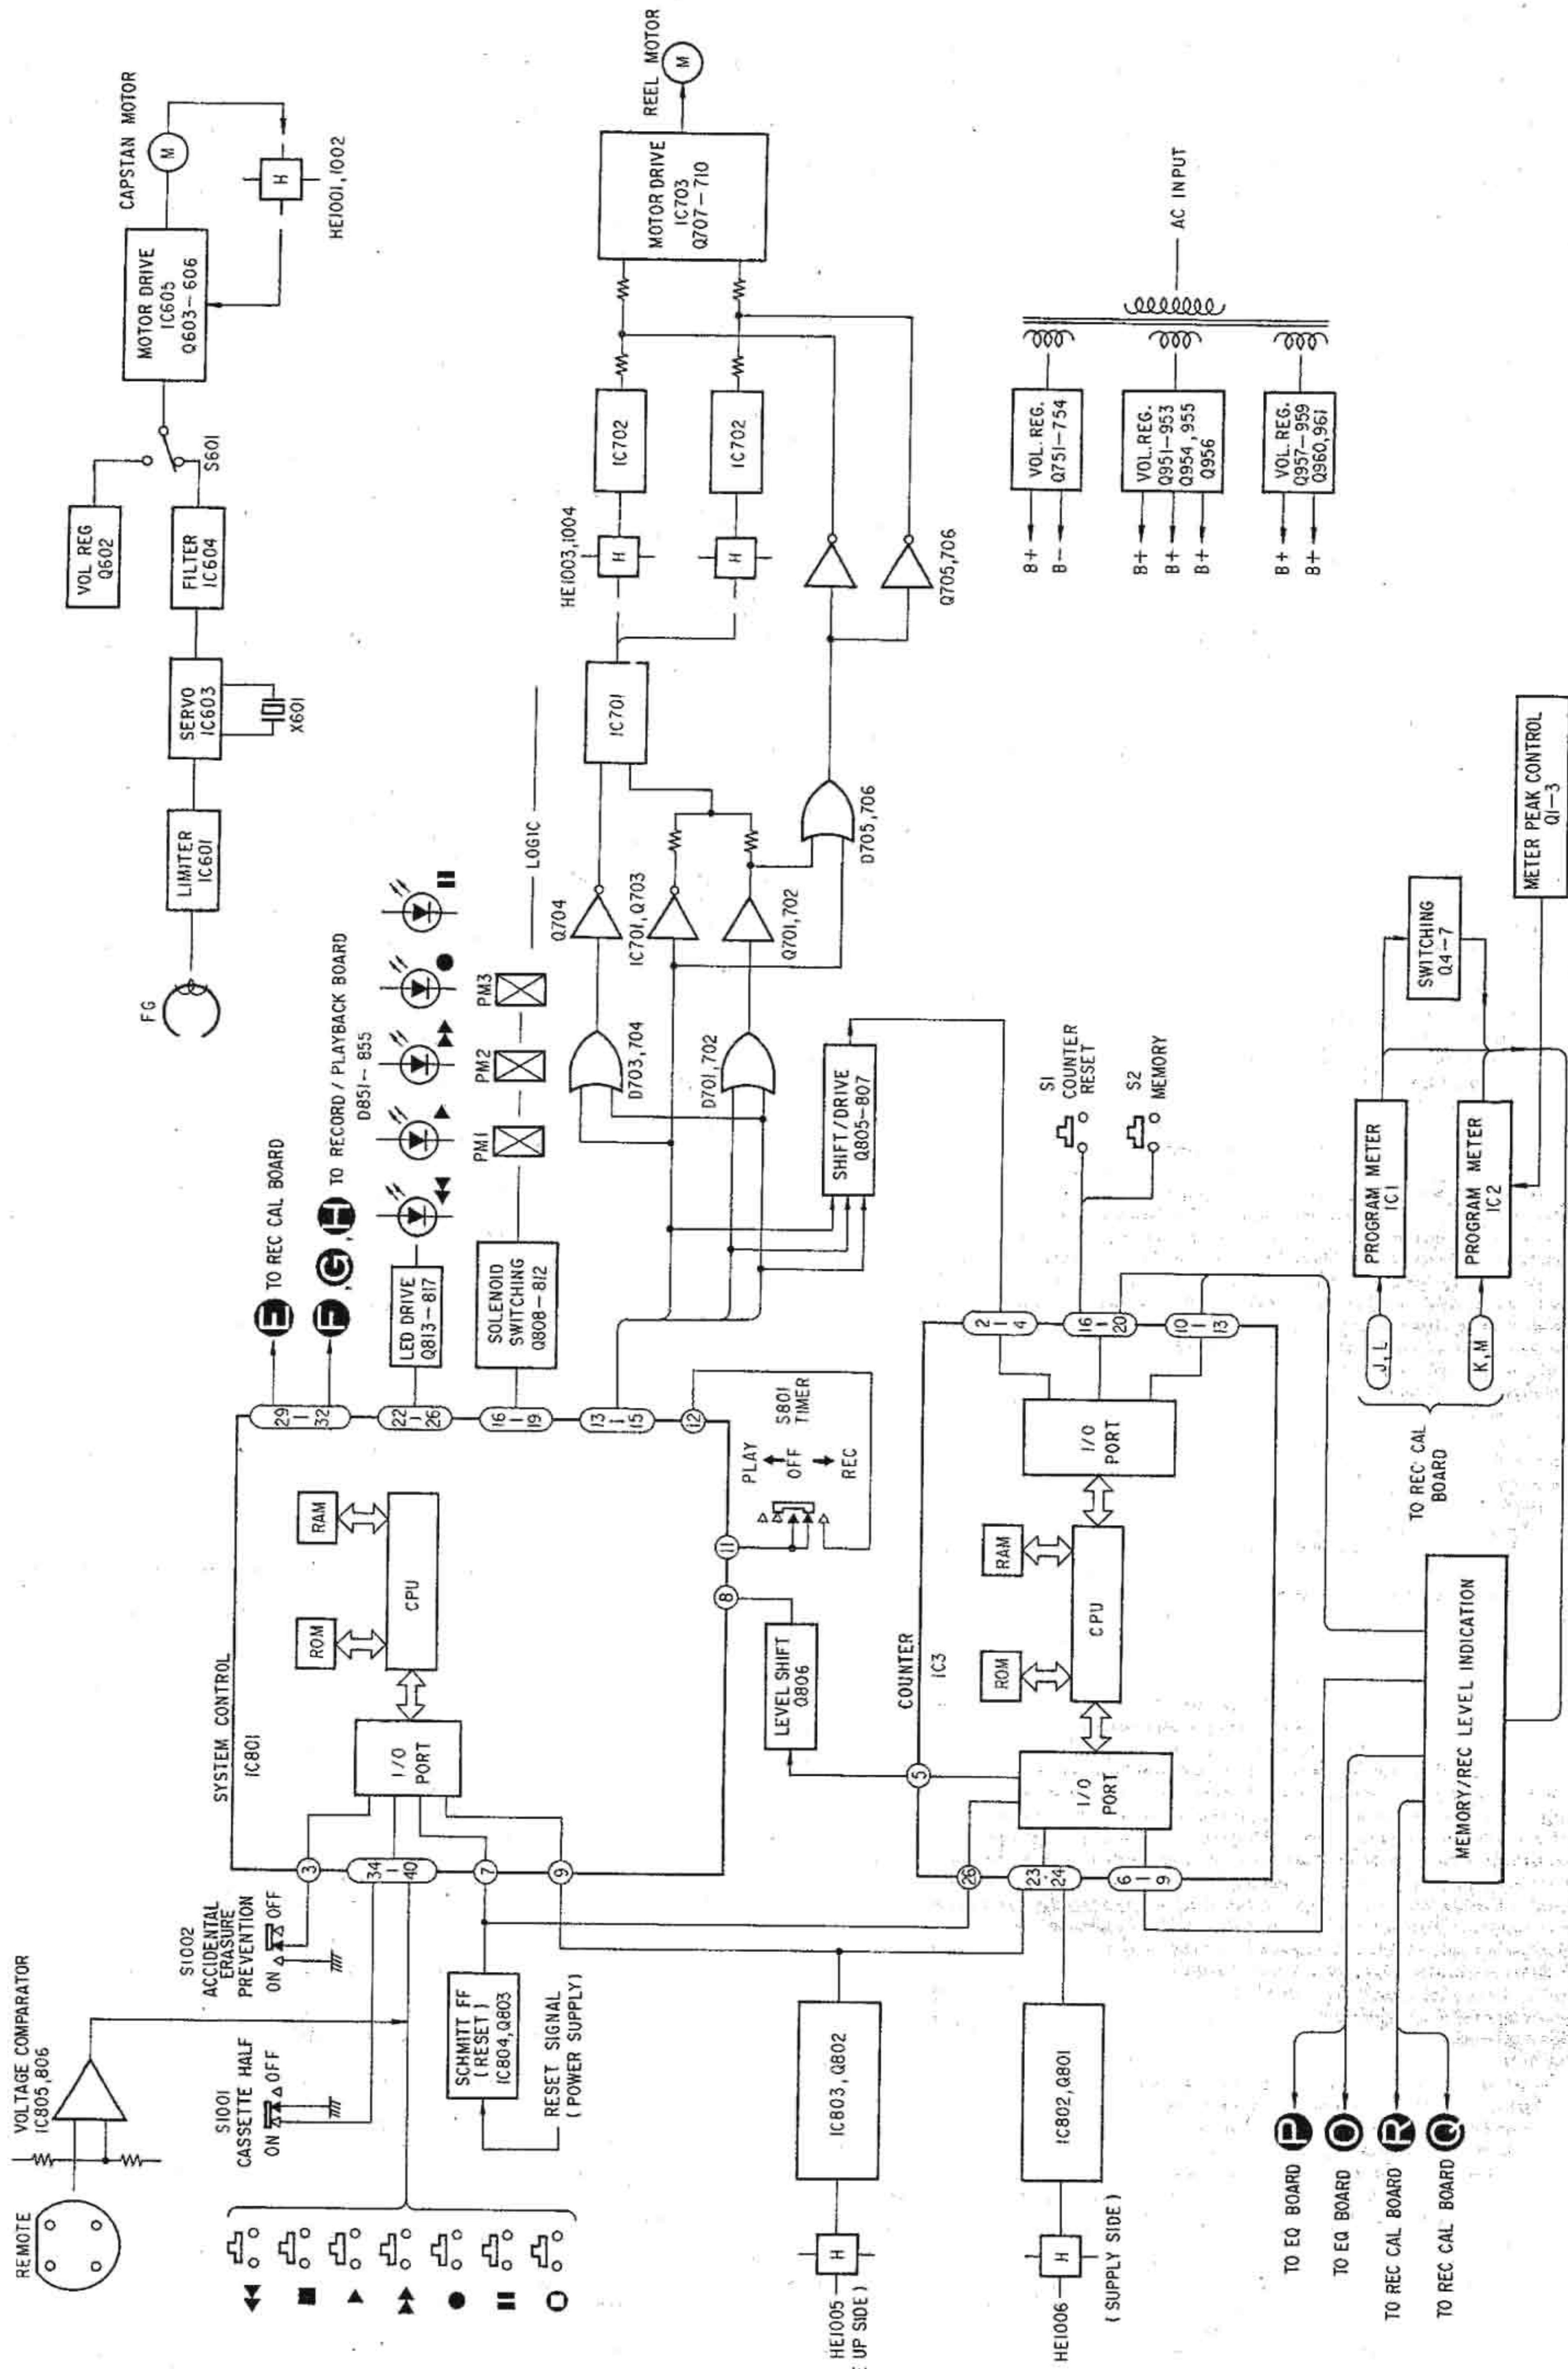

1-2. BLOCK DIAGRAMS

— Audio Amp Section —

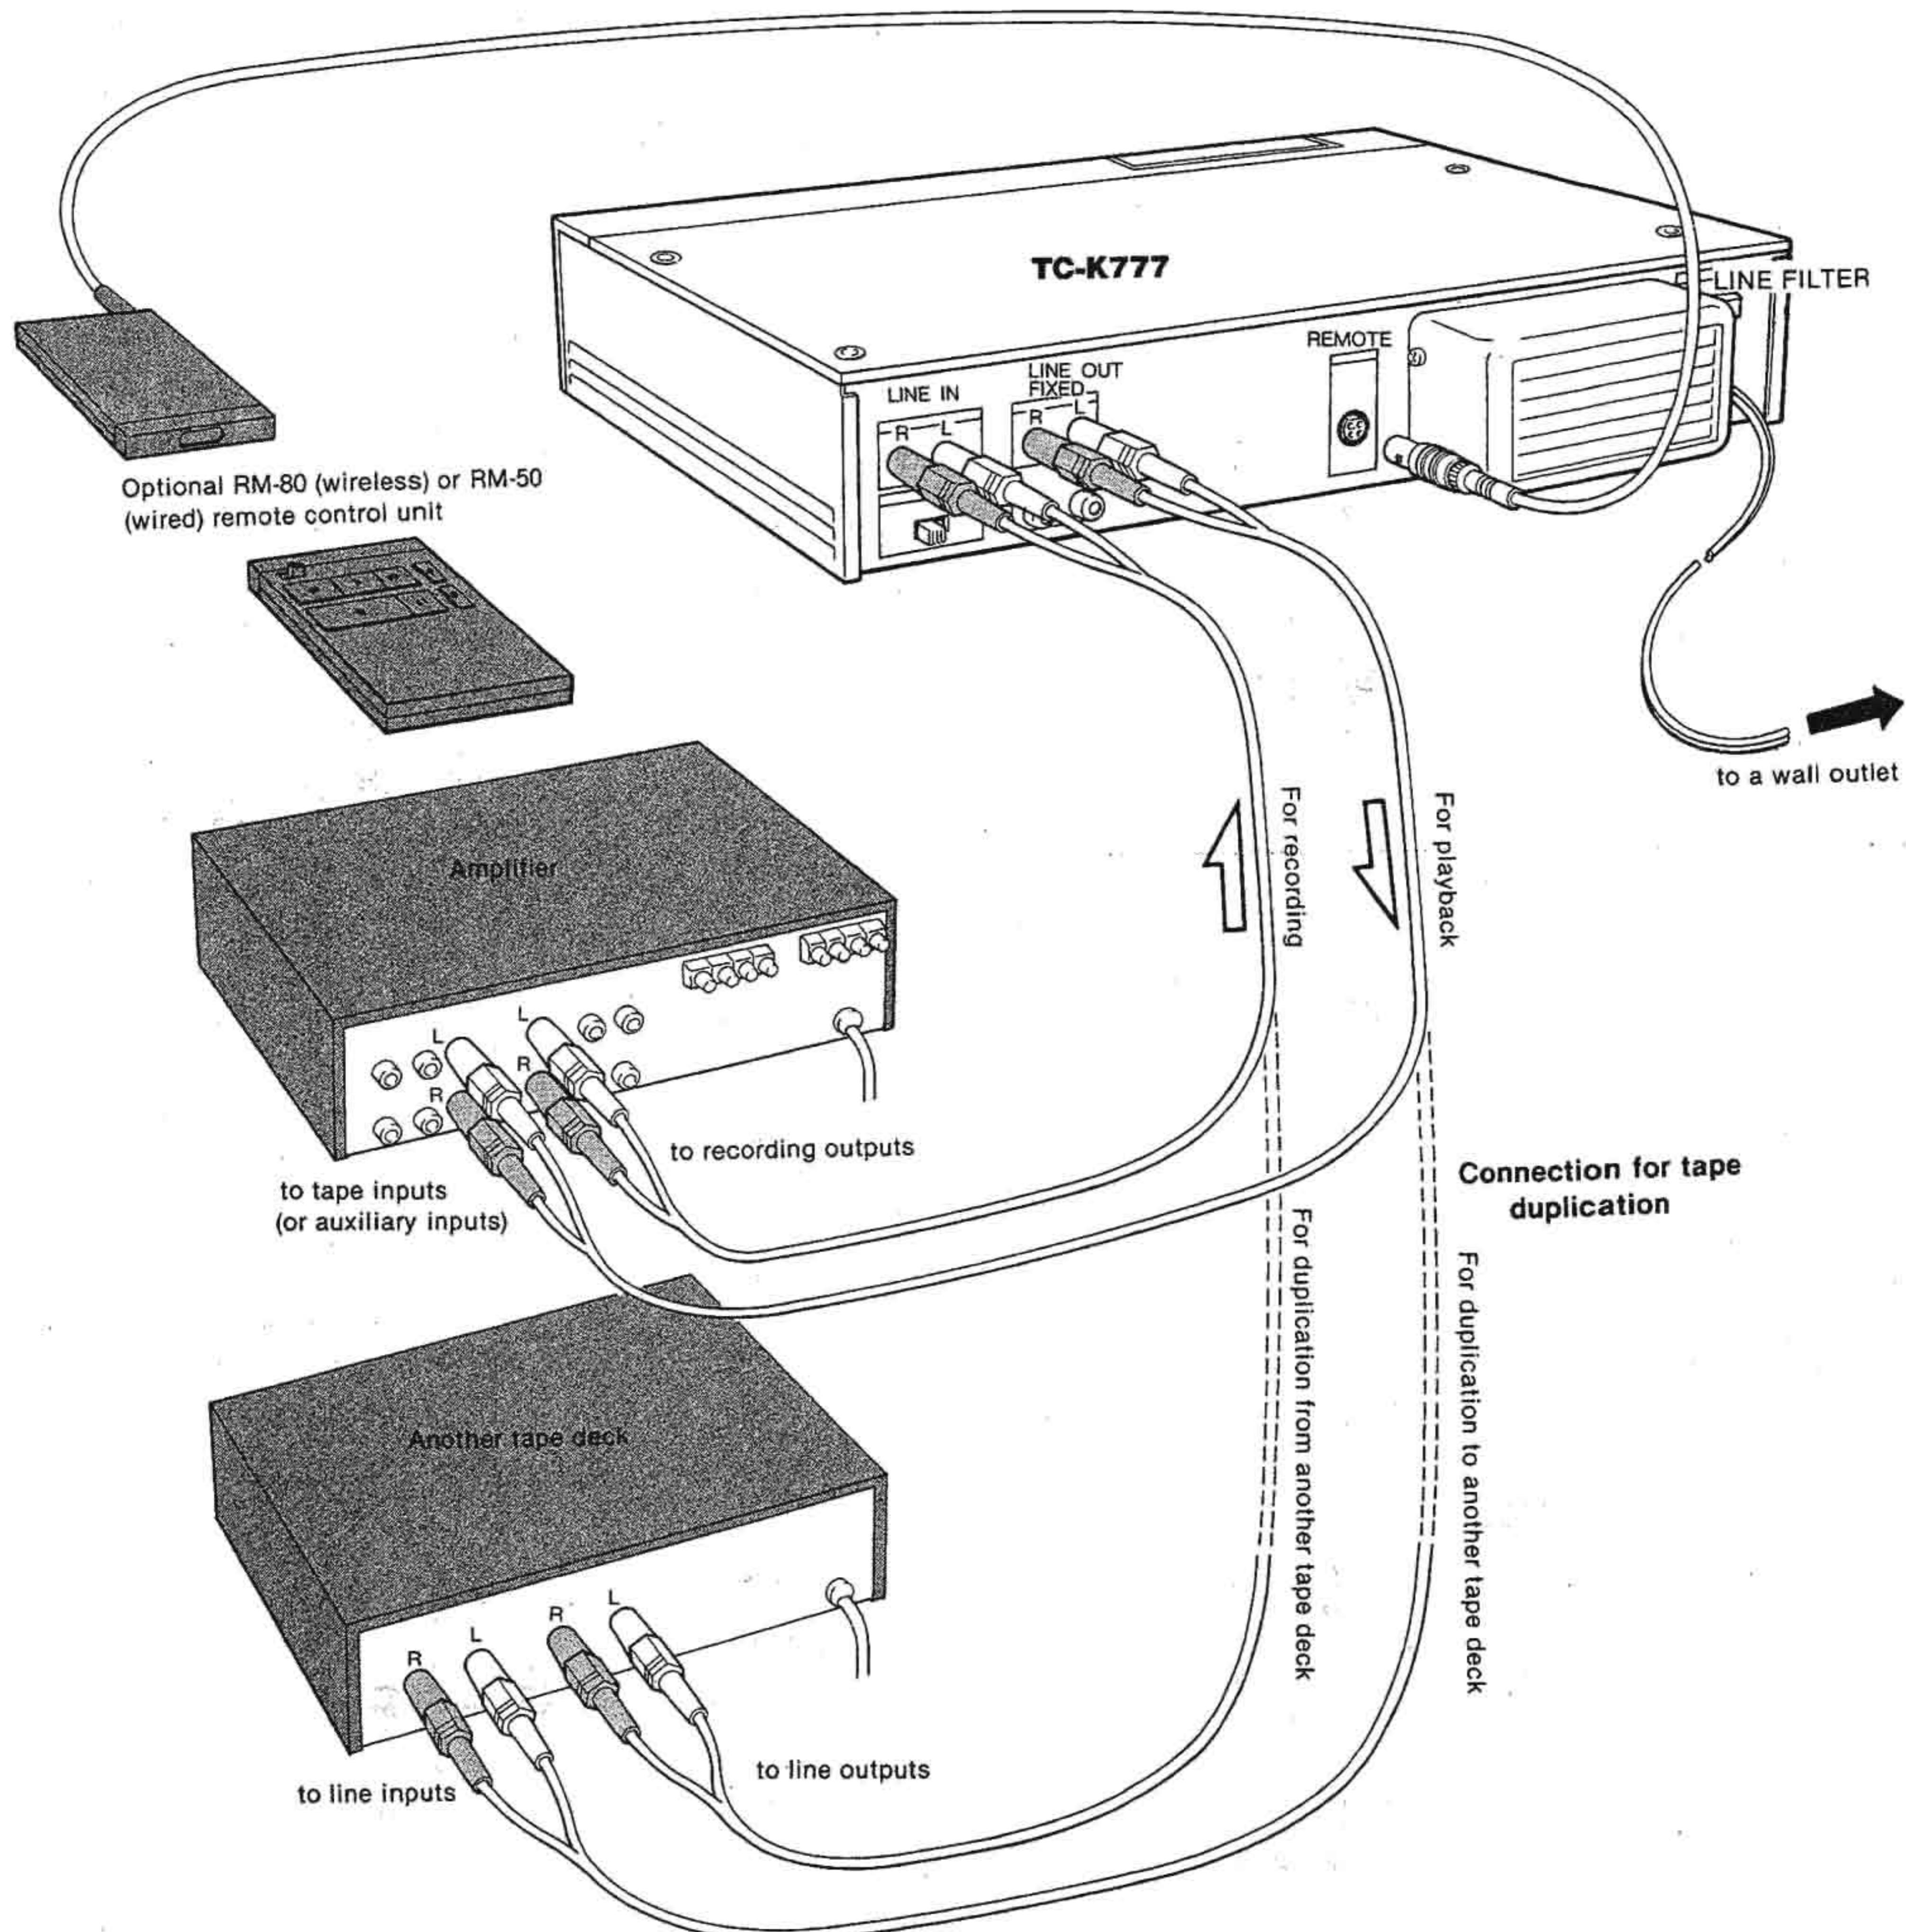

— System Control and Servo Amp Section —

1-3. OUTLINE CONNECTIONS

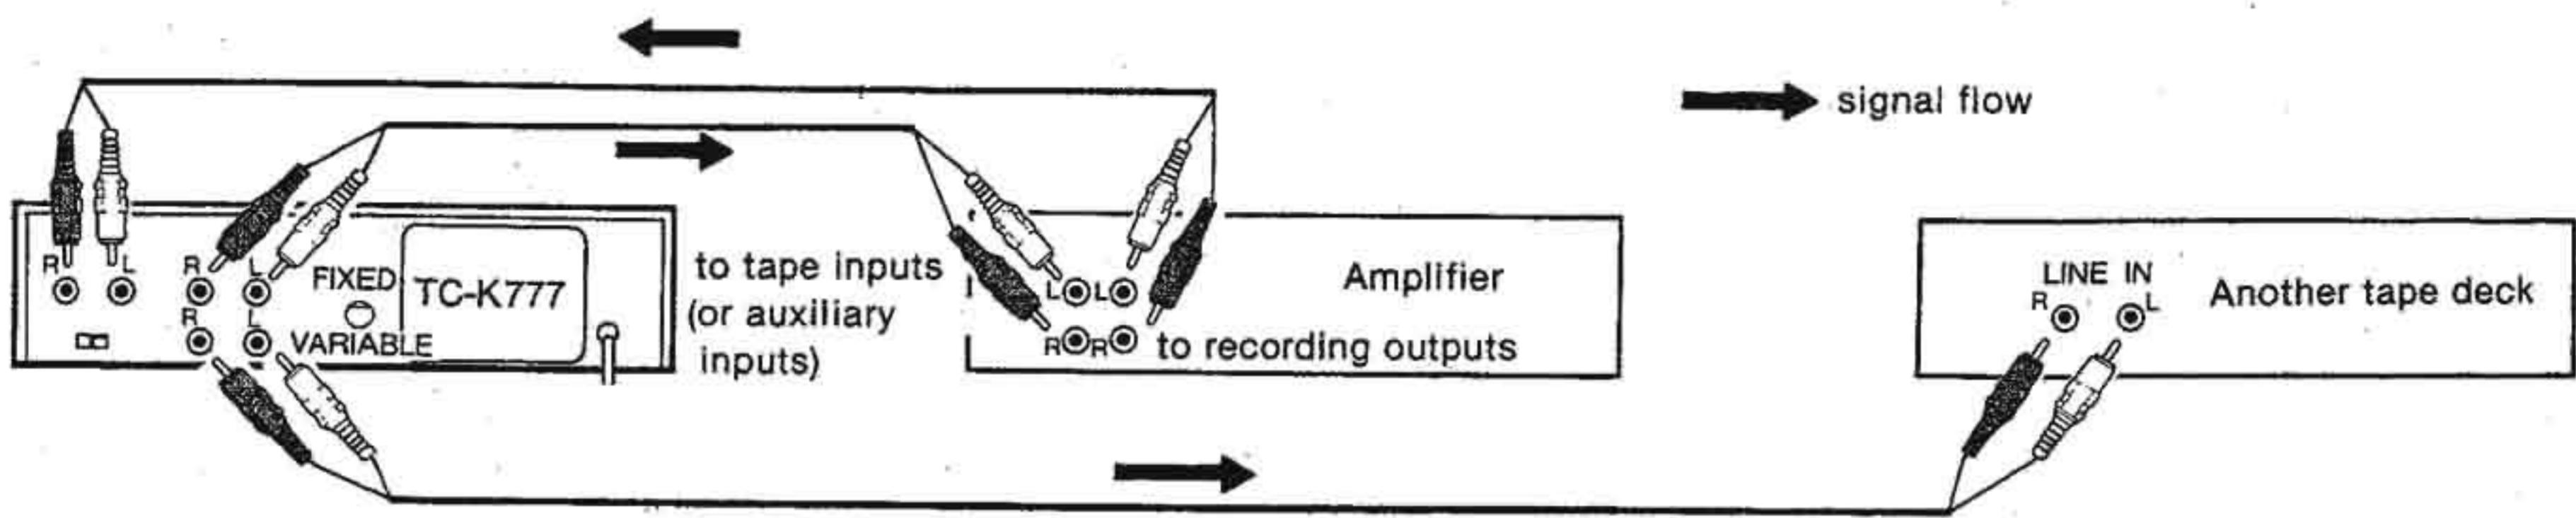

Notes

- Turn the amplifier off before making any connection.
- Be sure to insert the plugs firmly into the jacks. Loose connections may cause hum and noise.
- The 'red' plug of the supplied connecting cord should be connected to the red jack (R: right channel) and the other plug to the white jack (L: left channel).

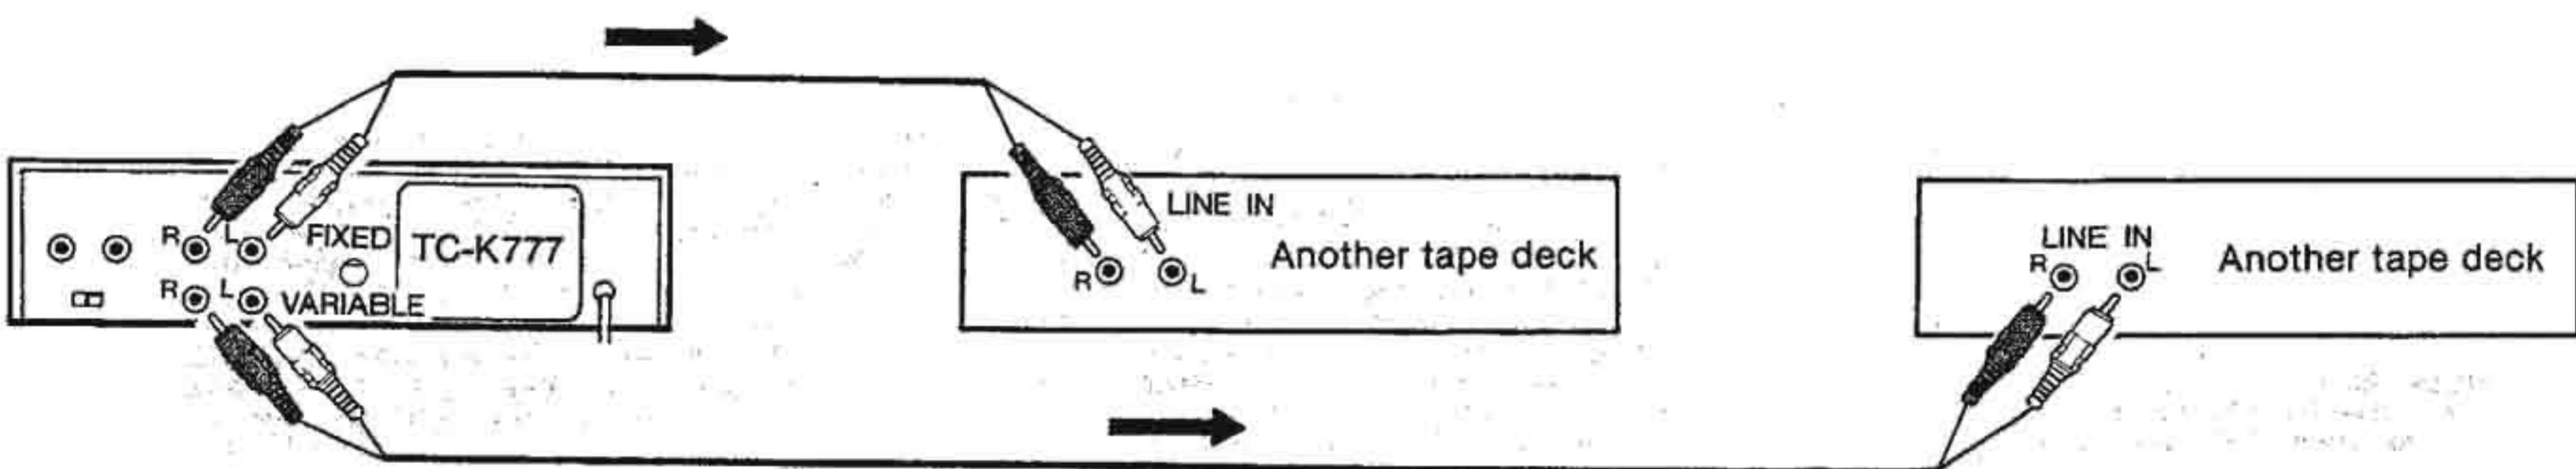

CONNECTIONS USING TWO TYPES OF LINE OUT JACKS

To use another tape deck to duplicate a tape being played without disconnecting the amplifier:

You can duplicate tapes while listening to speakers.

Duplication by two tape decks:

You can duplicate a tape on two decks at the same time.

REMOTE Control Connector

Connect the optional RM-80 (wireless) or RM-50 (wired) remote control unit to operate the tape transport functions from a distance. Read the instruction manual of your remote control unit before operating it.

LINE OUT Jacks

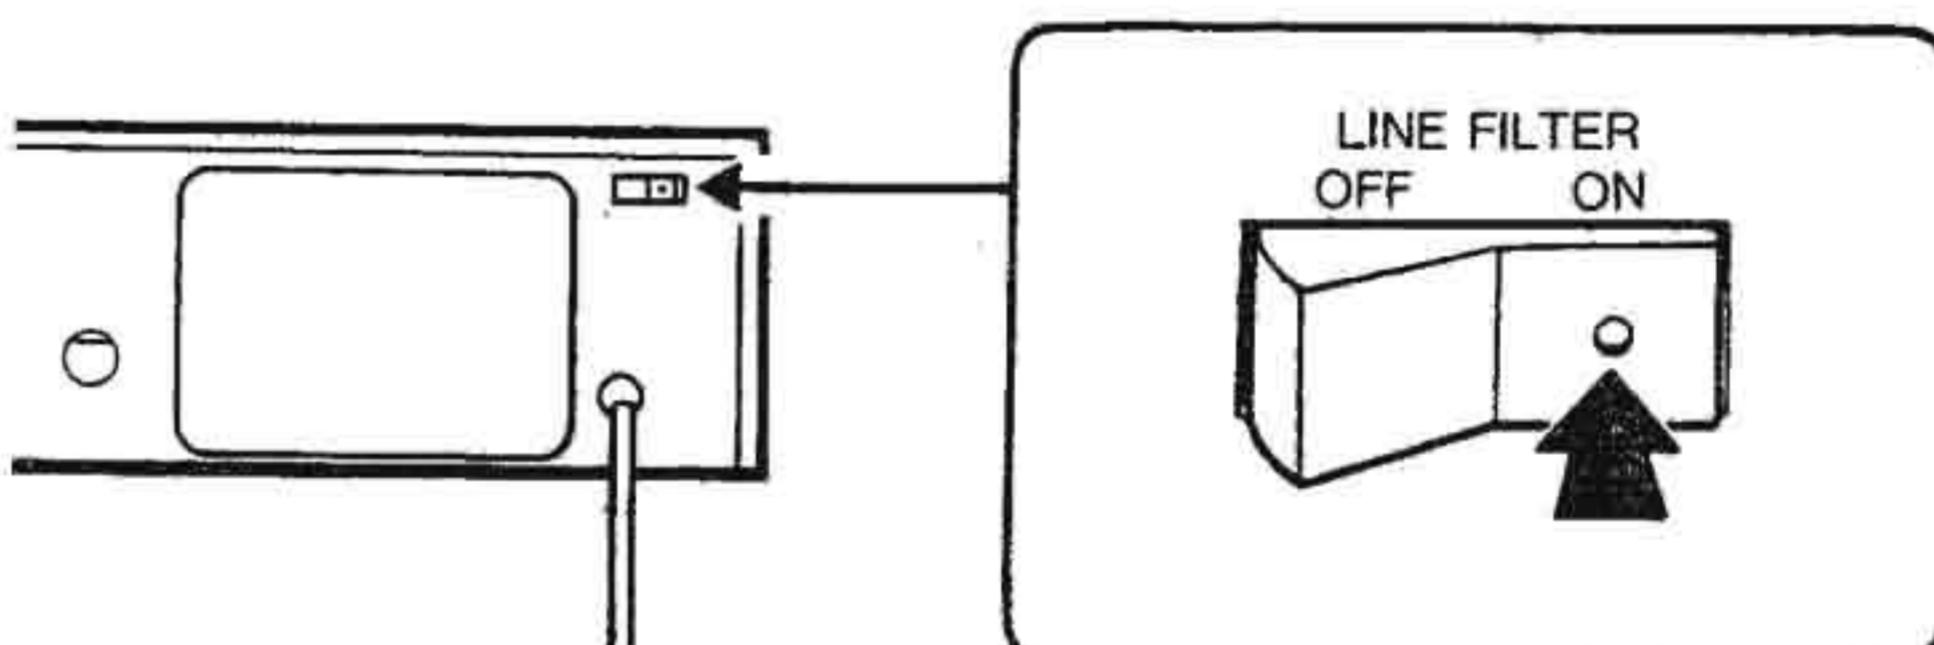

Either the FIXED or VARIABLE LINE OUT jacks can be used.

FIXED: The output level from these jacks is fixed regardless of the setting of the LINE OUT/HEADPHONES level control.

VARIABLE: The output level from these jacks can be adjusted by the LINE OUT/HEADPHONES level control. We recommend that you use these jacks when you want to match the output level of the tape deck with that of any other equipment connected to the amplifier.

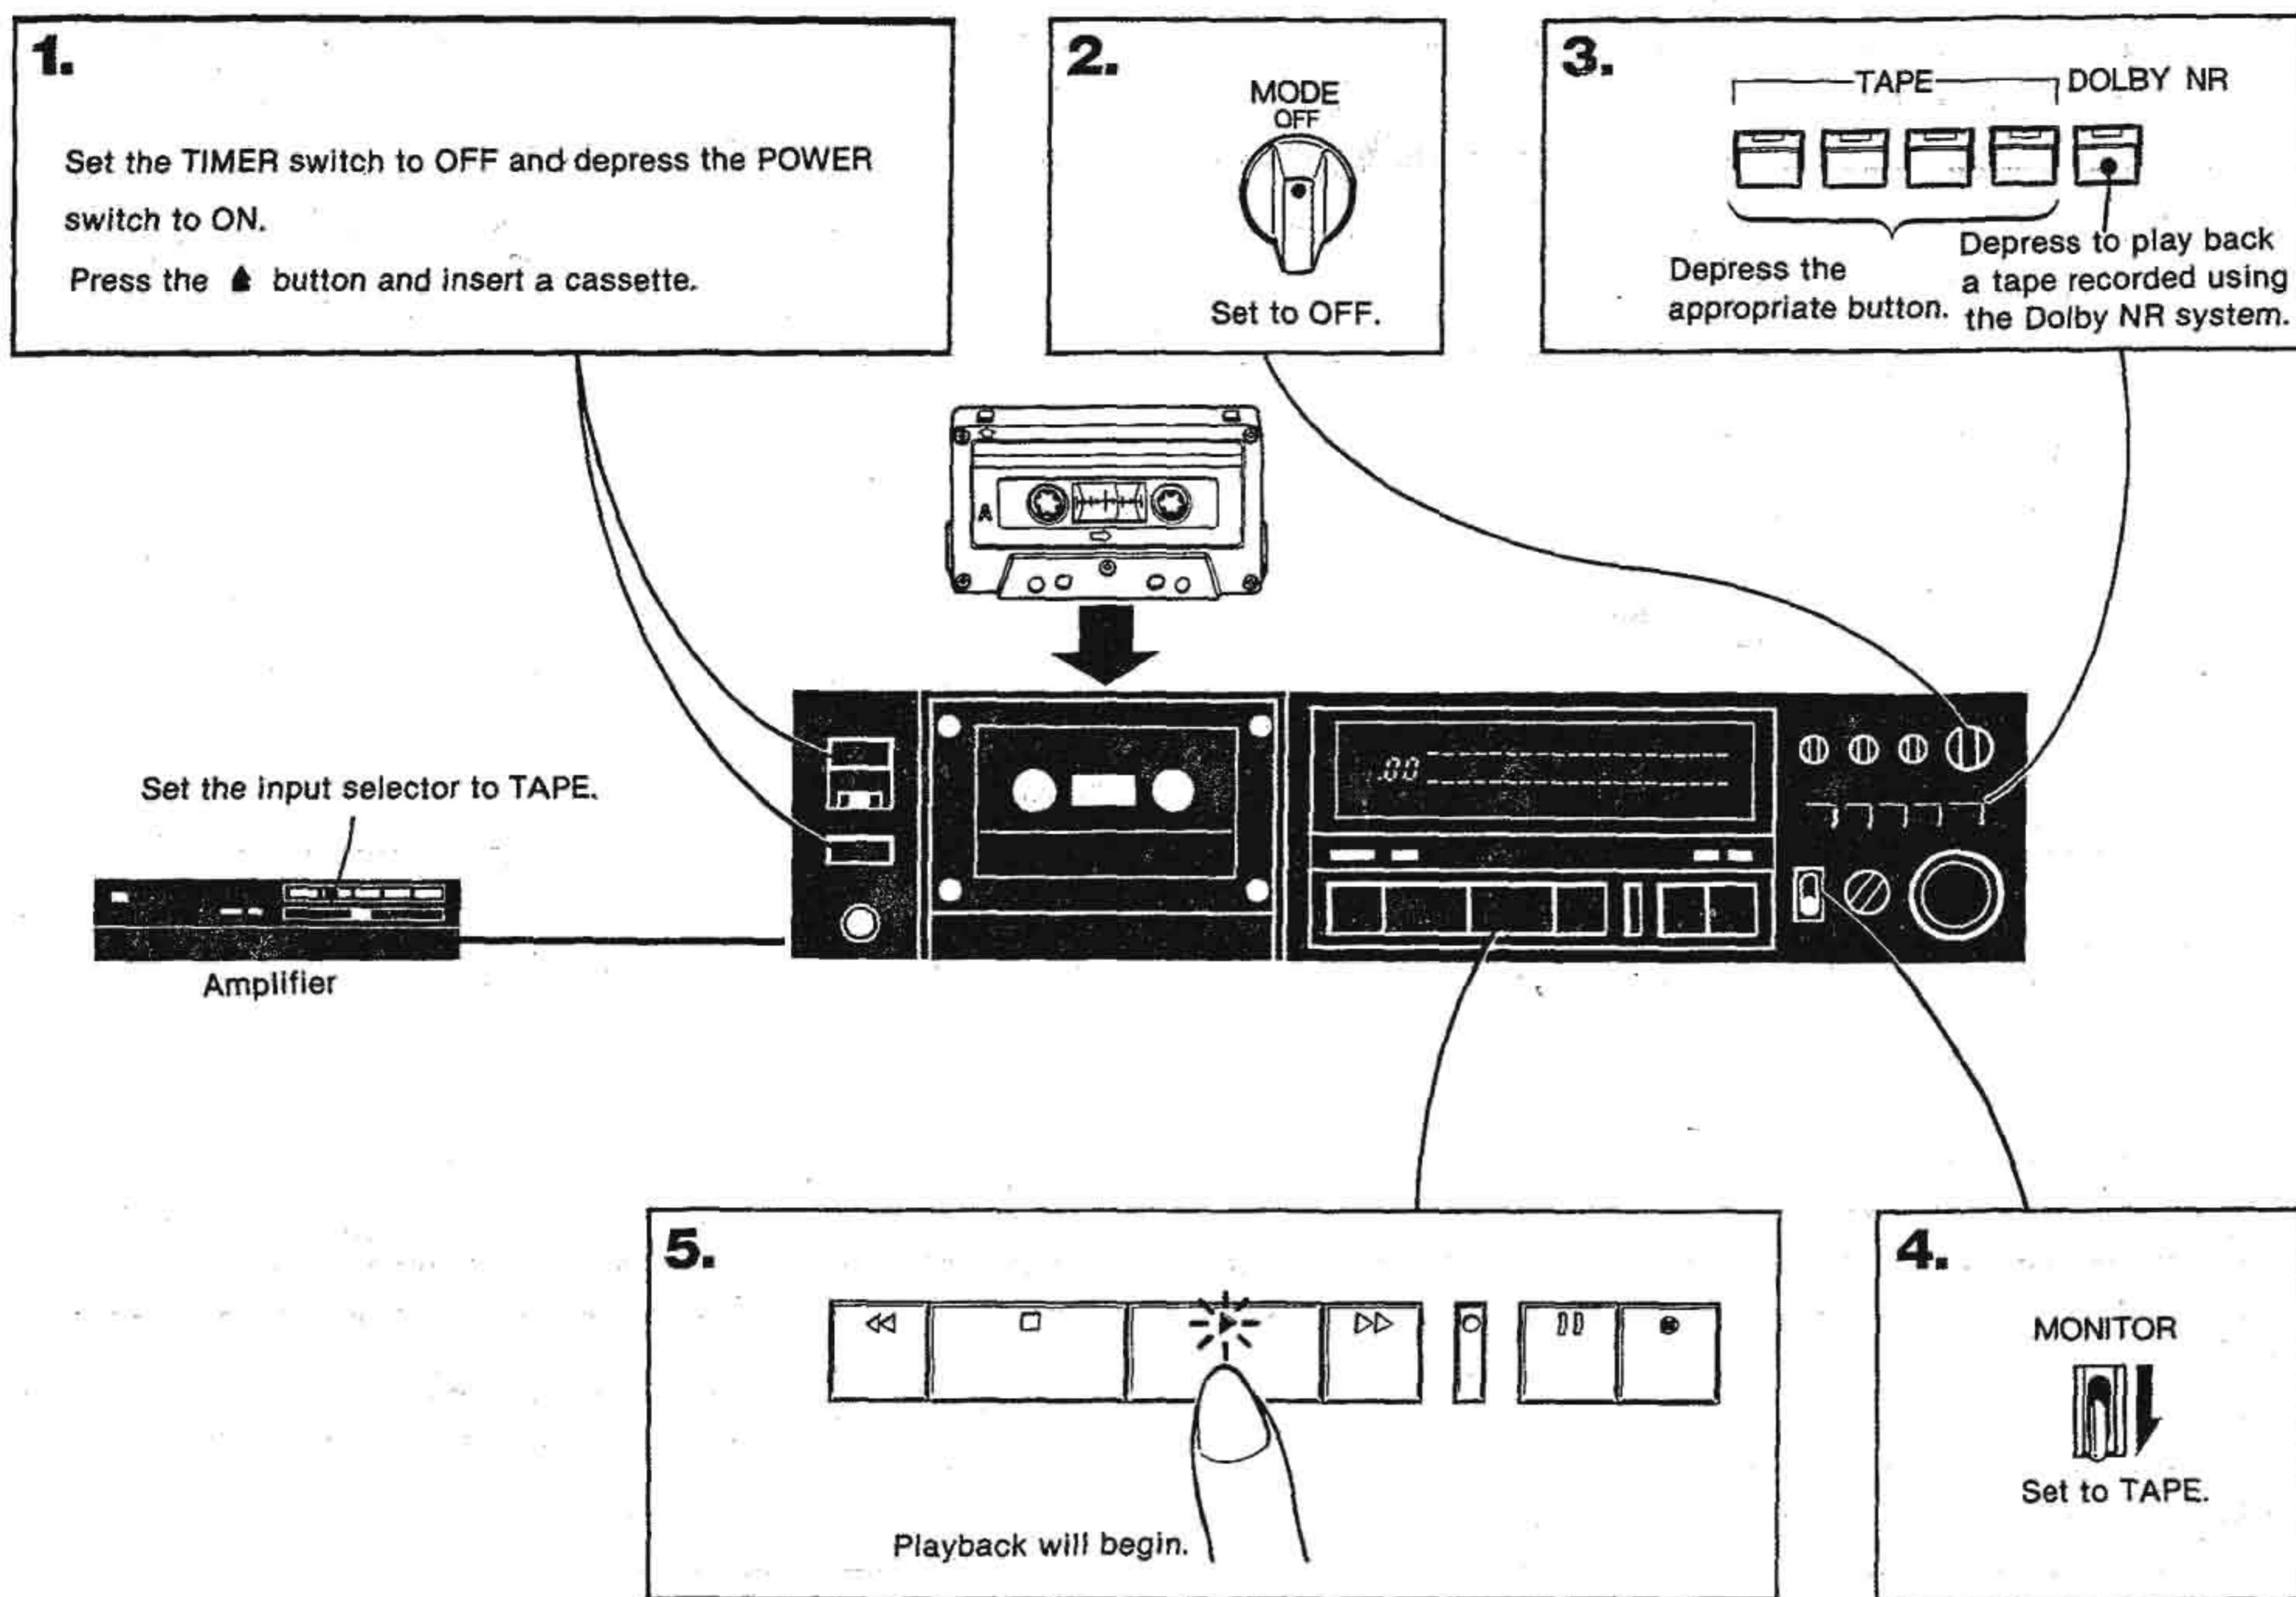

LINE FILTER Switch

The line filter reduces the noise produced by an household electric appliance (such as a refrigerator, a fluorescent light, or an air conditioning unit) and transmitted by the ac power cord (mains lead). Since the line filter has an effect on the tone quality, we recommend that you set the LINE FILTER switch to ON only when the line noise is so loud that it might be heard on recording.

PLAYBACK

The numbers in this diagram indicate the sequence to be followed.

RECOMMENDED SETTINGS FOR TAPE SELECT BUTTONS

Tapes (C-60 and C-90)		TAPE
SONY: AHF, BHF BASF: ferro super LH I MAXELL: UD, UD-XL I SCOTCH: MASTER I	AGFA: SUPER FERRO DYNAMIC FUJI: FX-I PHILIPS: SUPER FERRO-I TDK: SD	TYPE I (NORM)
SONY: CD- α BASF: chromdioxid MAXELL: UD-XL II SCOTCH: MASTER II	AGFA: STEREO CHROM FUJI: FX-II PHILIPS: CHROMIUM TDK: SA	TYPE II (CrO ₂)
SONY: FeCr BASF: ferrochrom SCOTCH: MASTER III	AGFA: CARAT PHILIPS: FERRO CHROMIUM	TYPE III (Fe-Cr)
SONY: METALLIC	Other metal tapes	TYPE IV (METAL)

RECORDING

TO RECORD

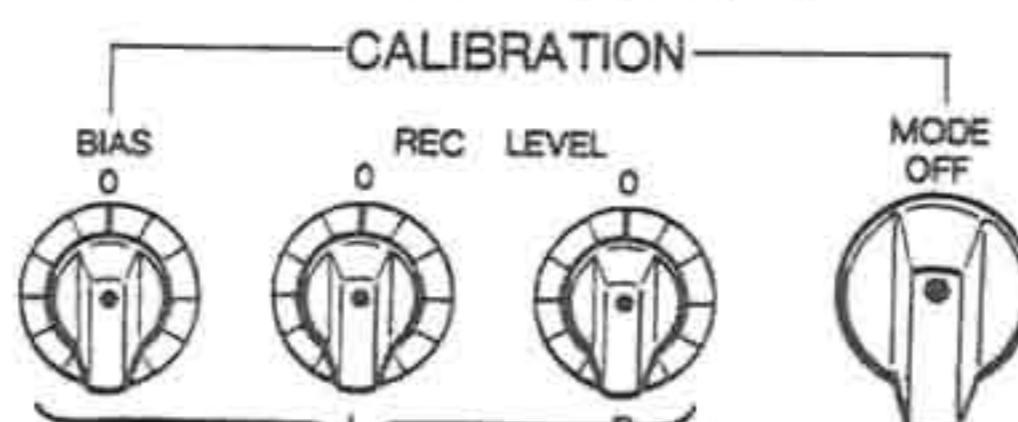

The numbers in this diagram indicate the sequence to be followed.

1.

Set the TIMER switch to OFF and depress the POWER switch to ON.
Press the Δ button and insert a cassette.

2.

For the calibration see page 12.

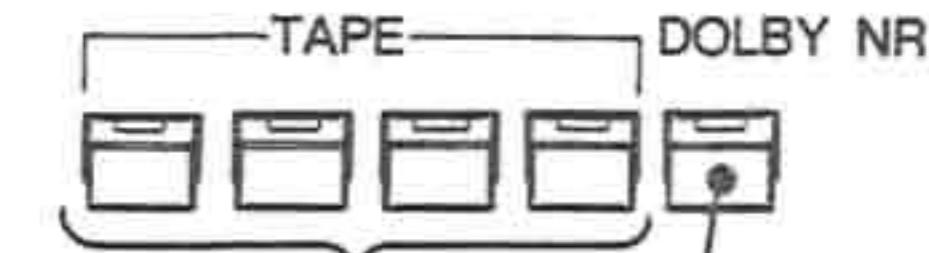

Set to OFF.

Set to "0" when recording without calibration.

If you know the optimum position, set to that position.

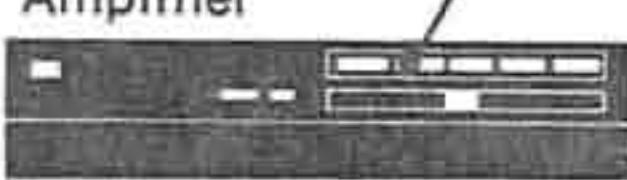

3.

Depress the appropriate button.

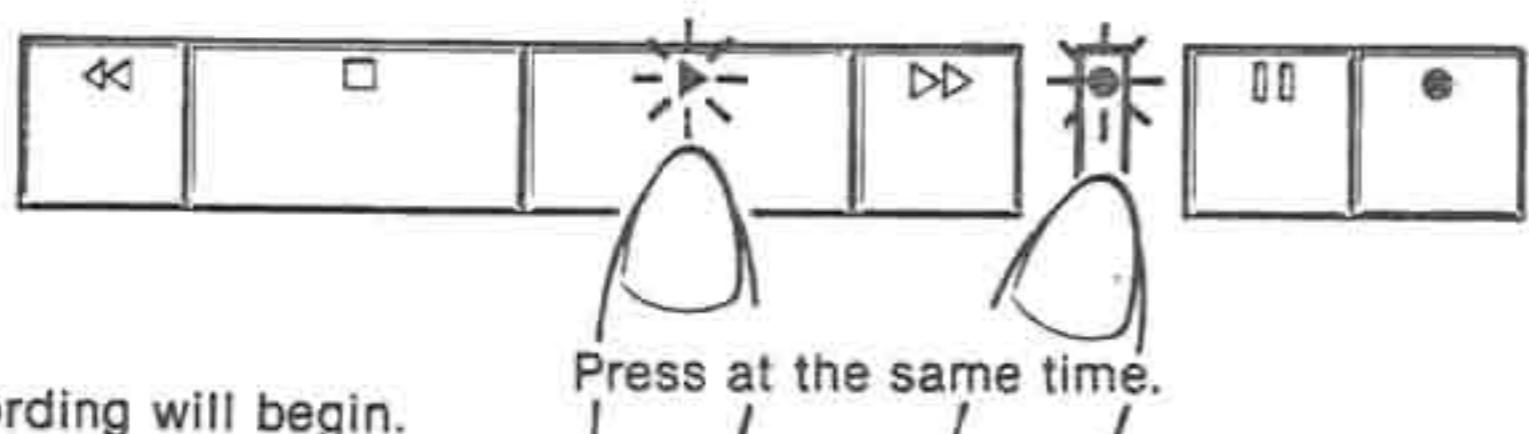

Depress to record using Dolby NR system.

Amplifier

Set the input selector to the desired program source.

6.

Recording will begin.

Press at the same time.

4.

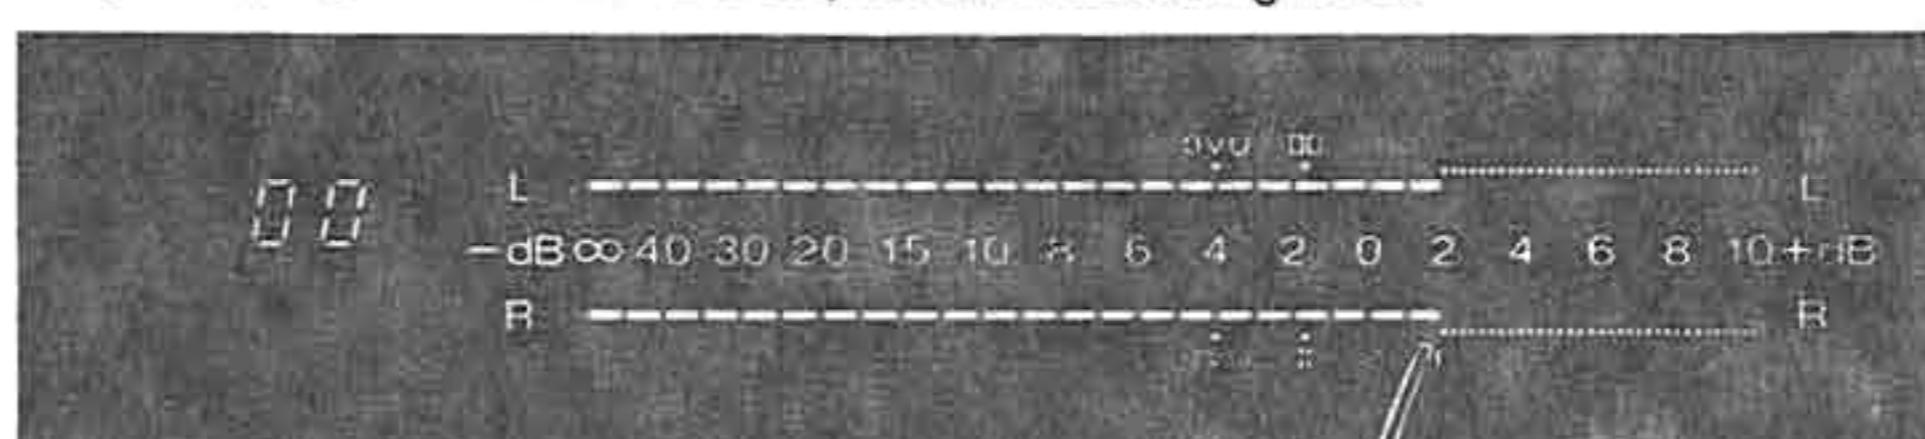

MONITOR SOURCE

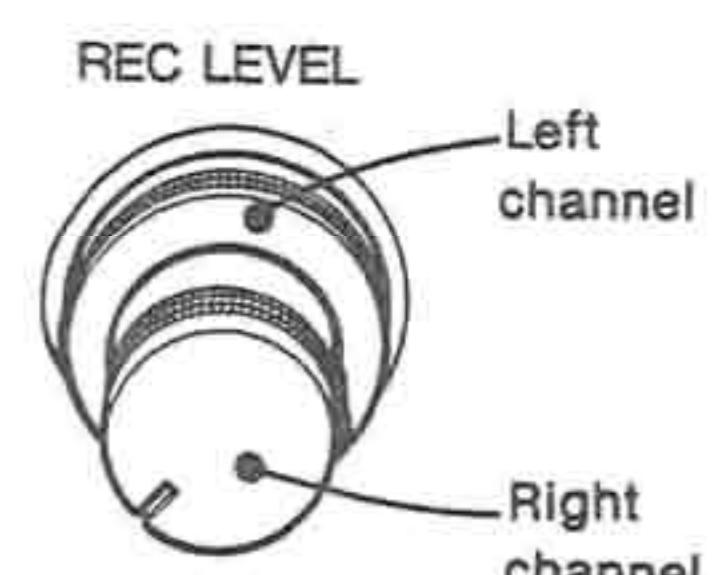

Set to SOURCE.

5.

Play the program source and adjust the recording level.

Adjust the REC LEVEL controls so that the peak program meters deflect only left end of the red line at the highest signal level.

TO RECORD MATERIAL ONTO A SPECIFIC PORTION OF TAPE

When you want to re-record a specific portion of tape or to insert new material between two points on a tape you will find it handy to be able to change directly from the playback to the record mode by pressing the record button while holding the forward button down.

BIAS/REC LEVEL CALIBRATION

There are many different cassettes on the market and their characteristics vary. The appropriate equalization characteristics and bias current will be obtained when the appropriate TAPE button is pressed. With the TC-K777 cassette deck you can adjust the recording characteristics much more precisely using the bias and record level calibrating function.

CALIBRATION SECTION

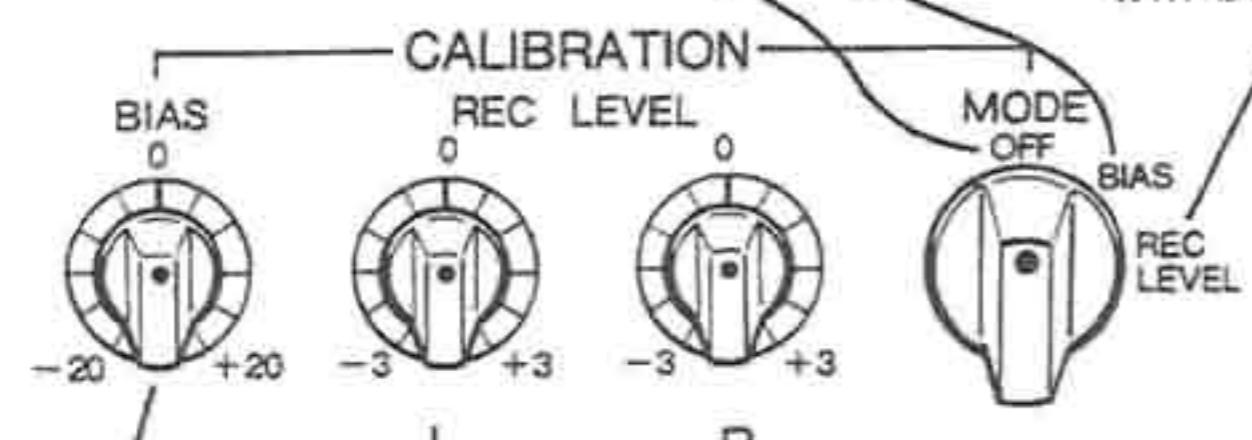

OFF: Set to this position except when calibrating.

BIAS: For bias calibration.

8 kHz and 400 Hz calibration test tones are provided.

The scale for bias calibration will be displayed on the display monitor.

REC LEVEL: For record level calibration.
A 400 Hz calibration test tone is provided.
The scale for record level calibration will be displayed.

Adjusts the bias amplitude $\pm 20\%$.

Adjust the L and R record level ± 3 dB.

The "0" positions are factory preset with Sony BHF, CD- α , FeCr and METALLIC cassettes.

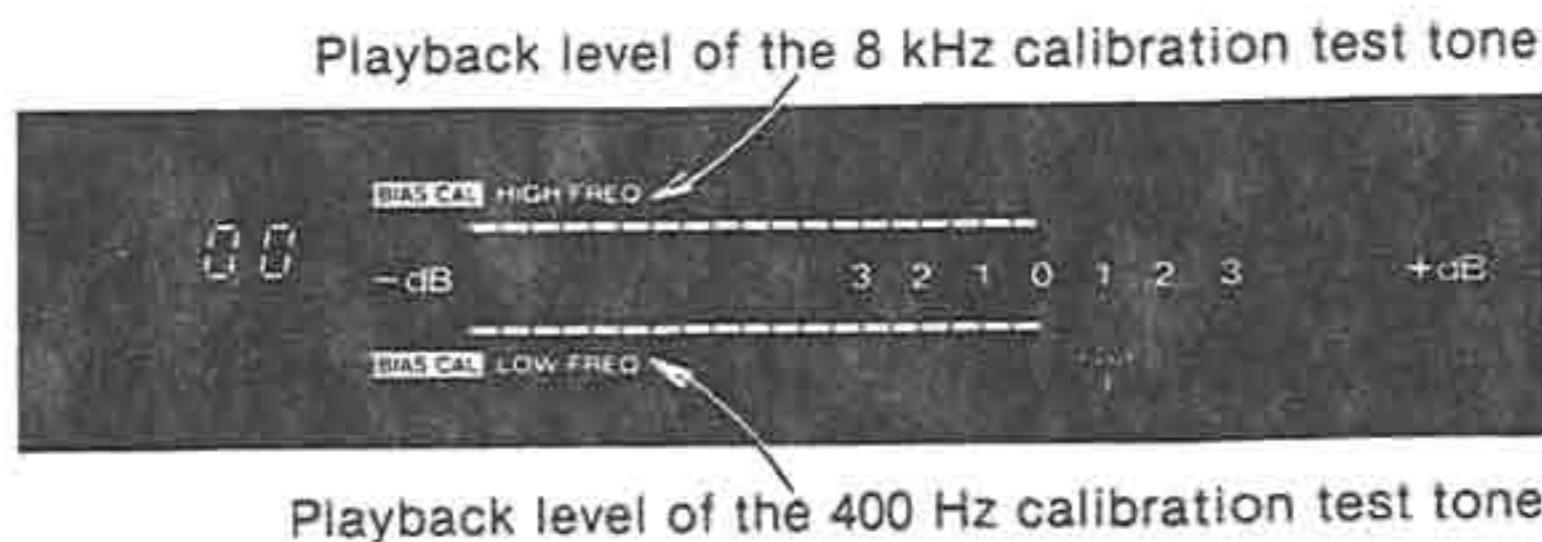

- When the CALIBRATION MODE switch is set at BIAS or REC LEVEL, the input and output signals are cut off internally and no sound is heard, regardless of the position of the MONITOR switch.

BIAS CALIBRATION

Too high a bias level gives a rolled-off high-frequency response, and too little bias reduces the signal-to-noise ratio and increases distortion.

To adjust the bias current to the level which results in the best possible frequency response, proceed as follows.

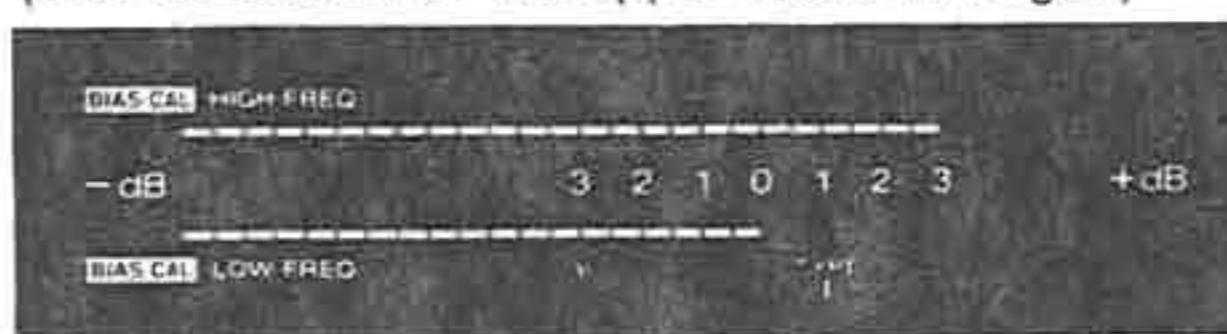

- Insert the cassette to be recorded.
 - Press the appropriate TAPE button according to the type of tape.
 - Set the MODE switch to BIAS.
 - Record the calibration test tones by pressing the ● button and the ▶ button.
- The meter shows the playback level of the calibration test tone, regardless of the position of the MONITOR switch.

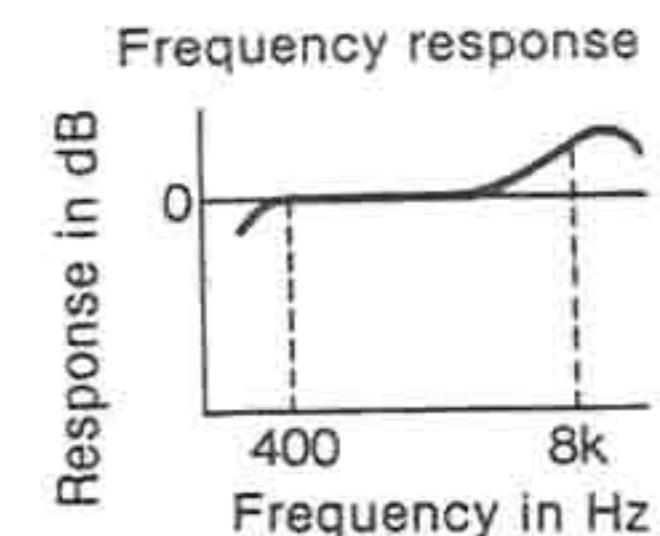

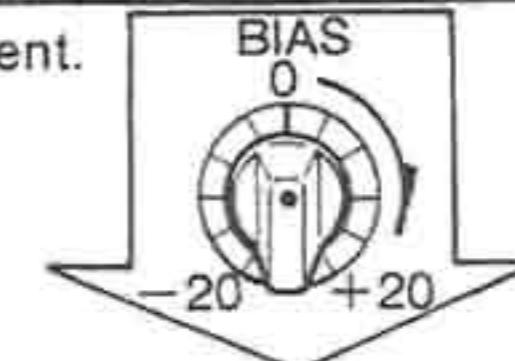

- Adjust the BIAS control so that the upper and lower meters deflect to the same point.

The bias level is low.

(The deflection of the upper meter is larger.)

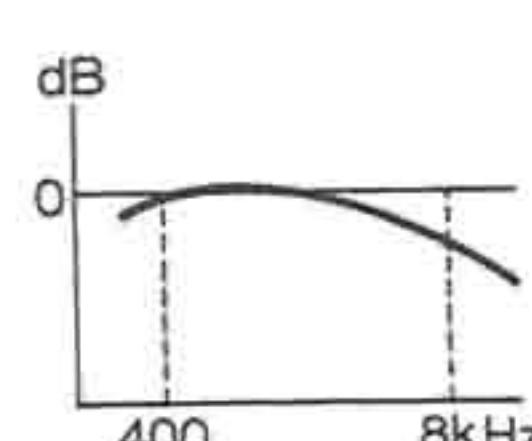

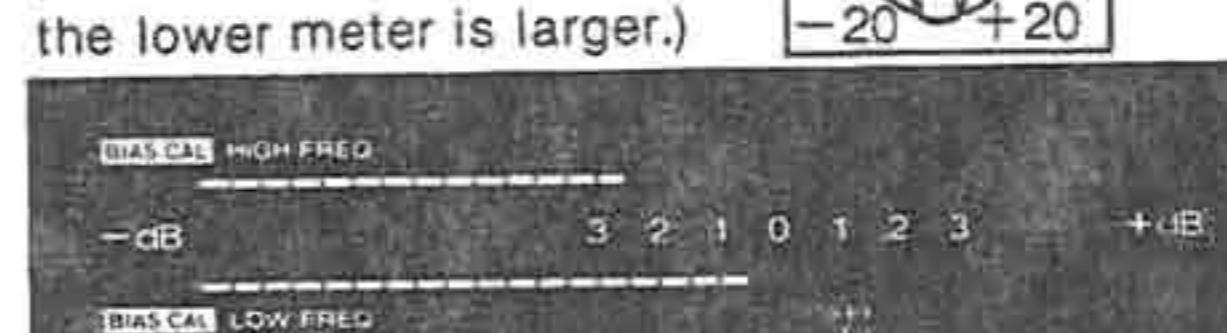

Apply more bias current.

The bias level is properly adjusted.

The bias level is high. Reduce bias current.
(The deflection of the lower meter is larger.)

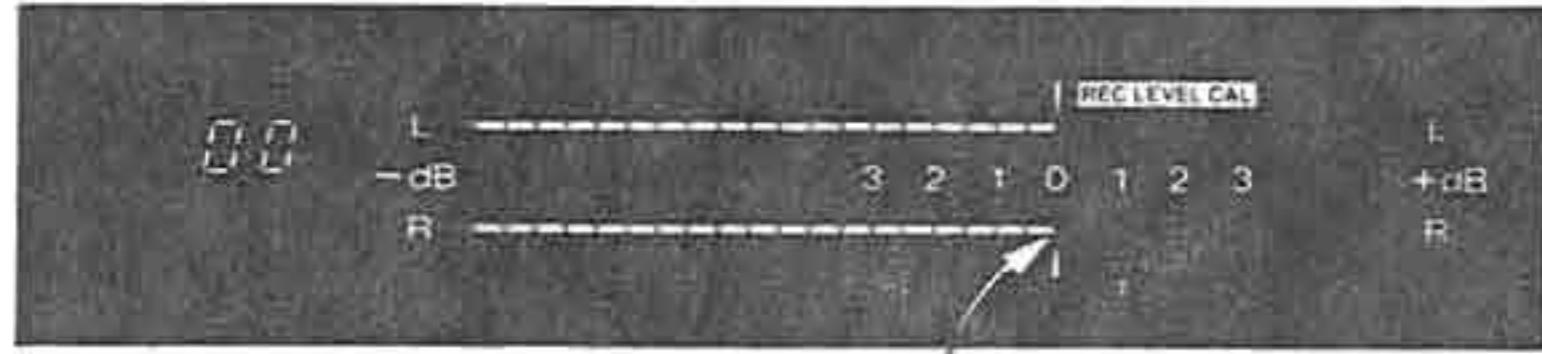

- As small variations in bias amplitude have practically no effect on the frequency response of metal tape, the optimum bias setting may not be obtained within the $\pm 20\%$ range of the BIAS control.

RECORDING LEVEL ADJUSTMENT

REC LEVEL CALIBRATION

The Dolby NR function is most effective when the recording level and the playback level are the same. Before making a recording, first calibrate the bias level, then calibrate the record level as follows. Tape sensitivity will be compensated for automatically.

1. Set the CALIBRATION MODE switch to REC LEVEL.
2. Record the calibration test tone by pressing the ● button and the ▶ button. The meters show the playback level of the calibration test tone regardless of the position of the MONITOR switch.
3. Adjust the REC LEVEL controls (L and R) so that the meters deflect to the indicated point.

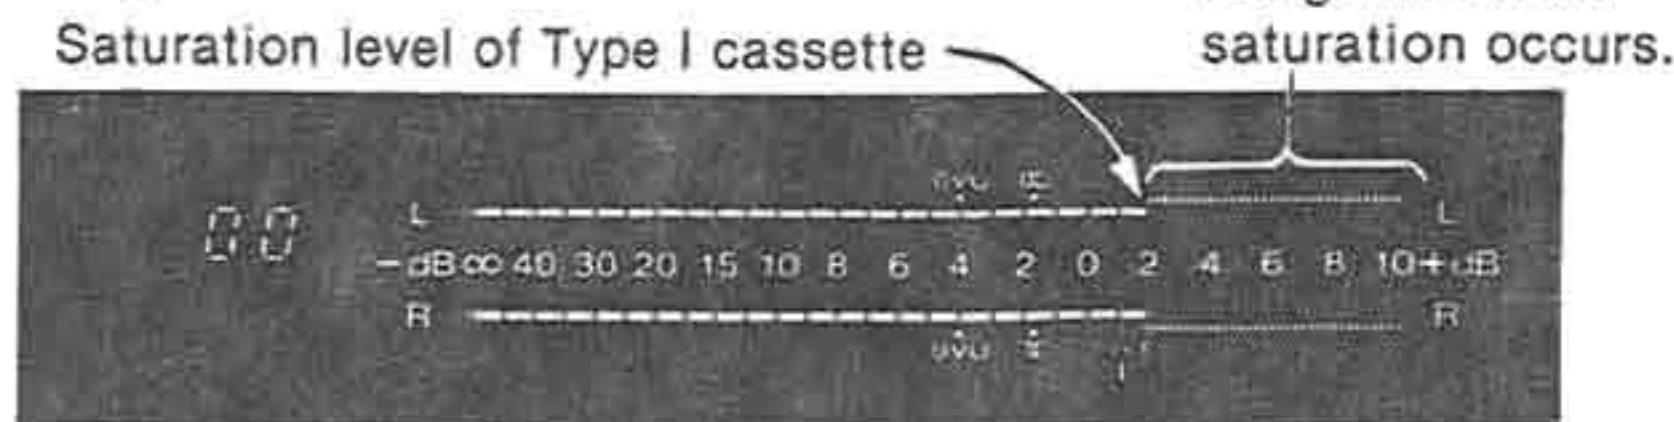

Let the meters deflect to this point.

The bias current is now adjusted to the optimum level and the tape sensitivity is compensated for.

Be sure to set the CALIBRATION MODE switch to OFF.
In order to erase the recorded calibration test tones, rewind the tape and start recording.

Adjust the recording level while monitoring on the peak program meters the input level of the program source to be recorded. If the recording level setting is too high, the recording will be distorted, and if the setting is too low, the recording will be noisy. The recording level should be set as high as possible while still avoiding distortion. This level will depend on the type of tape being used. When the TAPE button is pressed, the range above the saturation level of the selected type of tape is indicated by the red line. Generally speaking, adjust the recording level by making sure that the meters deflect only to the left end of the red line at the highest signal level.

Example: Type I cassette

Since the saturation level of any tape is lower in the higher frequencies than in the lower frequencies, the recording level may still be too high if adjusted in this way if the program to be recorded contains many high frequency signals. Consideration has to be given to the program source to be recorded as well as to the characteristics of the cassette to be used, since each cassette, even cassettes using the same type of tape, may have different characteristics. The following table will provide you with a starting point in setting the recording level of various kinds of programs when using Sony cassettes.

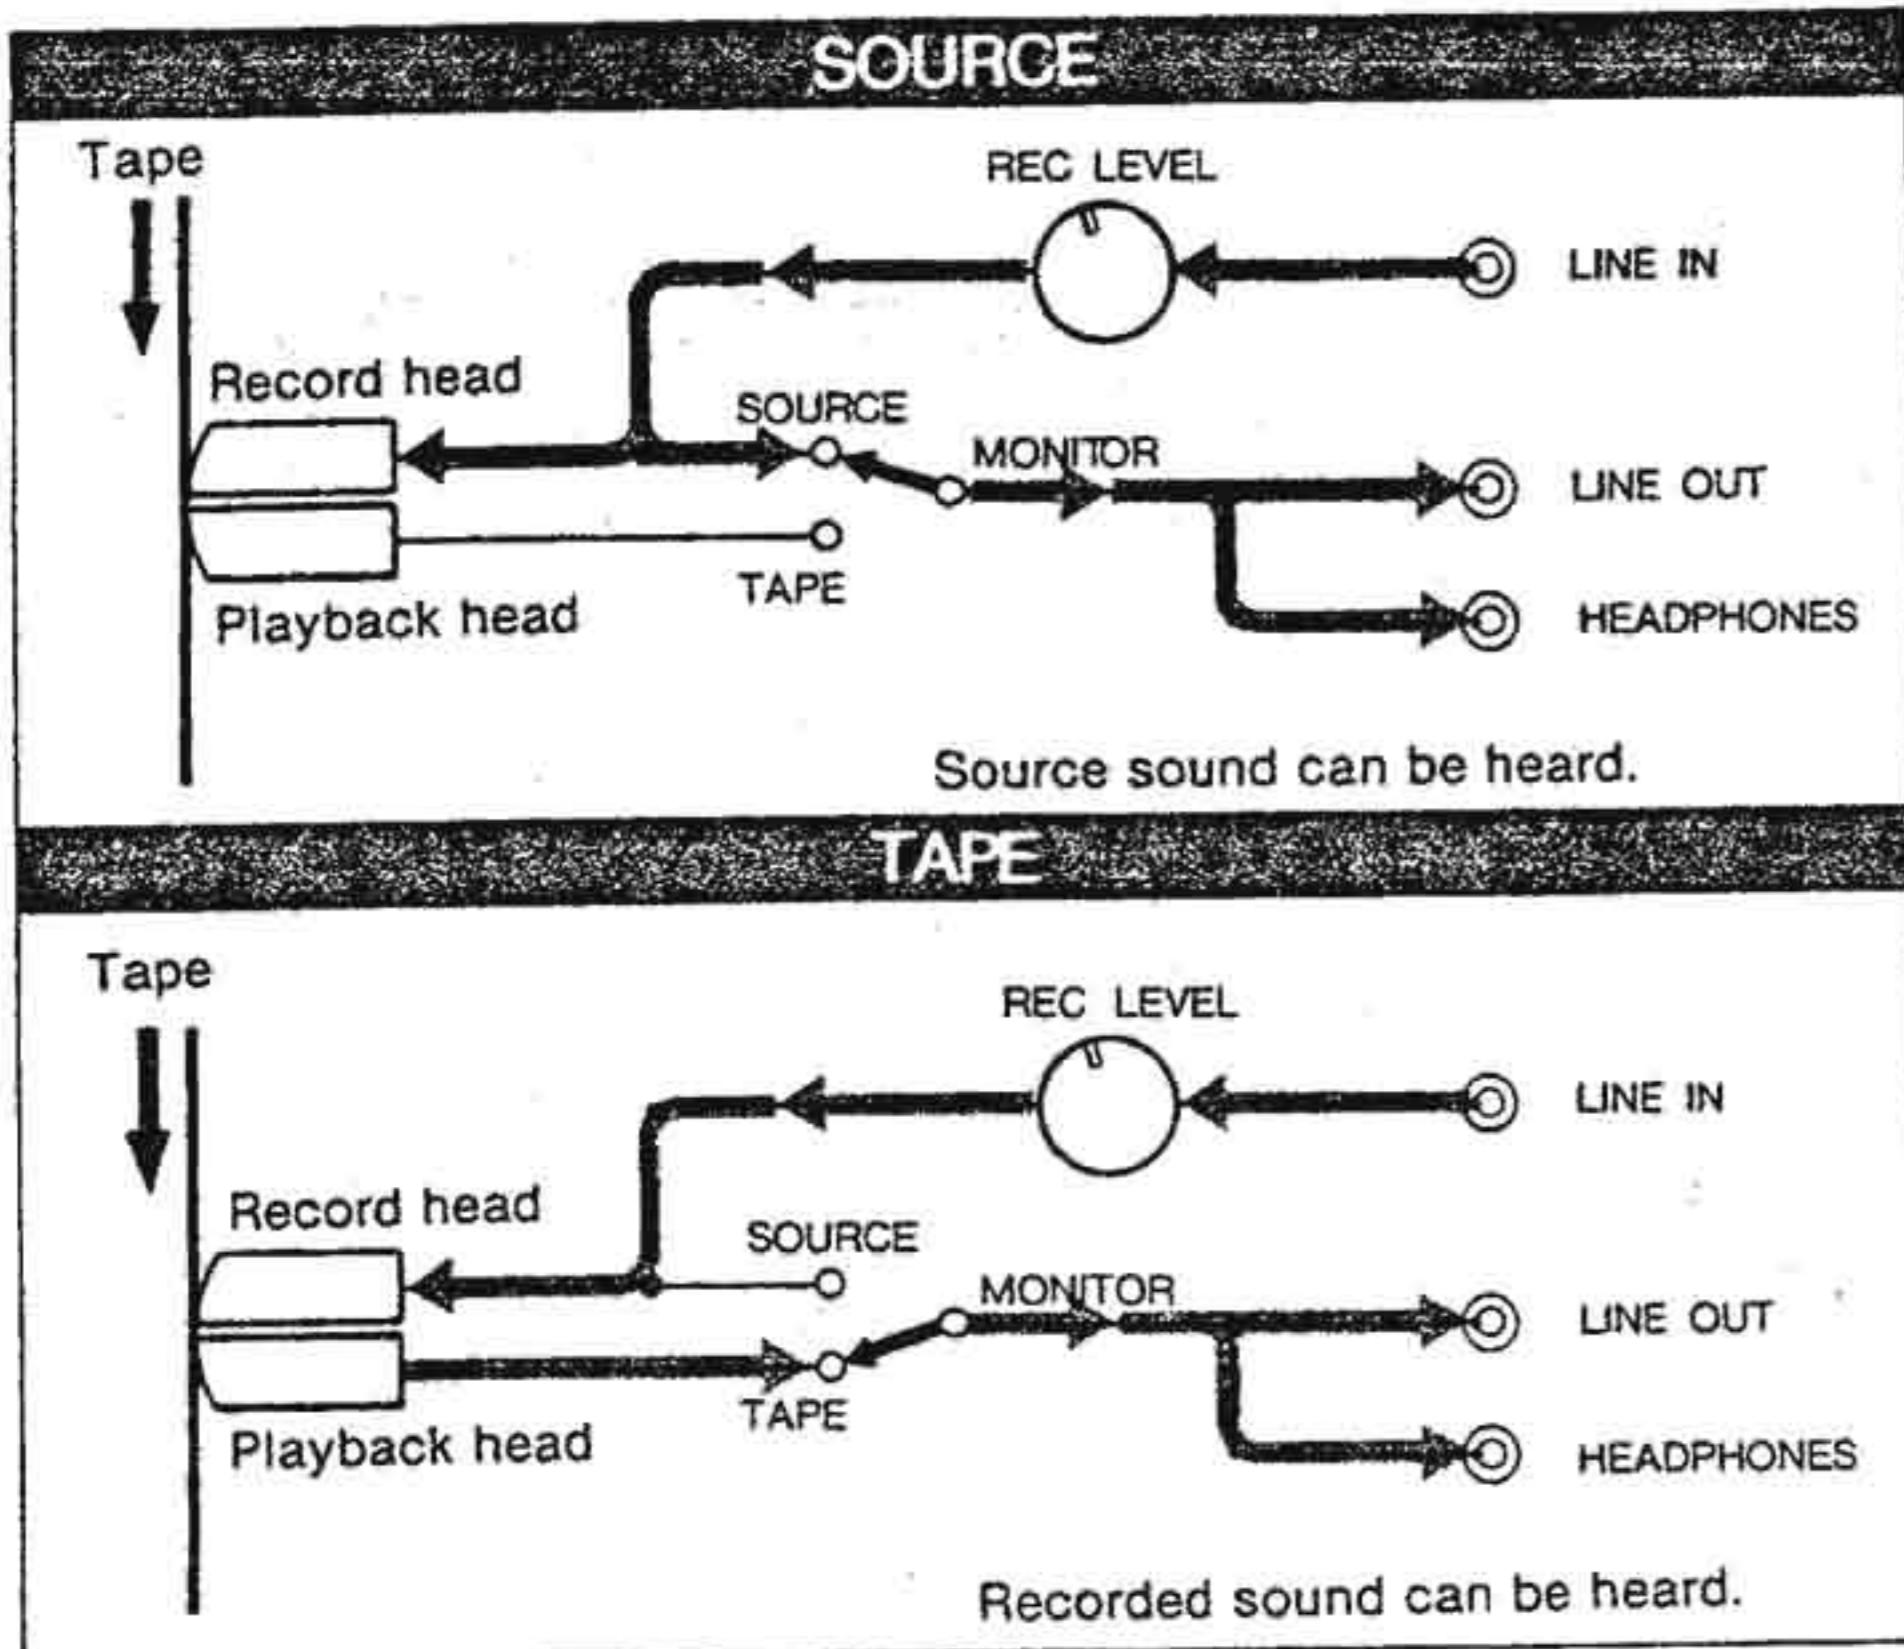

Type of tape	Sony cassettes	Low and mid freq. range programs (vocal, etc.)	Mid and high freq. range programs (piano, guitar, etc.)
I	BHF	+ 3 dB	+ 1 dB
	AHF	+ 4 dB	+ 2 dB
II	CD- α	+ 2 dB	+ 2 dB
III	FeCr	+ 5 dB	+ 1 dB
IV	METALLIC	+ 6 dB	+ 6 dB

RECORD MONITORING

As this tape deck has separate record and playback heads, you can easily compare the source and the recorded sounds in the recording mode by using the MONITOR switch. You can check the recording level and whether there is any contamination on the heads that is affecting the recording.

- If the connected amplifier has a tape monitor selector, source/tape comparison is possible with the amplifier monitor selector. In this case, set the tape deck MONITOR switch to TAPE.

MONITOR switch setting and signal flow

CHECKING THE AVAILABLE TAPING TIME

—The use of the tape counter—

The first two digits of this tape counter show the approximate recording or playback time in minutes, and the last two digits show the seconds.

To check how much longer you can record

Stop the tape and press the COUNTER RESET button to set the counter to ".00," press the **►** button and let the tape run to the end. The digits on the counter will show the approximate remaining recording time.

To rewind the tape to the ".00" point, use the memory stop function

To check the available recording time on one side of a cassette

At the beginning of the tape set the counter to ".00," press the **►** button and let the tape run to the end. The digits on the counter will show the approximate available recording time.

Note

Do not turn off the power while measuring the time because the numbers will return to ".00" when the power is turned on again.

The accuracy of the counter

This counter is not actually a digital clock, so that the displayed figures are not exactly equal to the actual time spent. The accuracy will vary depending on the type of tape being used.

This counter has been designed using C-60 cassettes as a standard. Make sure that the displayed time is greater than the required actual time when using a C-46 or C-30 cassette.

ERASING

When the tape deck functions in recording mode, the erase head automatically erases any previously recorded material.

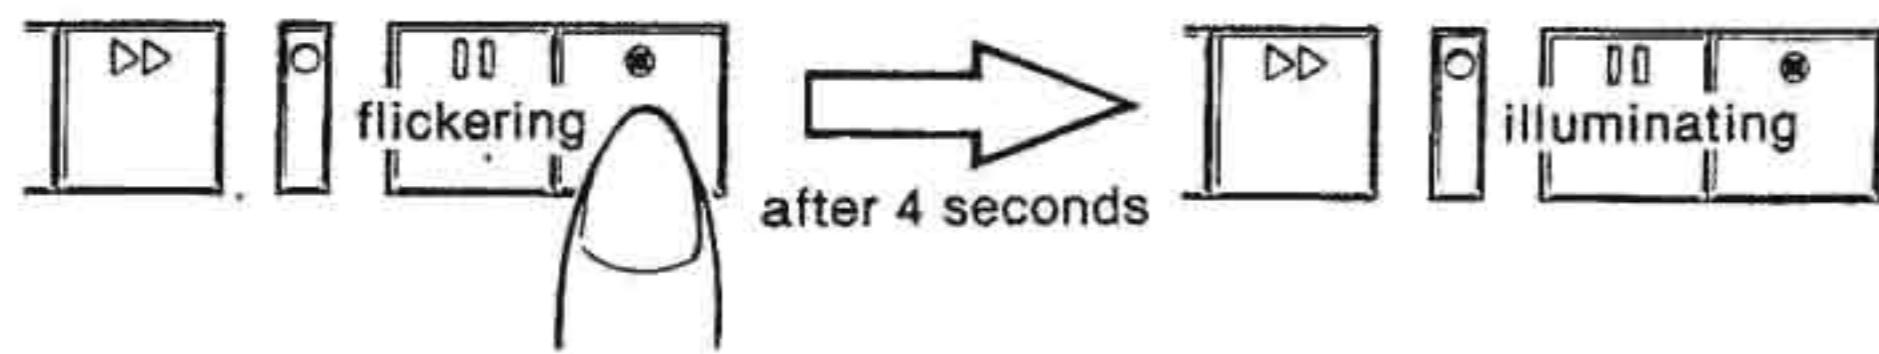

To erase without recording:

1. Make sure that the safety tab of the cassette is in place, or that the tab slot is covered with plastic tape.
2. Set the REC LEVEL controls fully to "0". (Disconnecting all inputs will result in a more complete erasure.)
3. Press the appropriate TAPE select button according to the type of tape to be erased. (The TYPE IV button assures good erasing for any type of tape.)
4. While holding the record button [●] down, press the forward button [►].

RECORD MUTING

By pressing the REC MUTE button during recording, four seconds interspacing is provided automatically, eliminating unwanted program material such as broadcasting commercials. While the record muting is operating, the incoming signal is not recorded on the tape but it continues to register on the meters and feed to the monitor so that you know exactly what is going on.

1. Press the REC MUTE button when the segment you do not want to record begins. The indicator of the pause button [II] will blink, and the tape path will pause automatically after four seconds.

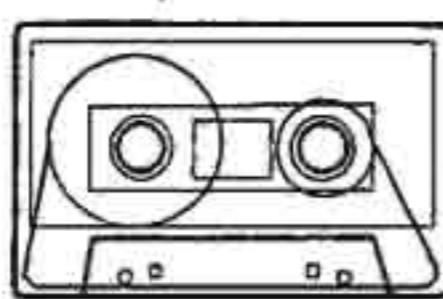

The record muting is operating.

A blank is made while the tape continues to run.

In the pause mode

The tape pauses.

2. When you want to resume recording, press the pause button.

To insert a blank less than four seconds long

Press the REC MUTE button to mute recording. Press the pause button when you want to resume recording.

To insert a blank over four seconds long

Hold down the REC MUTE button for as long as you want the blank segment on the tape to be. After four seconds, the indicator of the pause button will blink more rapidly. When you release the REC MUTE button, the tape deck will be in the pause mode. When you want to resume recording, press the pause button to release the pause mode.

AUTO PLAY

To rewind the tape and play from the beginning of the tape use the auto play function. The tape deck can automatically replay a tape immediately after rewinding.

1. Check that the word "MEMORY" is not displayed on the tape counter. If it is displayed, press the MEMORY button.
2. When you rewind the tape, press the \blacktriangleleft button and the \triangleright button simultaneously.

After the tape is completely rewound, the tape will automatically replay.

MEMORY STOP/PLAY

To rewind the tape to a desired point use the memory stop function. To play from a desired point use the memory play function. You can easily locate any particular point on a tape.

1. At the desired point on the tape, press the COUNTER RESET button to turn the tape counter to ".00."
2. Press the MEMORY button. The word "MEMORY" will be indicated.

3. Play back or record on the tape.

4. Rewind the tape in either of the following ways:

For memory stop: Press the \blacktriangleleft button. The tape stops automatically when it is rewound to the ".00" point.

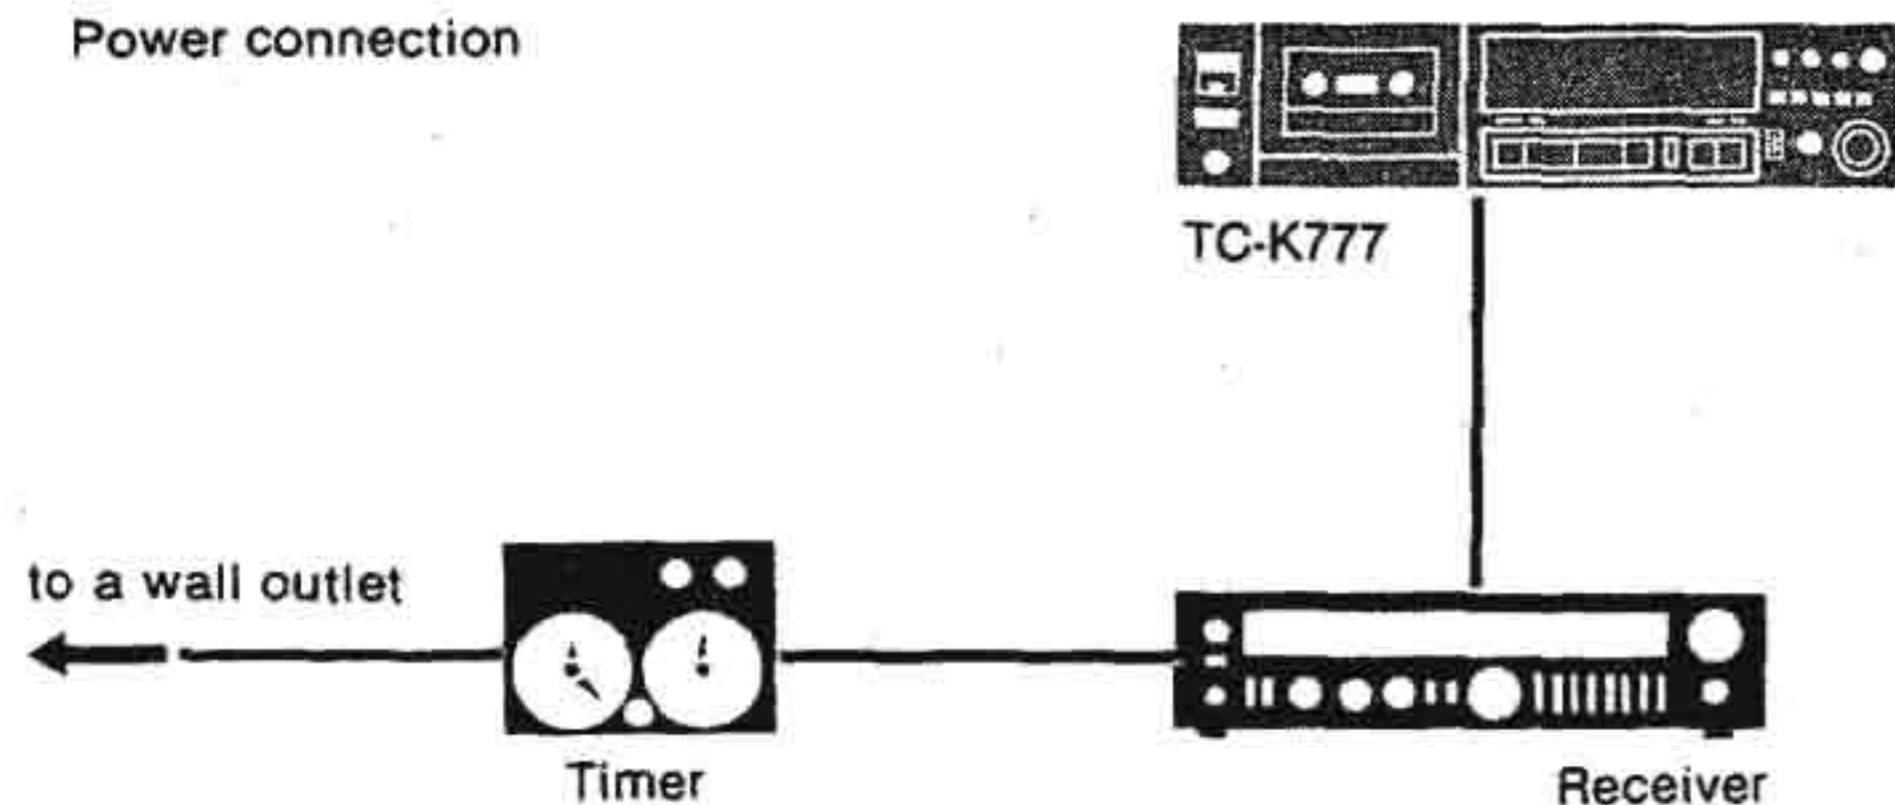

For memory play: Press the \blacktriangleleft button and the \triangleright button simultaneously. The tape will replay automatically after rewinding up to the ".00" point.

If you wish to rewind further than the ".00" point, press the \blacktriangleleft button again.

TIMER-ACTIVATED RECORDING AND PLAYBACK

By connecting any commercially available timer to the tape deck, the deck can be set to play back or record automatically at any desired time. As timers work in different ways, be sure to read the timer's instruction manual carefully.

Power connection

To record a broadcast using a timer

1. Connect the tape deck, receiver and timer. Set the timer so that power is supplied to the connected equipment.
2. Turn on the receiver and tune in the station which will broadcast the program you want to record.
3. Set the tape deck's TIMER switch to OFF.
4. Insert a cassette. Make sure that the tab is intact or that plastic tape covers the tab slot.
5. Turn on the tape deck and adjust the recording level.
6. Set the timer for the desired time. (At this point power to the connected equipment will be cut off.)
7. Set the tape deck's timer switch to REC.

The tape deck is now ready to start recording at the time set on the timer.

To play back using a timer

The connections between equipment are the same as for recording using a timer.

1. Set the tape deck's TIMER switch to OFF.
2. Turn on the receiver and set the appropriate switches for playback.
3. Turn on the tape deck and insert the recorded cassette.
4. Set the timer for the desired time. (At this point power to the connected equipment will be cut off.)
5. Set the tape deck's timer switch to PLAY. The tape deck is now ready to start playback at the time set on the timer.

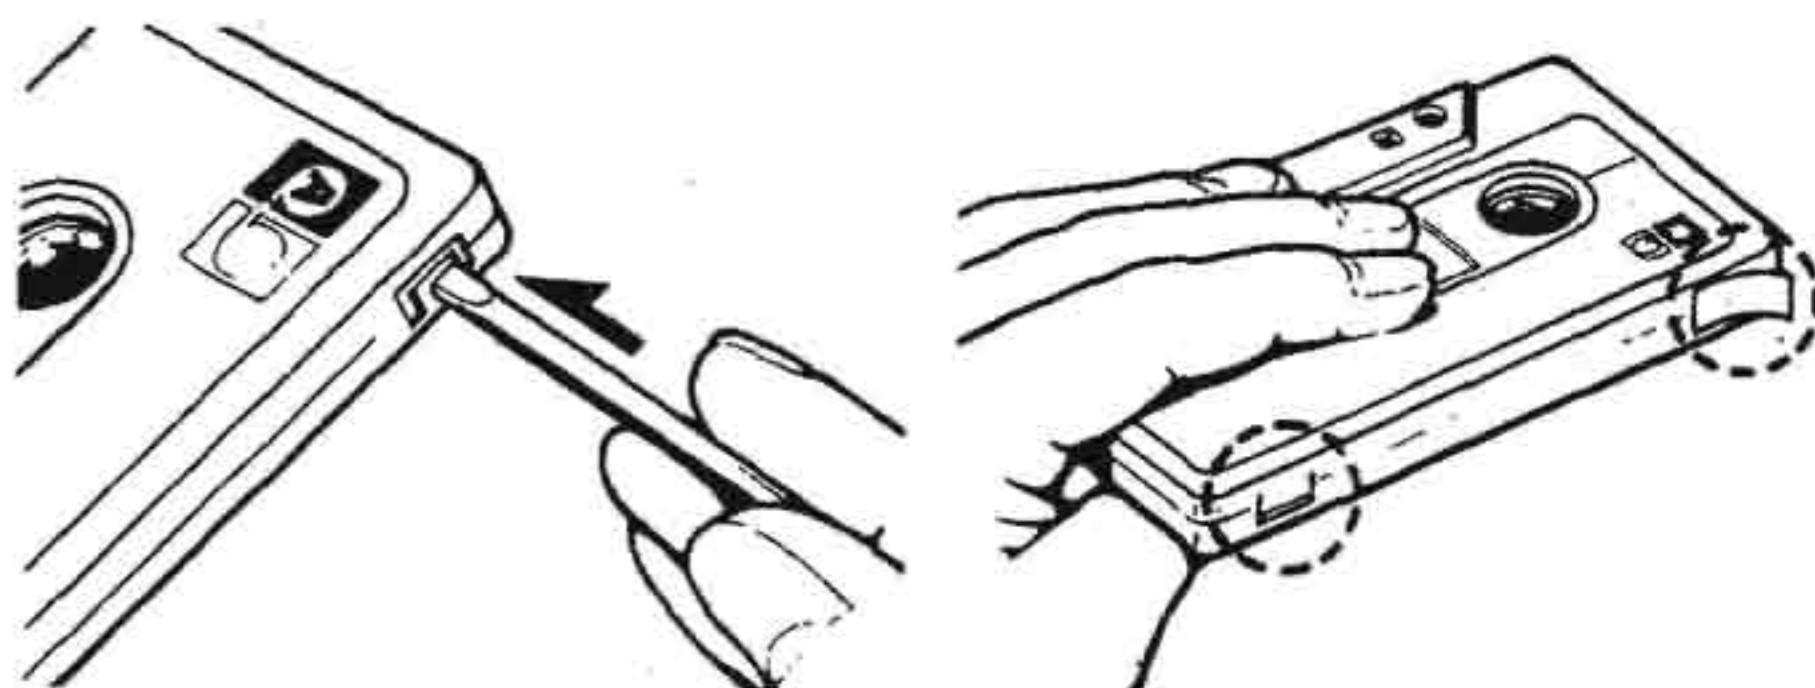

Note

The tape deck's timer switch will function properly only if the tape deck is turned on **after** the switch is set to REC or PLAY. Do not change the setting of the timer switch during the four second stand-by period immediately after the power is turned on. If you want to change the setting of the switch, turn the power off first.

NOTES ON CASSETTES

To protect cassettes from accidental erasure

Remove the tab as illustrated so that the record mode does not function when the record button is pressed. To record on a cassette once tabs have been removed, simply cover the slot with plastic tape.

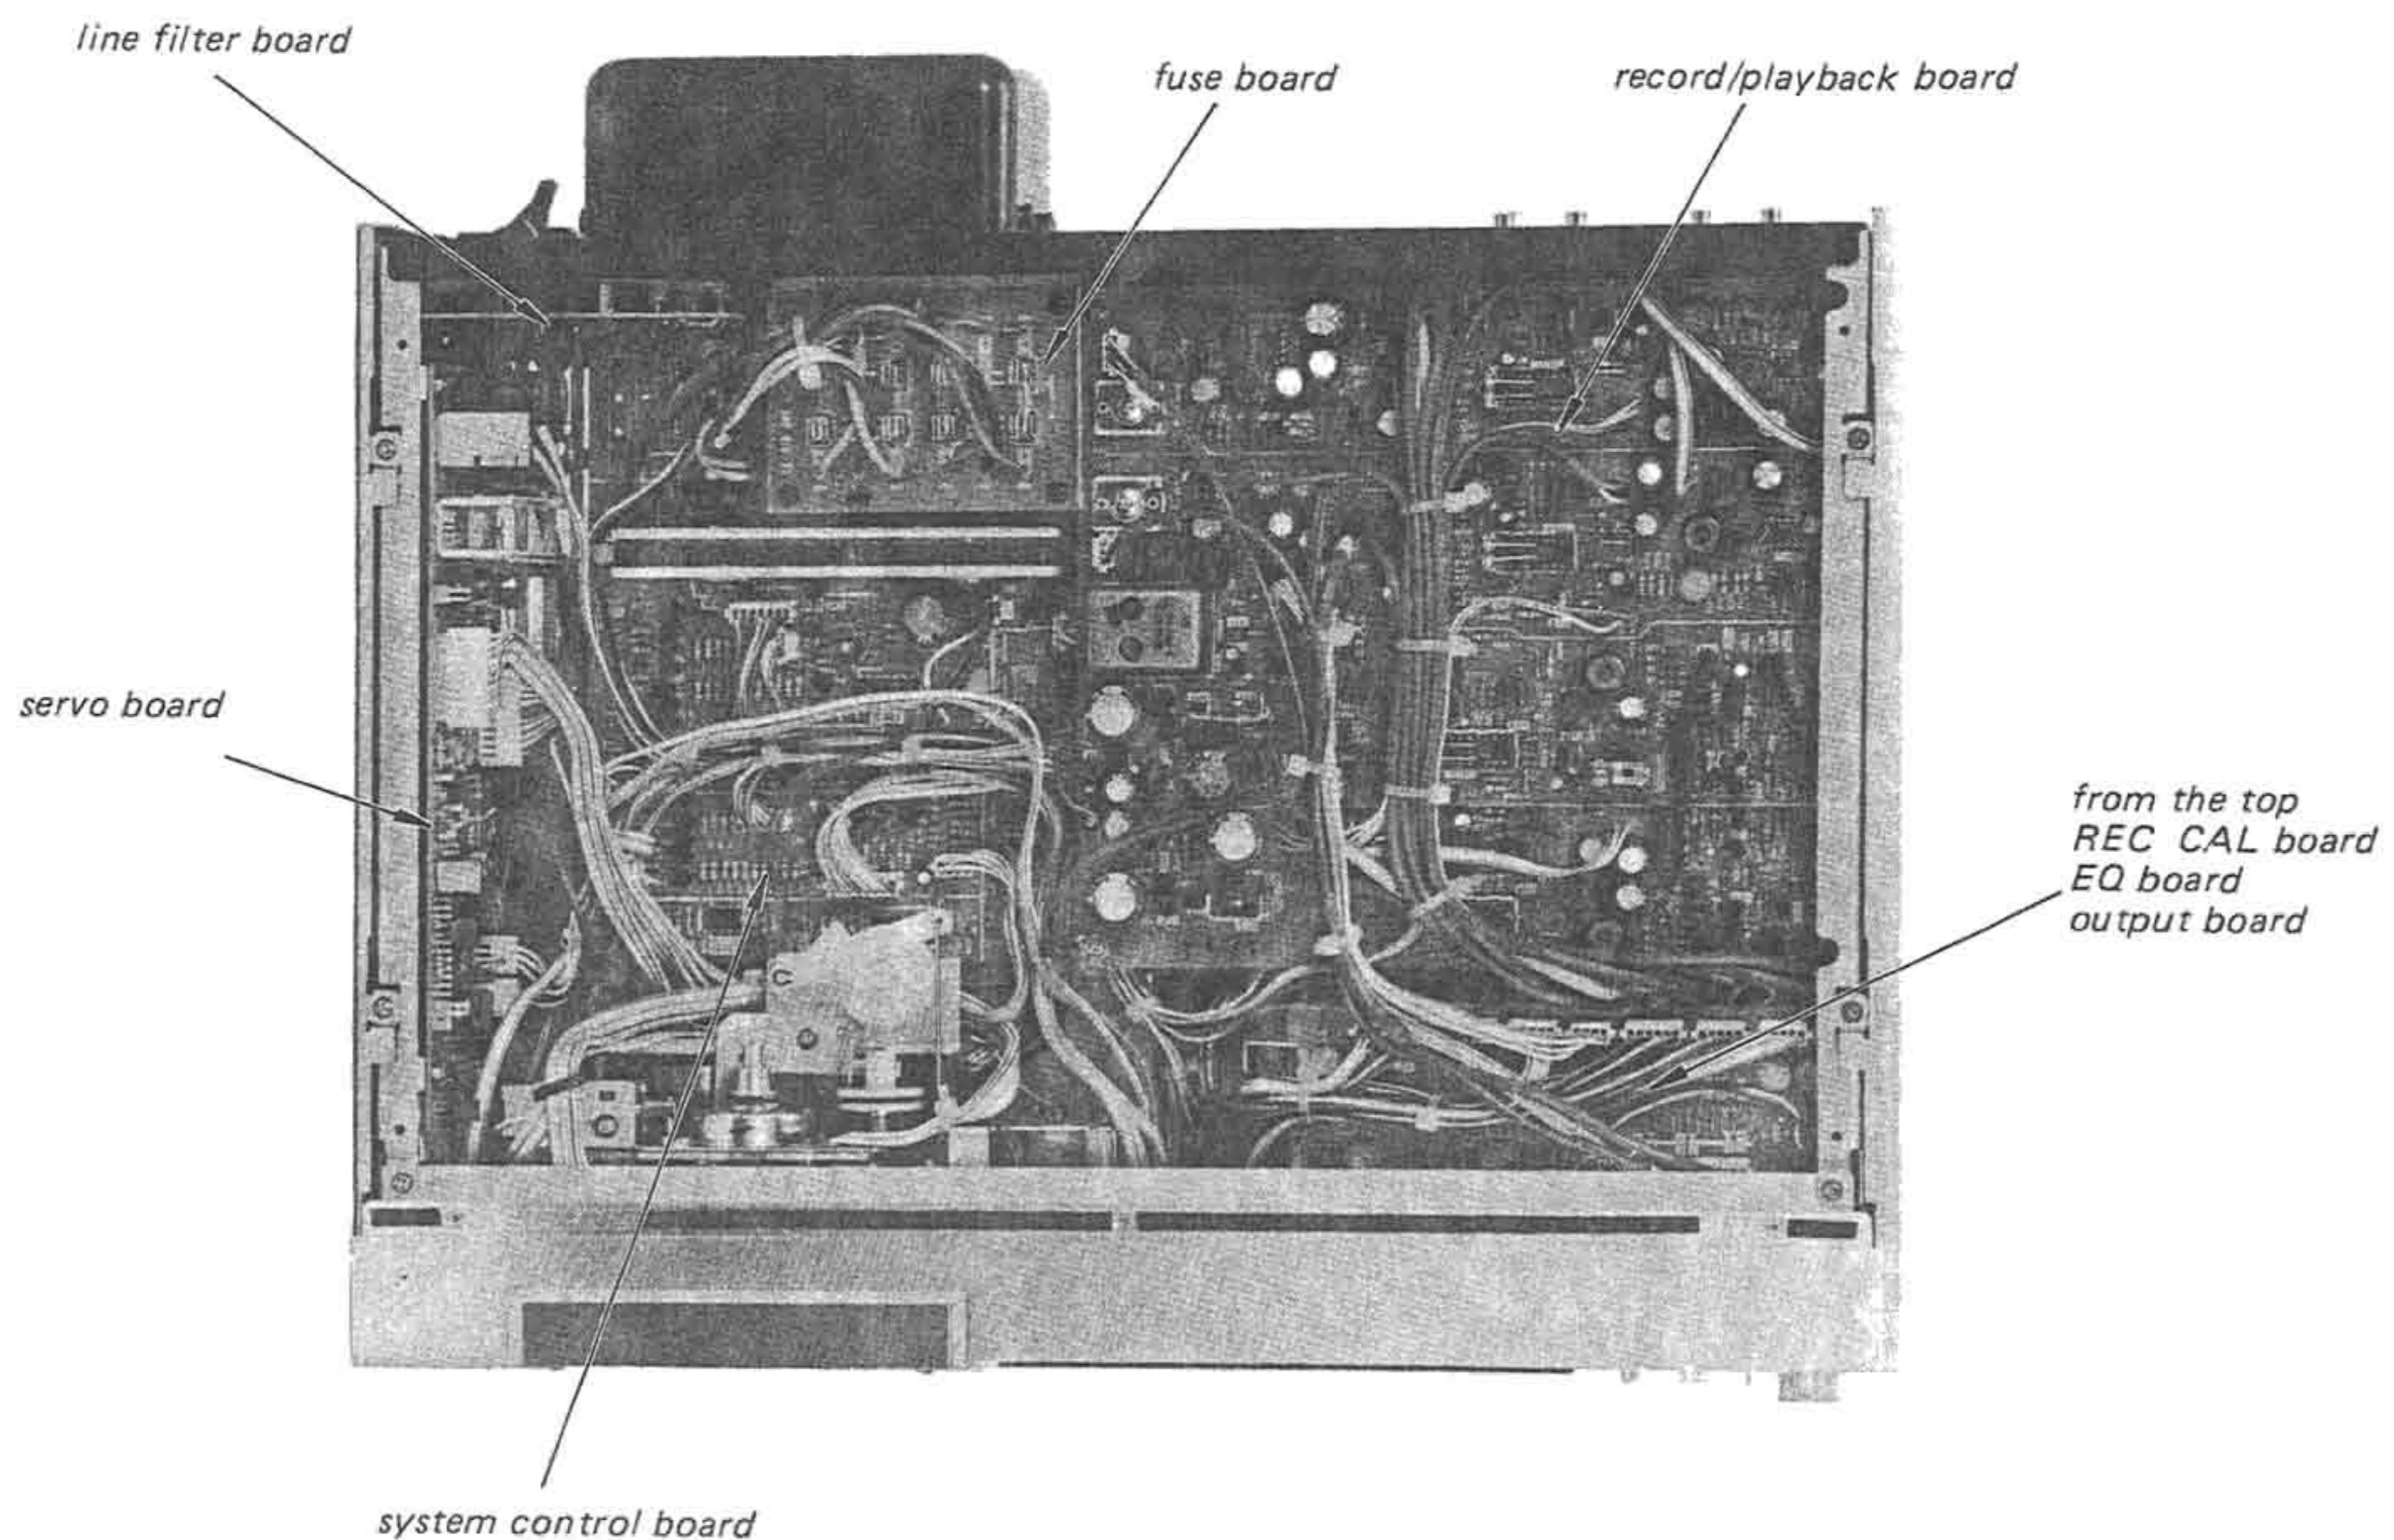

To protect side A recording

Do not stick any other material except on the portion marked.

Cassette care

- Avoid touching the tape surface of a cassette, as any dirt or dust will contaminate the heads.
- Do not stick thick labels or tape on the cassette, as this may affect proper cassette alignment and prevent the tape from making proper contact with the heads.
- Keep cassettes away from equipment with magnets, such as speakers and amplifiers, because their magnets could cause erasures or distortions of your recorded tapes.
- Protect cassettes from dust by storing them in their cases. Even minor dirt or dust could contaminate the heads, resulting in noise and sound drop-outs.
- Do not expose cassettes to direct sunlight, extremely cold temperature or moisture.
- Avoid fast-winding just before storing cassettes, as this may stretch the tape edge if the cassettes are left unused over a period of time.

SECTION 3 ADJUSTMENTS

3-1. MECHANICAL ADJUSTMENTS

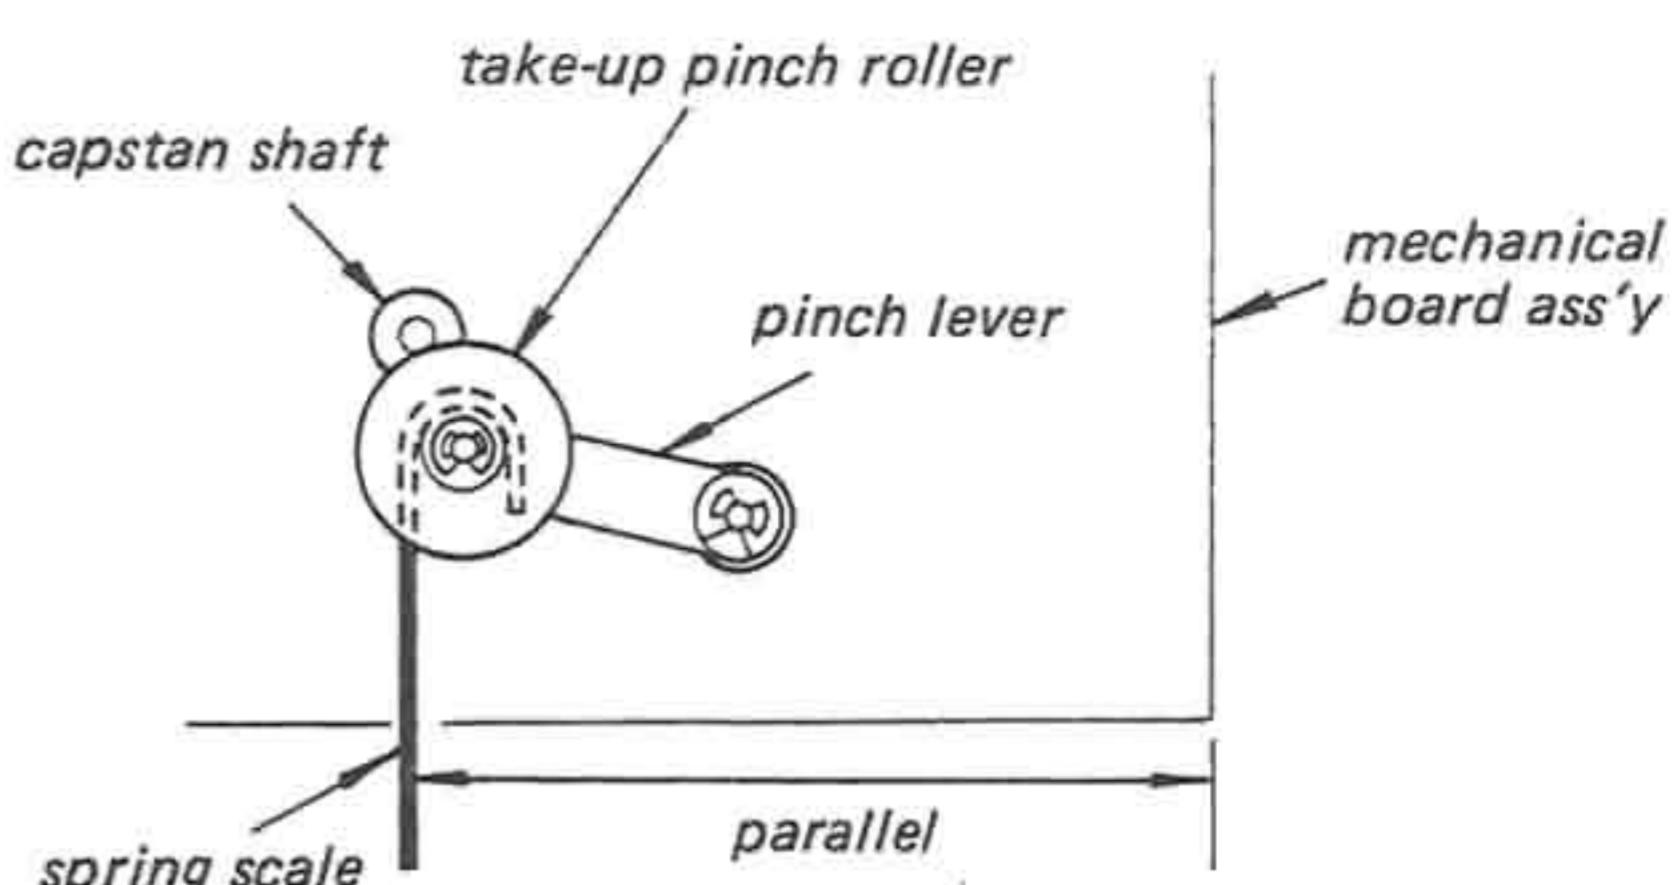

Precaution

1. Clean the following parts with a denatured alcohol-moistened swab.

2. Demagnetize the record/playback head with a head demagnetizer.
3. Do not use a magnetized screwdriver for the adjustments.

Pinch Roller Pressure Adjustment

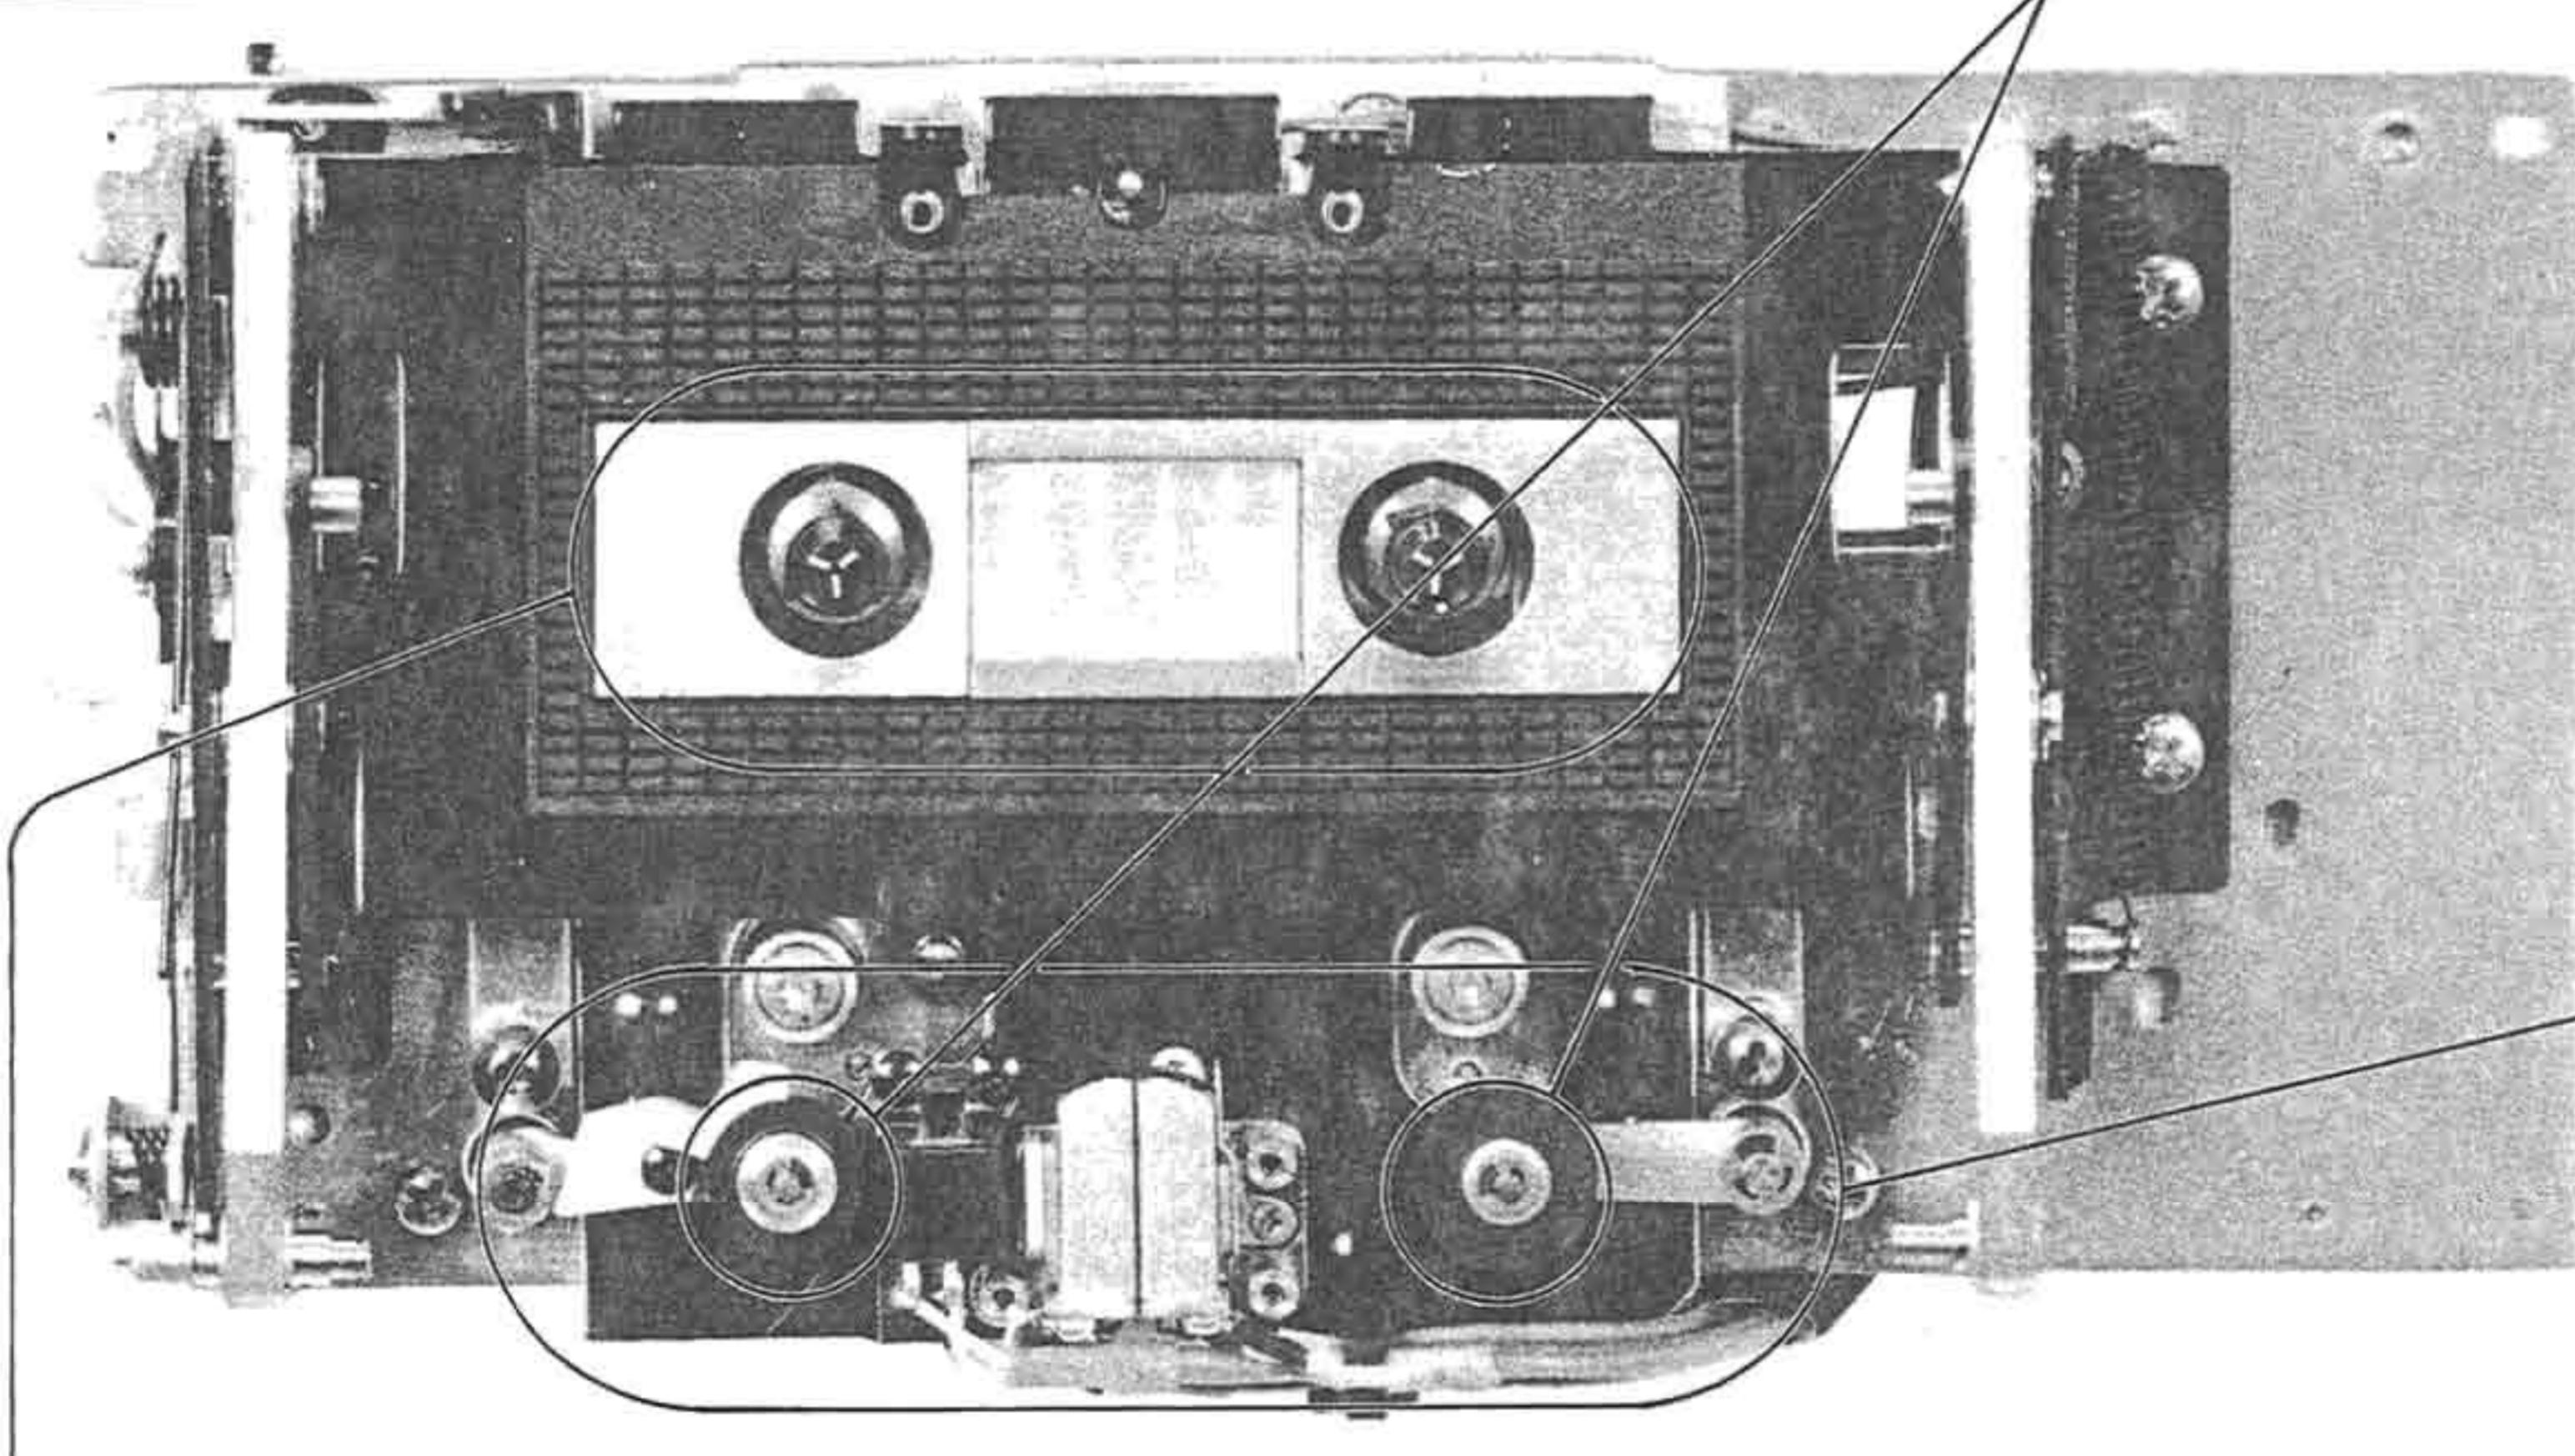

1. Make sure that the capstan shaft and pinch roller are parallel.
2. In forward mode, pull the spring scale slowly so that it is parallel to the surface of the mechanical board ass'y and read the spring scale when the pinch roller stops rotating.

Specification

	pinch roller pressure
take-up side	220 – 380 g
supply side	180 – 280 g

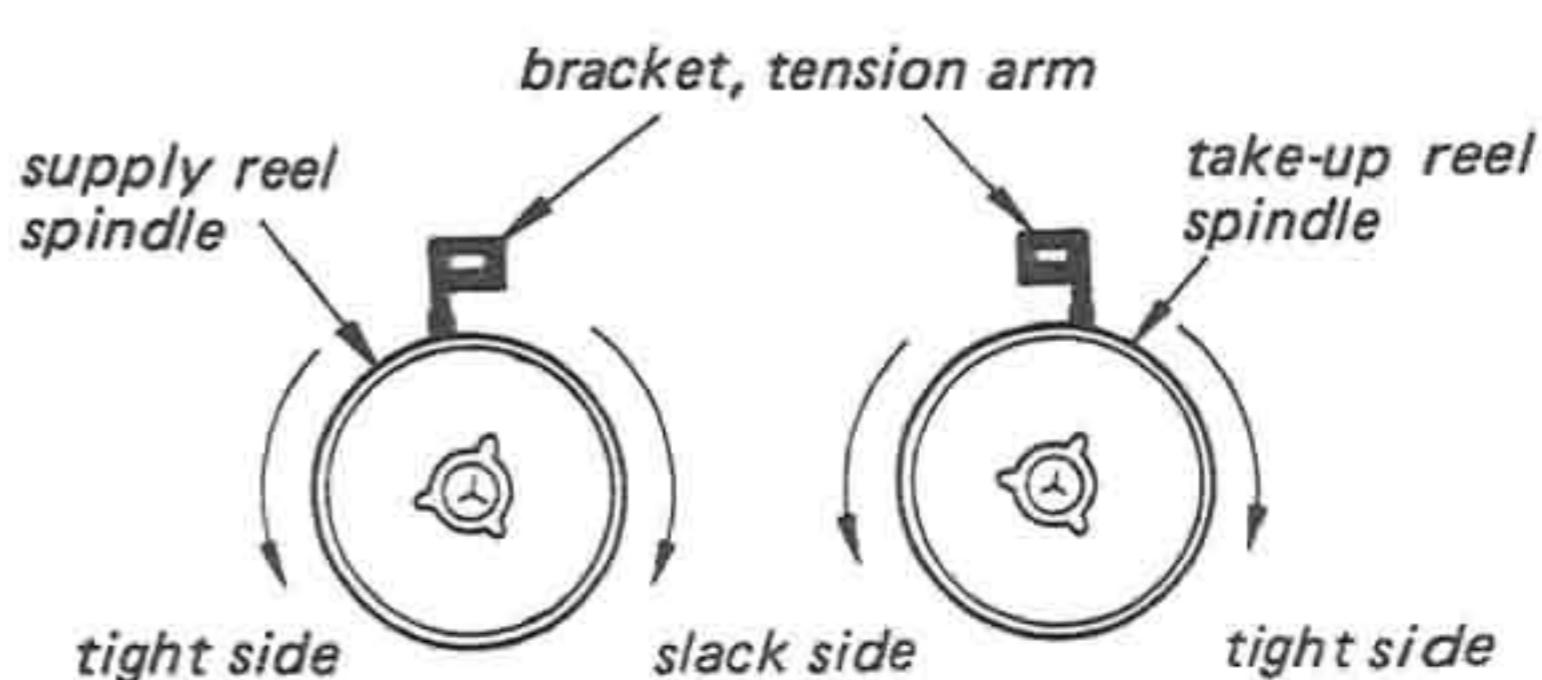

3. If necessary, change the position of pinch roller plunger. (Refer to Pinch Roller/Head Plunger Position Adjustment on page 28.)

Brake Torque Adjustment

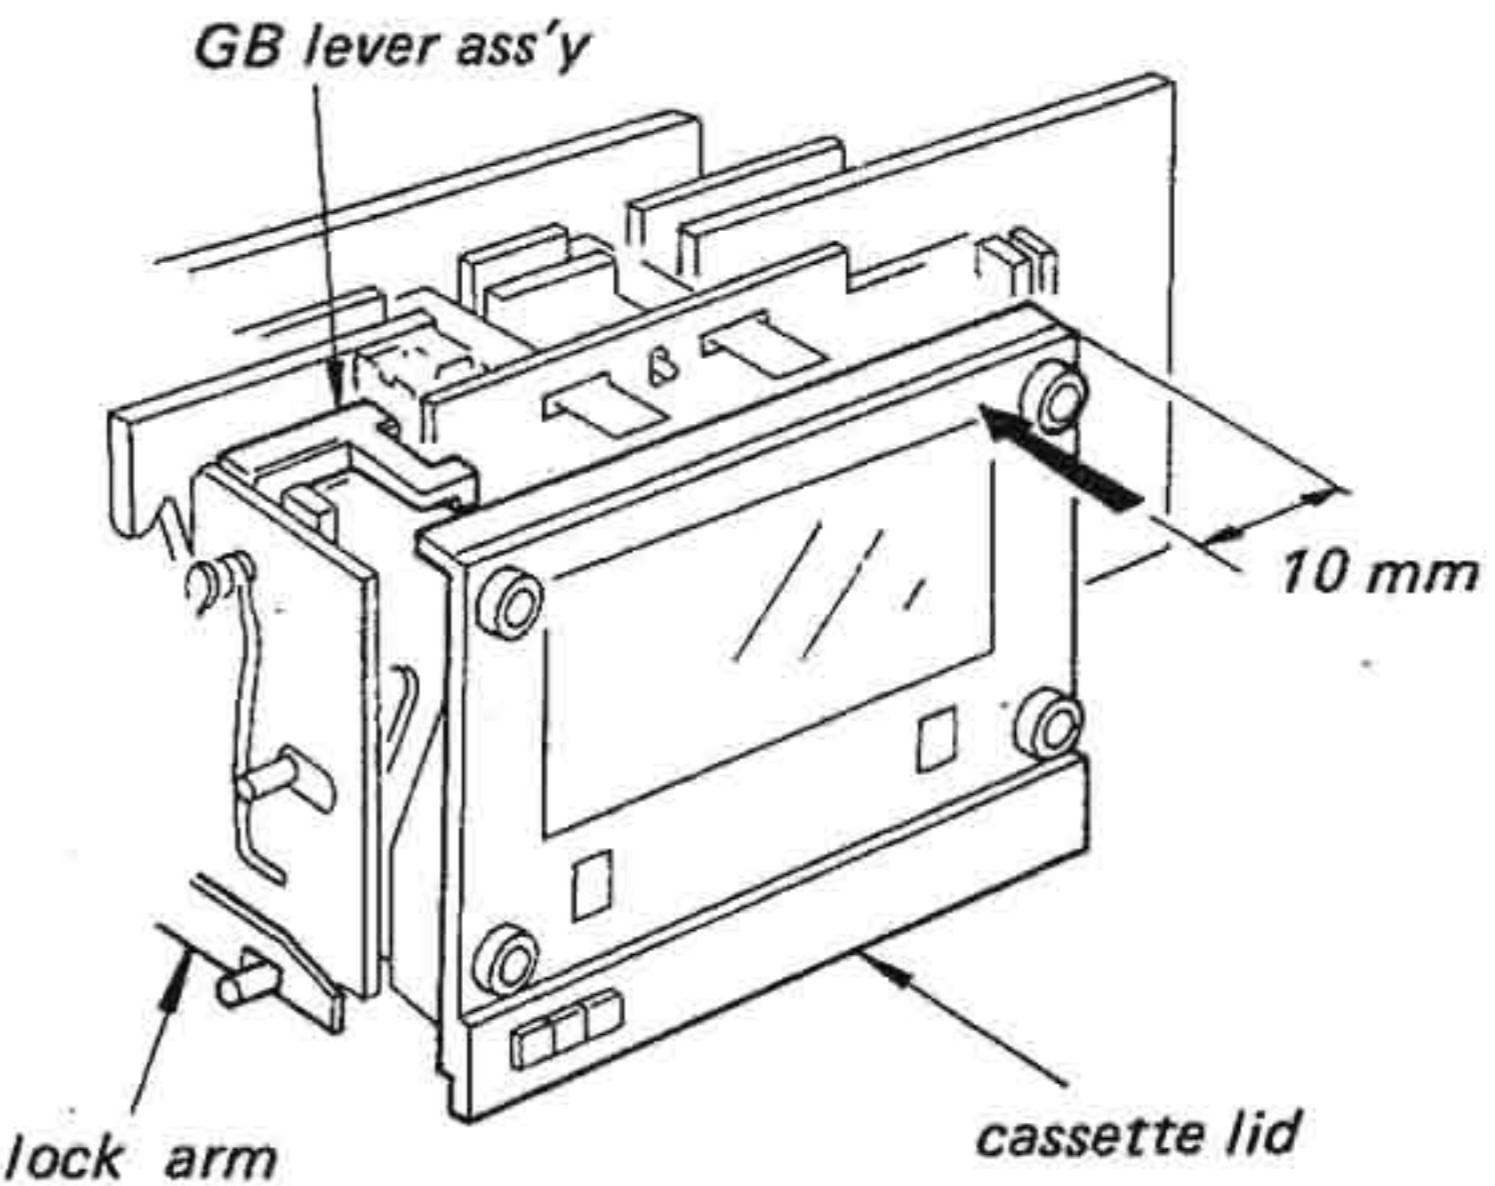

Specification

Tight side: 100 – 200 g·cm(1.4 – 2.8 oz·inch)
Slack side: less than 90 g·cm(1.3 oz·inch)

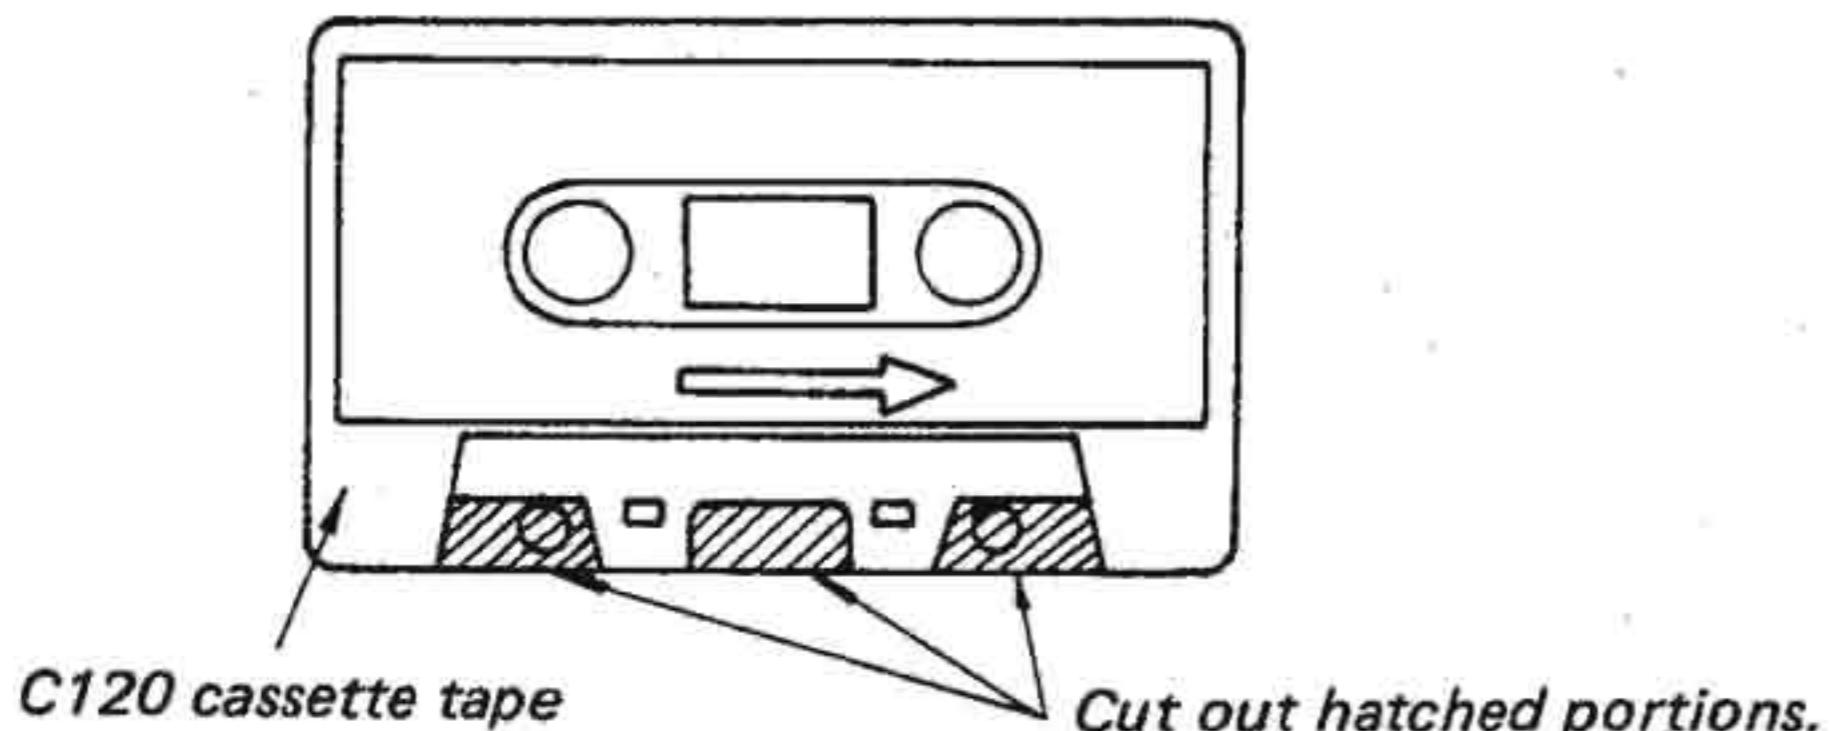

Cassette Holder Operation

1. Insert a cassette tape (C-90 with erasure prevention tab) into the cassette holder and push the portion shown by the arrow. Make sure that the cassette holder is locked, the GB lever ass'y is lowered and the lock arm returns completely.
2. Make sure that the cassette holder opens smoothly in 0.6 — 1.5 seconds.

Head Height Adjustment

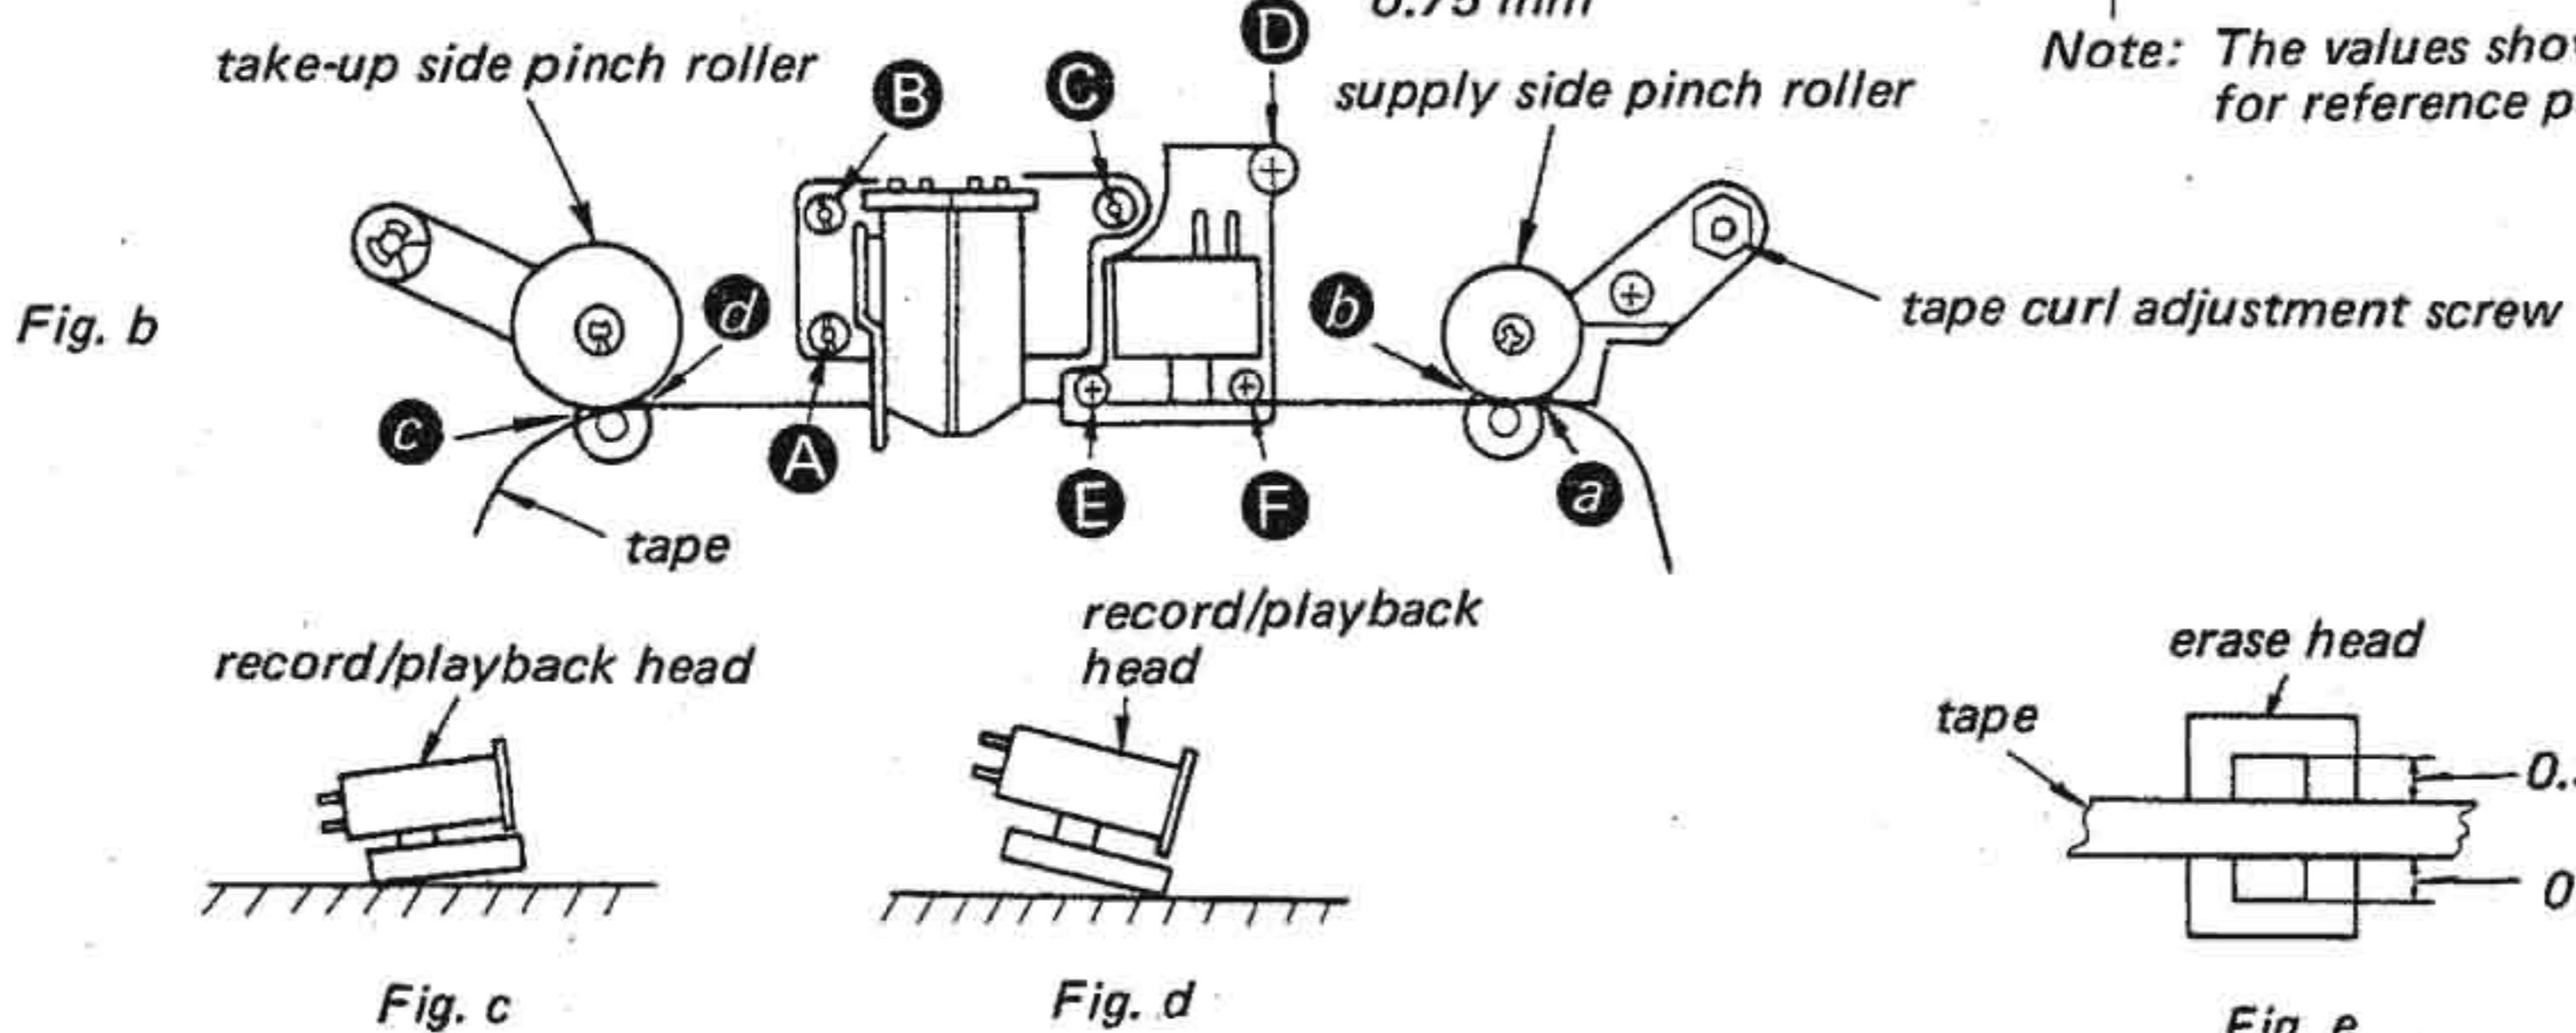

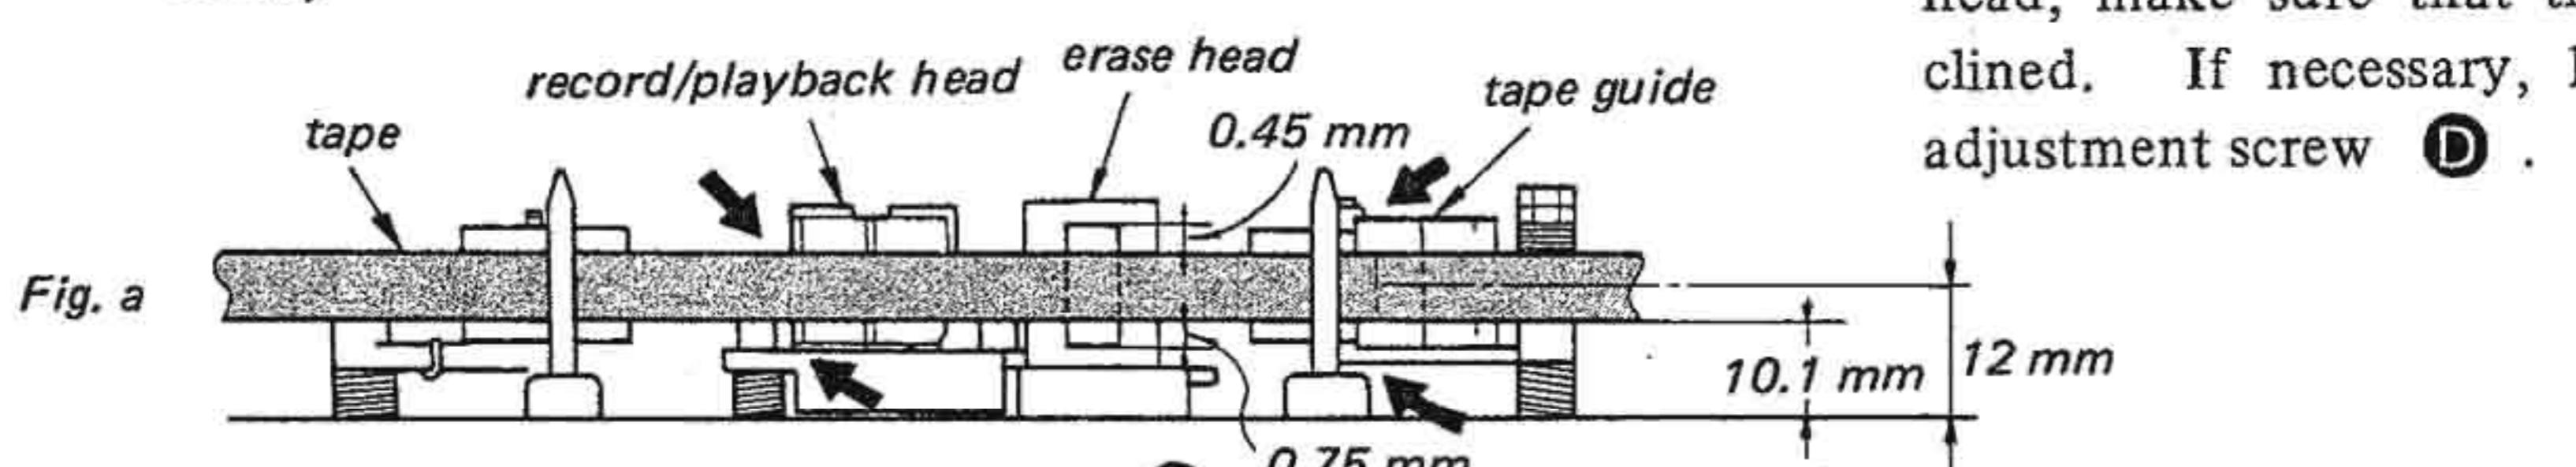

1. Make an adjustment cassette as shown below or use a mirror cassette.

2. Install the mirror cassette (or adjustment cassette) in the set. In playback mode, the tape should not curl at the portions shown by arrows (tape guides) in Fig. a. If the tape curls, adjust the height of tape guide of supply pinch roller.

Adjustment locations:

adjustment screw of tape curl in Fig. b
(Be careful not to turn the screw more than 1/2 turn.)

3. Back tension: 0

Make sure that there is no tape twist at portions **a** — **d**.

1. When the tape twists upwards:
Turn adjustment screws **B**, **C** of the record/playback head and recline the head as shown in Fig. C.
2. When the tape twists downwards:
Turn adjustment screws **B**, **C** and recline the head as shown in Fig. D.

4. Measure the height of erase head.
If it is out of the range indicated in Fig. e, follow the procedures below.
1. When the height of erase head is out of the range:
Loosen screws **E**, **F** of the erase head and adjust the height by the adjustment shim of the erase head.

erase head adjustment shim

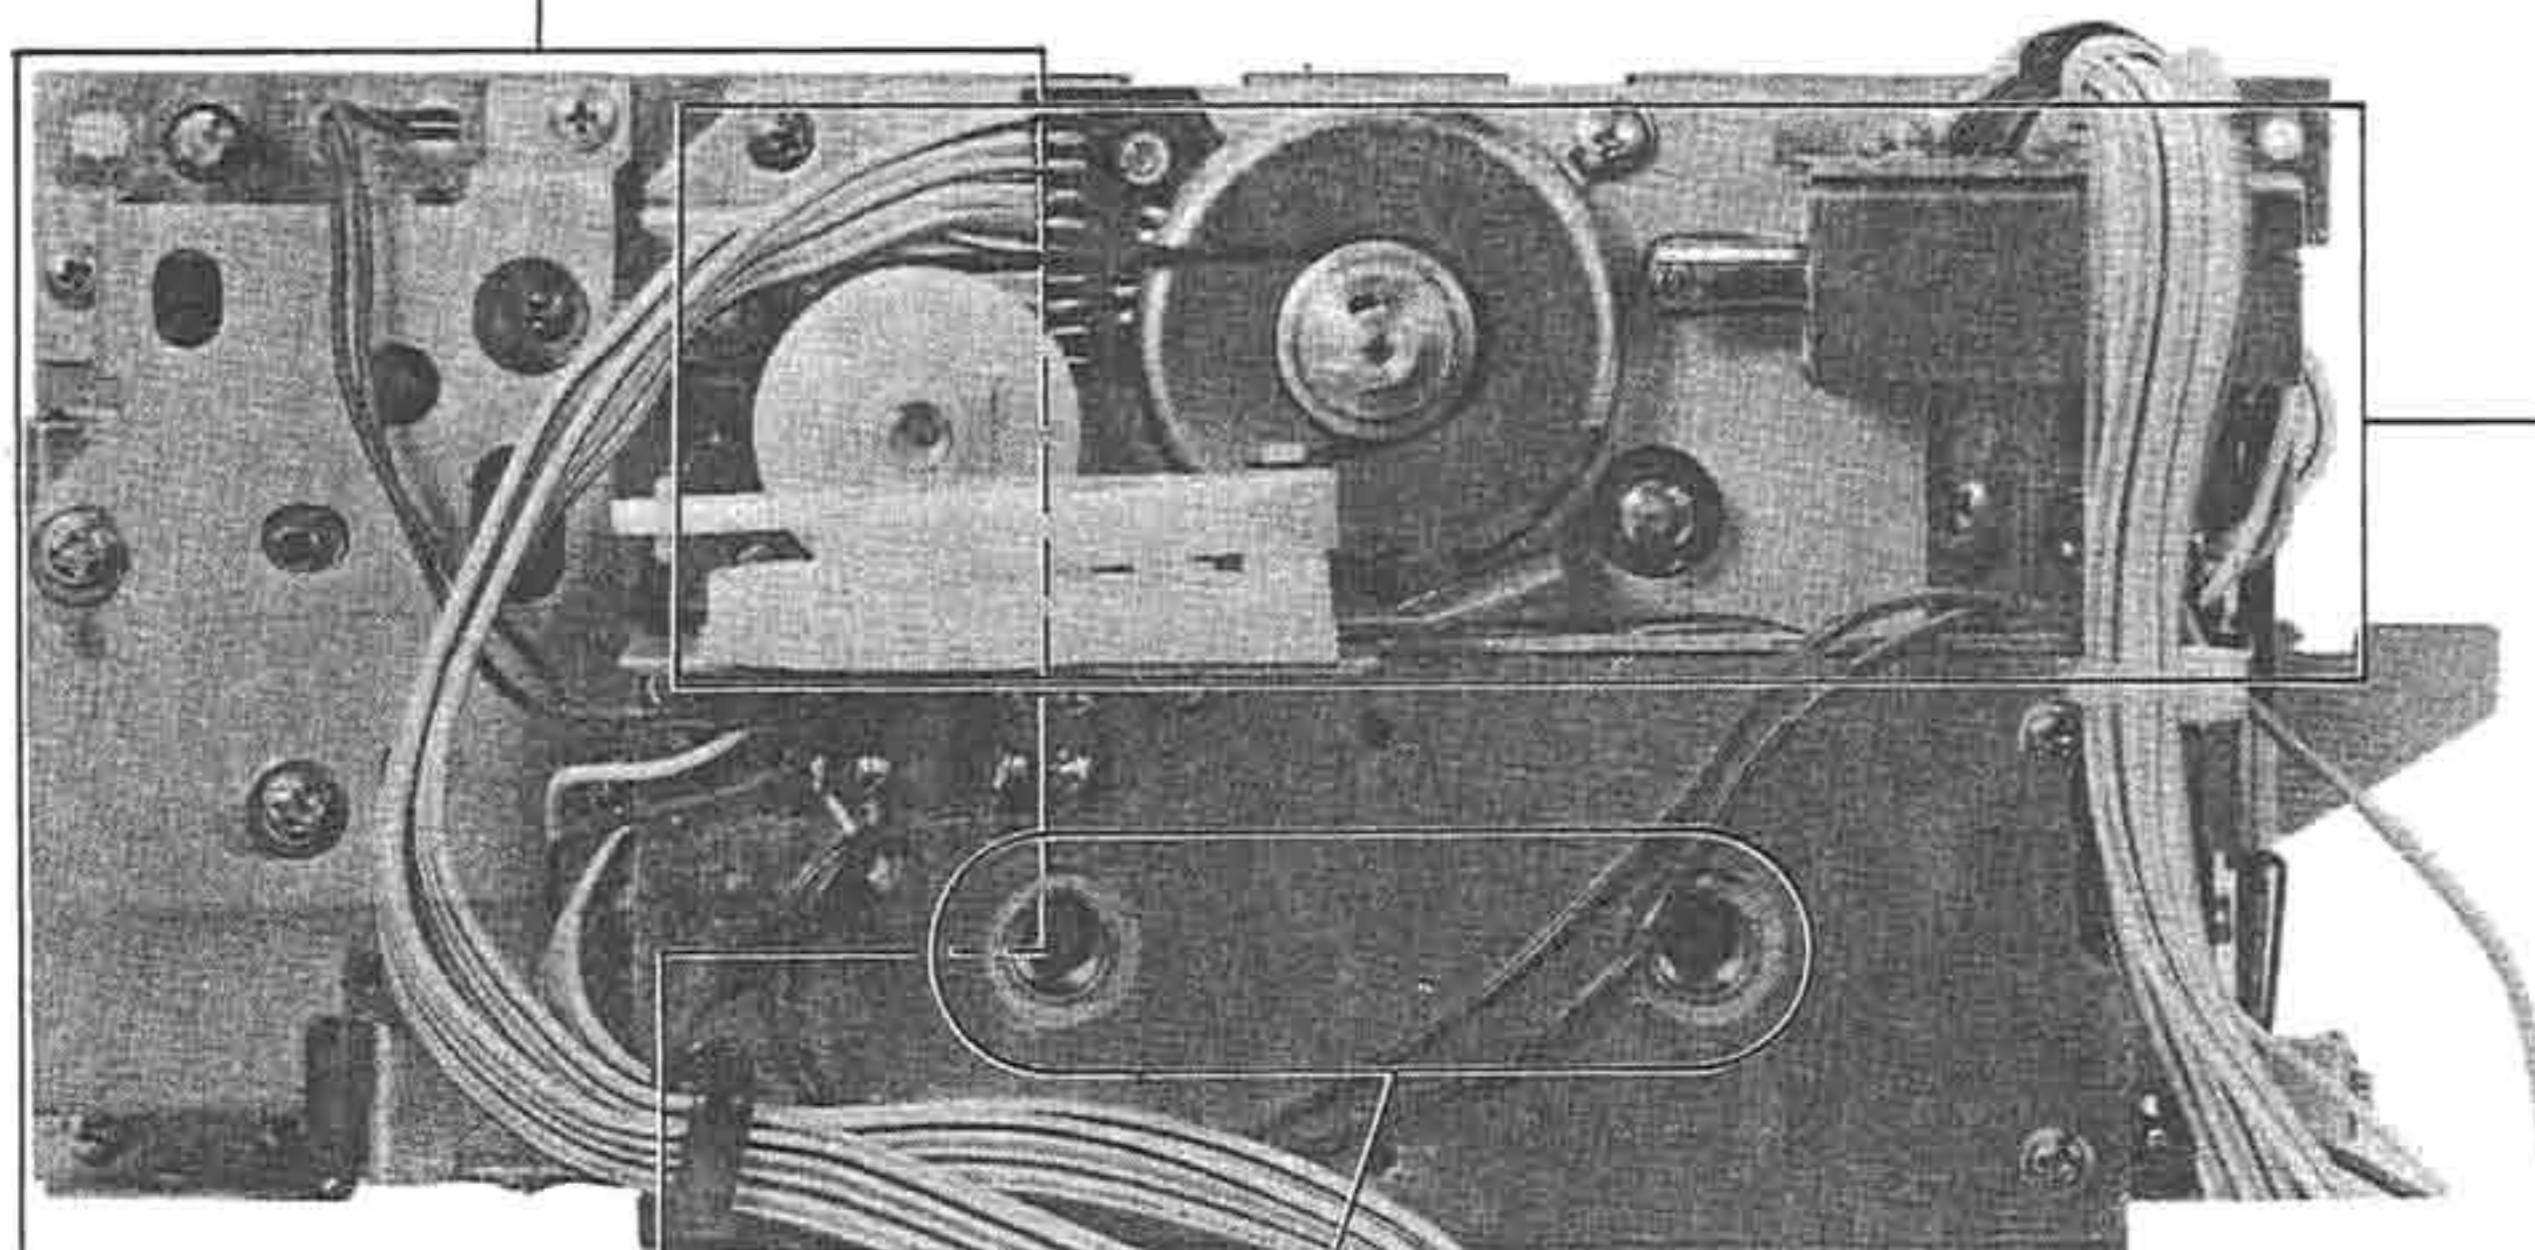

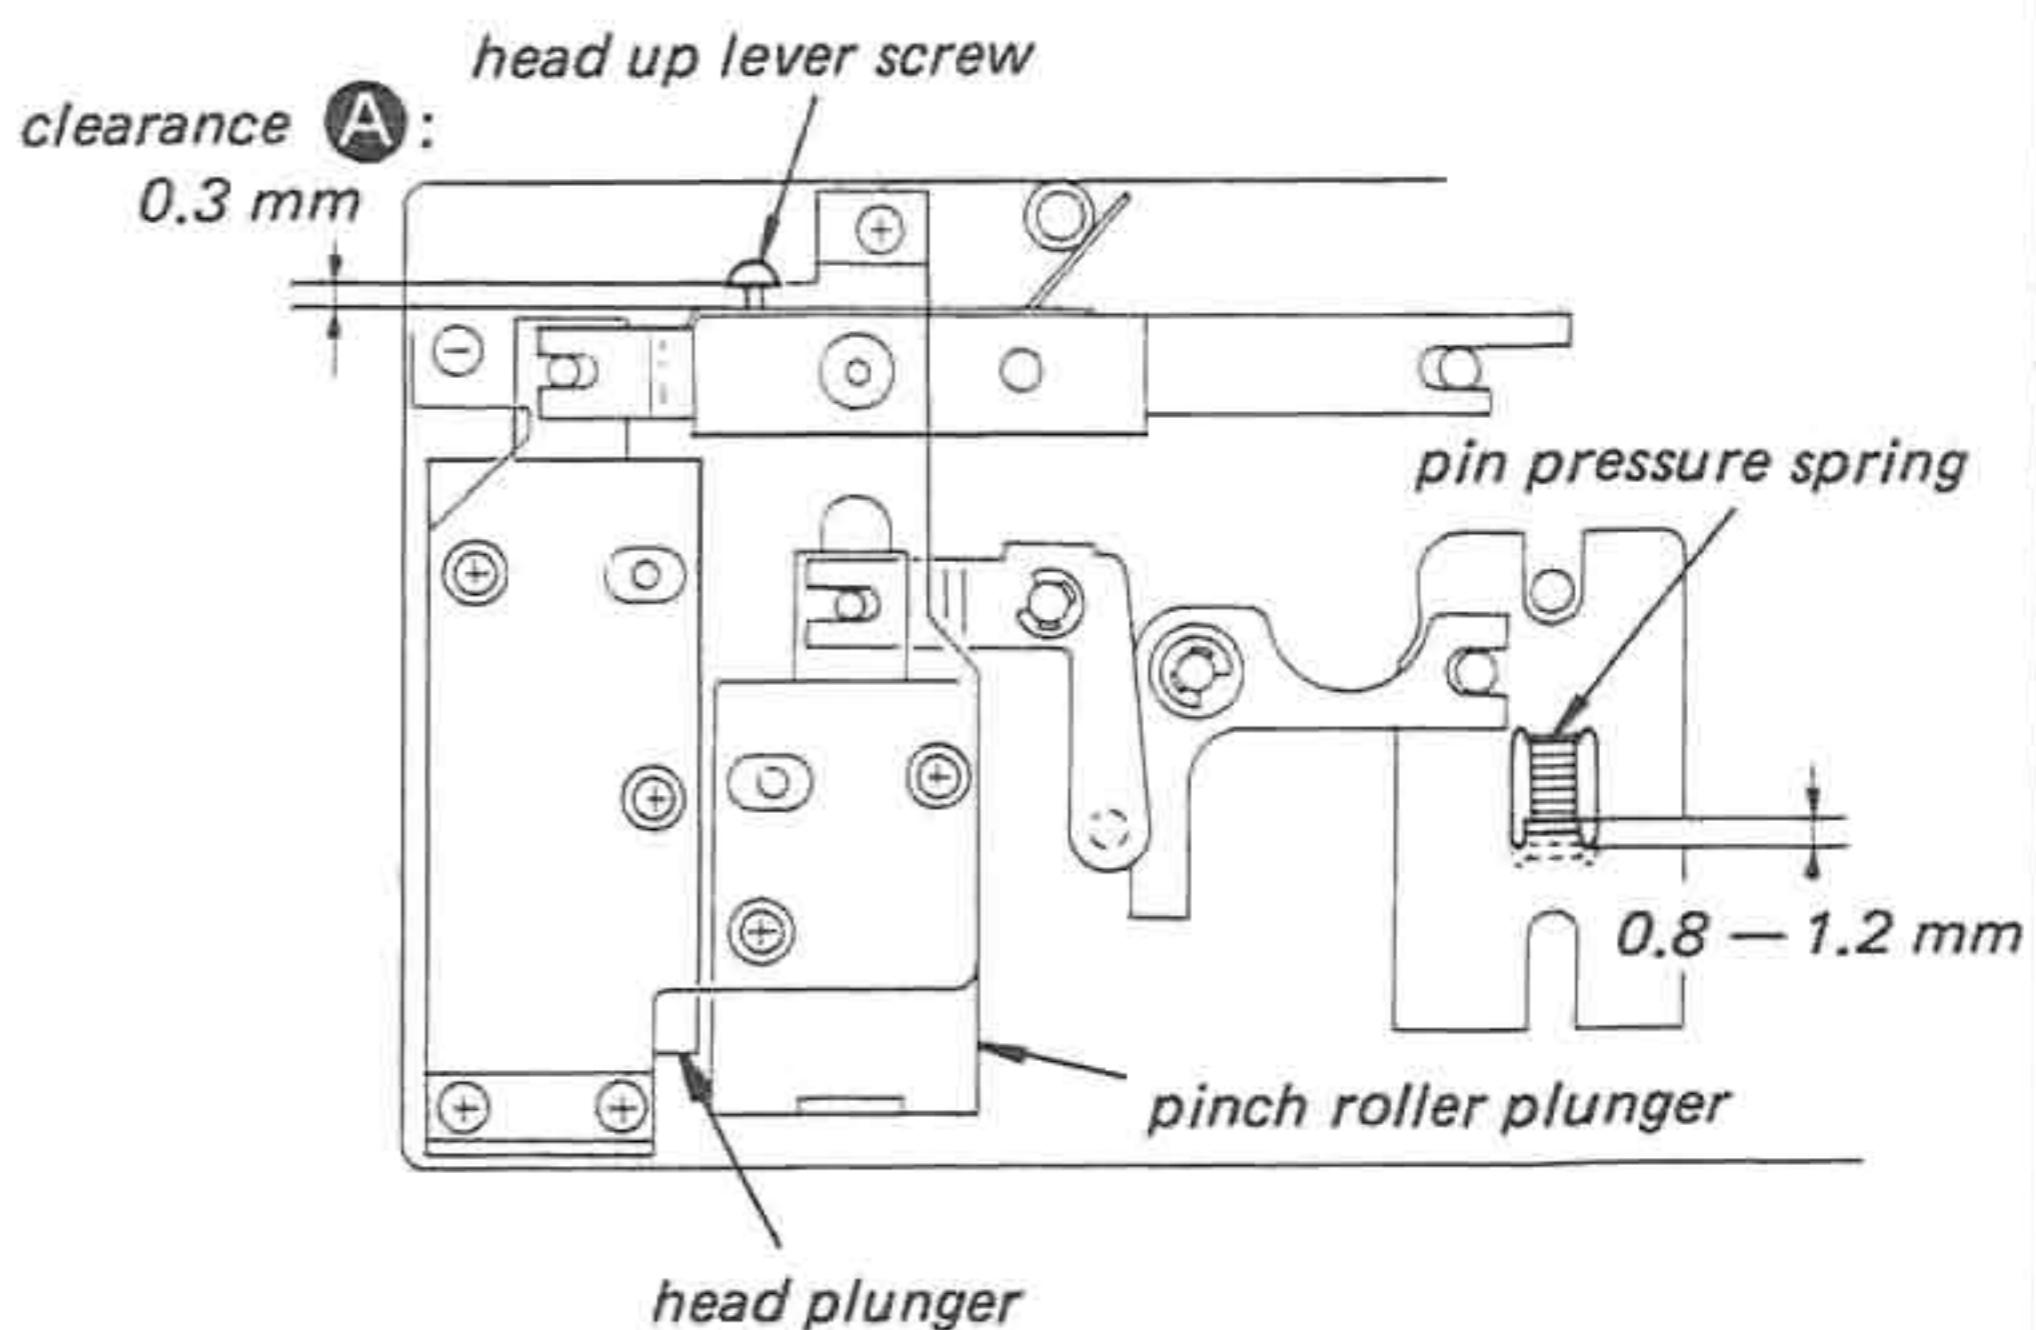

3-576-835-01 *t*=0.1 mm

3-576-835-11 *t*=0.2 mm

2. After adjusting the height of the erase head, make sure that the head is not inclined. If necessary, loosen or tighten adjustment screw **D**.

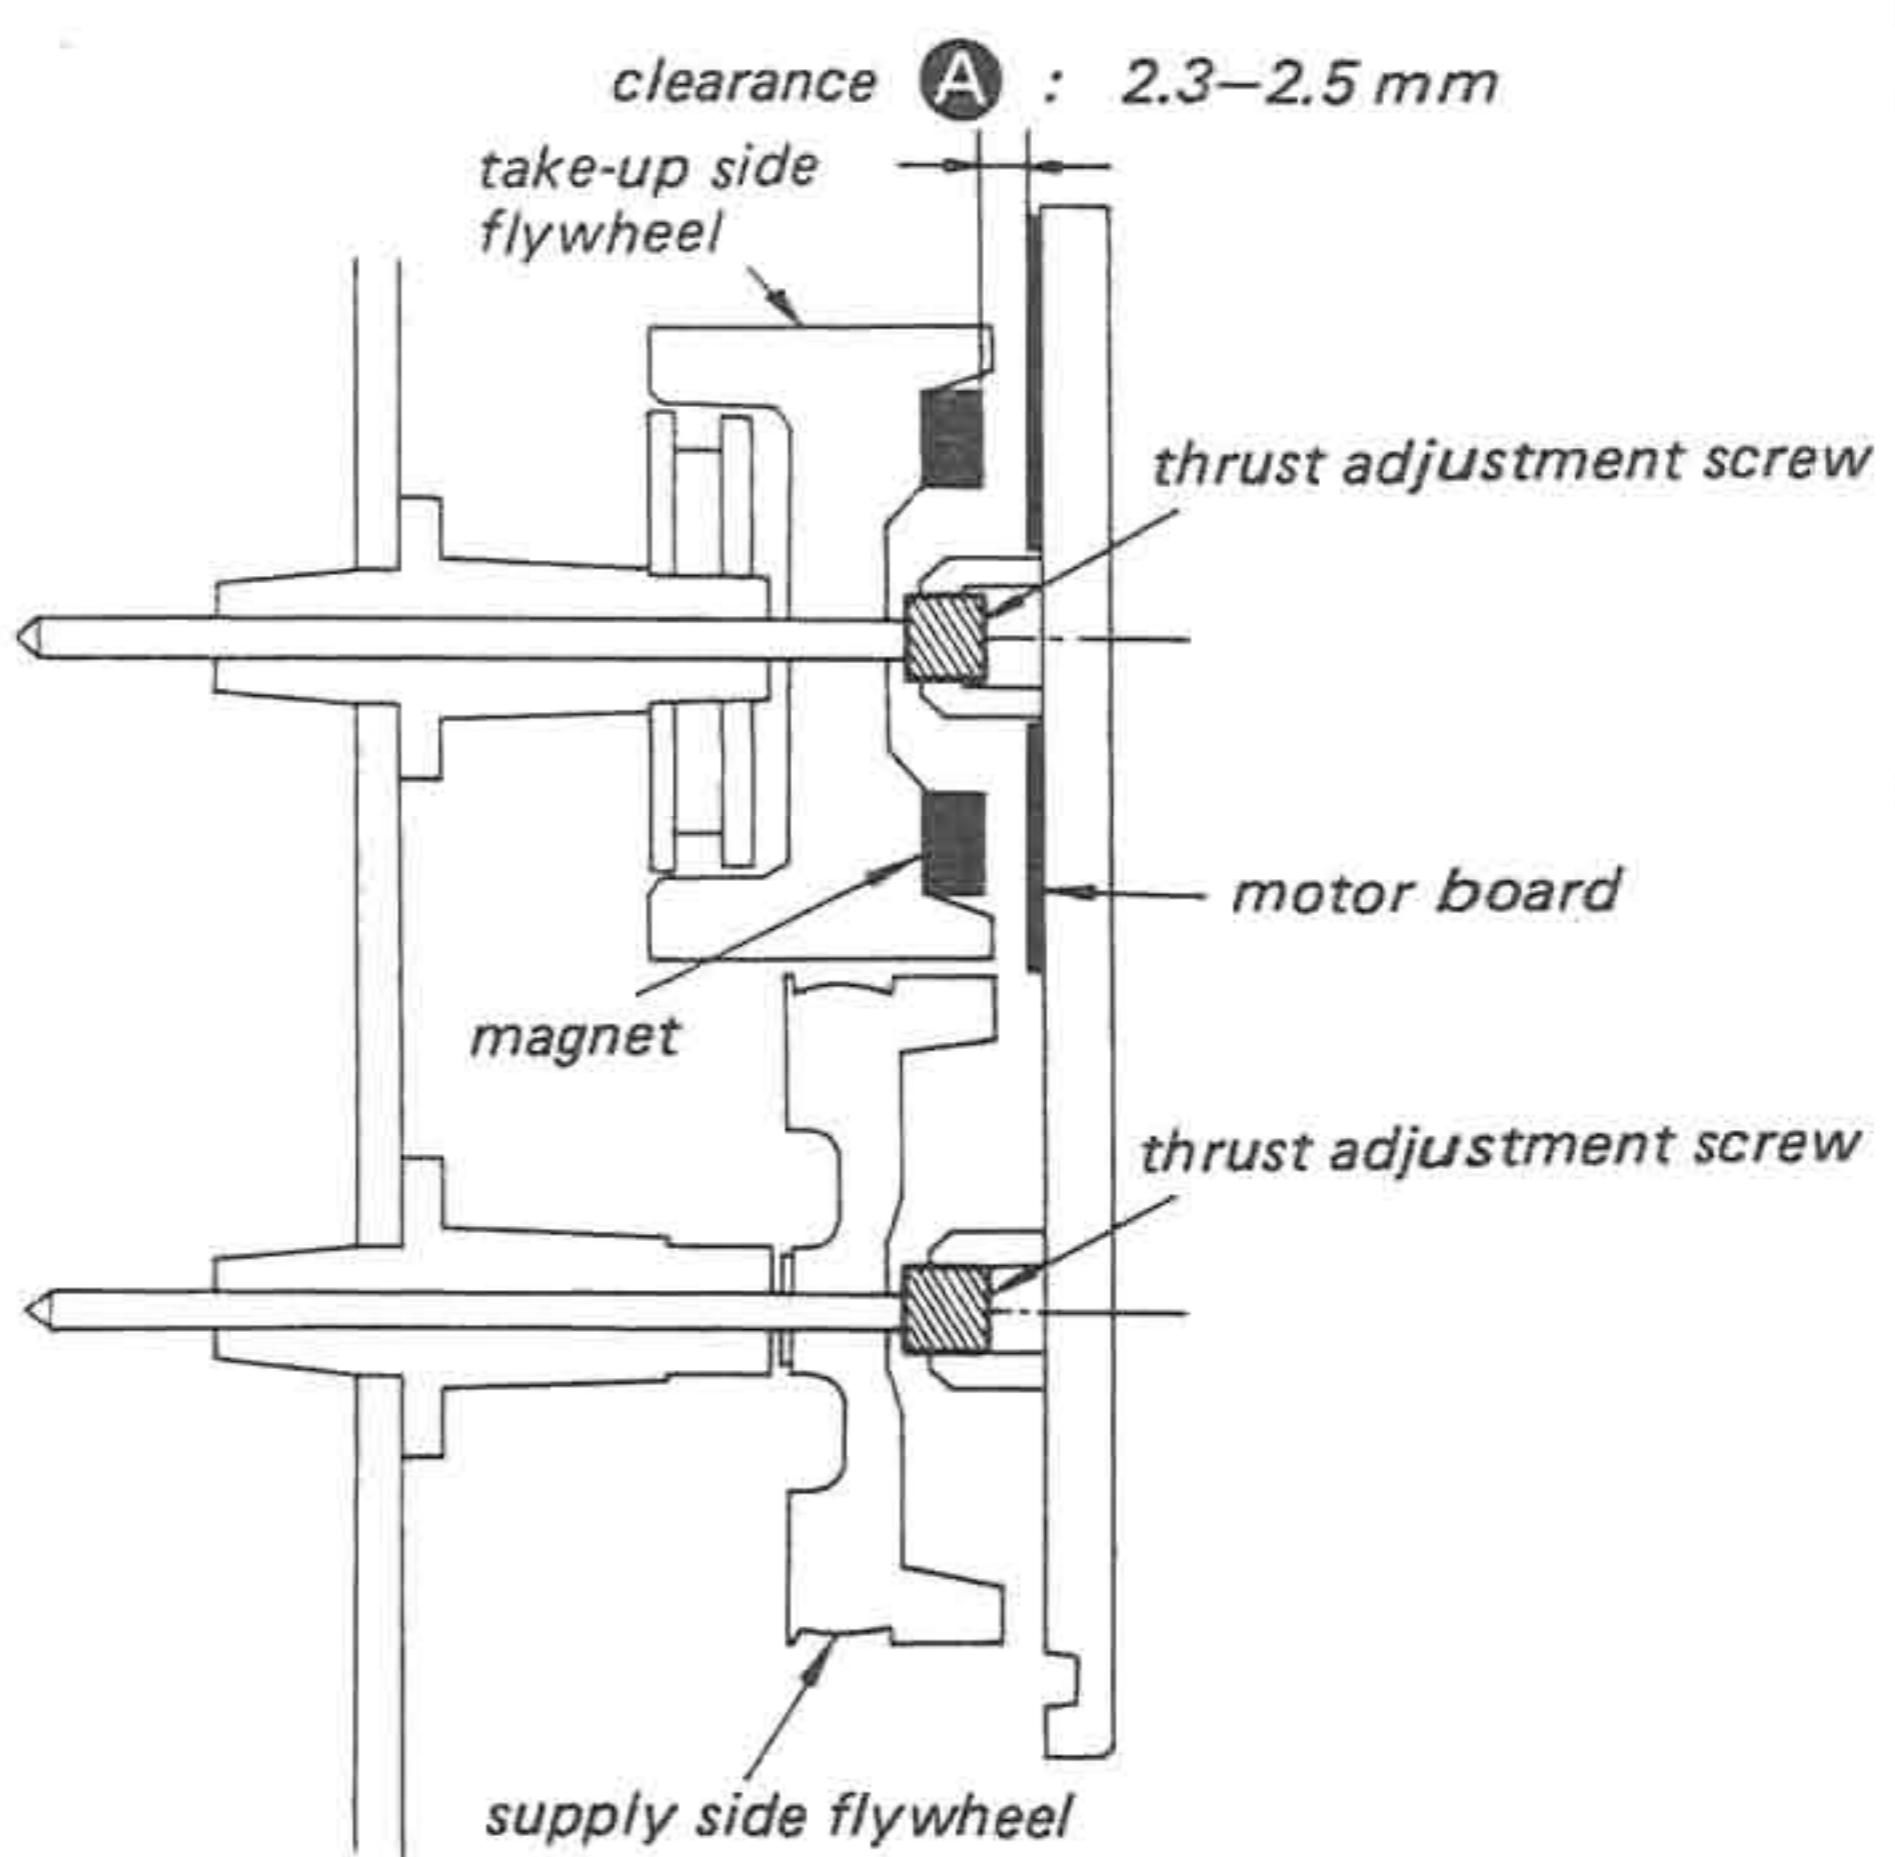

Pinch Roller/Head Plunger Position Adjustment

1. Position the head plunger so that clearance **A** is 0.3 mm.
2. Move the head plunger and the pinch roller plunger and adjust the position of the pinch roller plunger so that the pin pressure spring can move in the range of 0.8 mm—1.2 mm.
3. Lock the plunger screw with suitable locking compound.

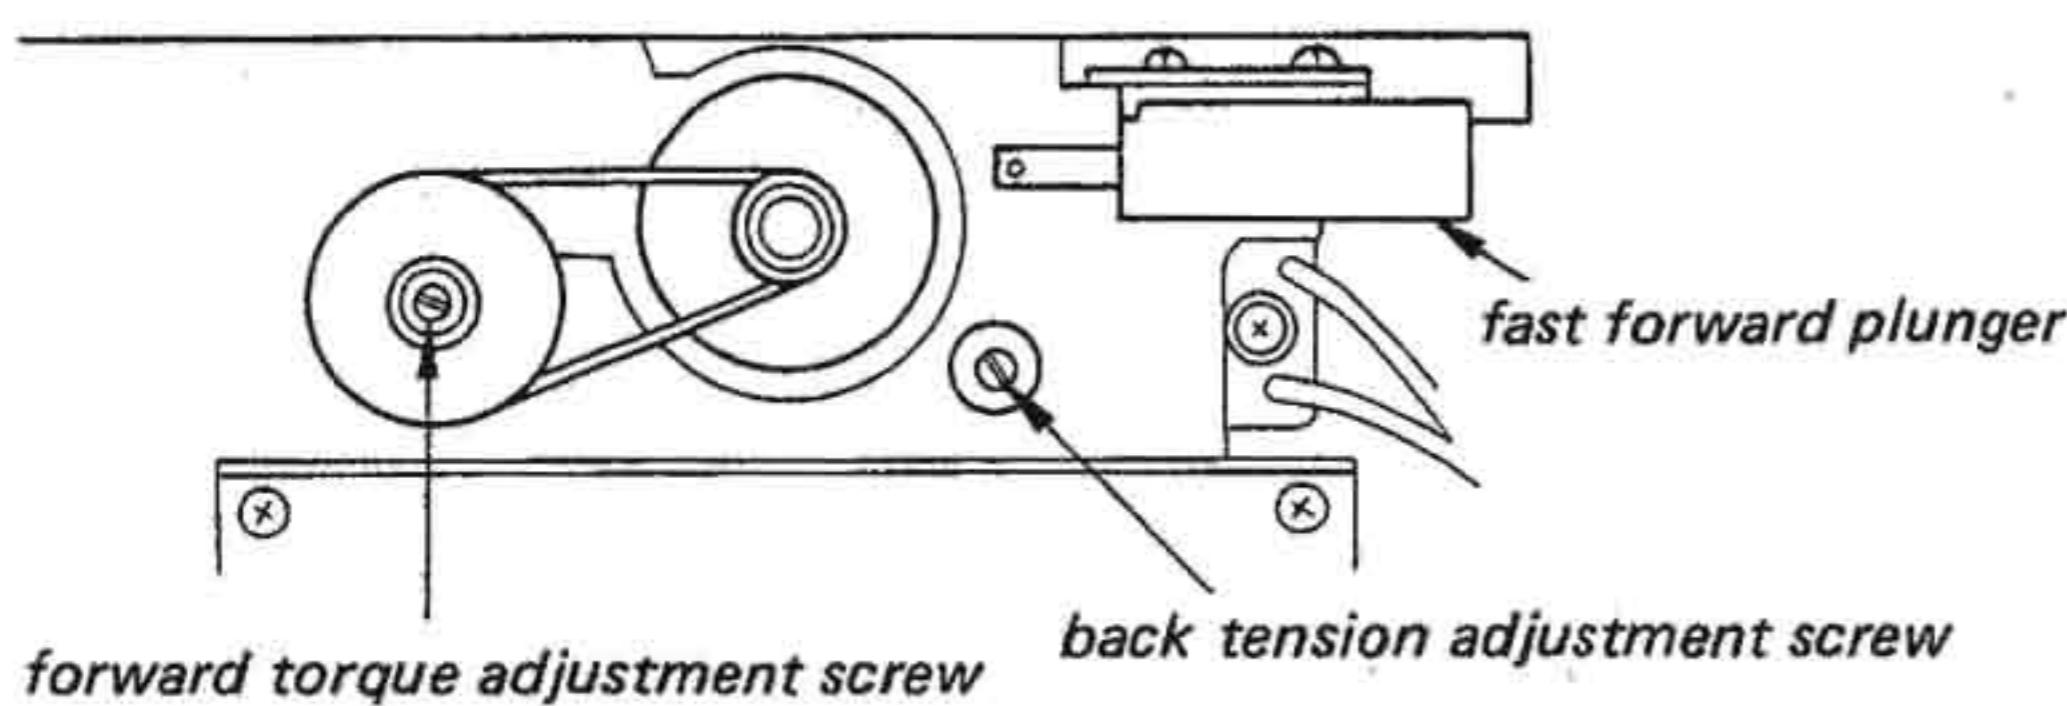

Take-up Side/Supply Side Flywheel Thrust Adjustment

1. Take-up Side Flywheel
Insert a spacer of 2.4 mm between the flywheel magnet and motor board and adjust the position of the magnet so that clearance **A** is between 2.3 mm and 2.5 mm.
2. Supply Side Flywheel
Tighten the thrust adjustment screw lightly till the flywheel does not move and then loosen it by 1/2 – 3/4 turns.
3. After the adjustment, lock the adjustment screw with suitable locking compound.

Forward Torque/Back Tension Torque Adjustment

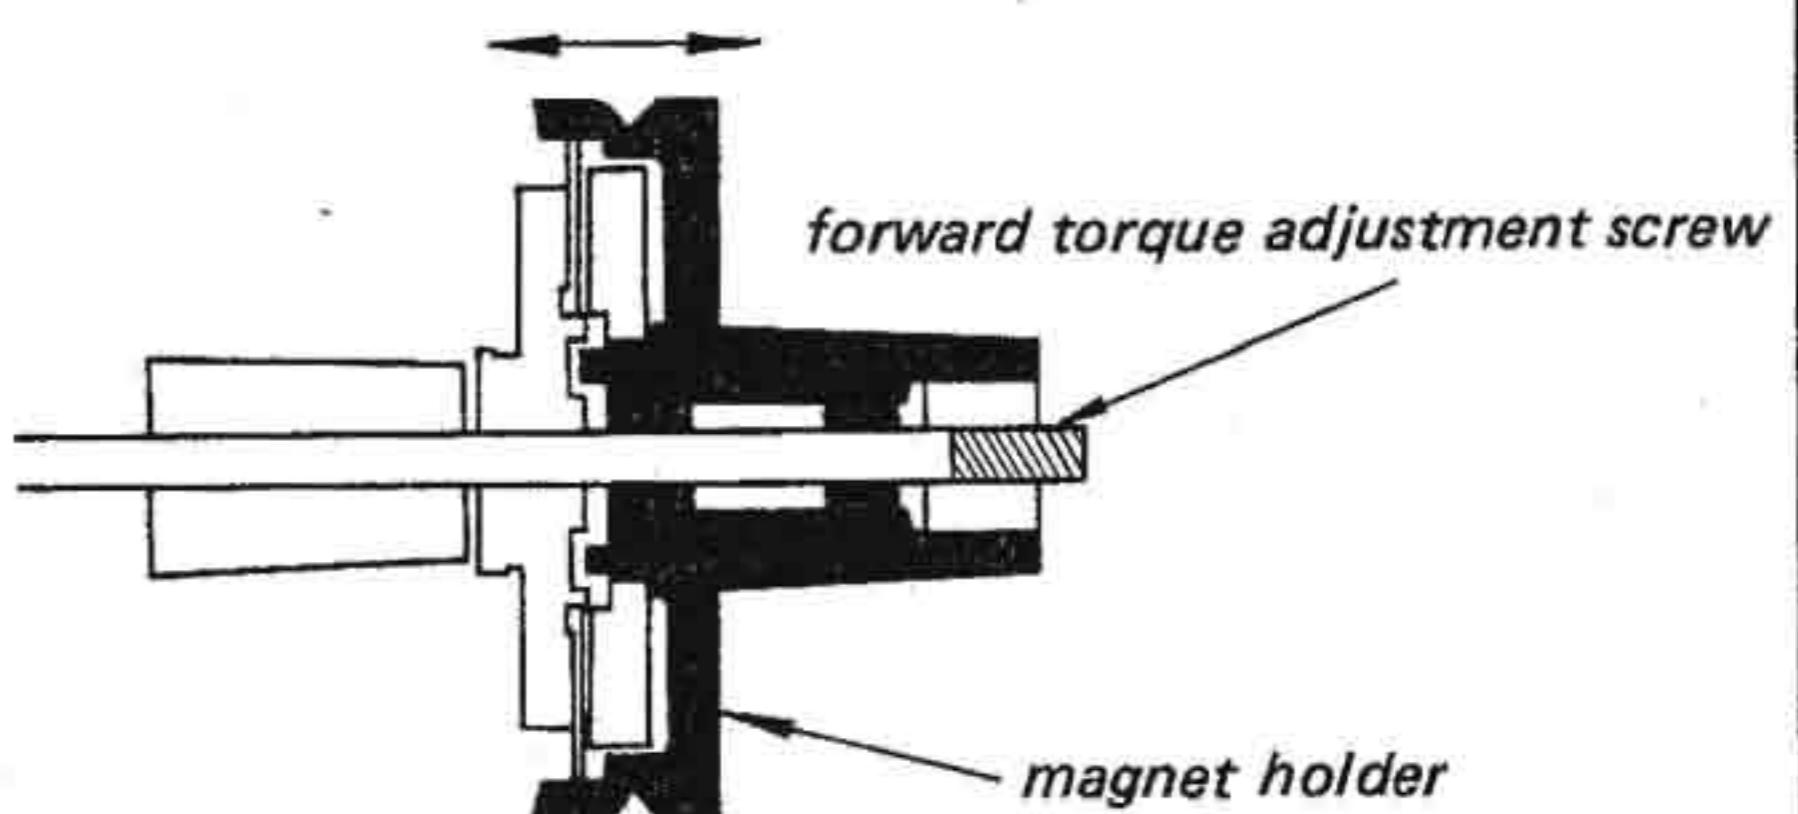

1. Loosen adjustment screws of the forward torque and back tension torque till the magnet holder does not move and then tighten them by 1/2 turn.
2. Connect the cassette torque meter (CQ-102B) and measure forward torque and back tension. If they do not meet the specifications, adjust the back tension adjustment screw.

Specifications:

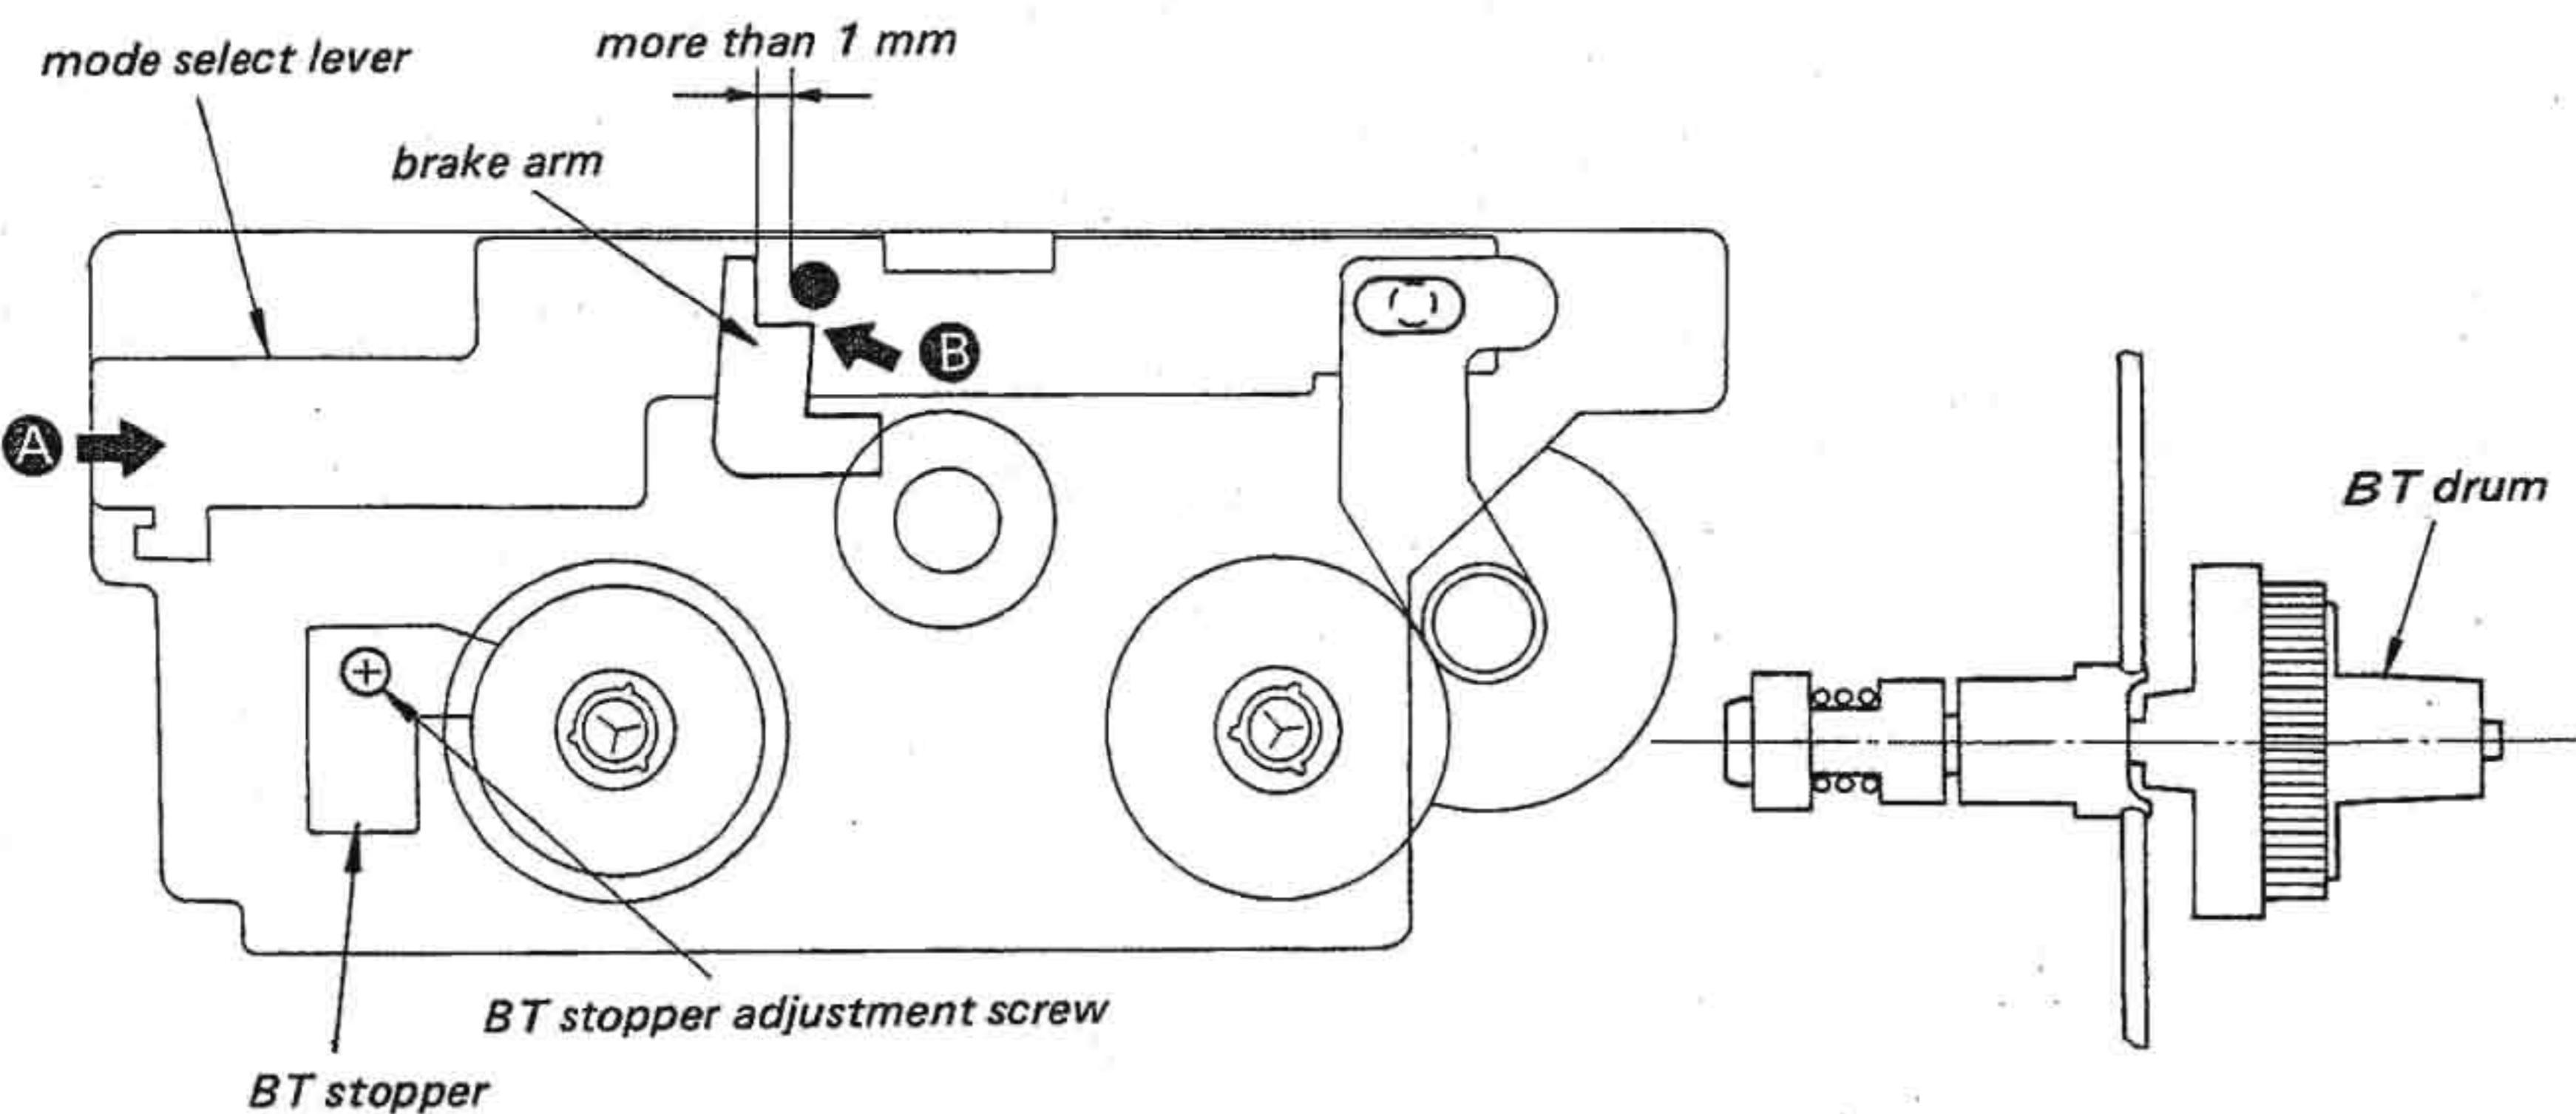

forward torque	35 – 45 g·cm
back tension torque	7 – 9 g·cm

3. Lock the adjustment screw with suitable locking compound.

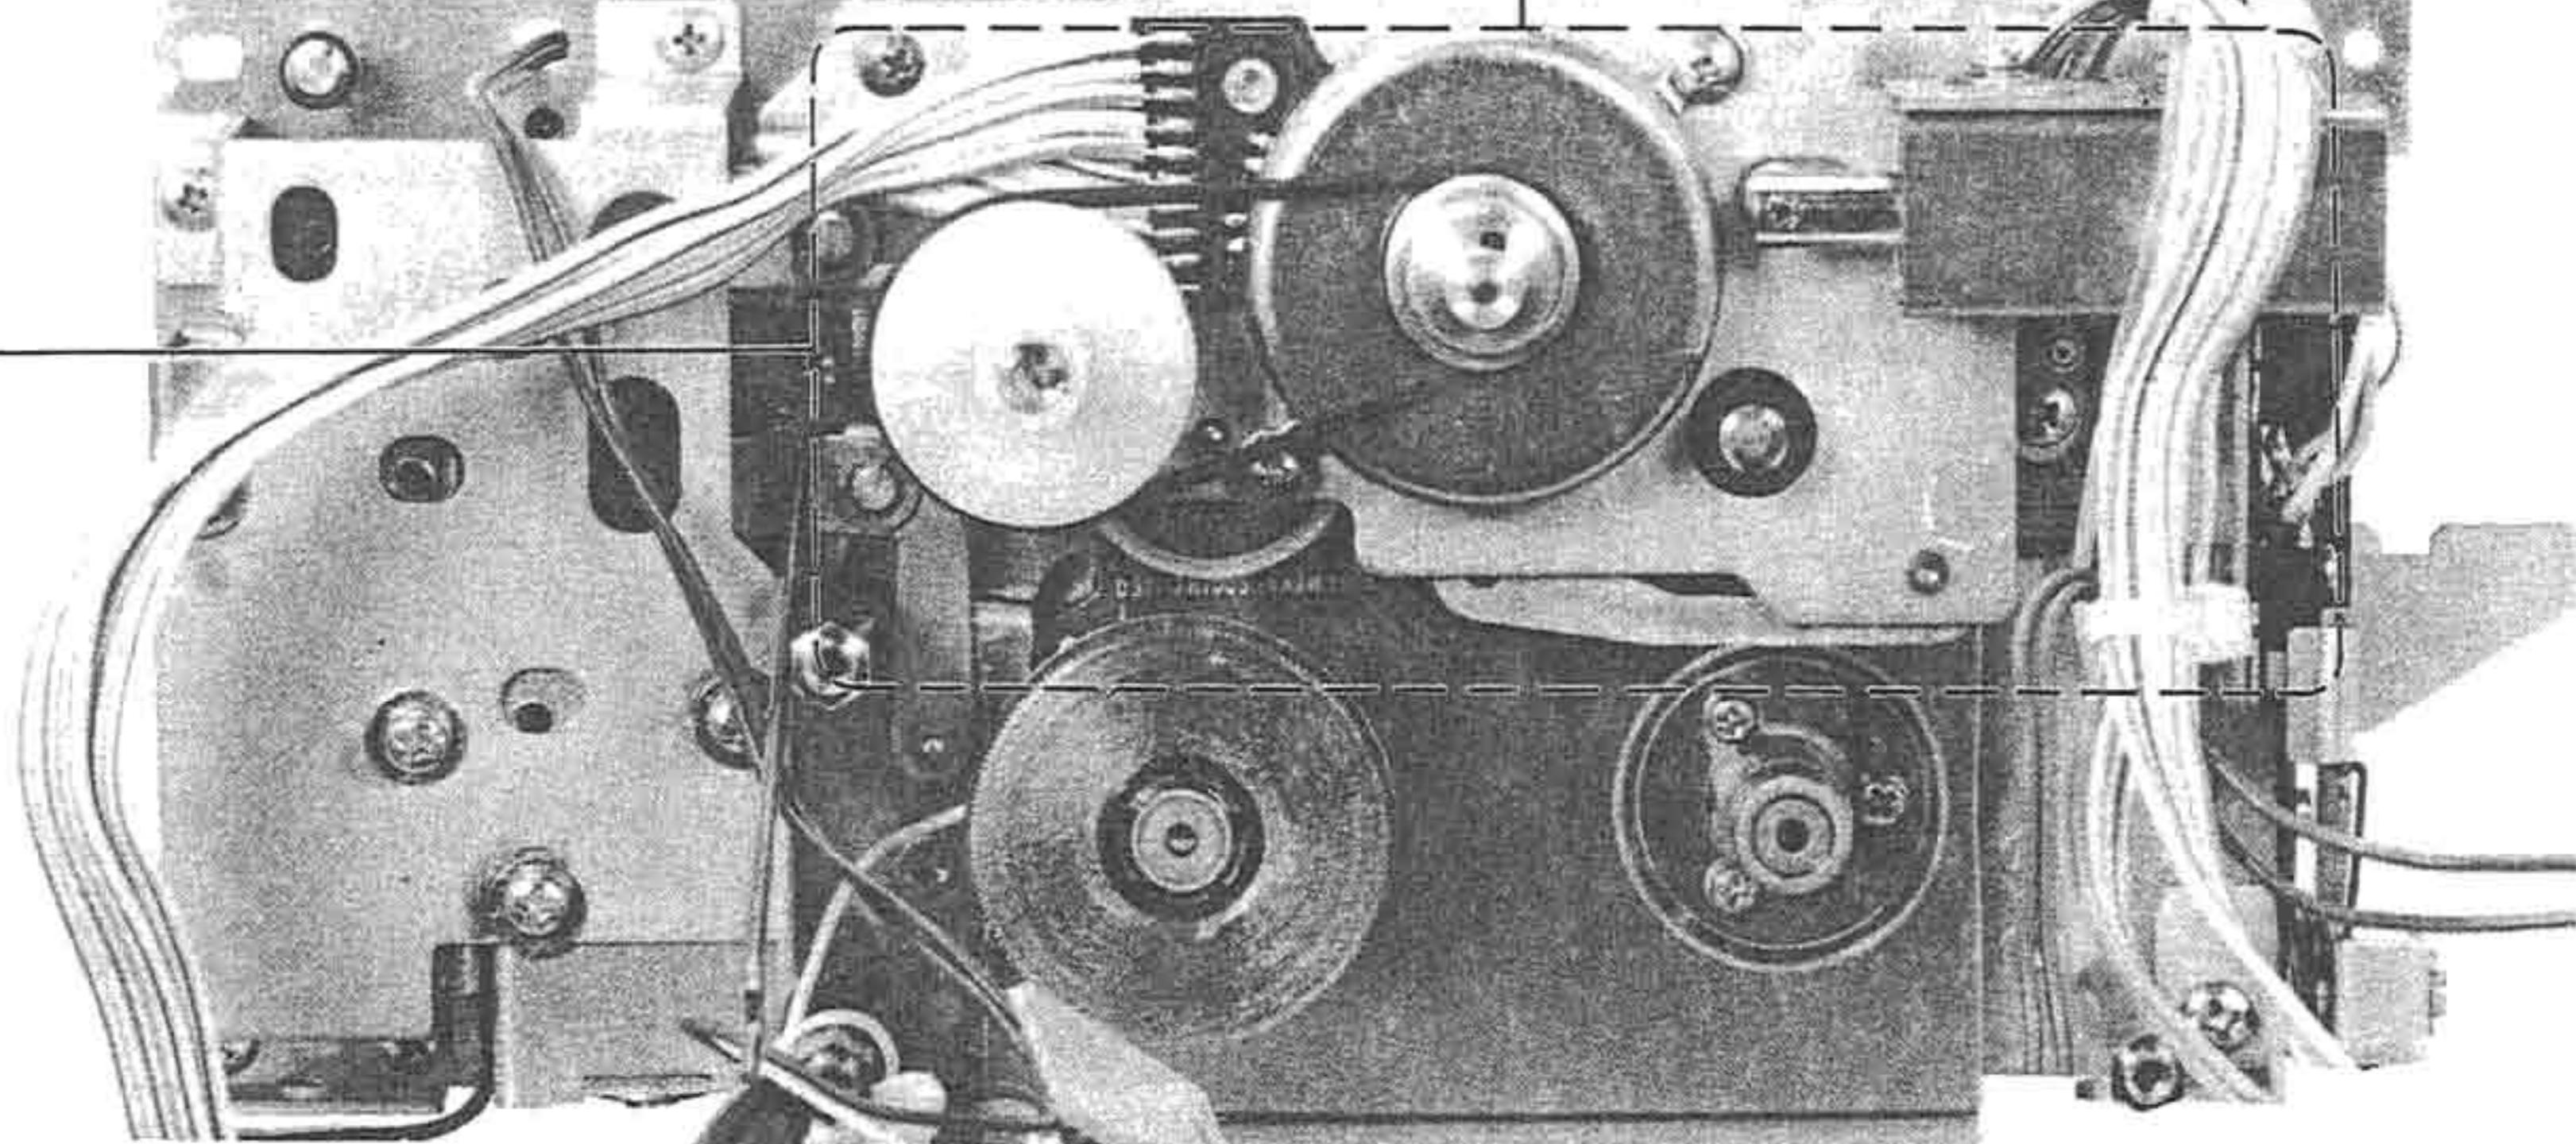

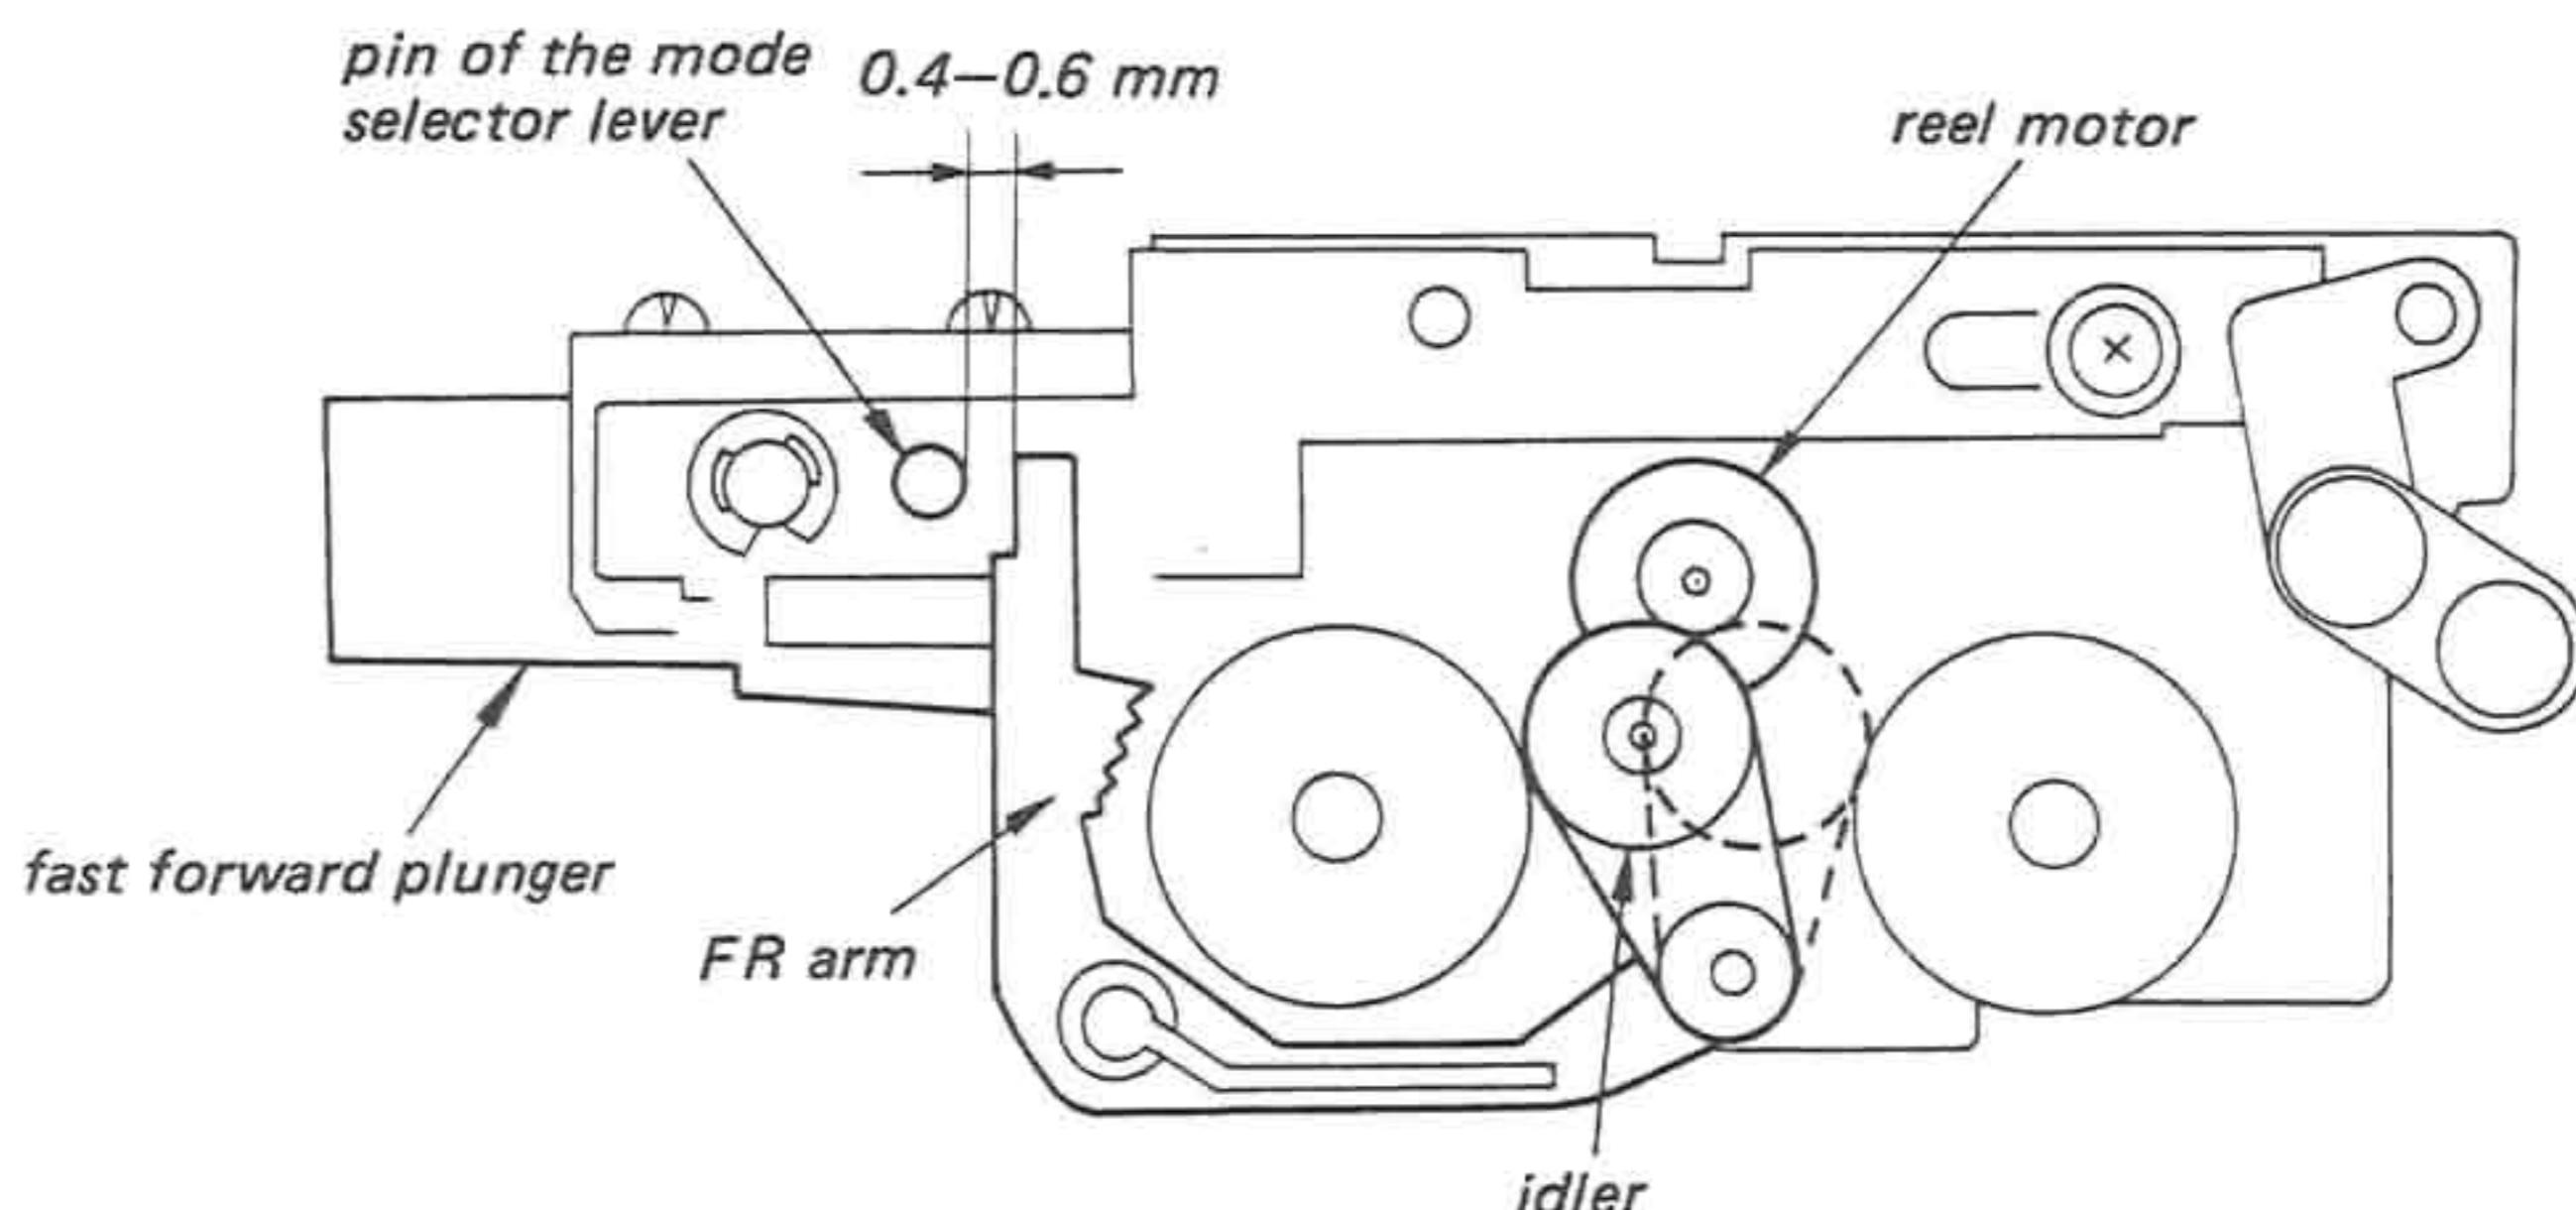

Check of BT Stopper Position

1. Loosen the BT stopper adjustment screw, push the mode select lever in the direction of arrow **A** and fix the BT stopper to the reel spindle with the adjustment screw.
2. Move the brake arm in the direction of arrow **B**, remove the brake from the reel spindle and confirm that the BT drum does not rotate together with the reel spindle.
3. Make sure that the clearance between the mode select lever and the brake arm is more than 1 mm when the mode select lever returns to its original position.

Fast Forward Plunger Position Adjustment

1. Push the fast forward plunger.
2. Turn the reel motor clockwise (fast forward mode). When the idler and the reel spindle come into contact, adjust the position of the fast forward plunger by loosening the screw so that the clearance between the FR arm and the mode selector lever pin is between 0.4 mm and 0.6 mm.
3. Next, turn the reel motor counterclockwise (rewind mode) and adjust to obtain the same result as in step 2.
4. Lock the screw with suitable locking compound.

3-2. ELECTRICAL ADJUSTMENTS

Note: The adjustment should be performed in the order given in this service manual. The adjustments should be performed for both L-CH and R-CH.

- Set the TAPE switch according to the test tape as follows.

Tape	TAPE Switch
CS-15	TYPE I
CS-25	TYPE II
CS-30	TYPE III
CS-40	TYPE IV

- Switches and controls should be set as follows unless otherwise specified.

CALIBRATION MODE	OFF
REC LEVEL (L/R)	MED
CALIBRATION BIAS	
REC LEVEL.....	MED
DOLBY NR	OFF
TAPE	TYPE I
LINE OUT	0 dB
MONITOR	SOURCE
TIMER	OFF

- Standard Record:

Deliver the standard input signal level to the input jack and set the REC LEVEL control to obtain the standard output signal level.

Standard Input Level

Input Terminal	LINE IN
source impedance	10 kΩ
input level	0.25 V (-10 dB)

Standard Output Level

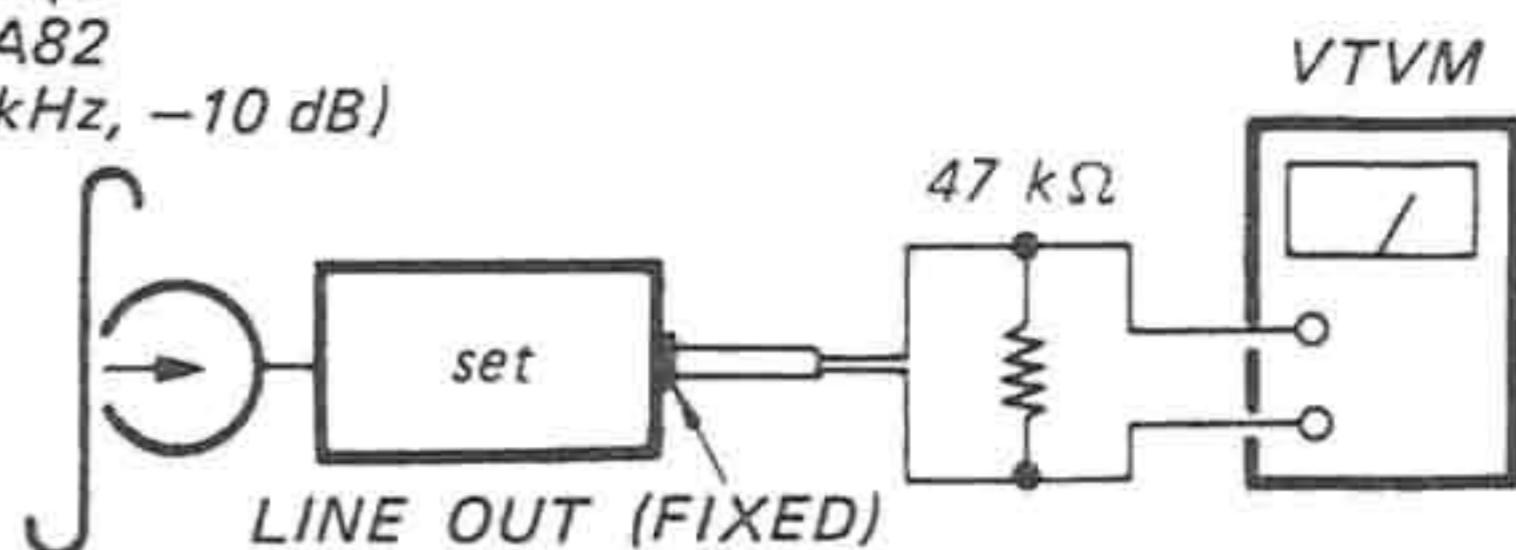

Output Terminal	LINE OUT	HEADPHONES
load impedance	47 kΩ	8 Ω
output level	0.44 V (-5 dB)	39 mV (-26 dB)

1. Record/playback Head Azimuth Adjustment

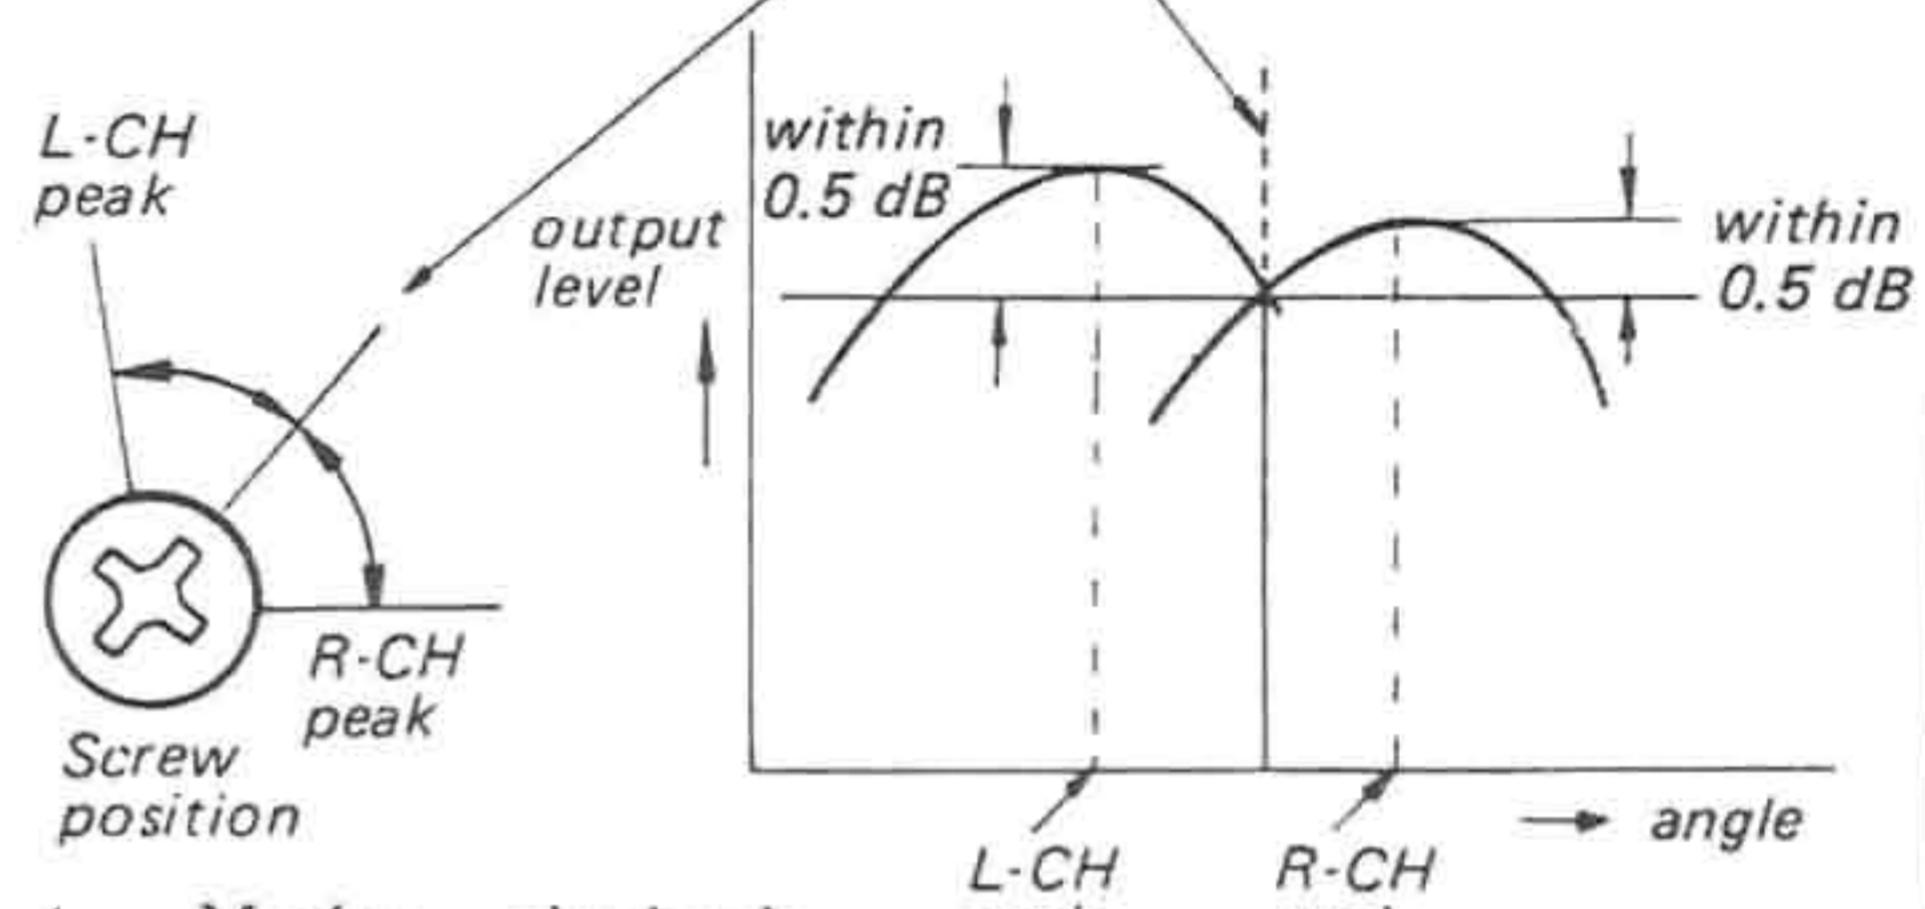

Procedure:

- Loosen the head-holding screw.
- Mode: playback

test tape
P-4-A82
(10 kHz, -10 dB)

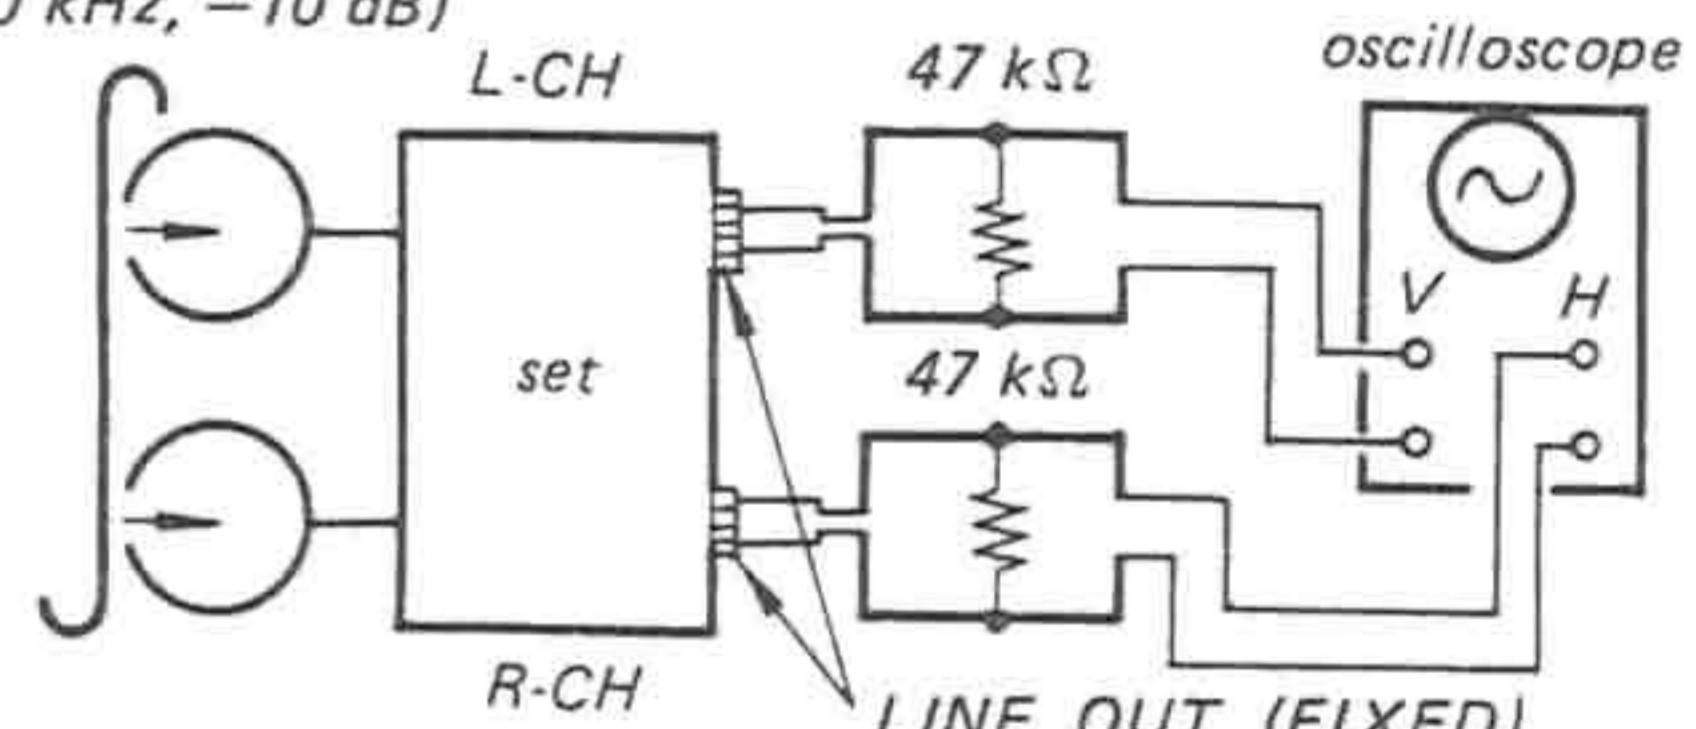

- Turn the adjustment screw for the maximum output levels. If these levels do not match, turn the adjustment screw until both of output levels match together within 0.5 dB.

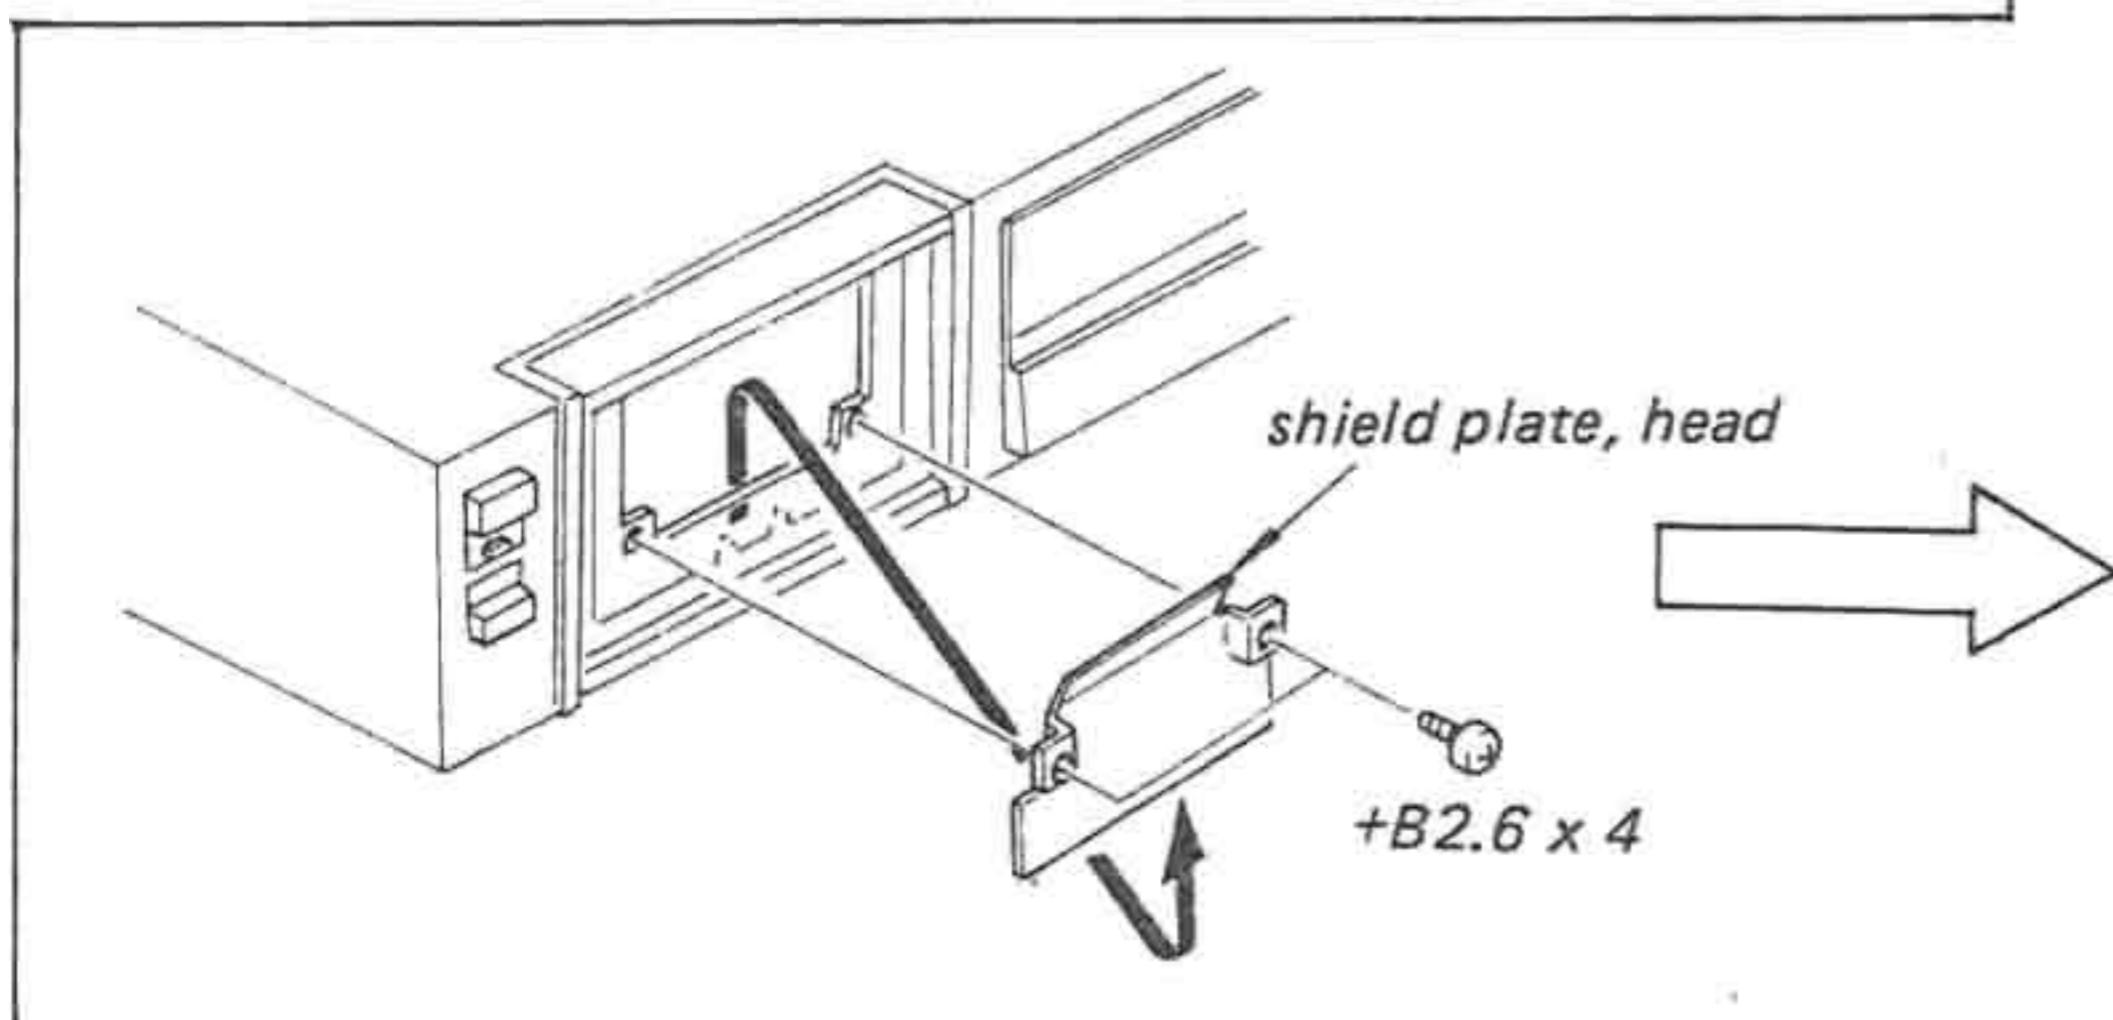

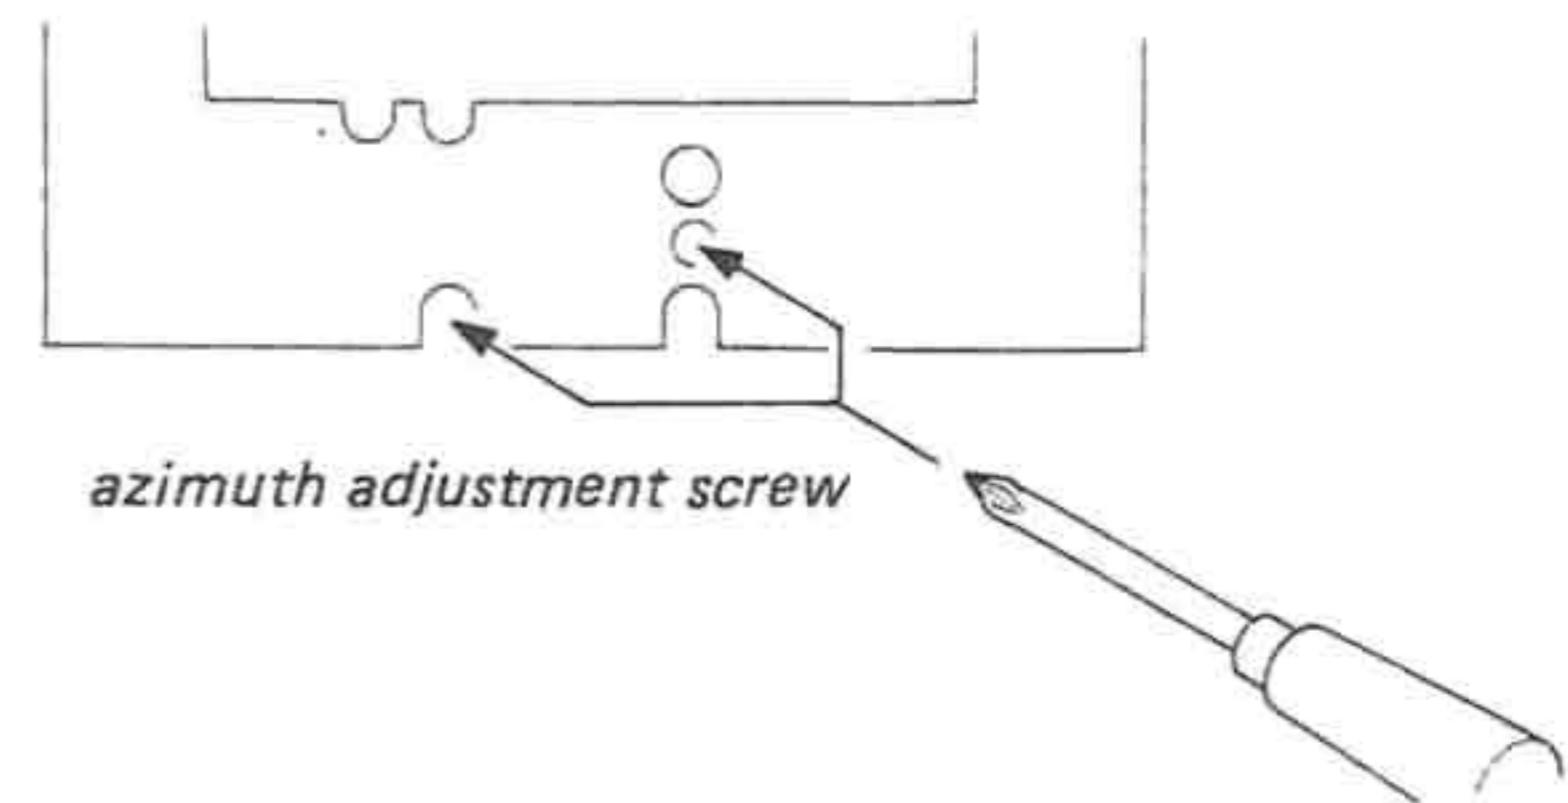

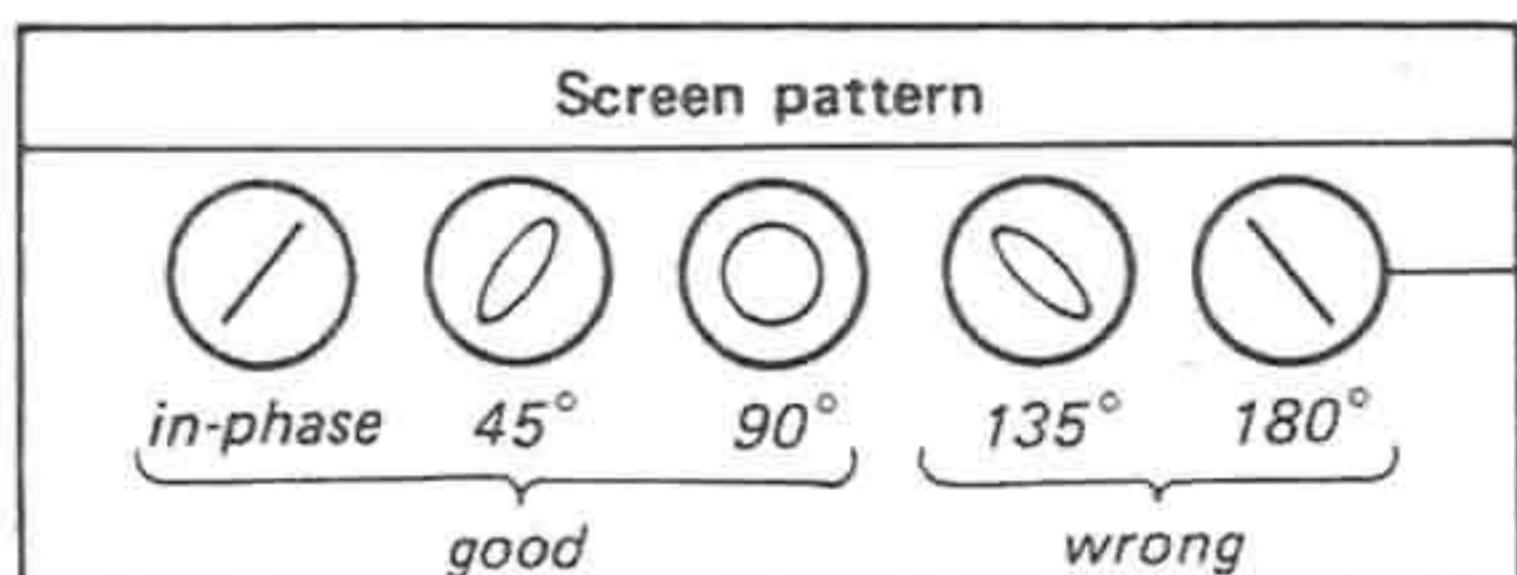

- Mode: playback

test tape P-4-A82
(10 kHz, -10 dB)

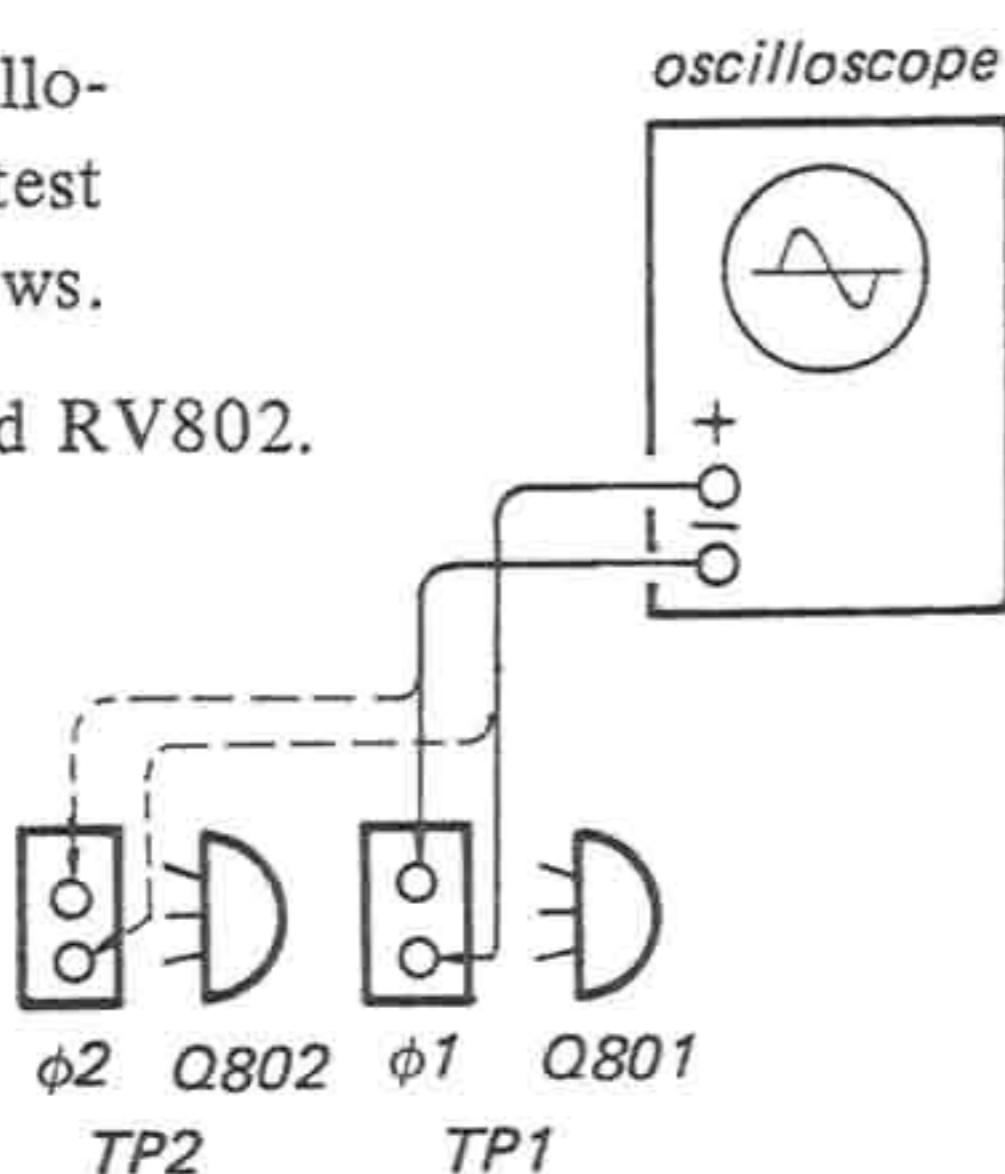

Adjust the adjustment screw for a good pattern.

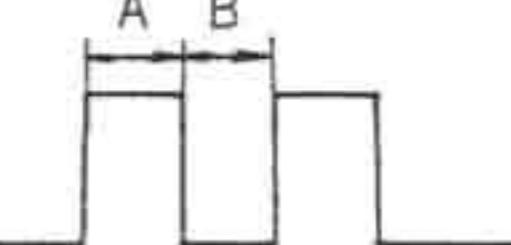

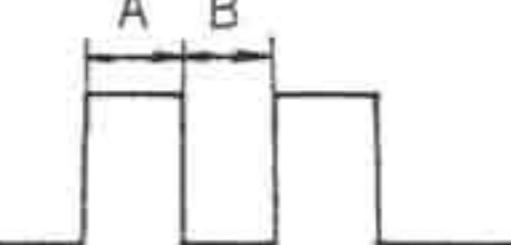

2. Speed Detecting Head Adjustment

Procedure:

1. Install blank cassette tape CS-15 and set the unit in fast-forward or rewind mode.
2. Connect an oscilloscope to the test points as follows.
3. Adjust RV801 and RV802.

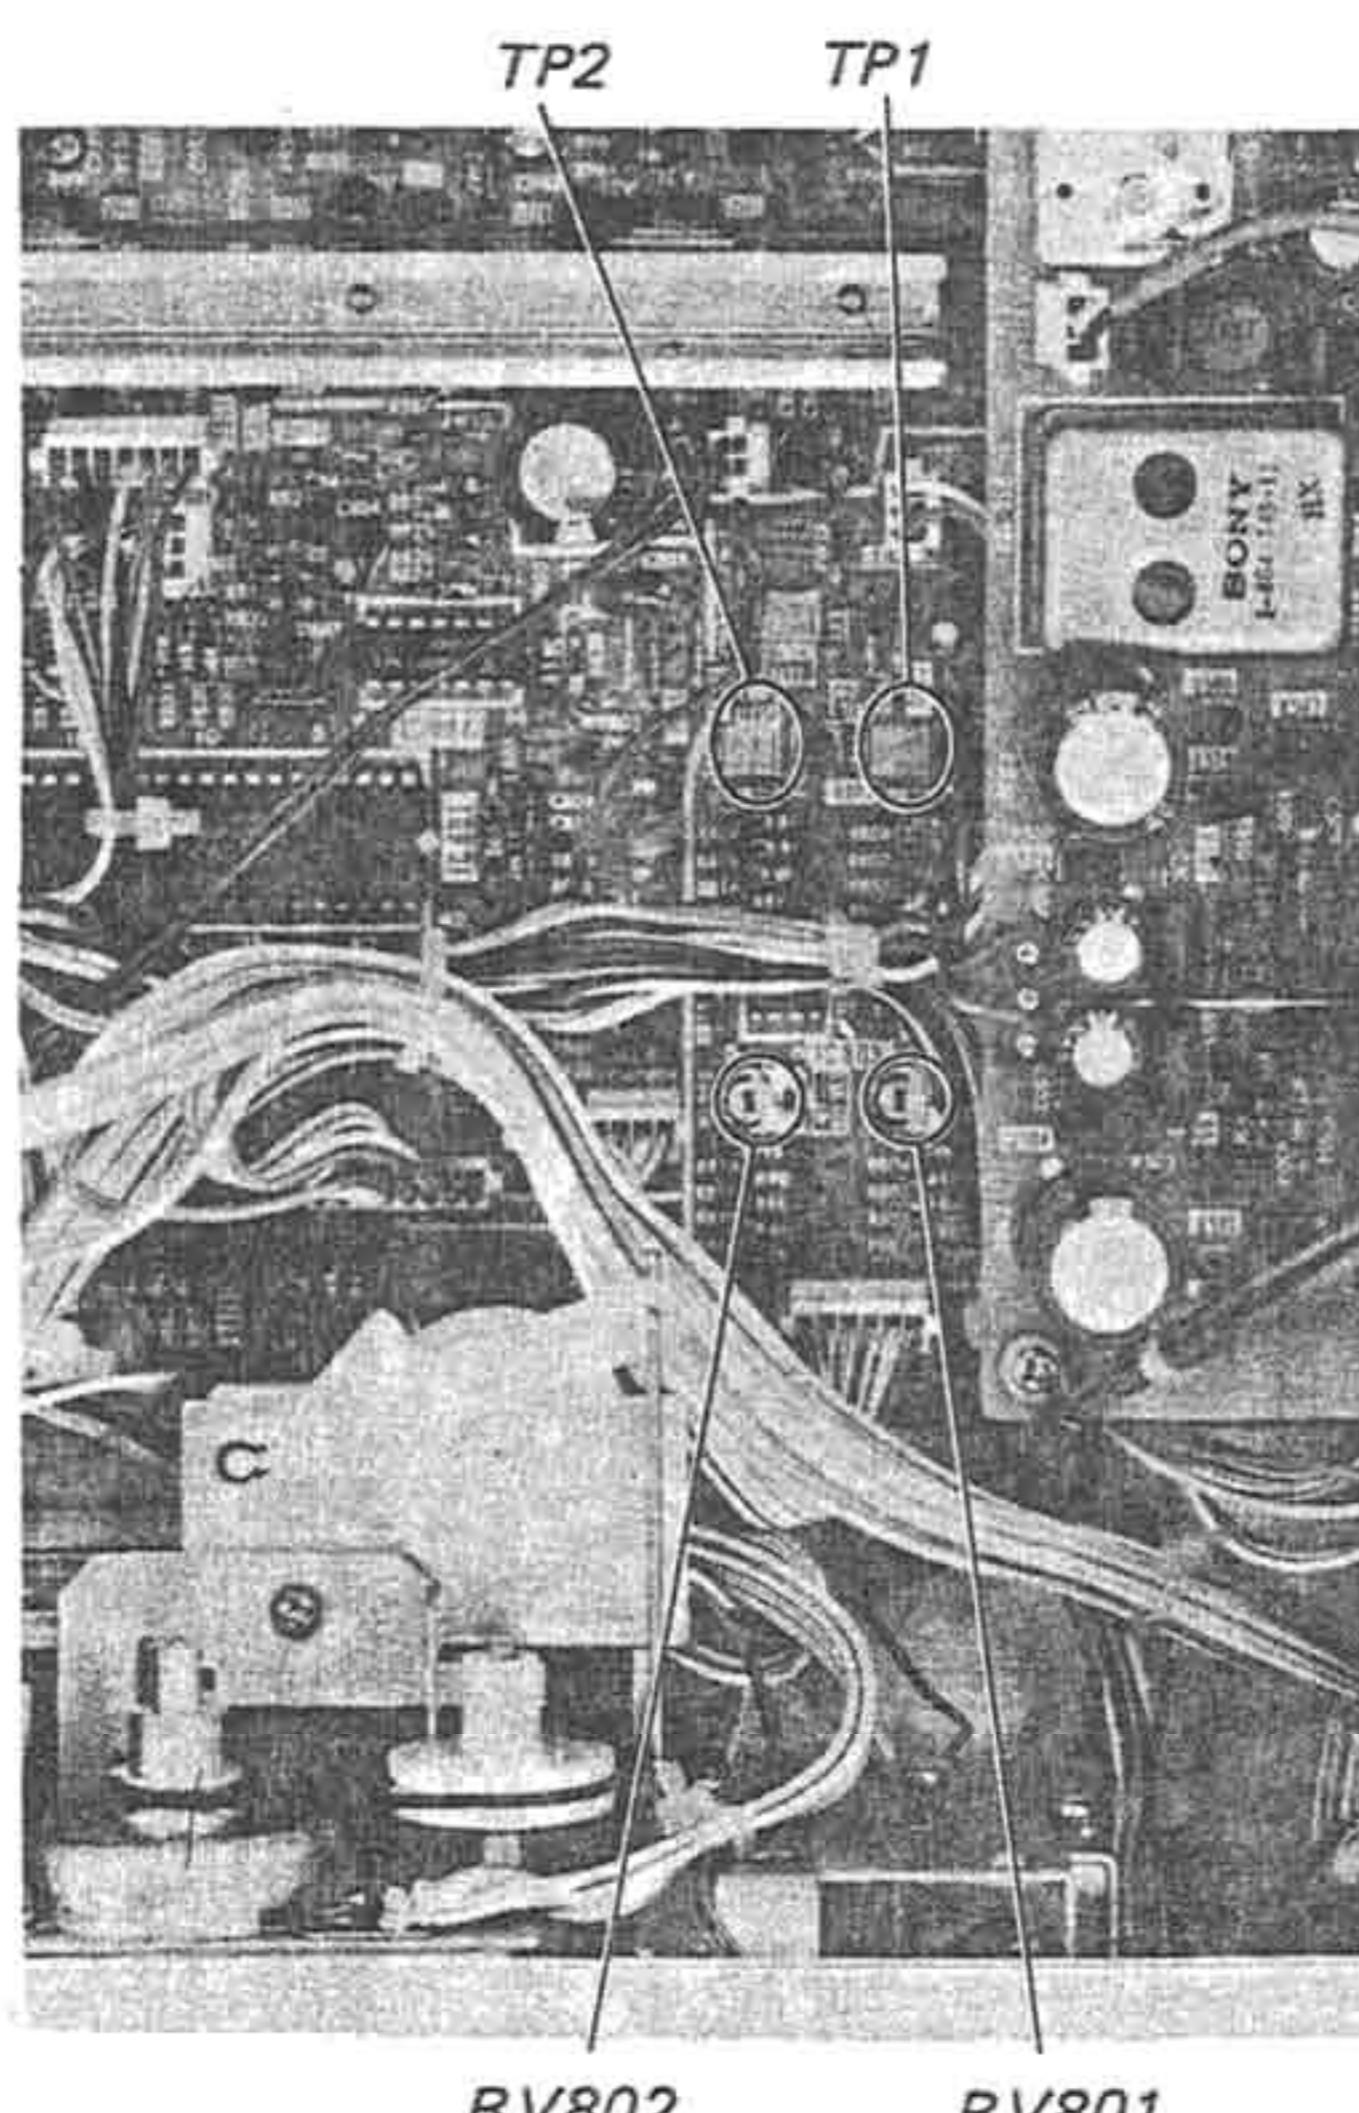

Specification:

Oscilloscope Connection	Adjust	Waveform
TP1 (ϕ_1)	RV801	 A = B (both within ±10 %)
TP2 (ϕ_2)	RV802	

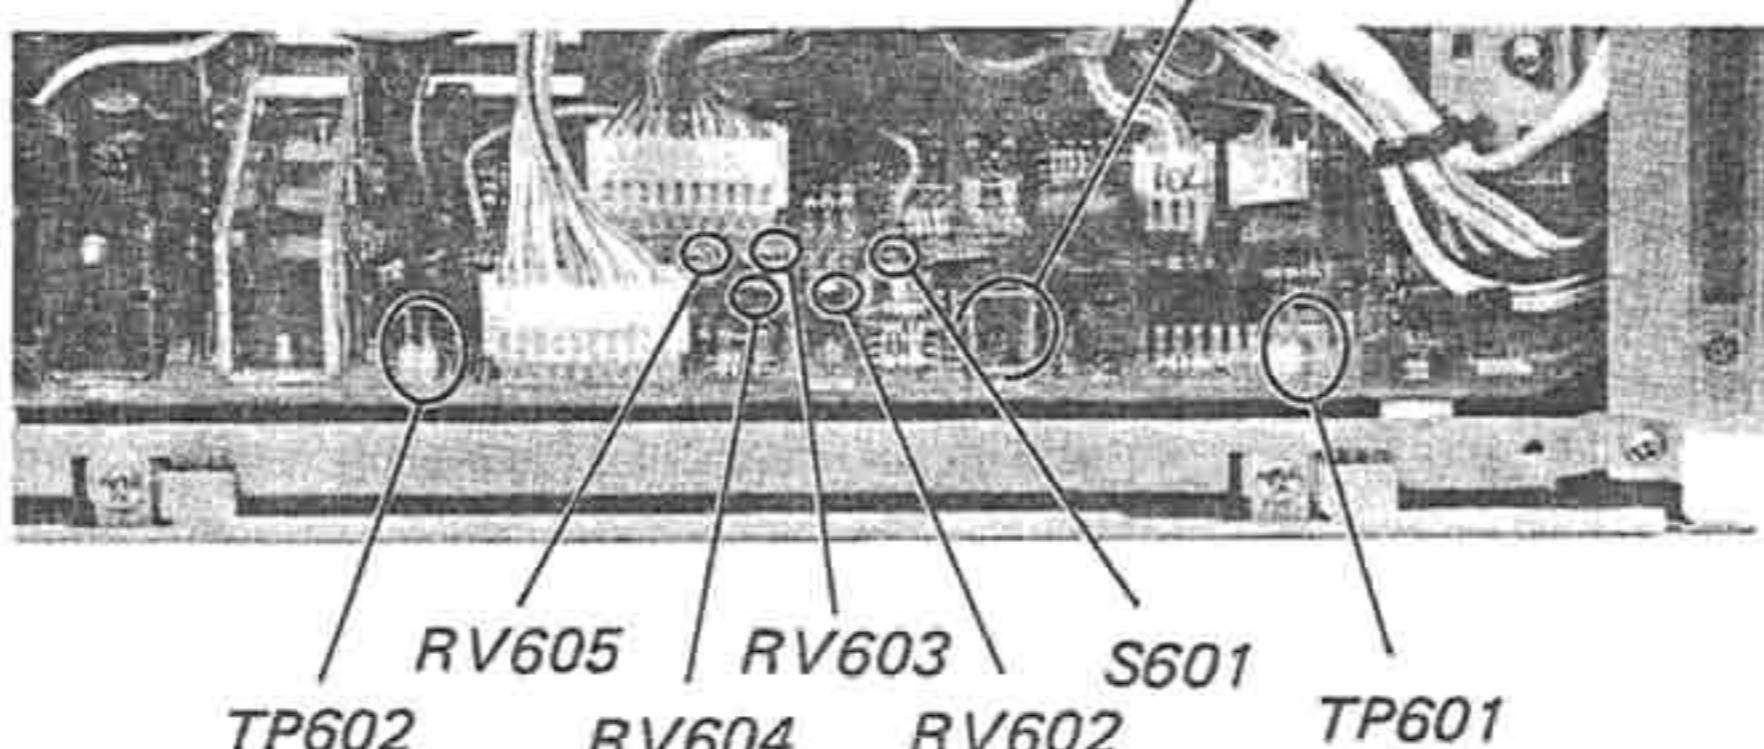

Adjustment Location:

- system control board -

Adjustment Location:

- servo amp board -

3. Capstan Motor Adjustment

Setting:

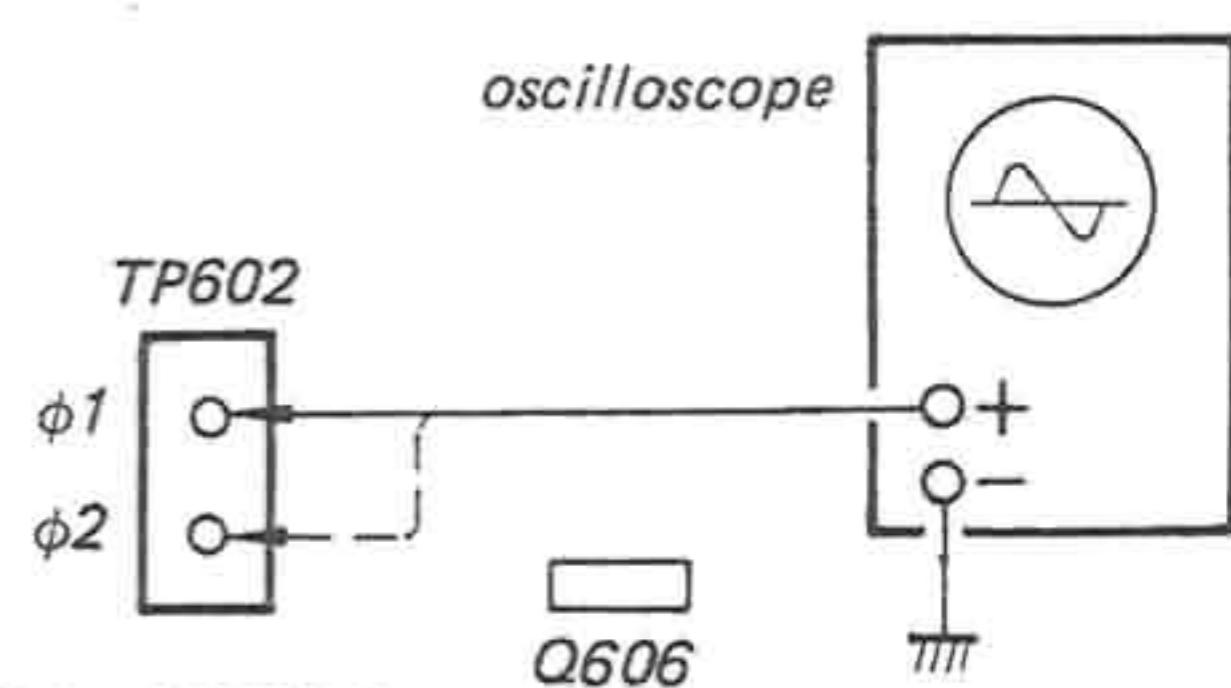

POWER switch: ON

Mode: stop

Procedure:

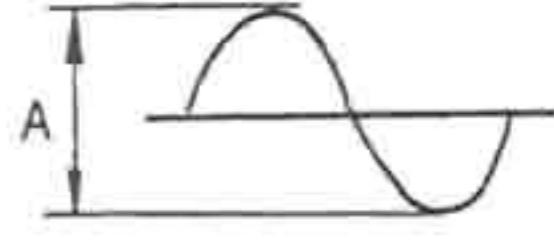

1. Set S601 to DC side (full-counterclockwise position).
2. Connect an oscilloscope to the test points as follows.

Connection

3. Adjust RV602 to RV605.

GAIN

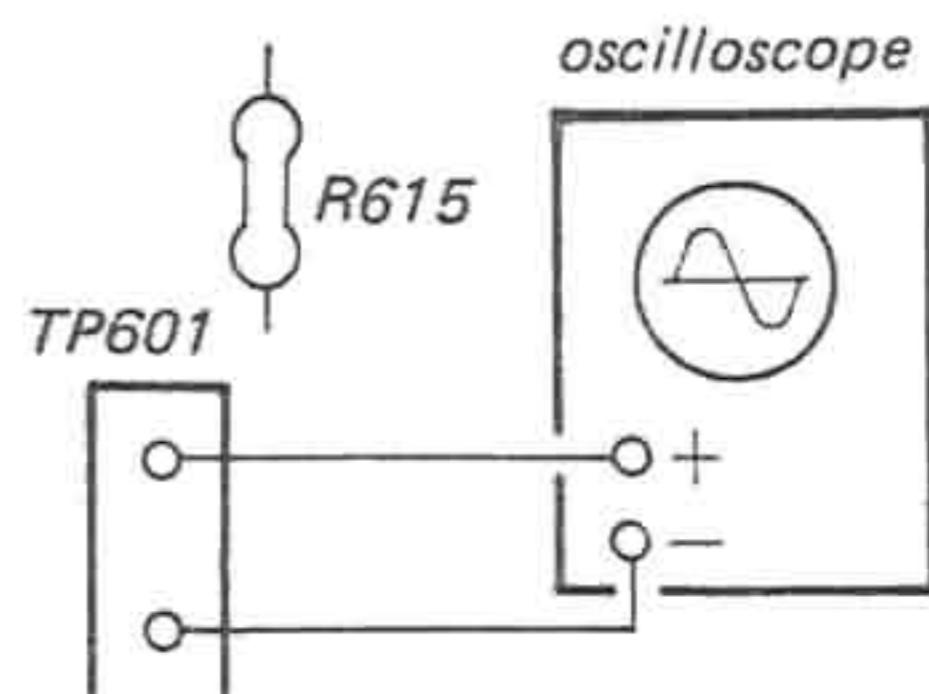

Oscilloscope Connection	Adjust	Waveform
TP602 (ϕ_1)	RV602	
TP602 (ϕ_2)	RV604	A = 3.6 – 4.4 V p-p

OFFSET

Oscilloscope Connection	Adjust	Waveform
TP602 (ϕ_1)	RV603	0 V
TP602 (ϕ_2)	RV605	

4. Set S601 to SERVO side (full-clockwise position).

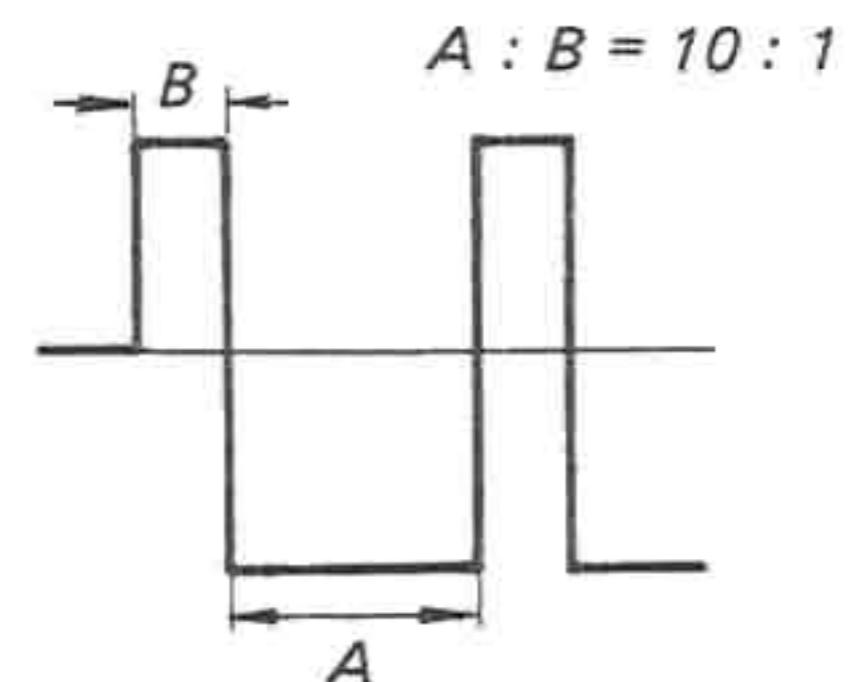

5. Connect an oscilloscope to the test points as follows.

6. Adjust RV601 to obtain square waveforms as shown below.

Specification:

RV601

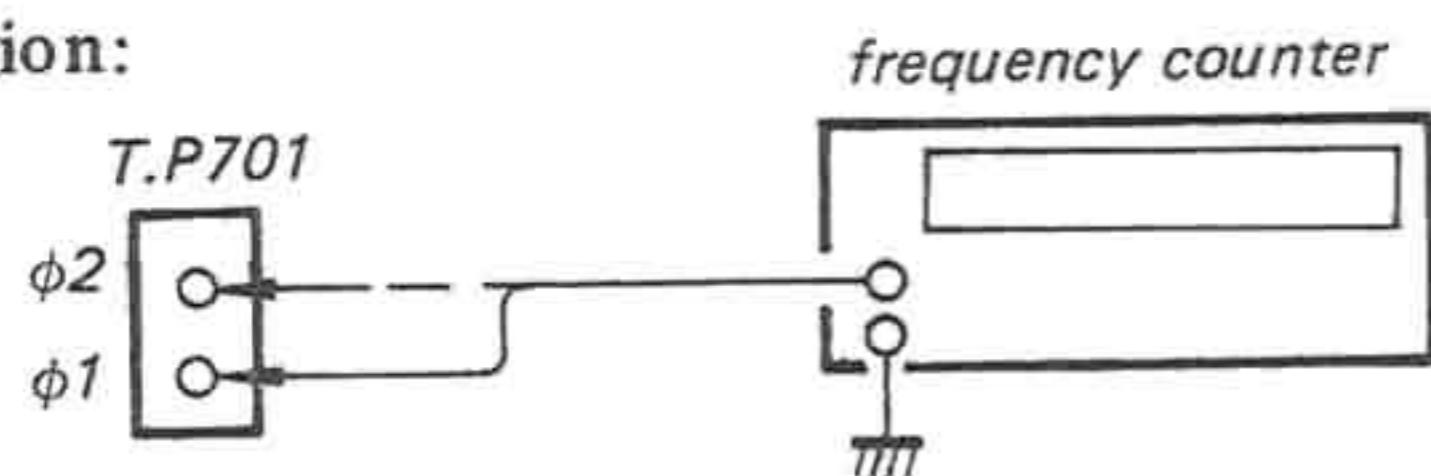

4. Reel Motor Adjustment

Procedure:

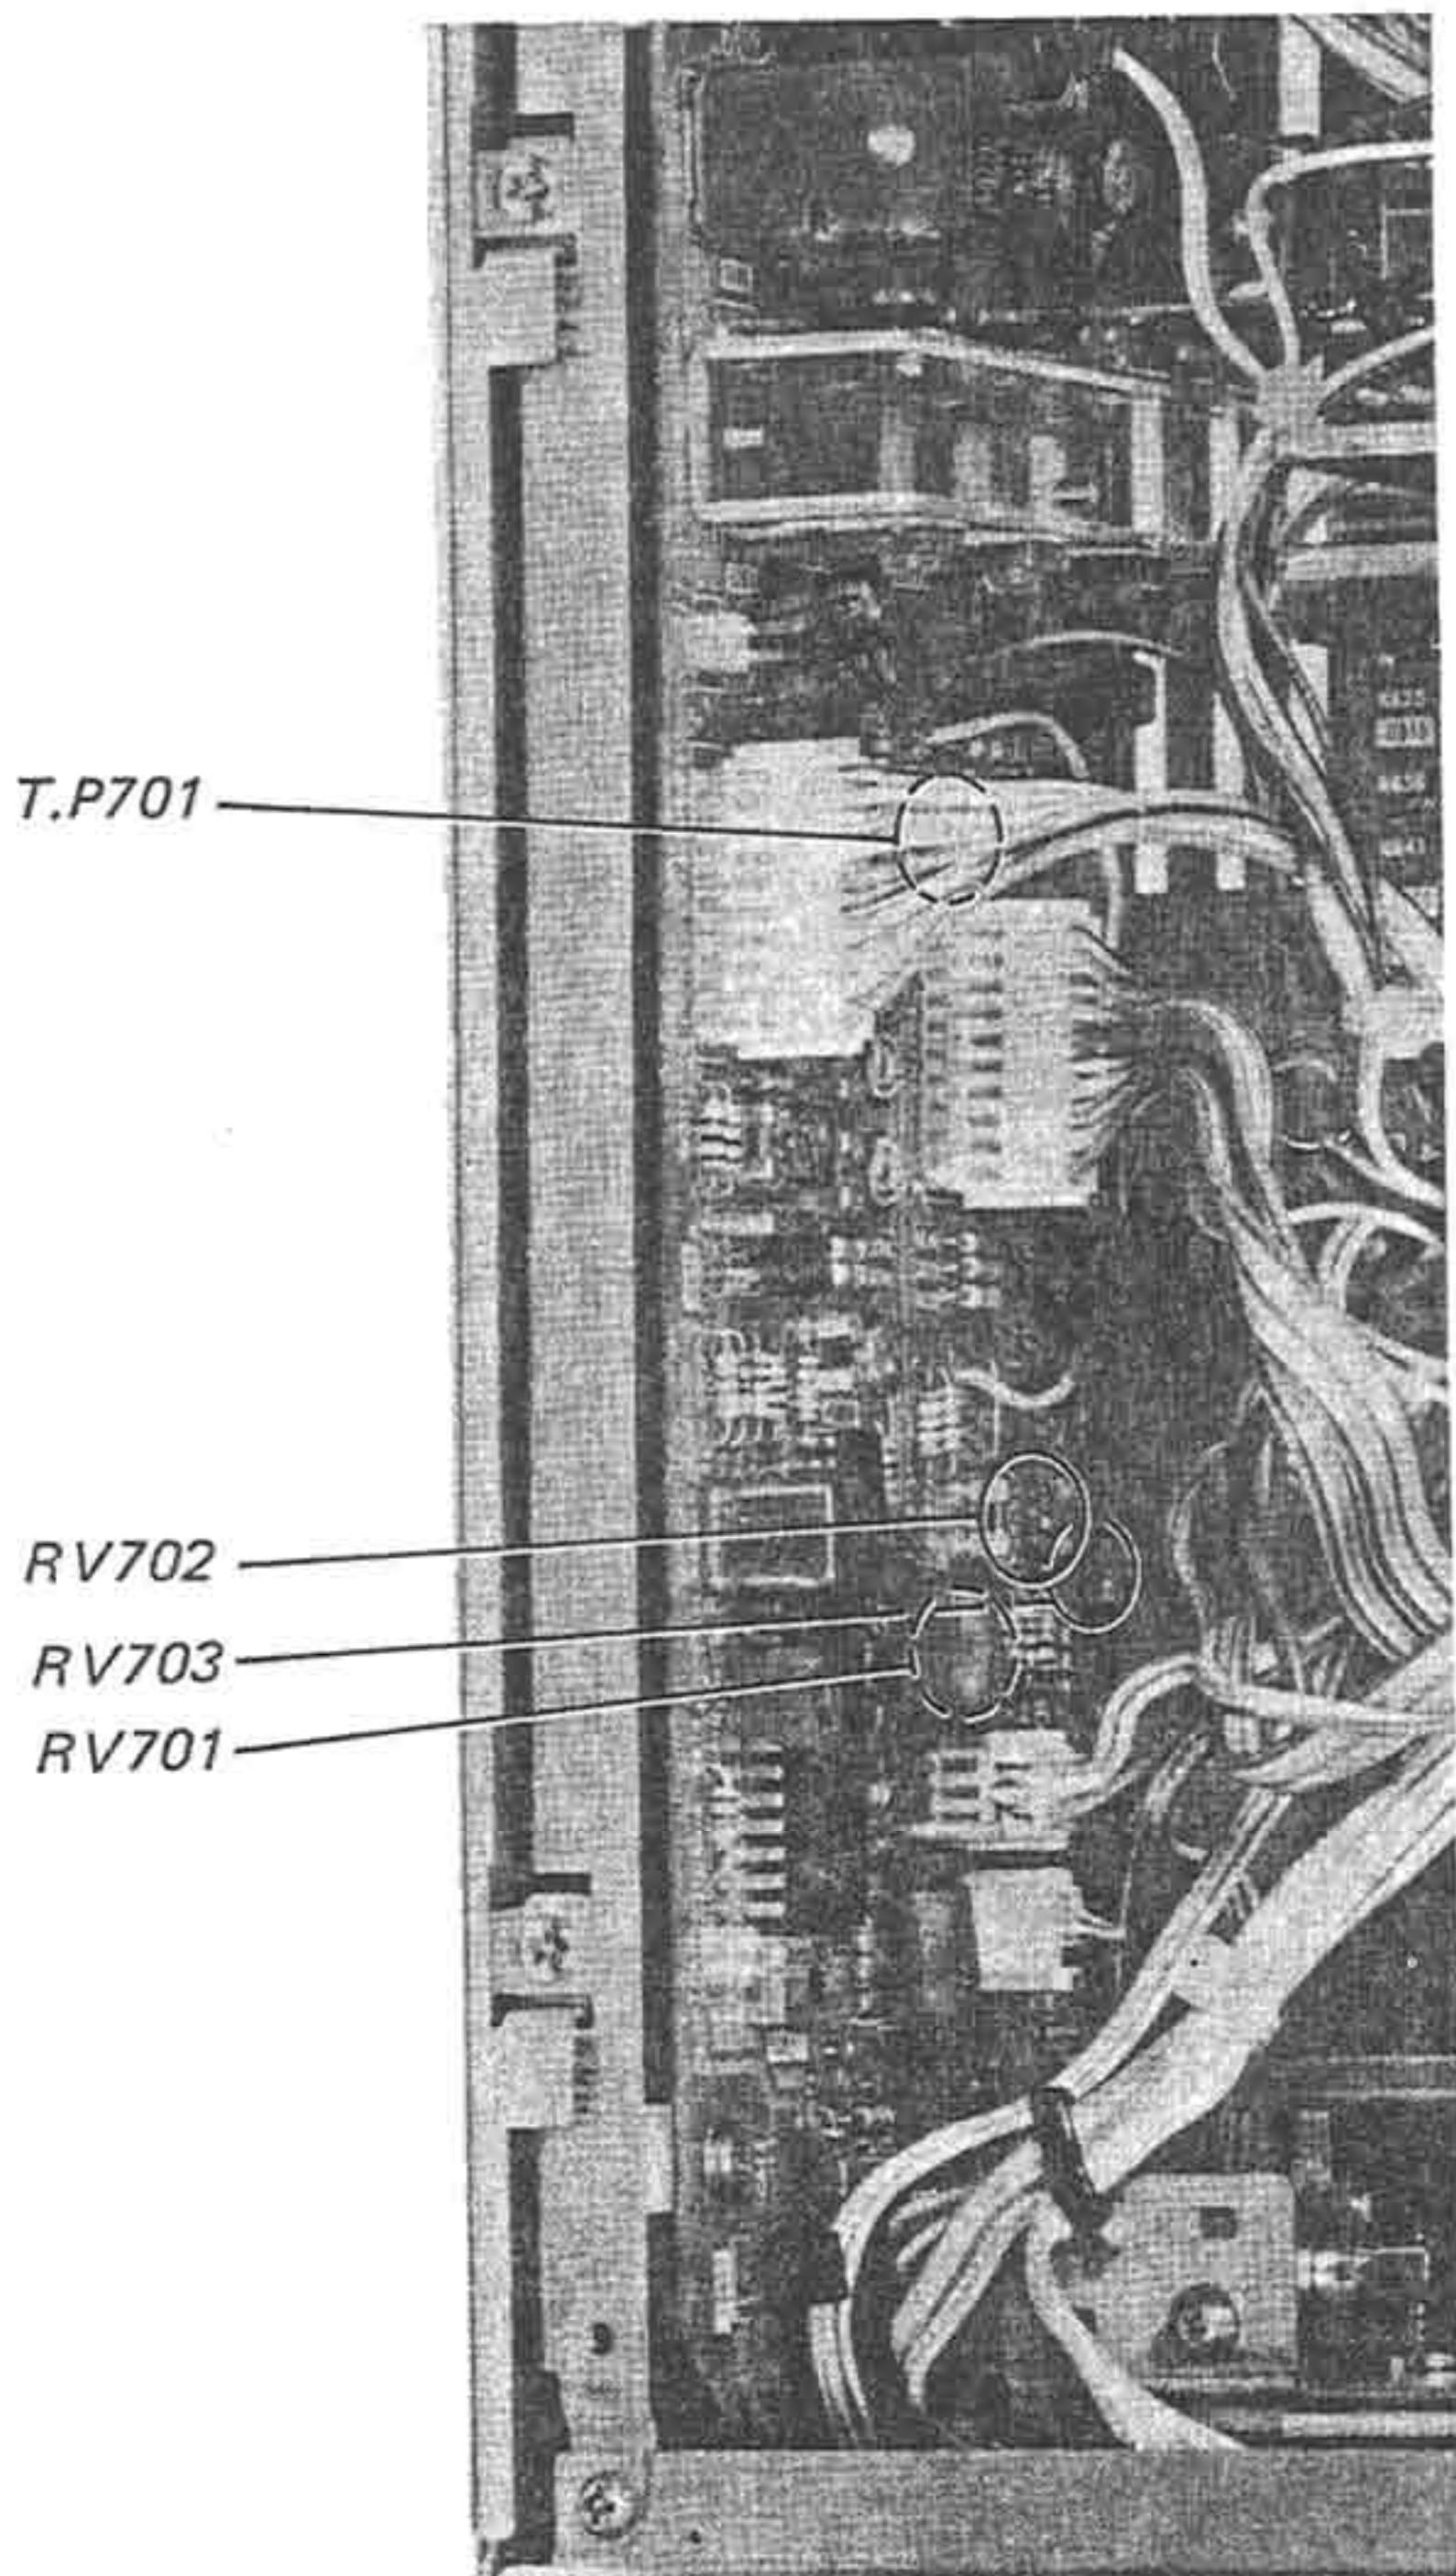

1. Set the unit in playback mode with a tape cassette installed.
2. Adjust RV702 so that the output frequency of TP701 is between 48 and 52 Hz.
3. Remove the cassette and adjust RV703 so that output frequency of TP701 in rewind mode is the same as that in fast forward mode.
4. Adjust RV701 so that output frequency of TP701 is 140 – 144 Hz.

Connection:

Adjustment Location:

— servo amp board —

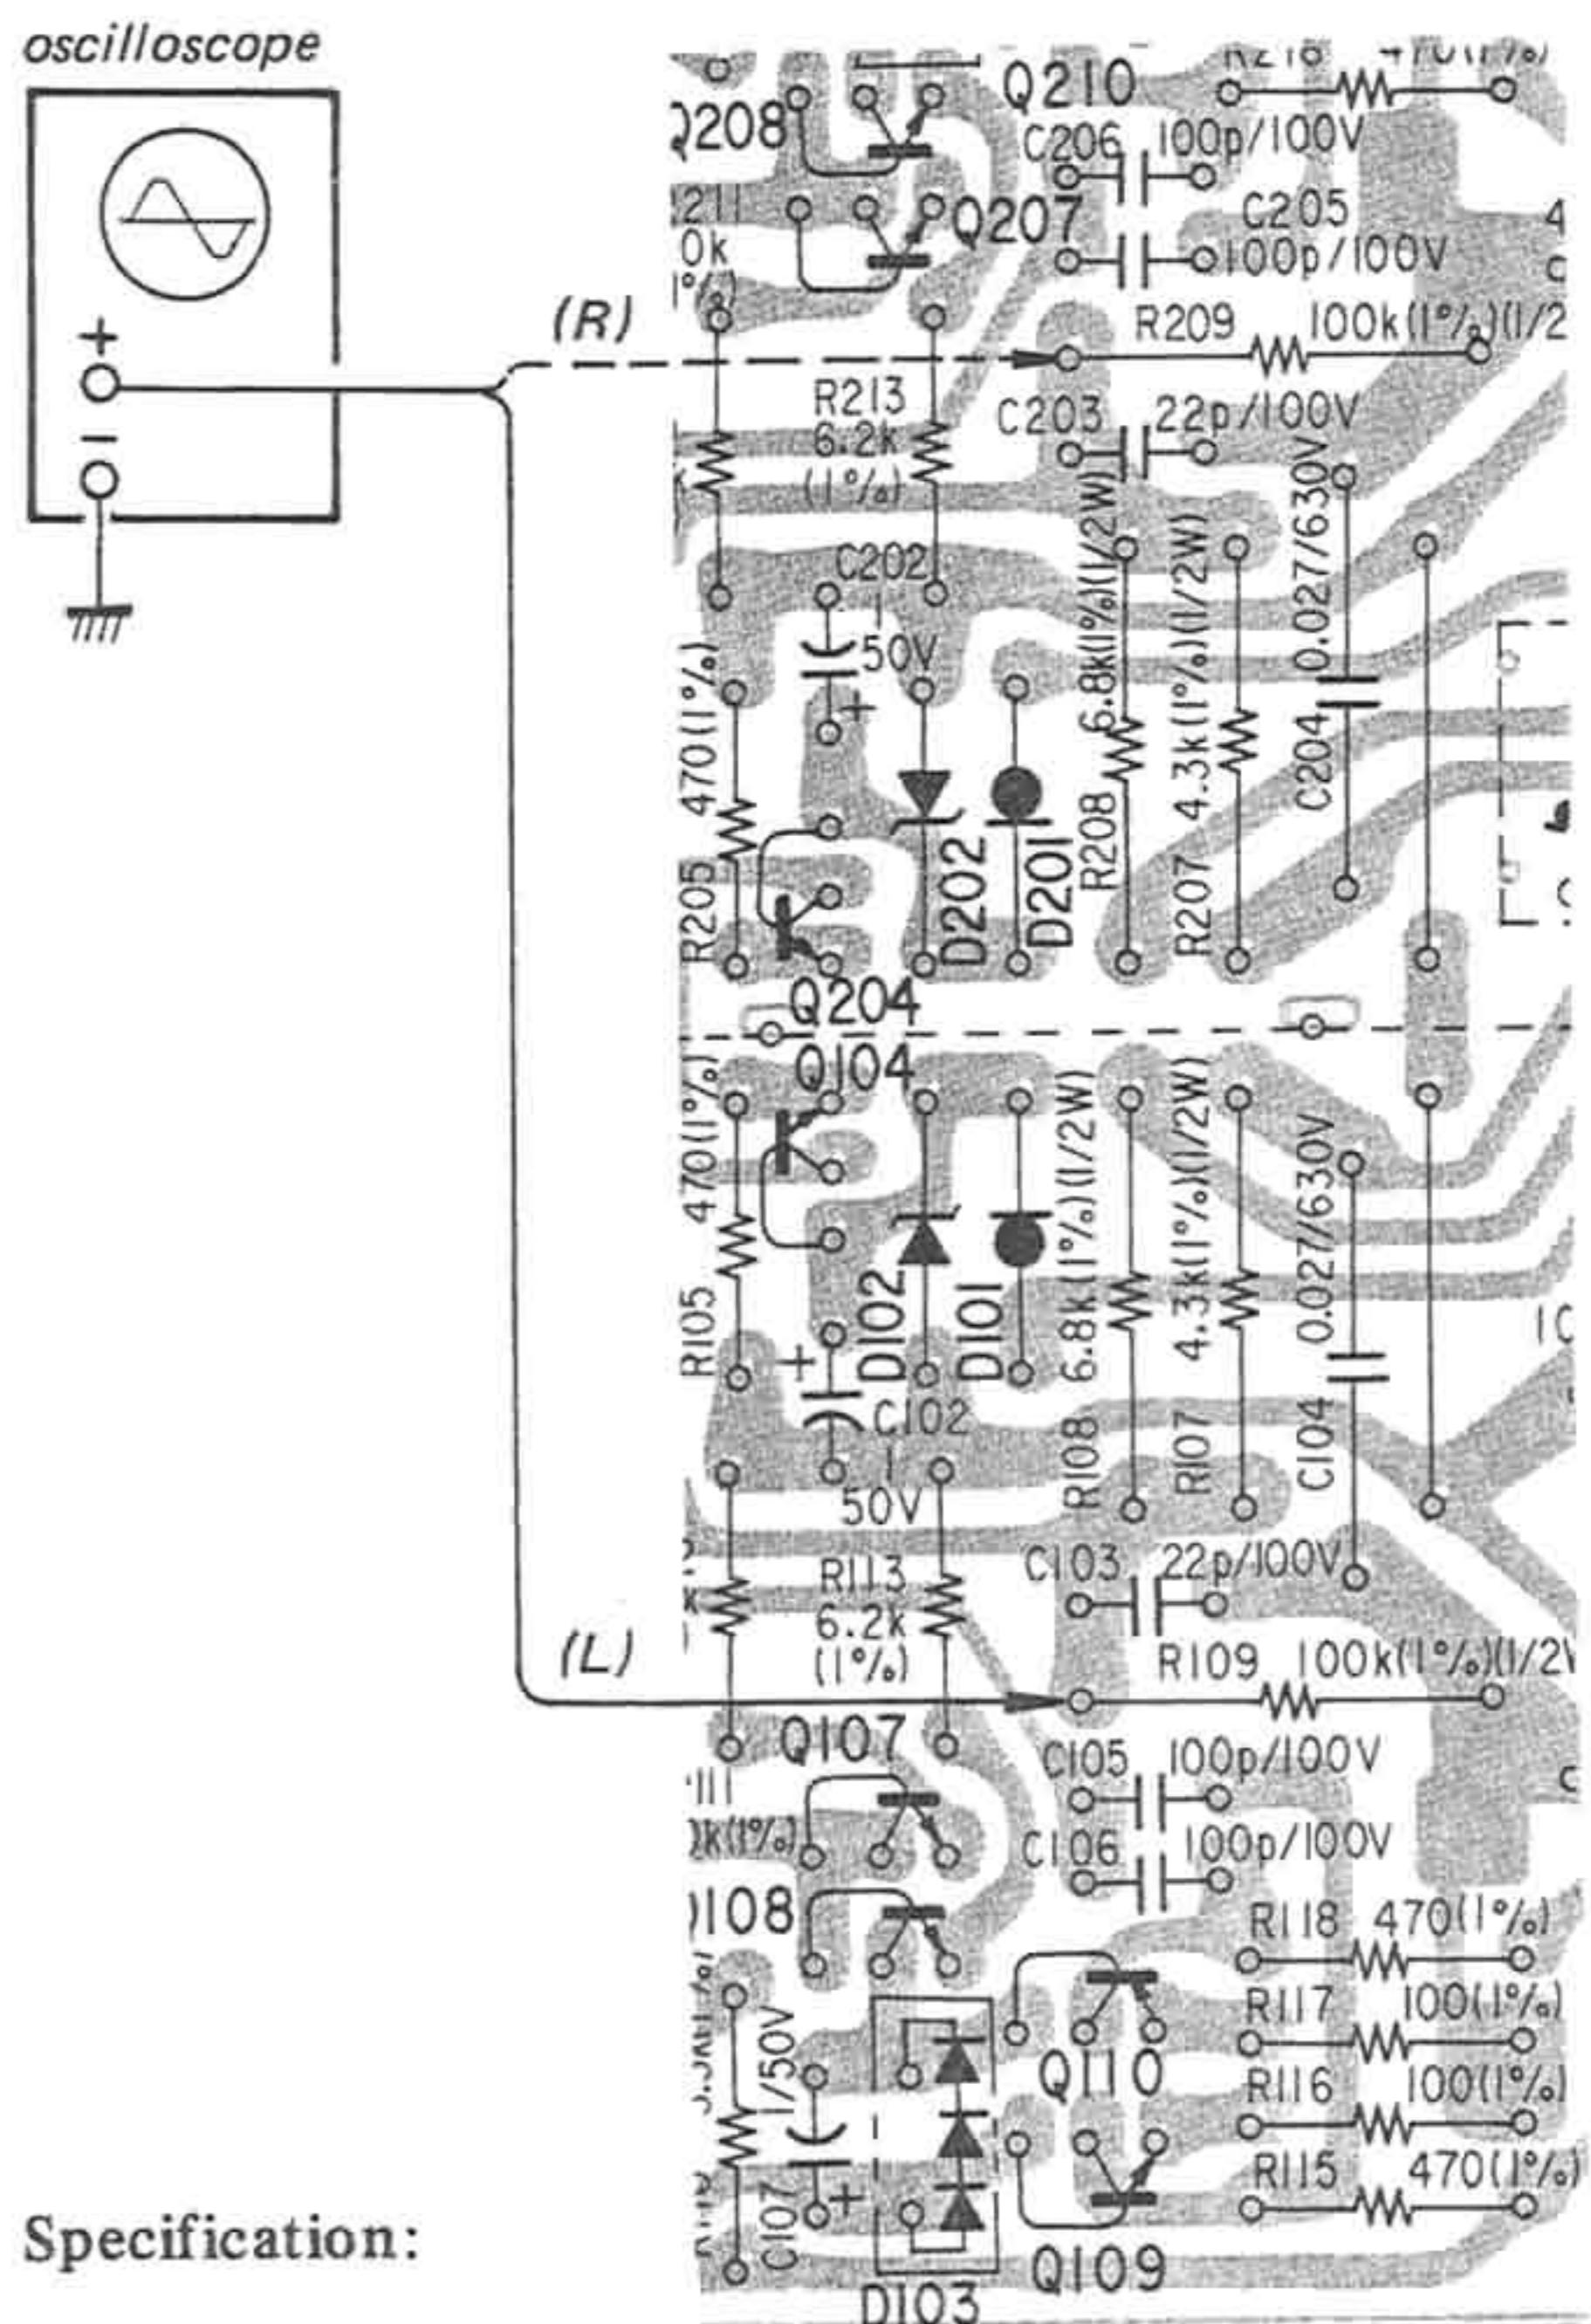

5. Playback Offset Adjustment

Procedure:

Adjust RV101 (L-CH), RV201 (R-CH) so that output level at test points, R109 (L-CH), R209 (R-CH) is $0 \text{ V} \pm 100 \text{ mV}$.

Connection:

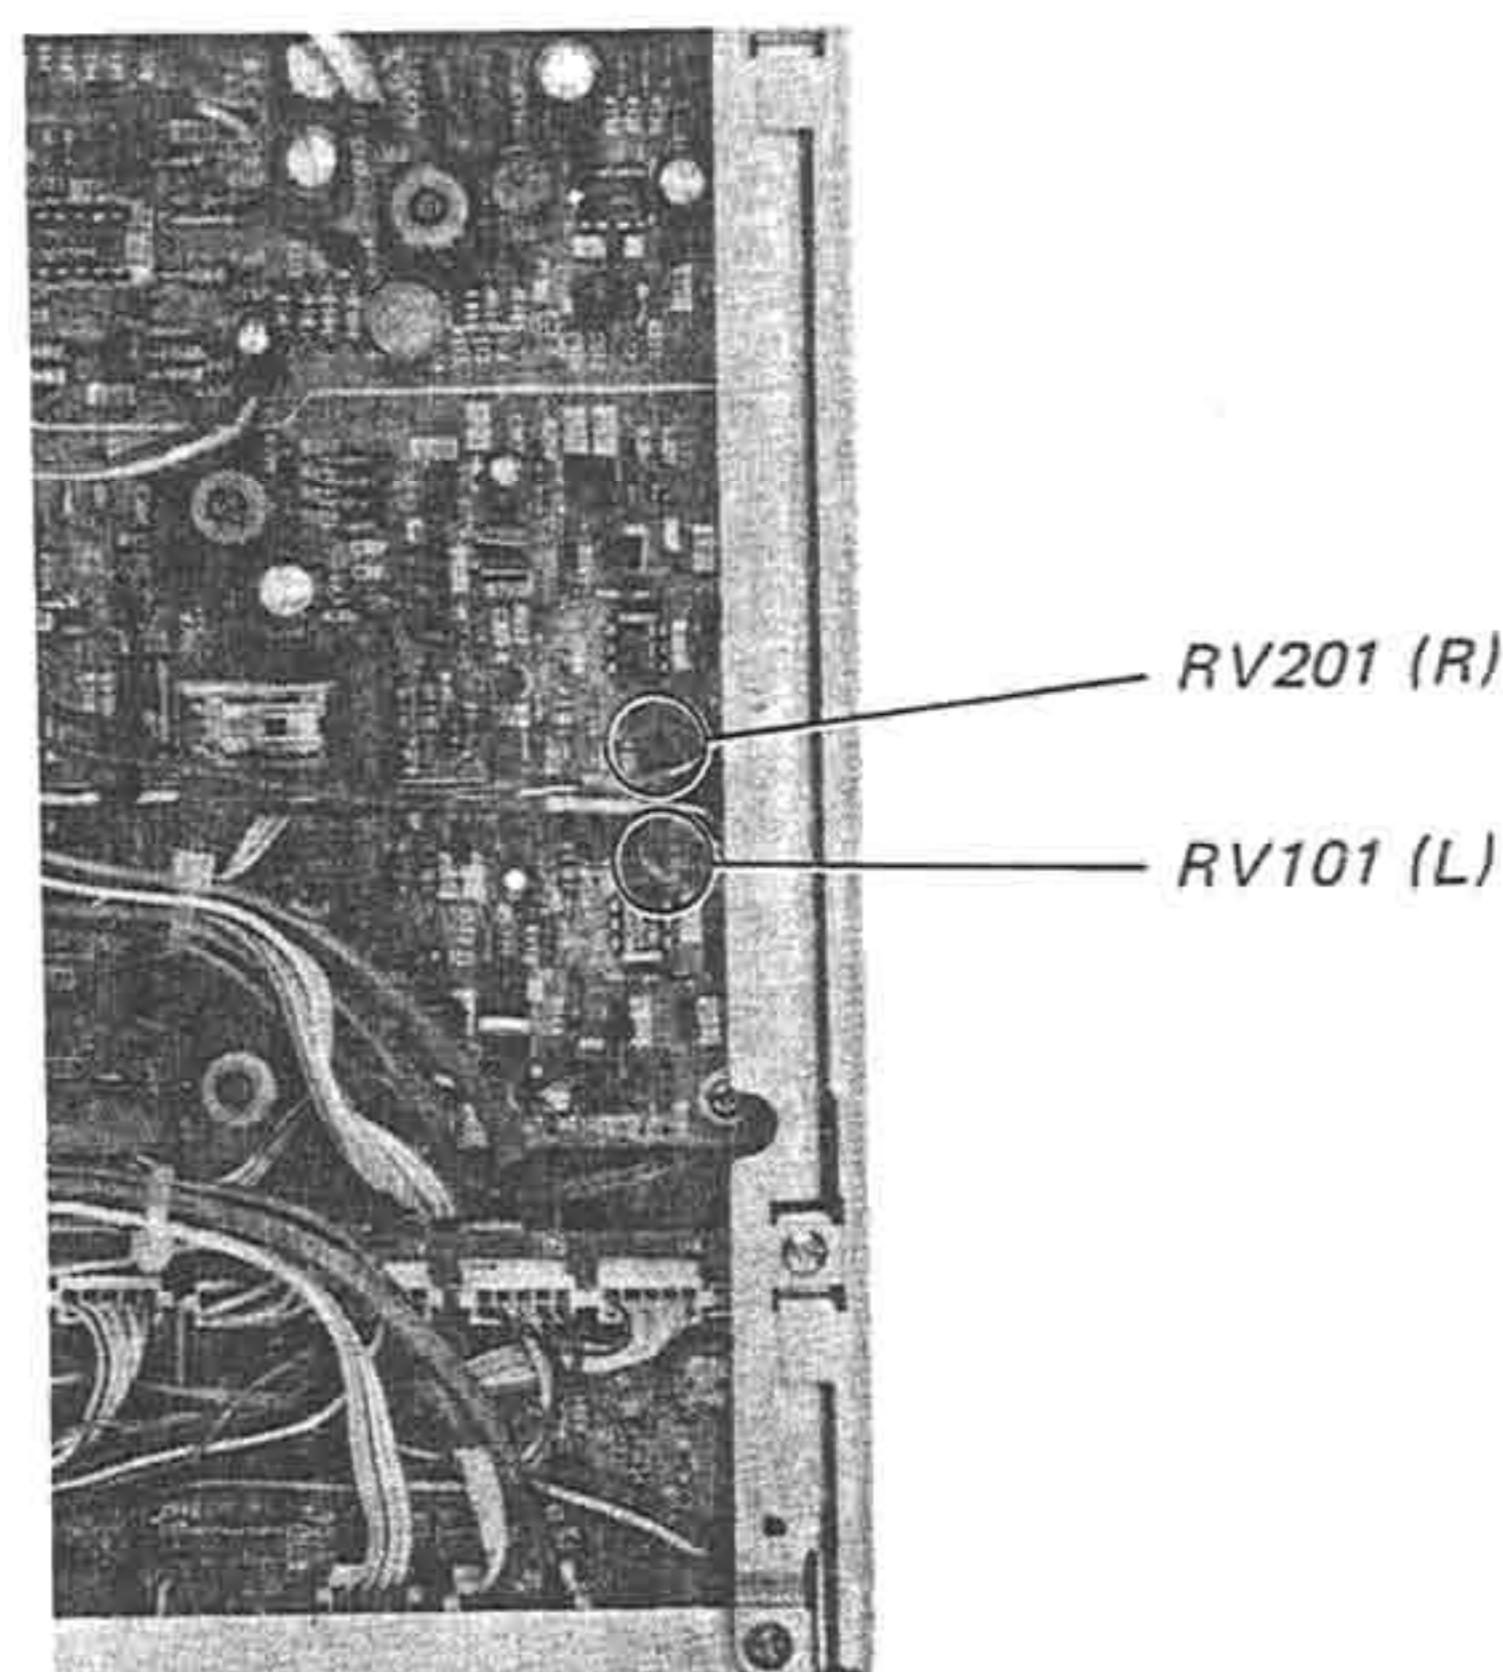

Specification:

$0 \text{ V} \pm 100 \text{ mV}$

Adjustment Location:

— record/playback board —

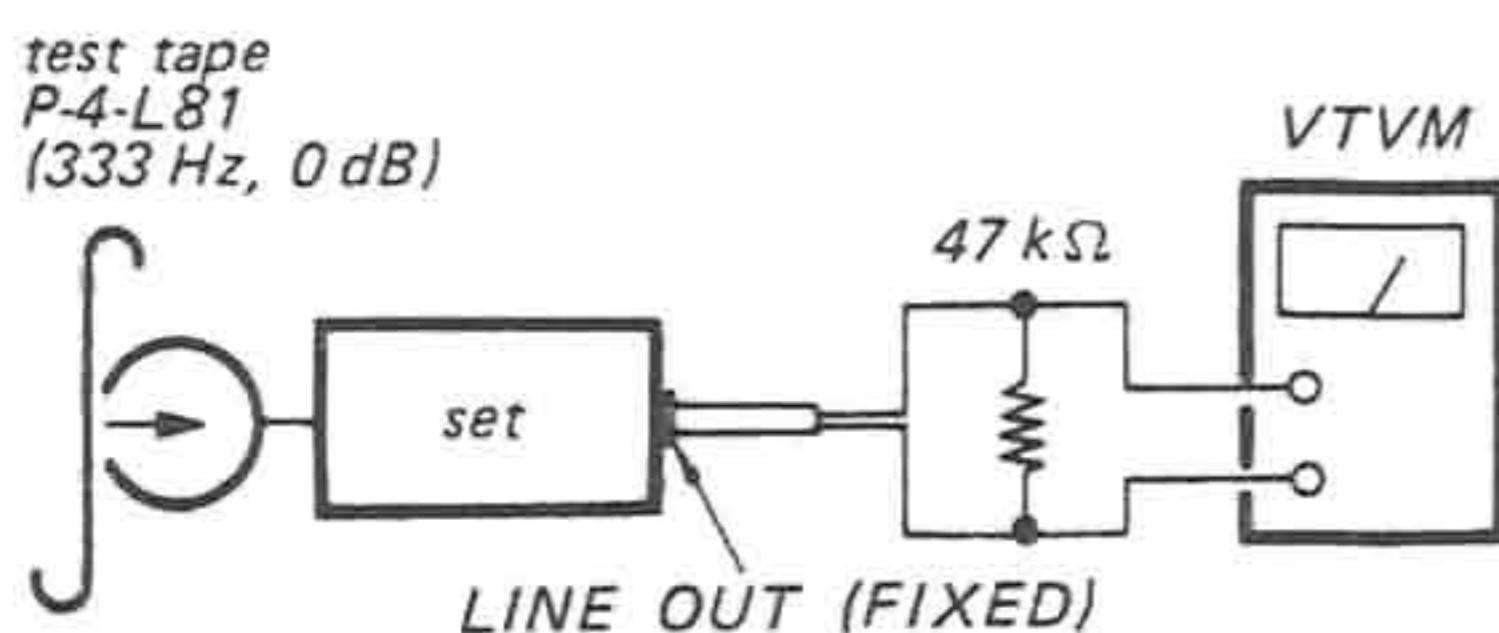

6. Playback Level Adjustment

Setting:

TAPE SELECT switch: TYPE I
mode: playback

Procedure:

Adjust RV102 (L-CH) and RV202 (R-CH) to obtain the specified LINE OUT level.

Specification:

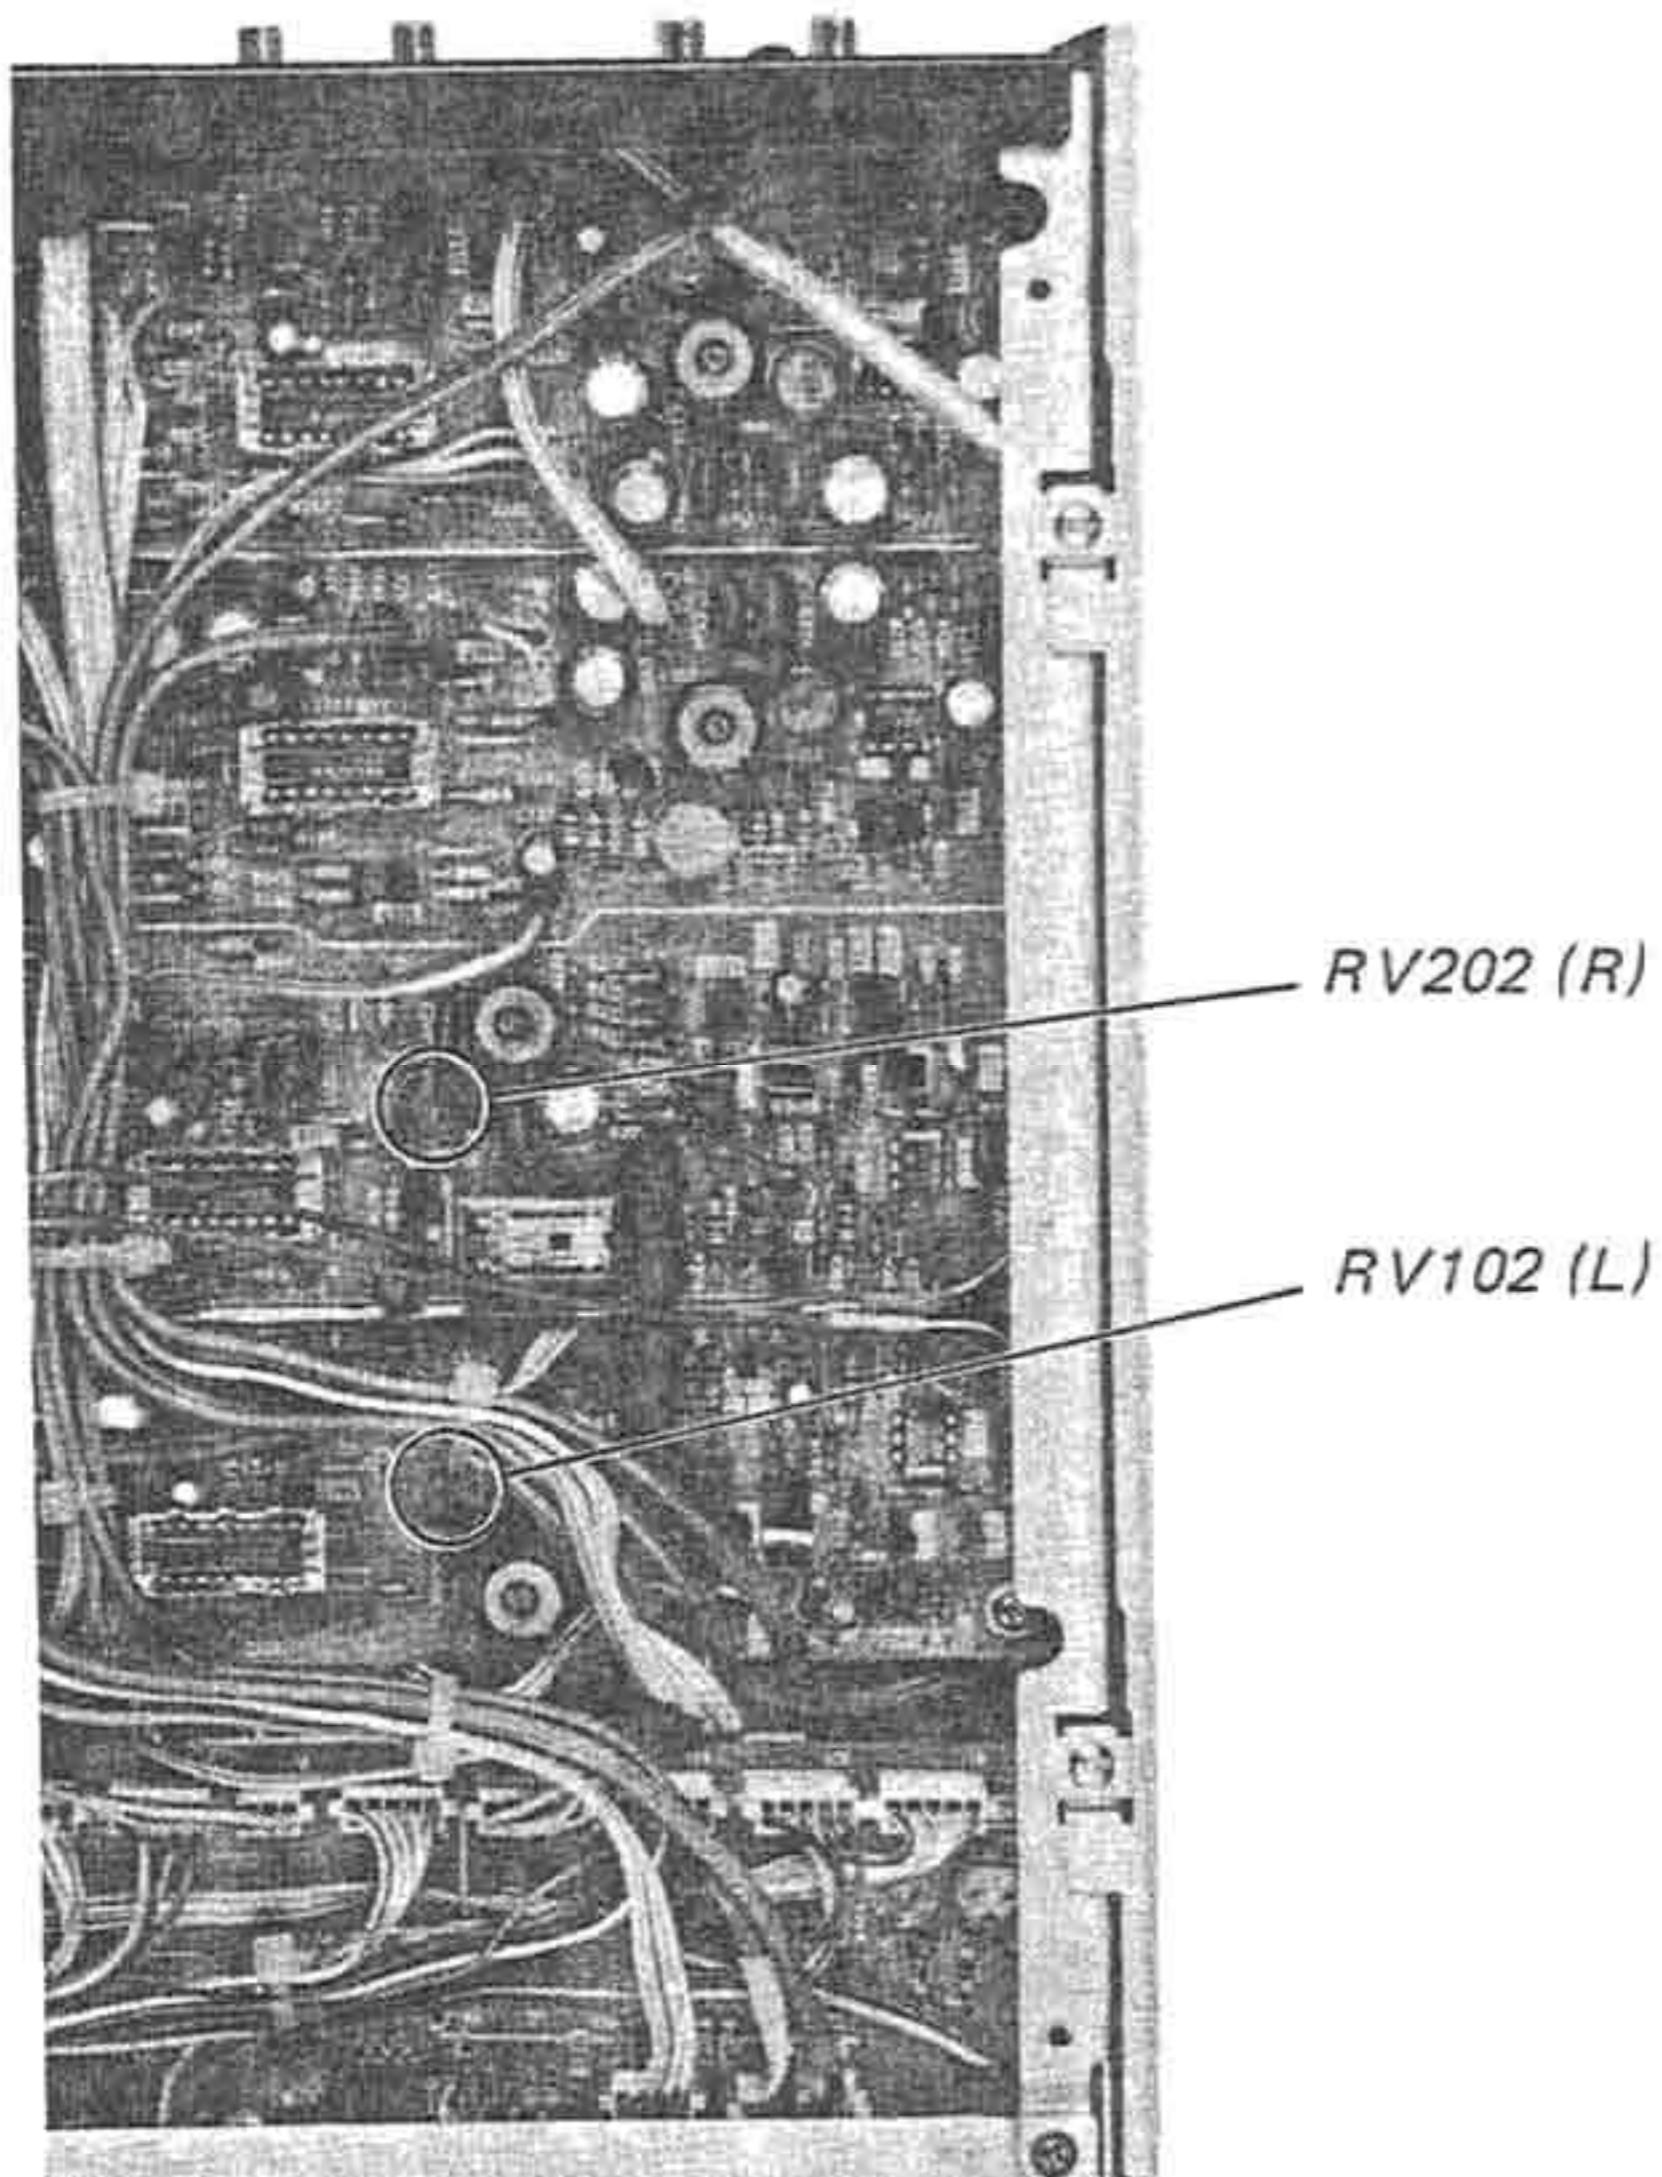

LINE OUT level: 0.52 – 0.58V
(-3.5 to -2.5dB)

Level difference between channels:
less than 0.5dB

Check that the LINE OUT level does not change in playback mode while changing the mode from playback to stop several times.

Adjustment Location:

— record/playback board —

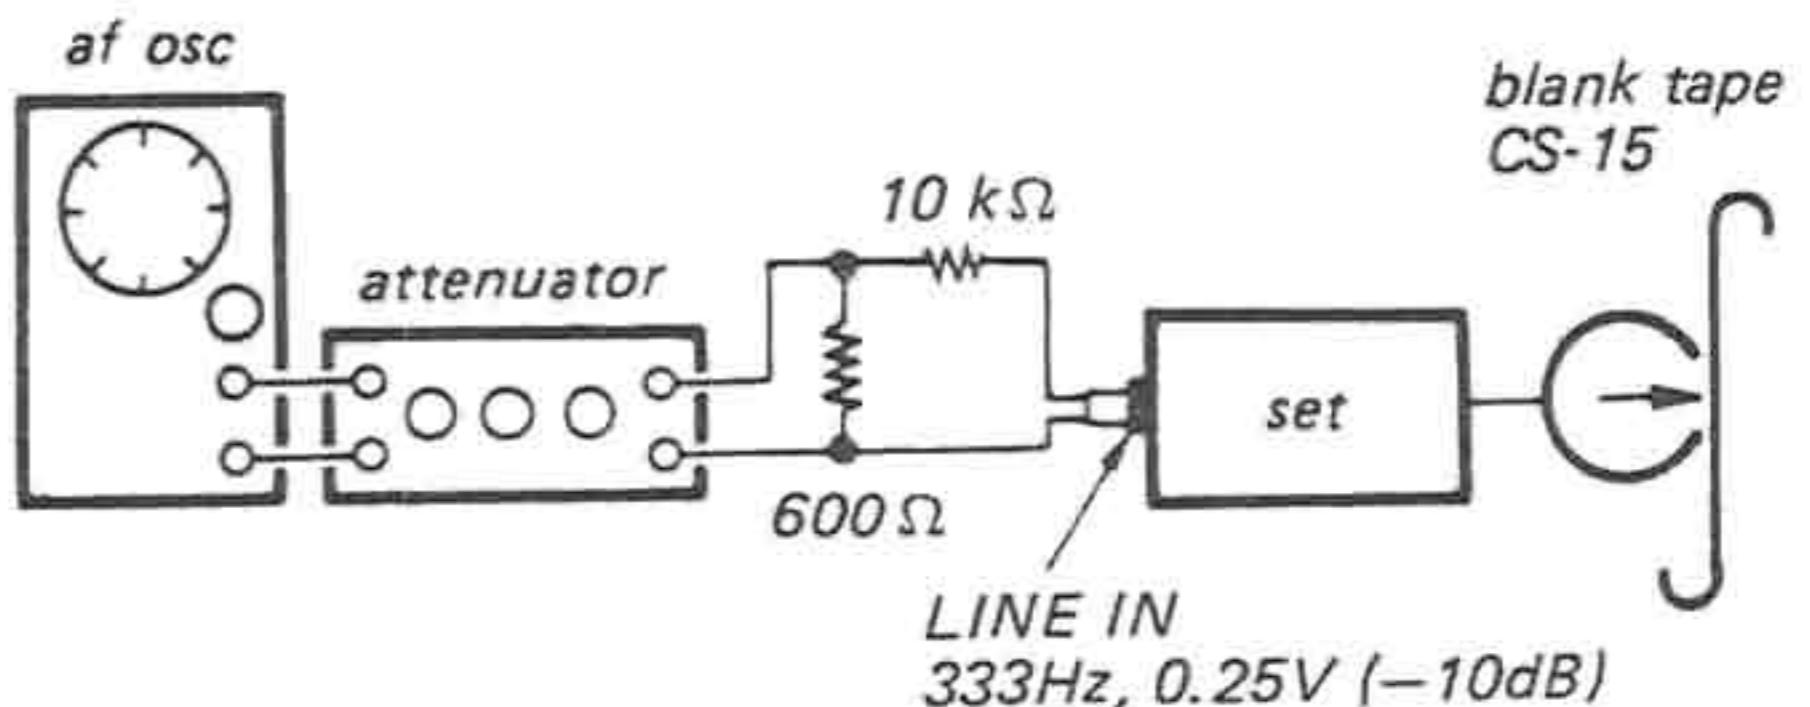

7. Record Level Adjustment

Setting:

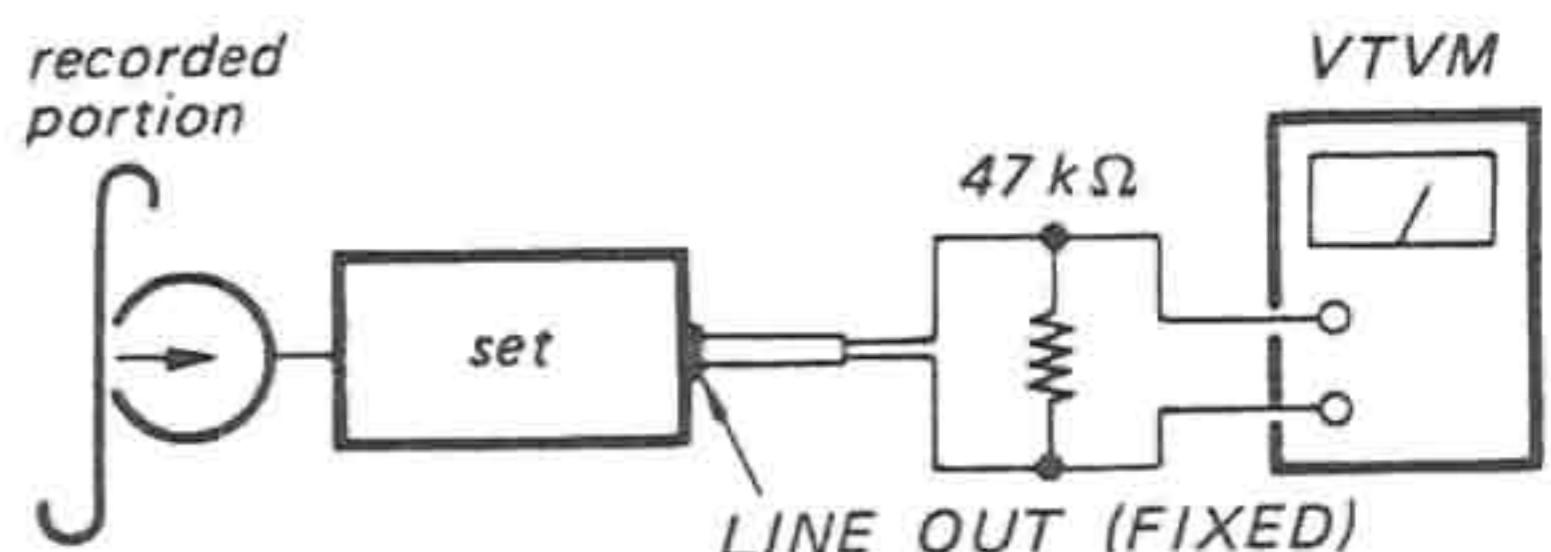

REC LEVEL control: standard record
(See page 31.)

Procedure:

1. Mode: record

2. Mode: playback

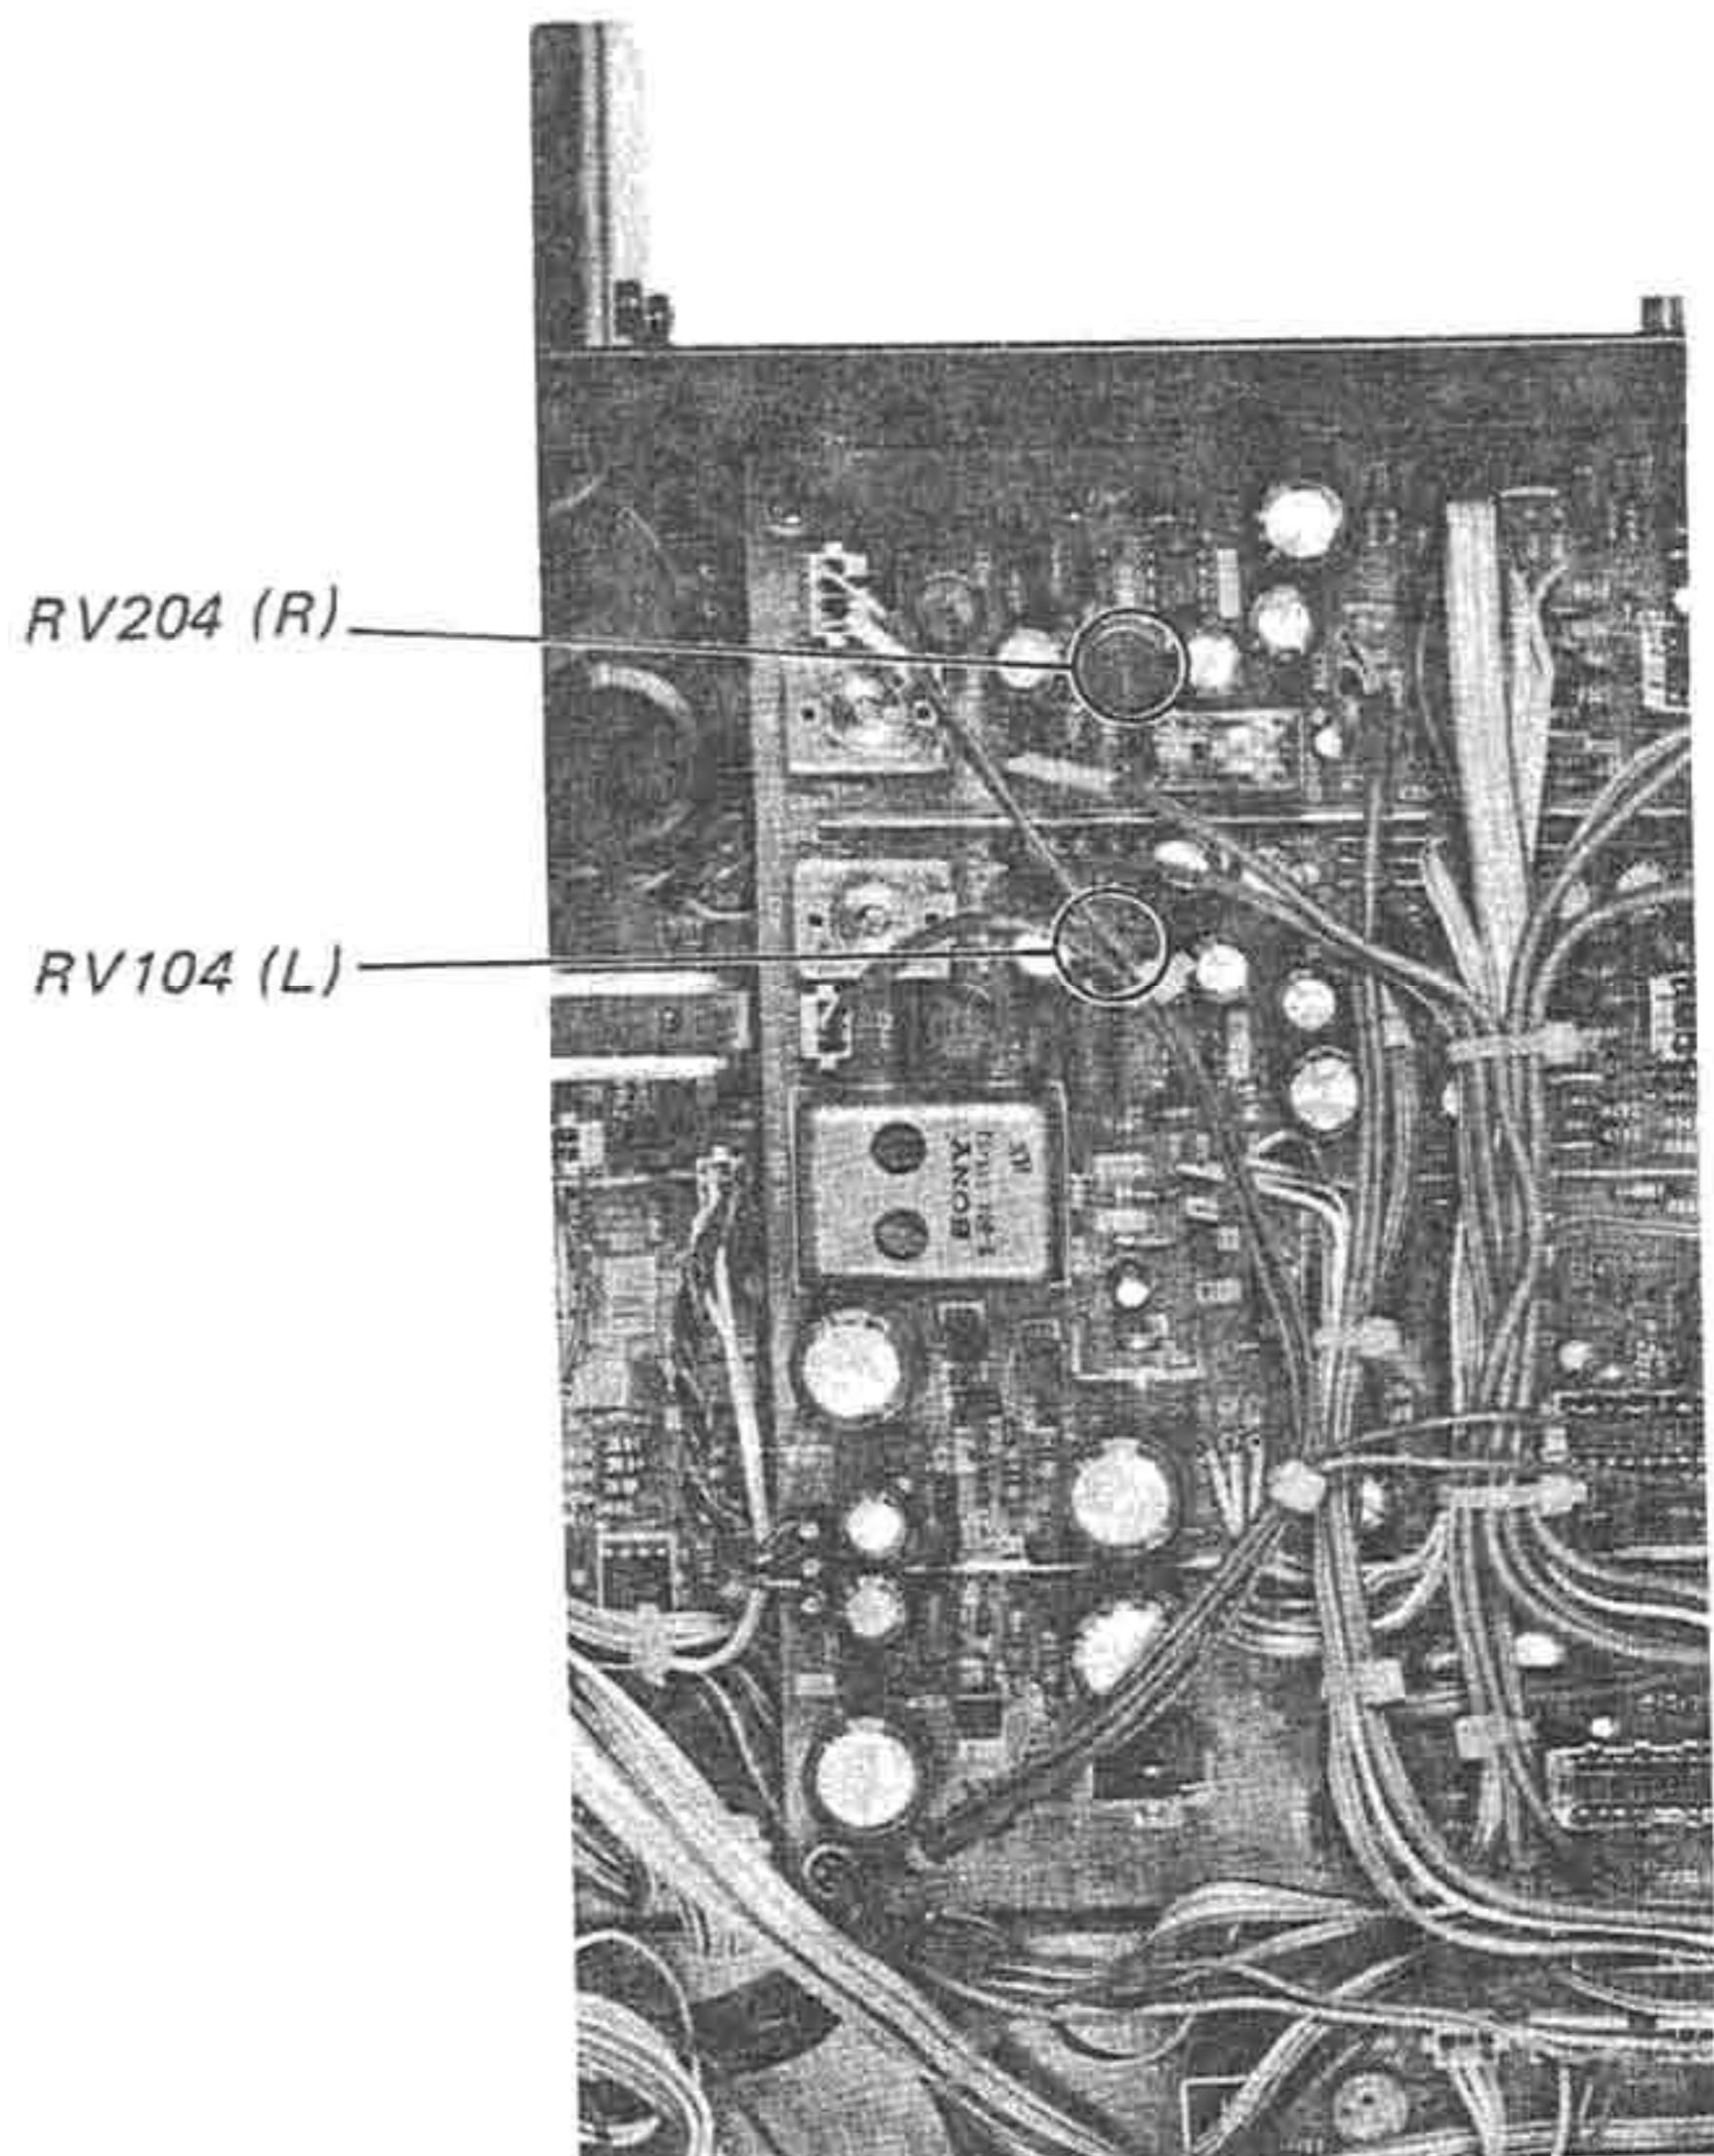

Adjust RV104 (L-CH) and RV204 (R-CH) to obtain 0.44V (-5dB) LINE OUT level.

Specification:

LINE OUT level: 0.39 – 0.49V
(-6 to -4dB)

Adjustment Location: — record/playback board —

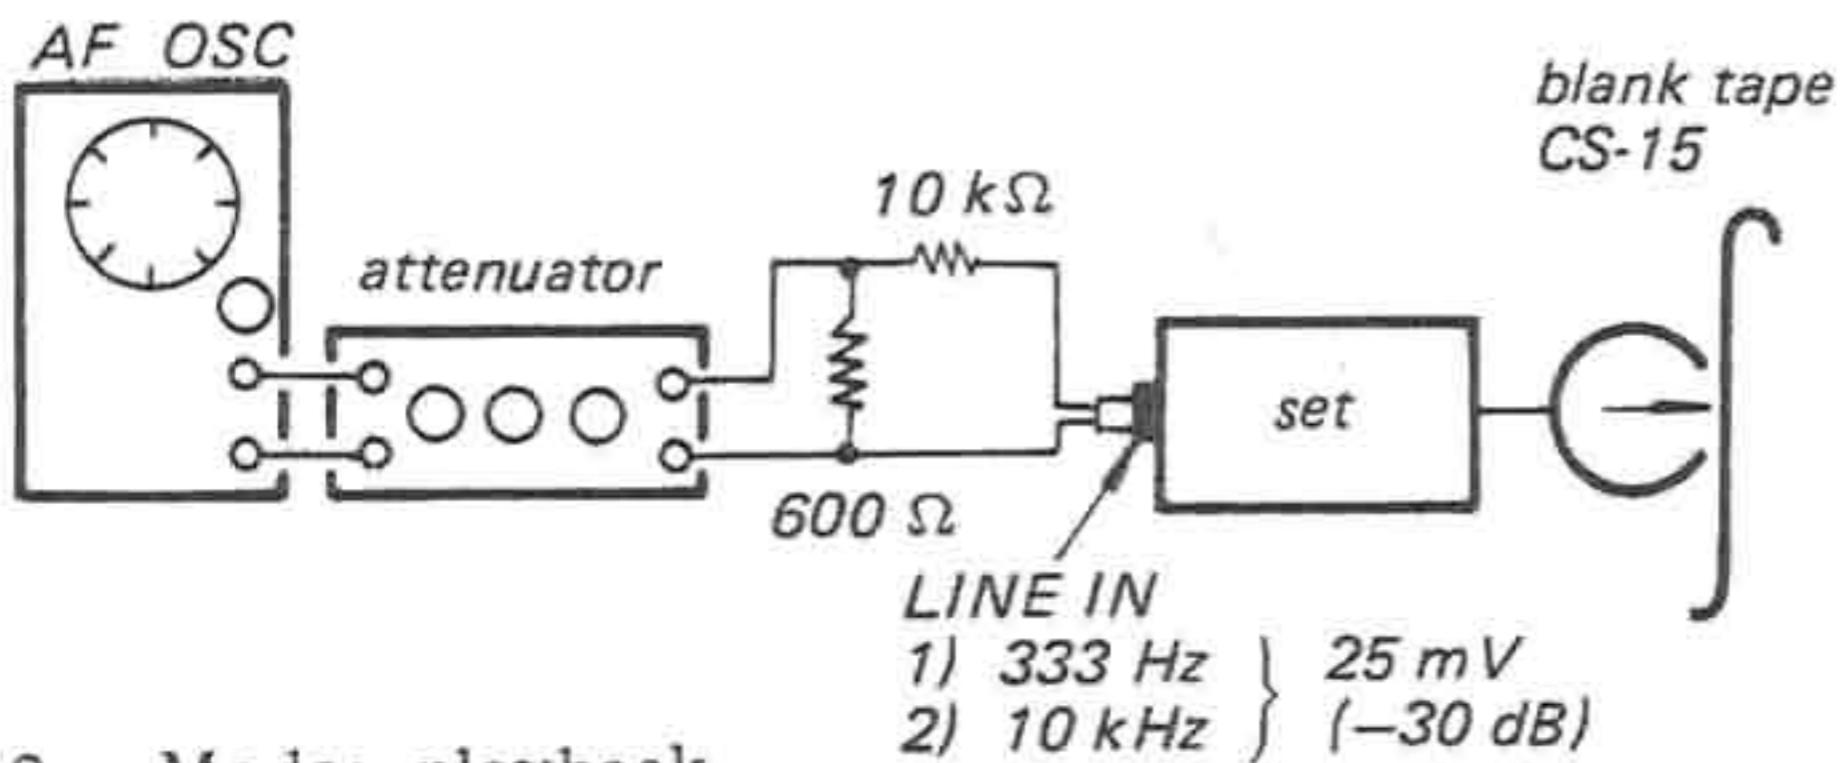

8. Record Bias Adjustment

Setting:

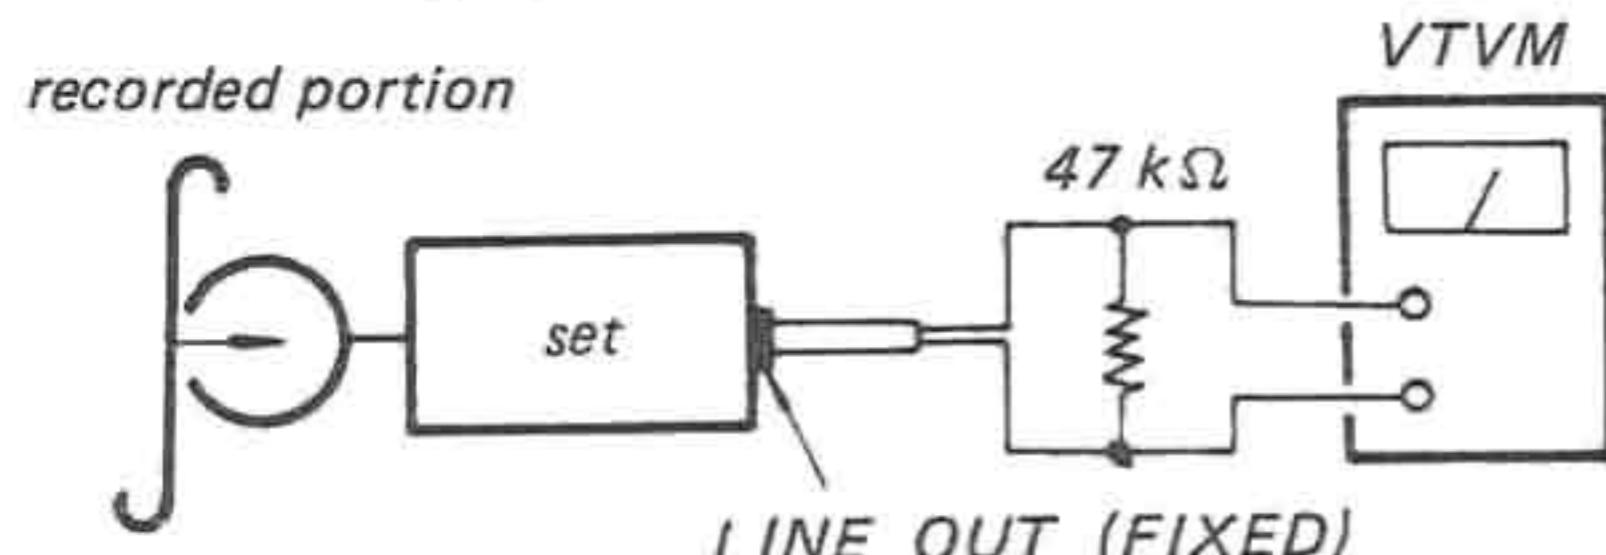

REC LEVEL control: standard record
(See page 31.)

Procedure:

1. Mode: record

2. Mode: playback

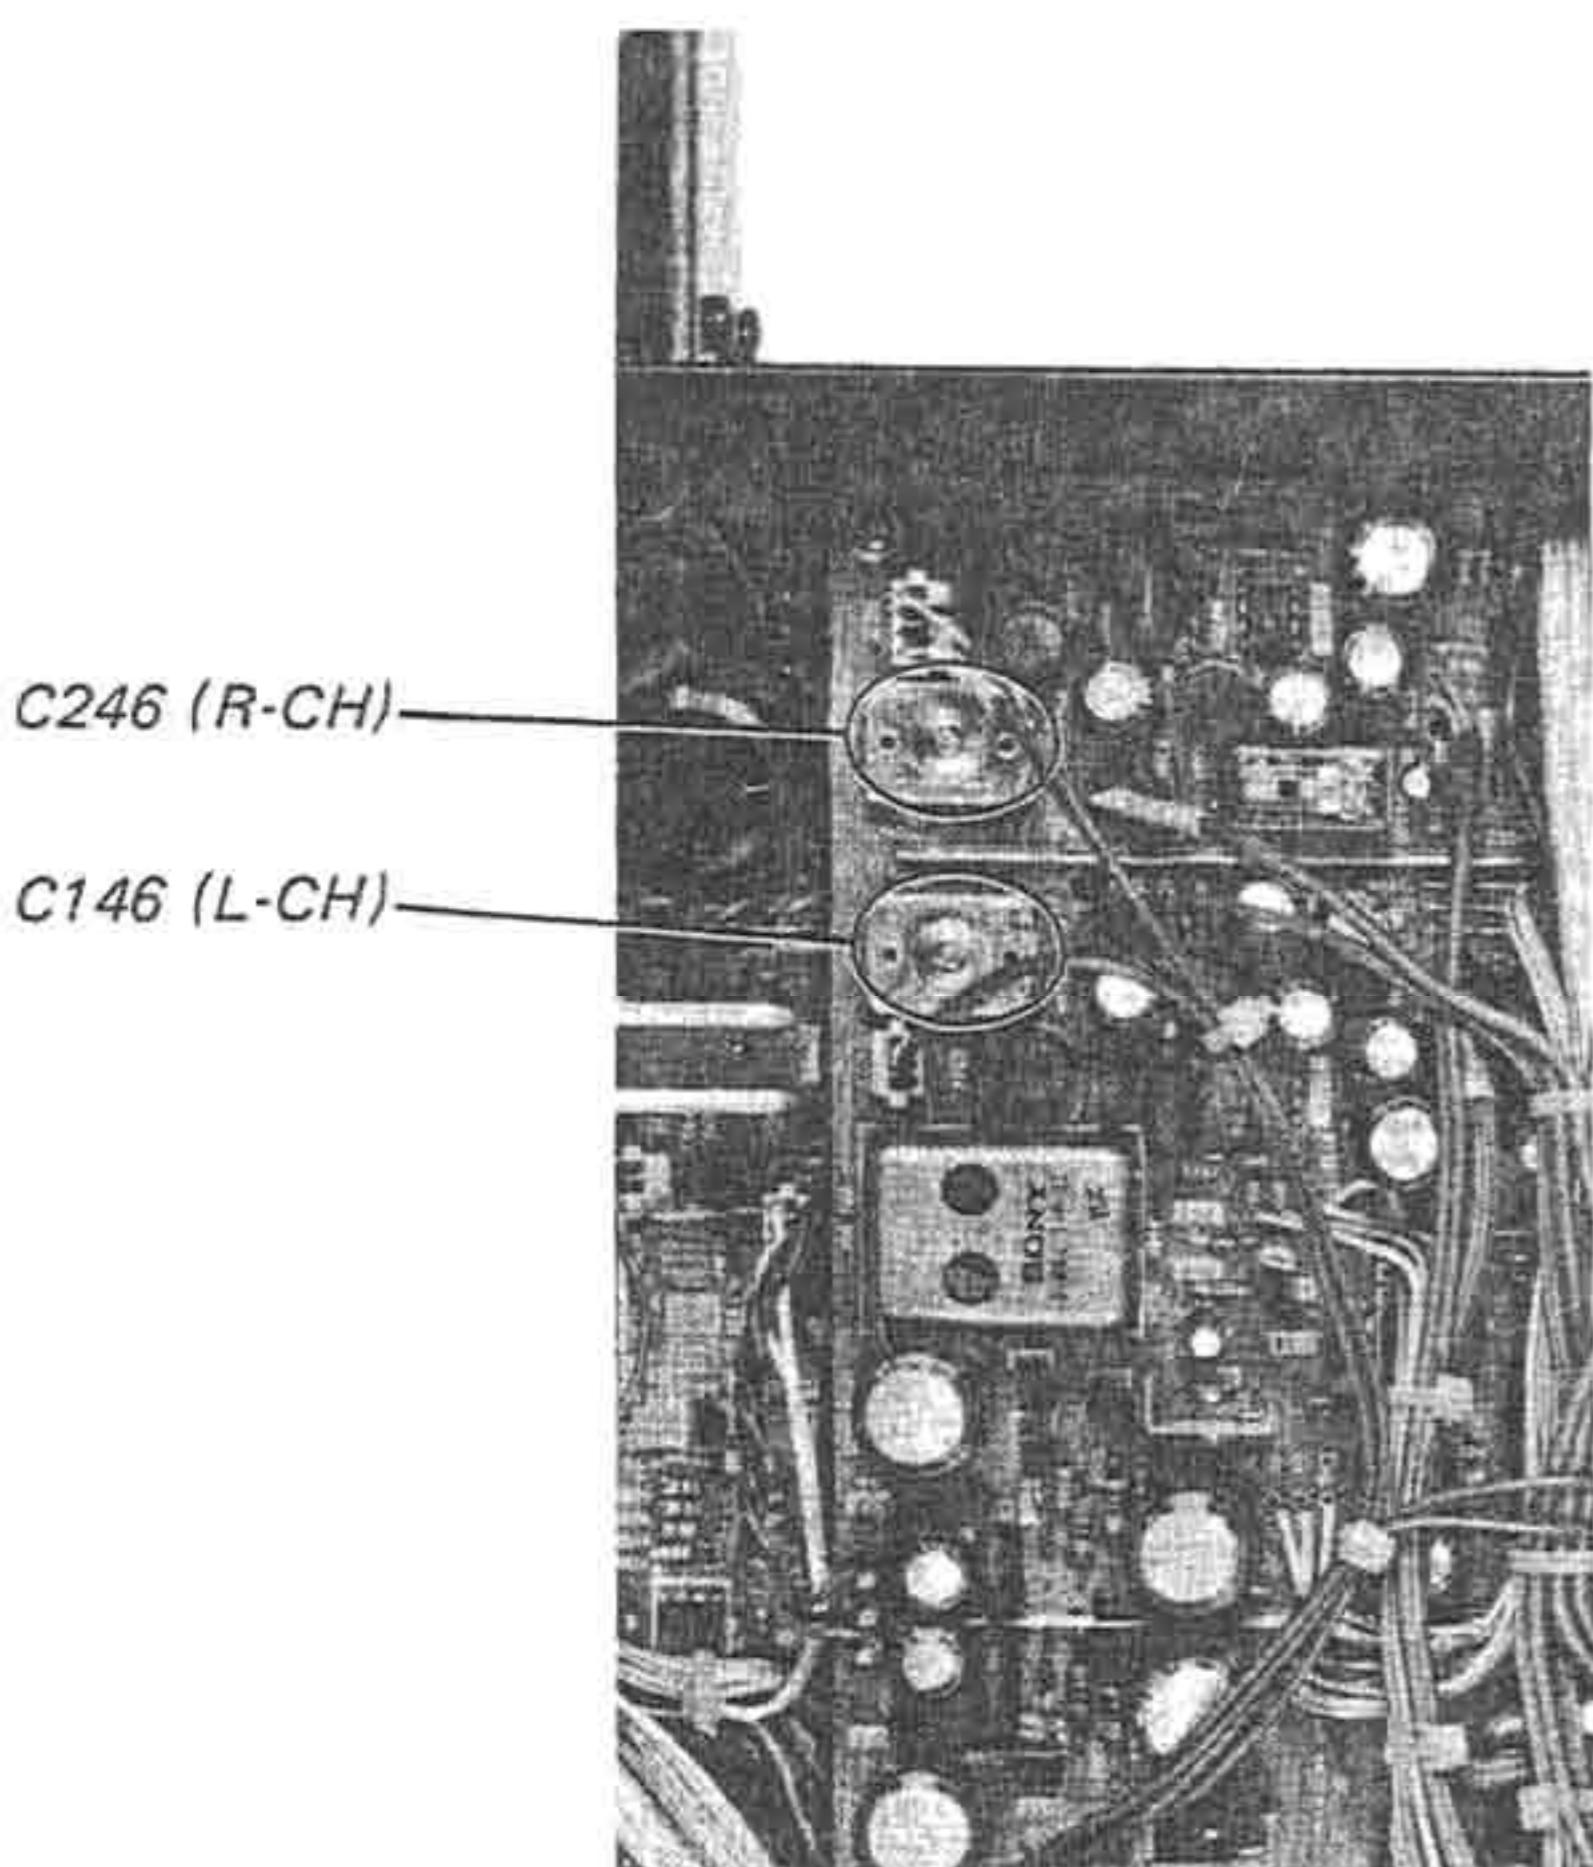

Adjust C146 (L), C246 (R) to obtain the same playback level at 333 Hz and 10 kHz.

3. Repeat steps 1 and 2. Be sure to finish adjusting C146, 246 by turning them clockwise.

Adjustment Location:

— record/playback board —

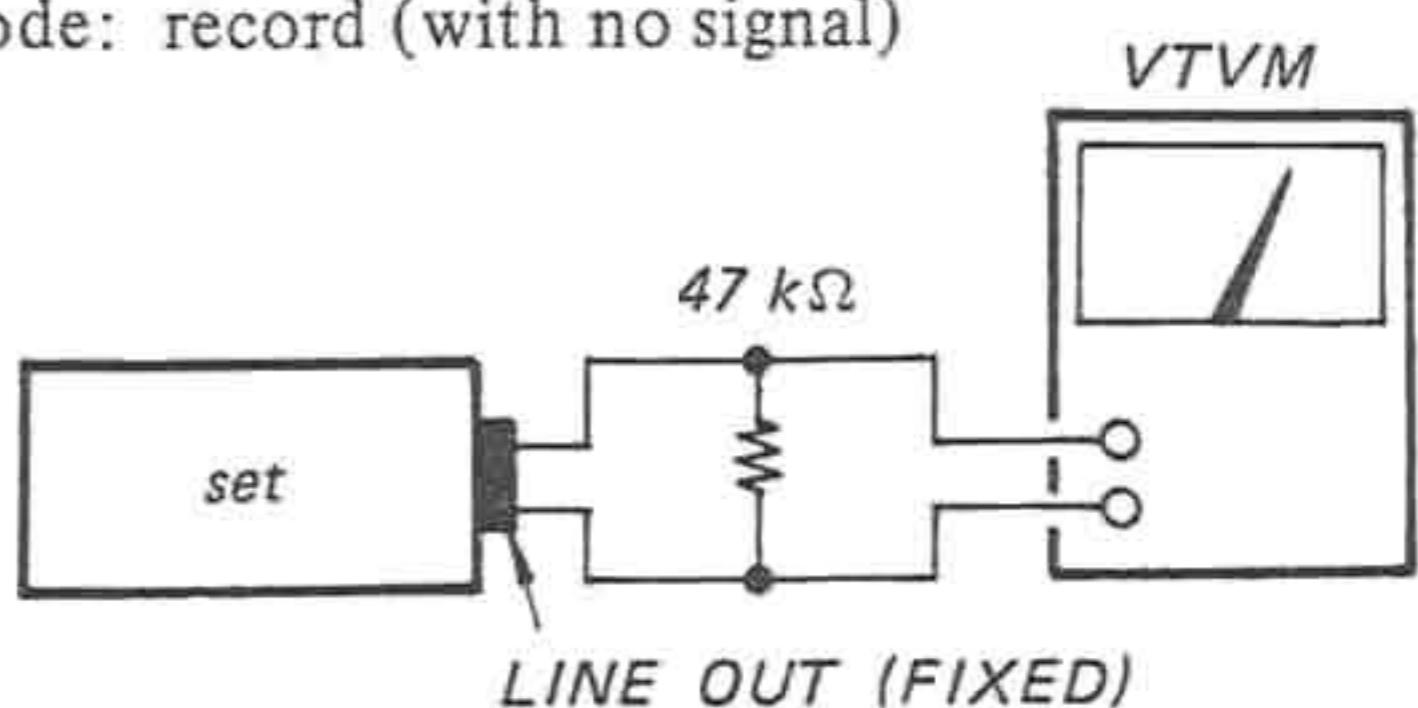

9. Record-Bias Trap and Bias Osc Frequency Adjustments

Setting:

TAPE switch: TYPE IV
MONITOR switch: TAPE

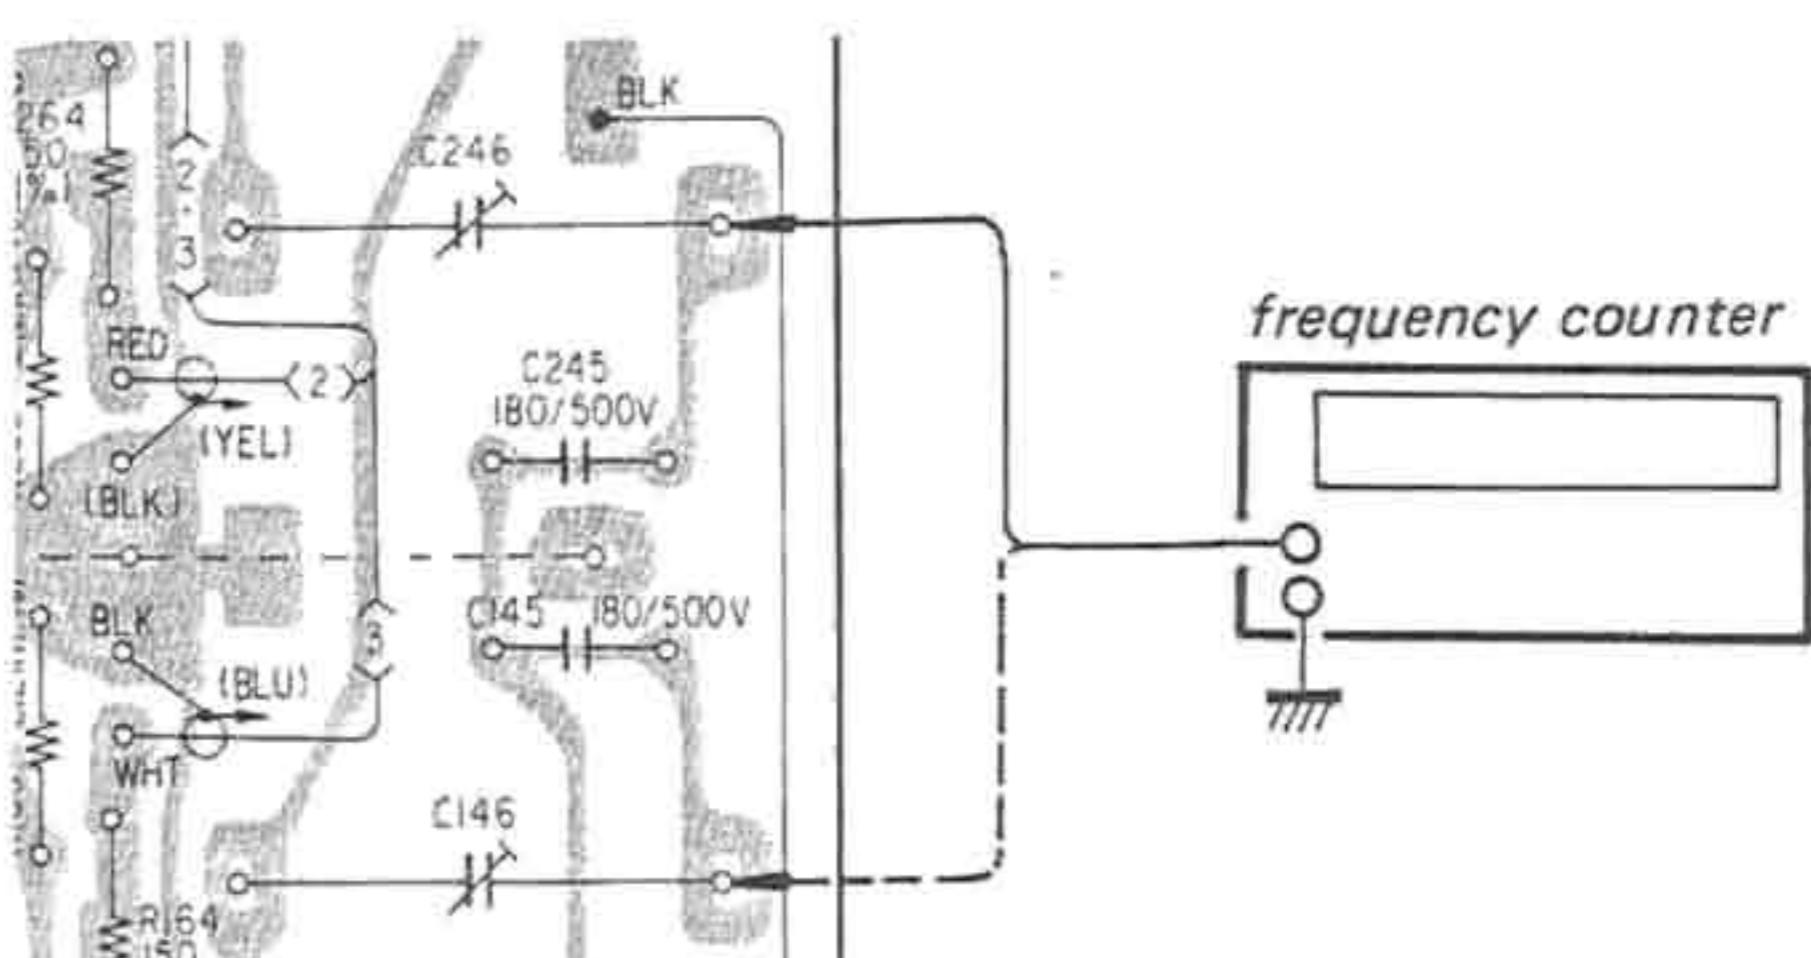

Procedure:

1. Mode: record (with no signal)

2. Adjust L101 (L-CH) and L201 (R-CH) so that LINE OUT level is less than 2.5 mV (-50 dB).
3. Next, connect the frequency counter with a trimmer capacitor (C146 or C246) and adjust bias osc frequency by turning red core of OSC501 (bias osc unit) so that the reading is 103–107 kHz.

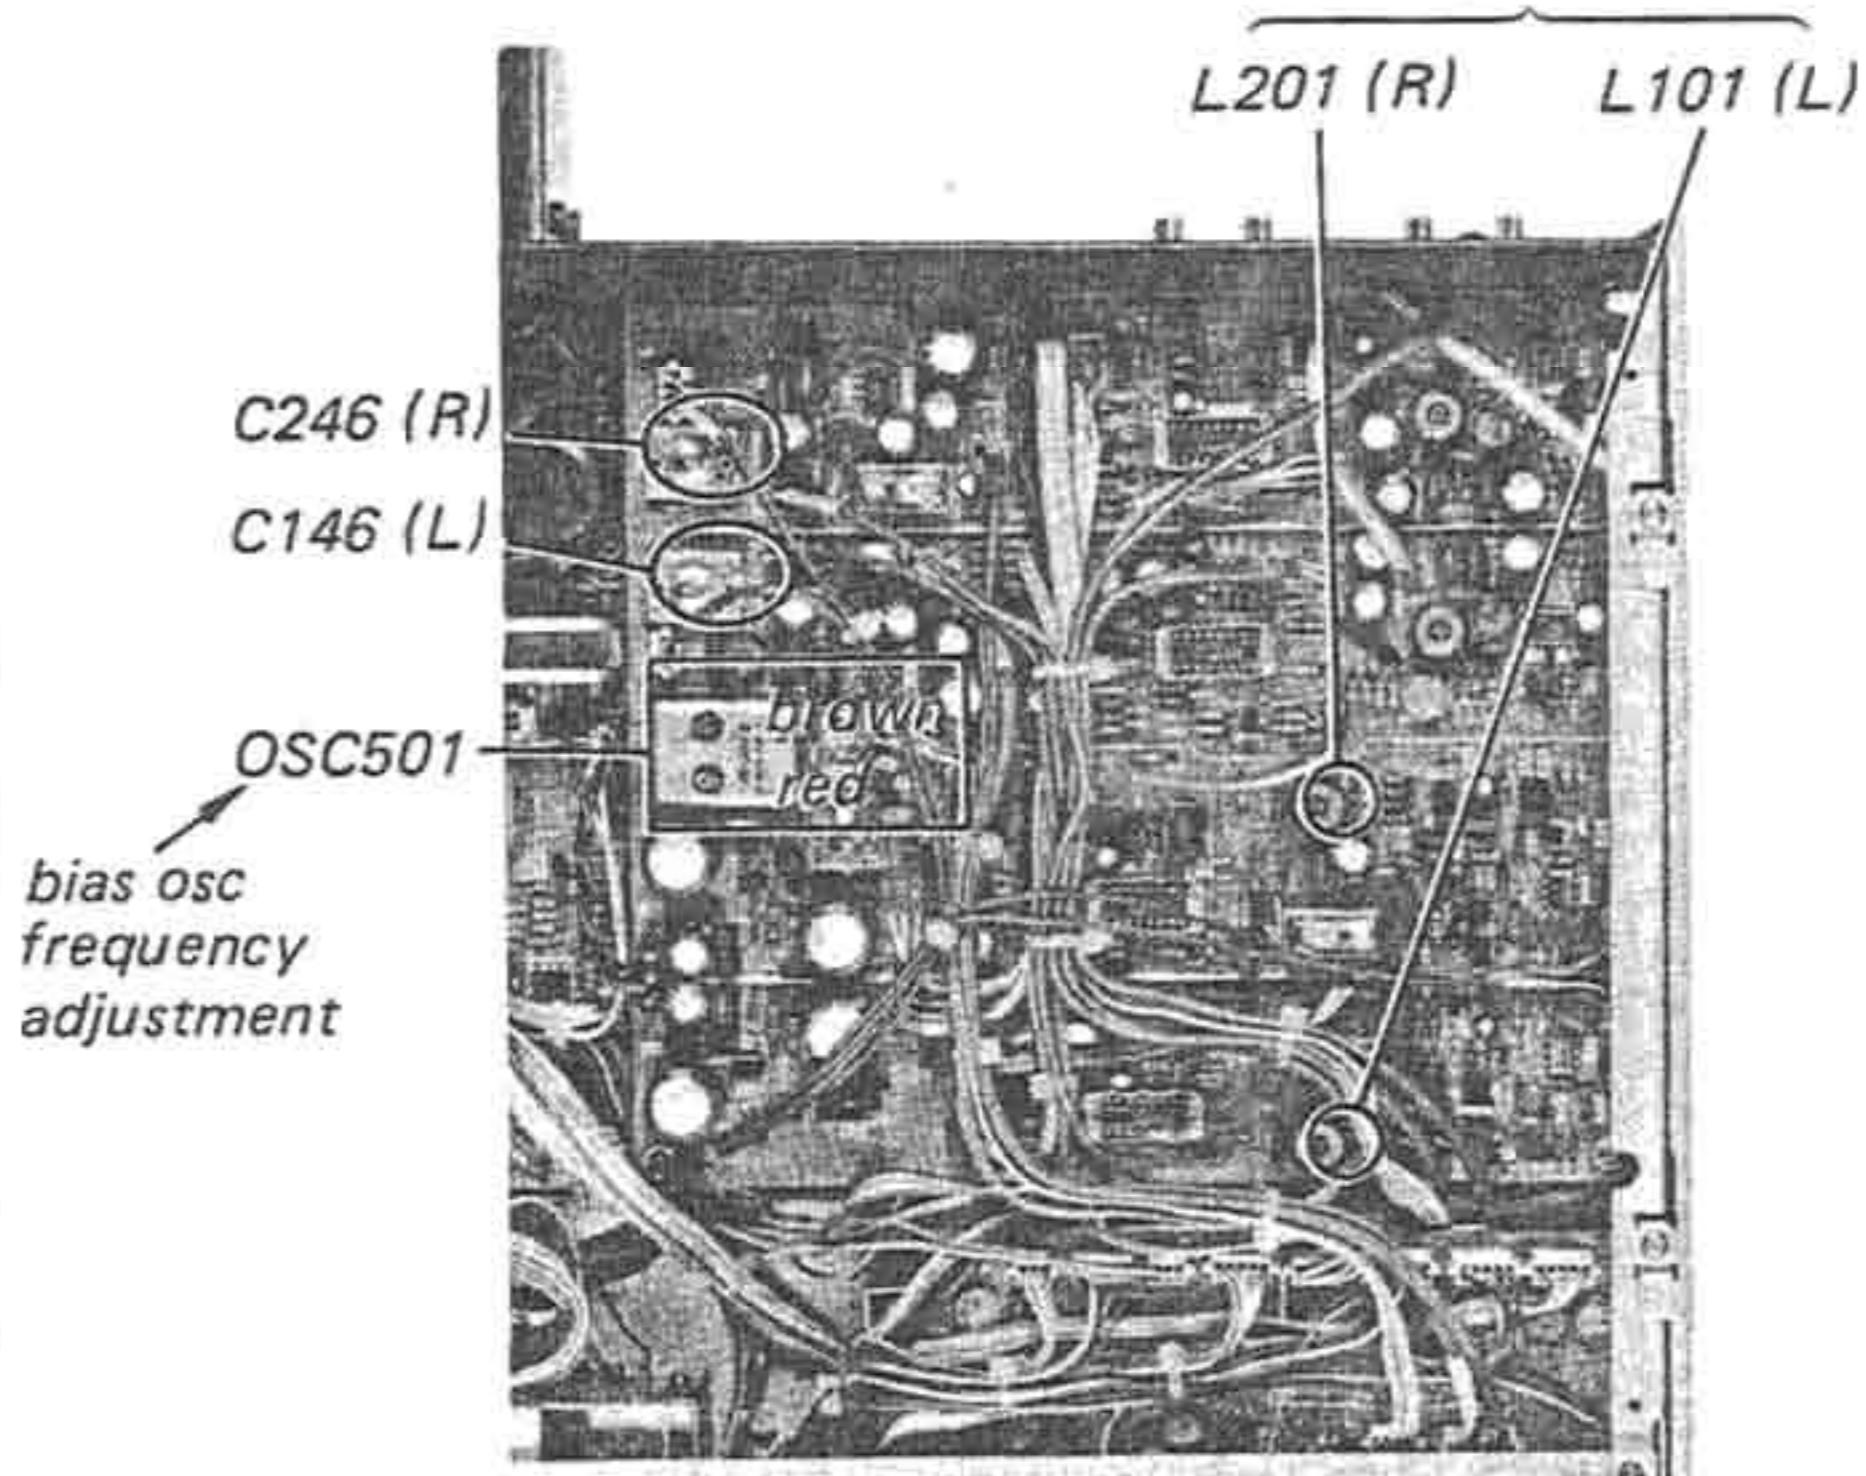

Note: Never turn brown core.

Adjustment Location:

— record/playback board —

record-bias trap adjustment

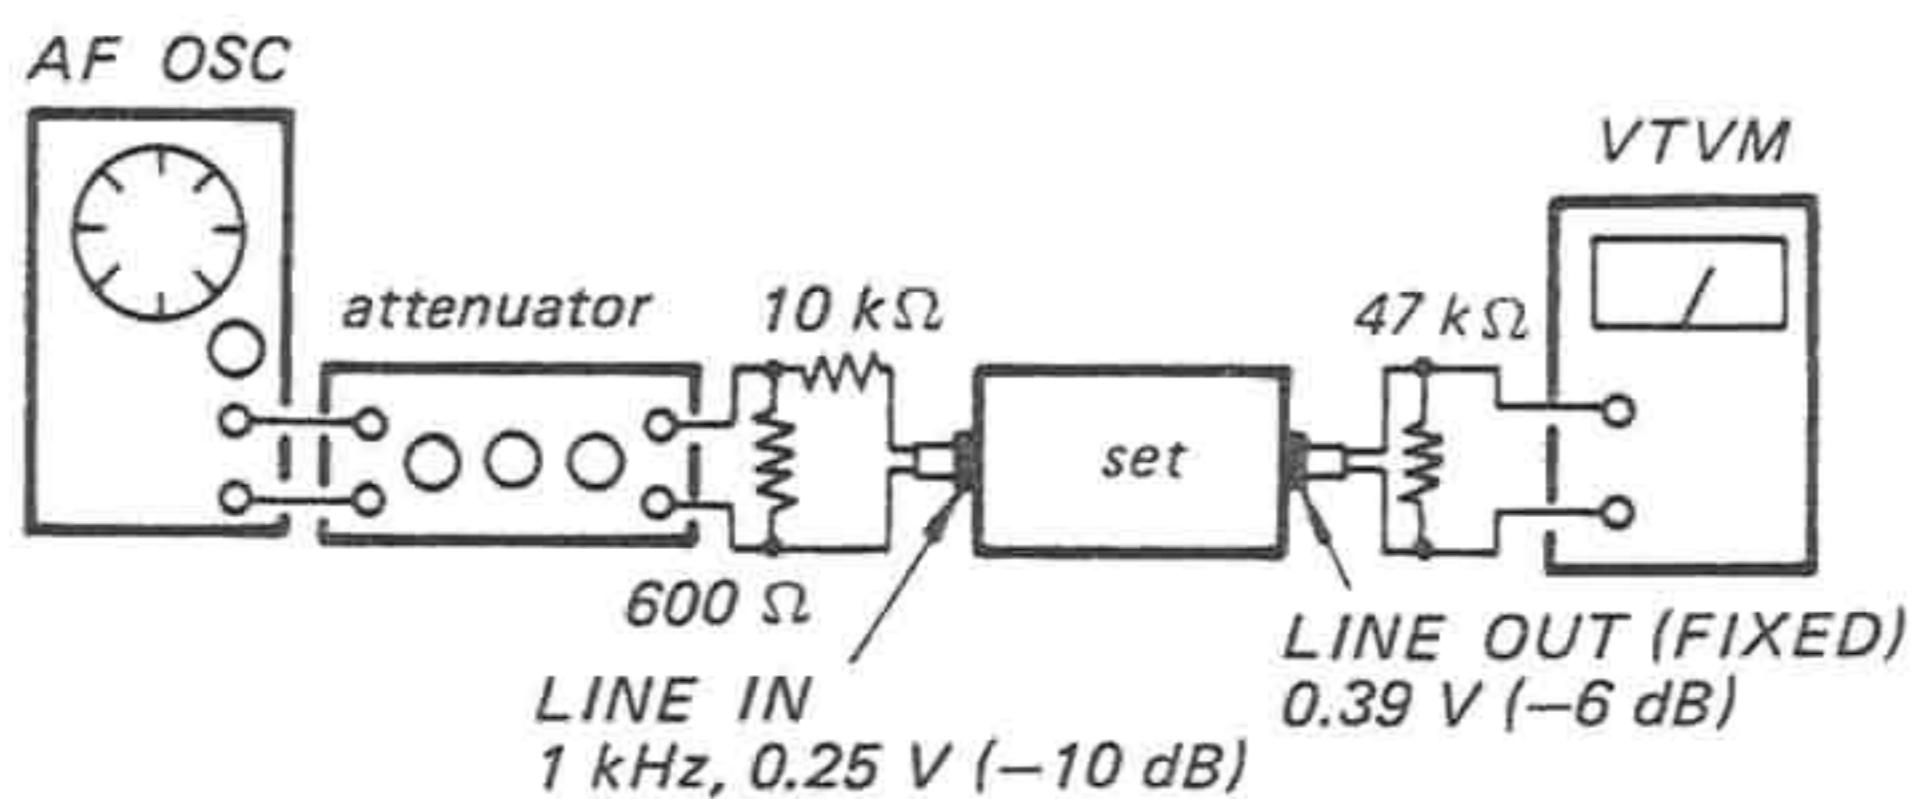

10. Meter Adjustment

Setting:

PEAK HOLD reset switch: MANUAL
REC LEVEL control : standard record
(See page 31.)

Procedure:

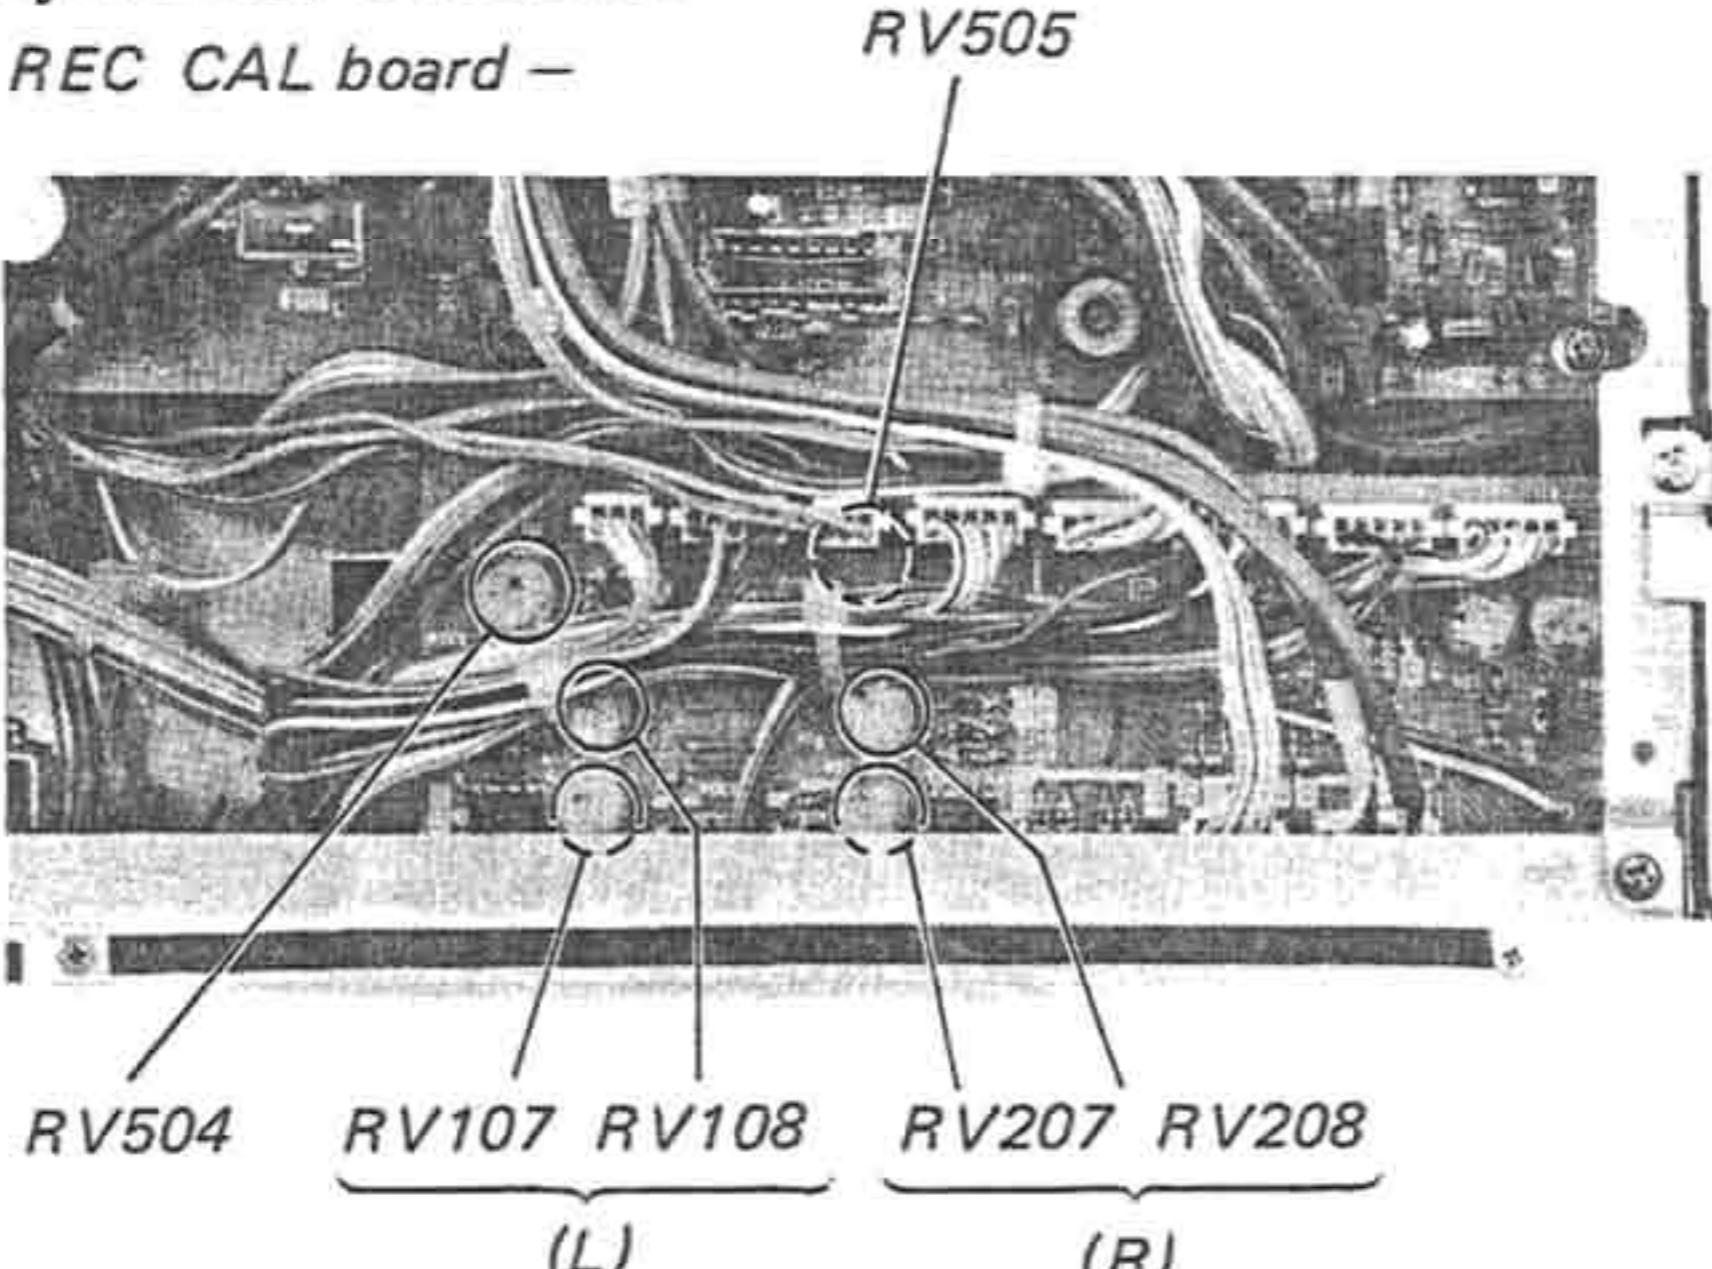

1. Mode: record

2. Set RV504, 505, 108 (L-CH), 208 (R-CH) at mechanical center.
3. Turn the REC LEVEL control so that the LINE OUT level is -6 dB when LINE IN level is at 1 kHz.
4. Adjust RV107 (L-CH), 207 (R-CH) so that the segment one above the -6 dB indication of meter lights up.
5. Set LINE OUT level to 0.44 V (-5 dB) and adjust RV504, 505 so that the segment one below 0 VU (-4 dB) indication goes off.
6. Next, set LINE OUT level to 2.2 V (9 dB) and adjust RV108 (L-CH) 208 (R-CH) so that uppermost segment lights up.
7. Be sure that the segment one below the 0 VU (-4 dB) indication goes off when returning LINE OUT to 0.44 V (-5 dB). If necessary, readjust RV504.

Adjustment Location:

- REC CAL board -

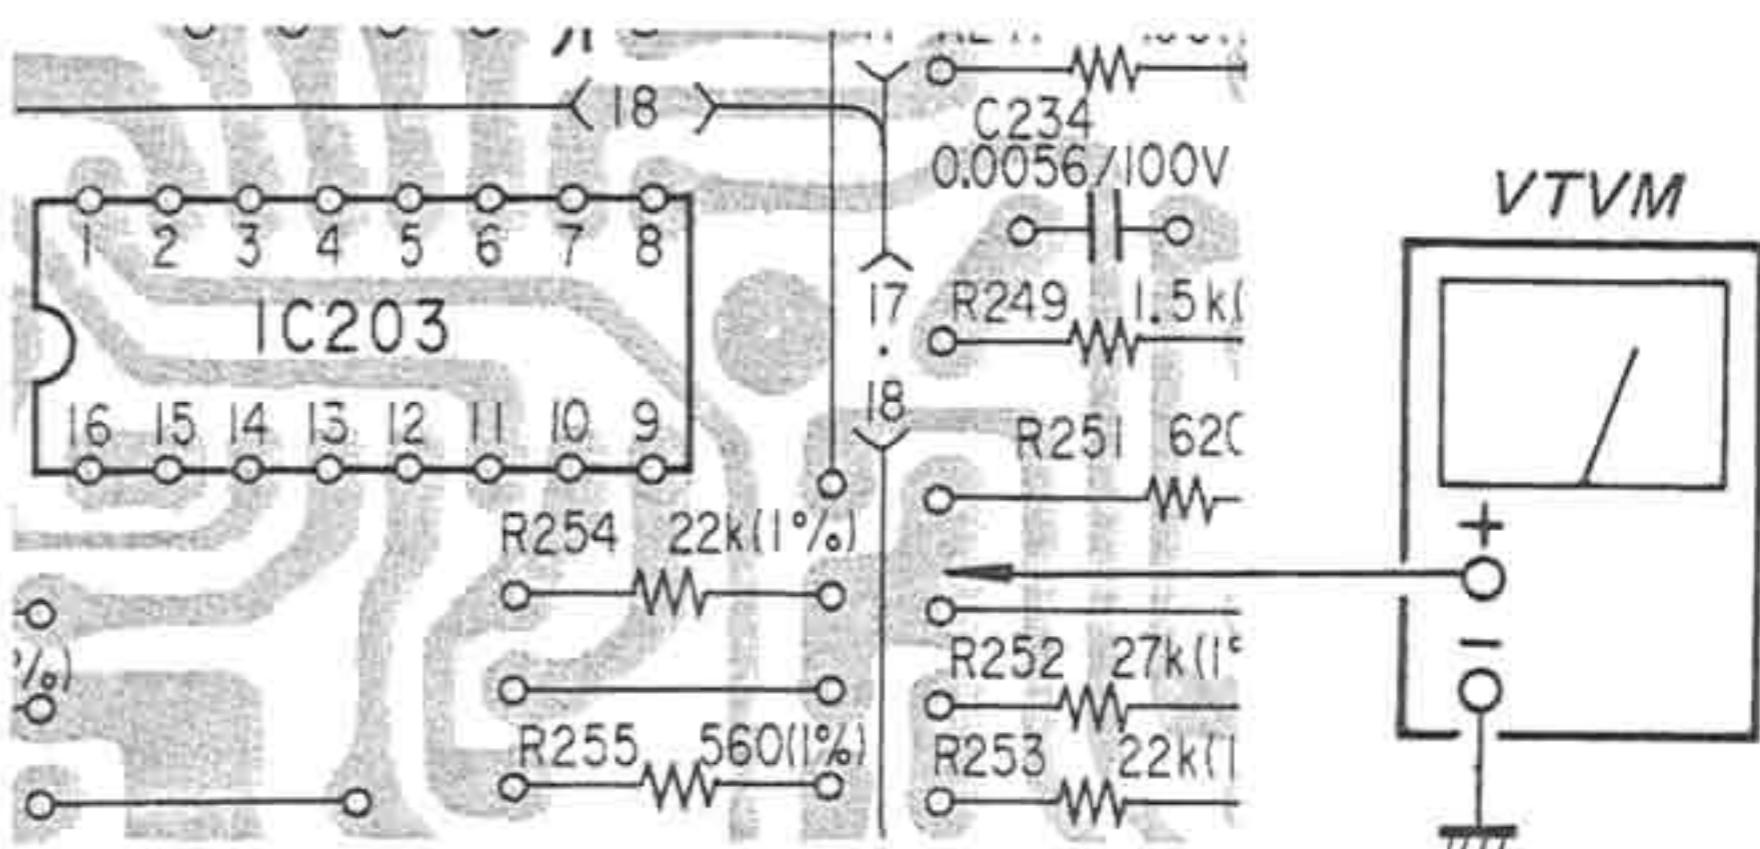

11. REC LEVEL CAL adjustment

Setting:

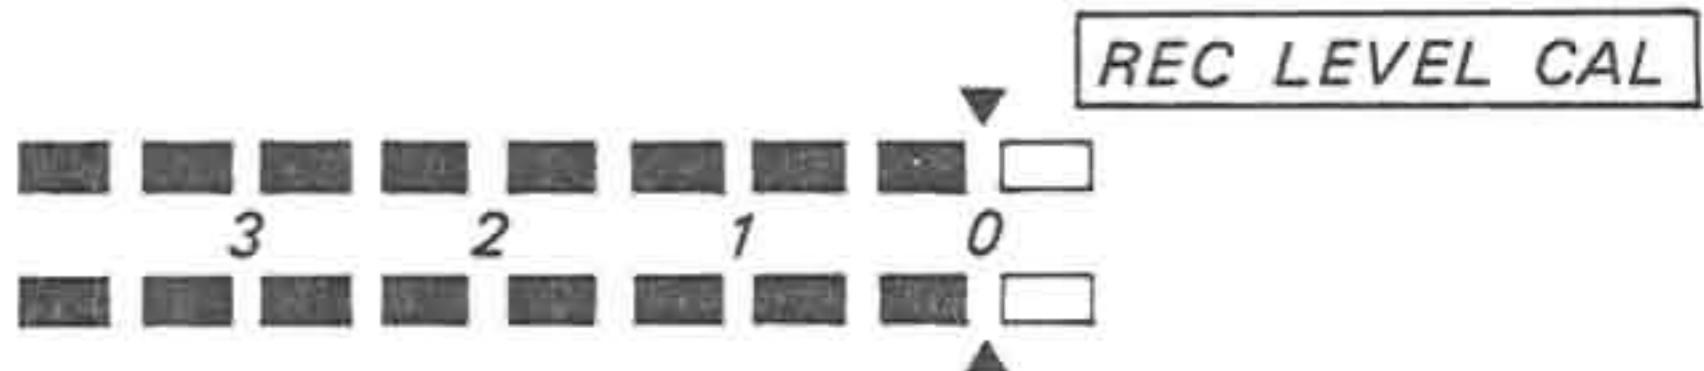

CALIBRATION MODE switch: REC LEVEL

Procedure:

1. Adjust RV501 so that the level at the check point (R251), is 44 mV (-25 dB).

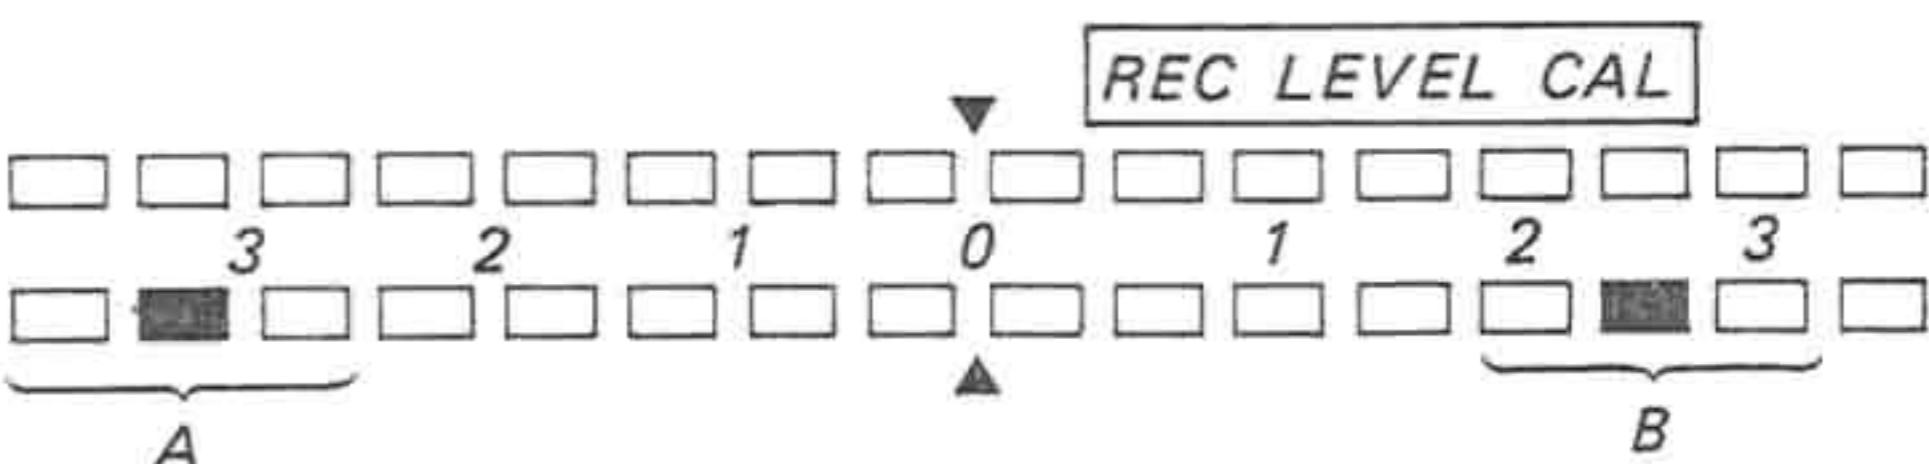

2. Install blank tape (CS-15) and set the unit to RECORD MONITORING mode by changing the MONITOR switch to TAPE position. Adjust RV106 (L-CH), 206 (R-CH) so that the segment over 0 dB indication goes out.

3. Be sure that indication of meter varies as follows when turning REC LEVEL CAL control from mechanical center to MIN or MAX. The right segment should be lit up in the following range.

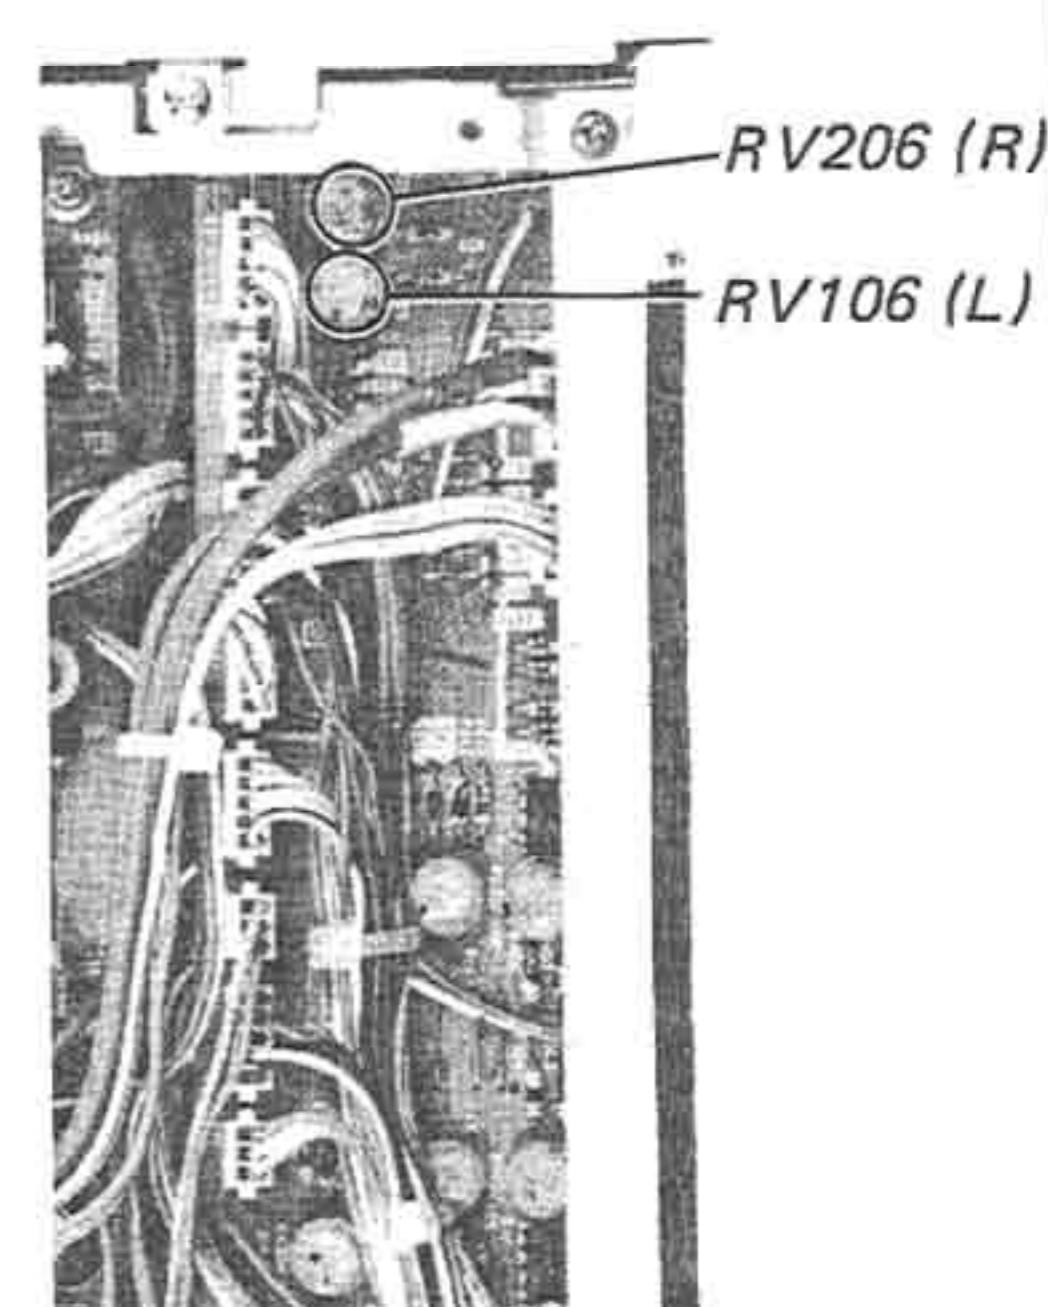

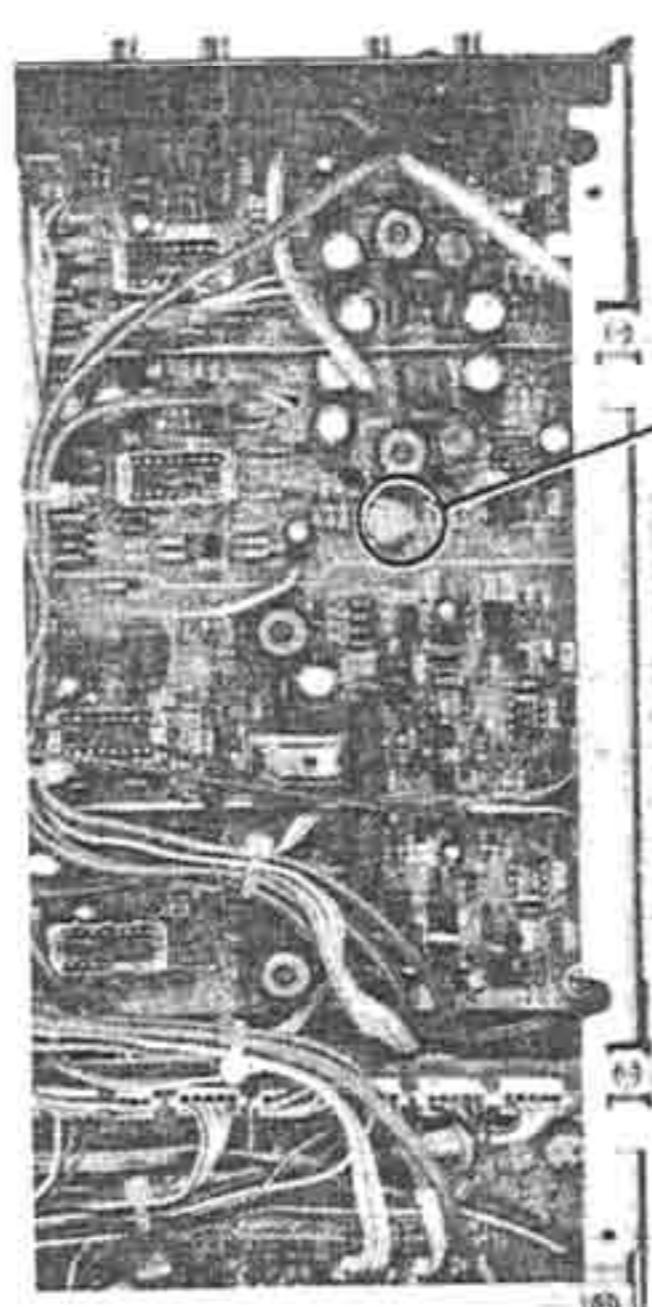

MINIMUM : A range

MAXIMUM: B range

Adjustment Location:

- record/playback board, REC CAL board -

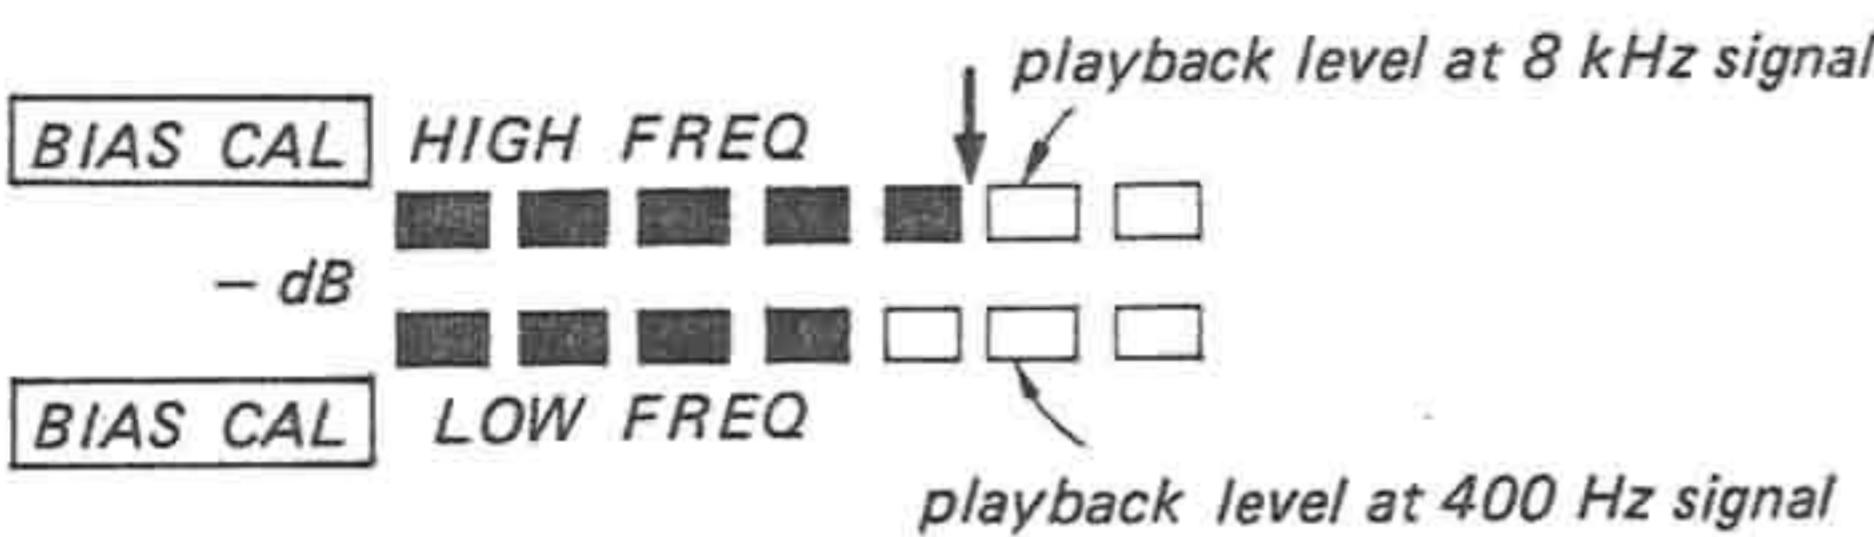

12. Bias Cal Adjustment

Setting:

CALIBRATION MODE switch: BIAS

Procedure:

- MONITOR switch: TAPE
- Install the blank tape (CS-15) and adjust RV502 so that the HIGH FREQ element one above the maximum LOW FREQ element lights up completely. (The next one up may blink).

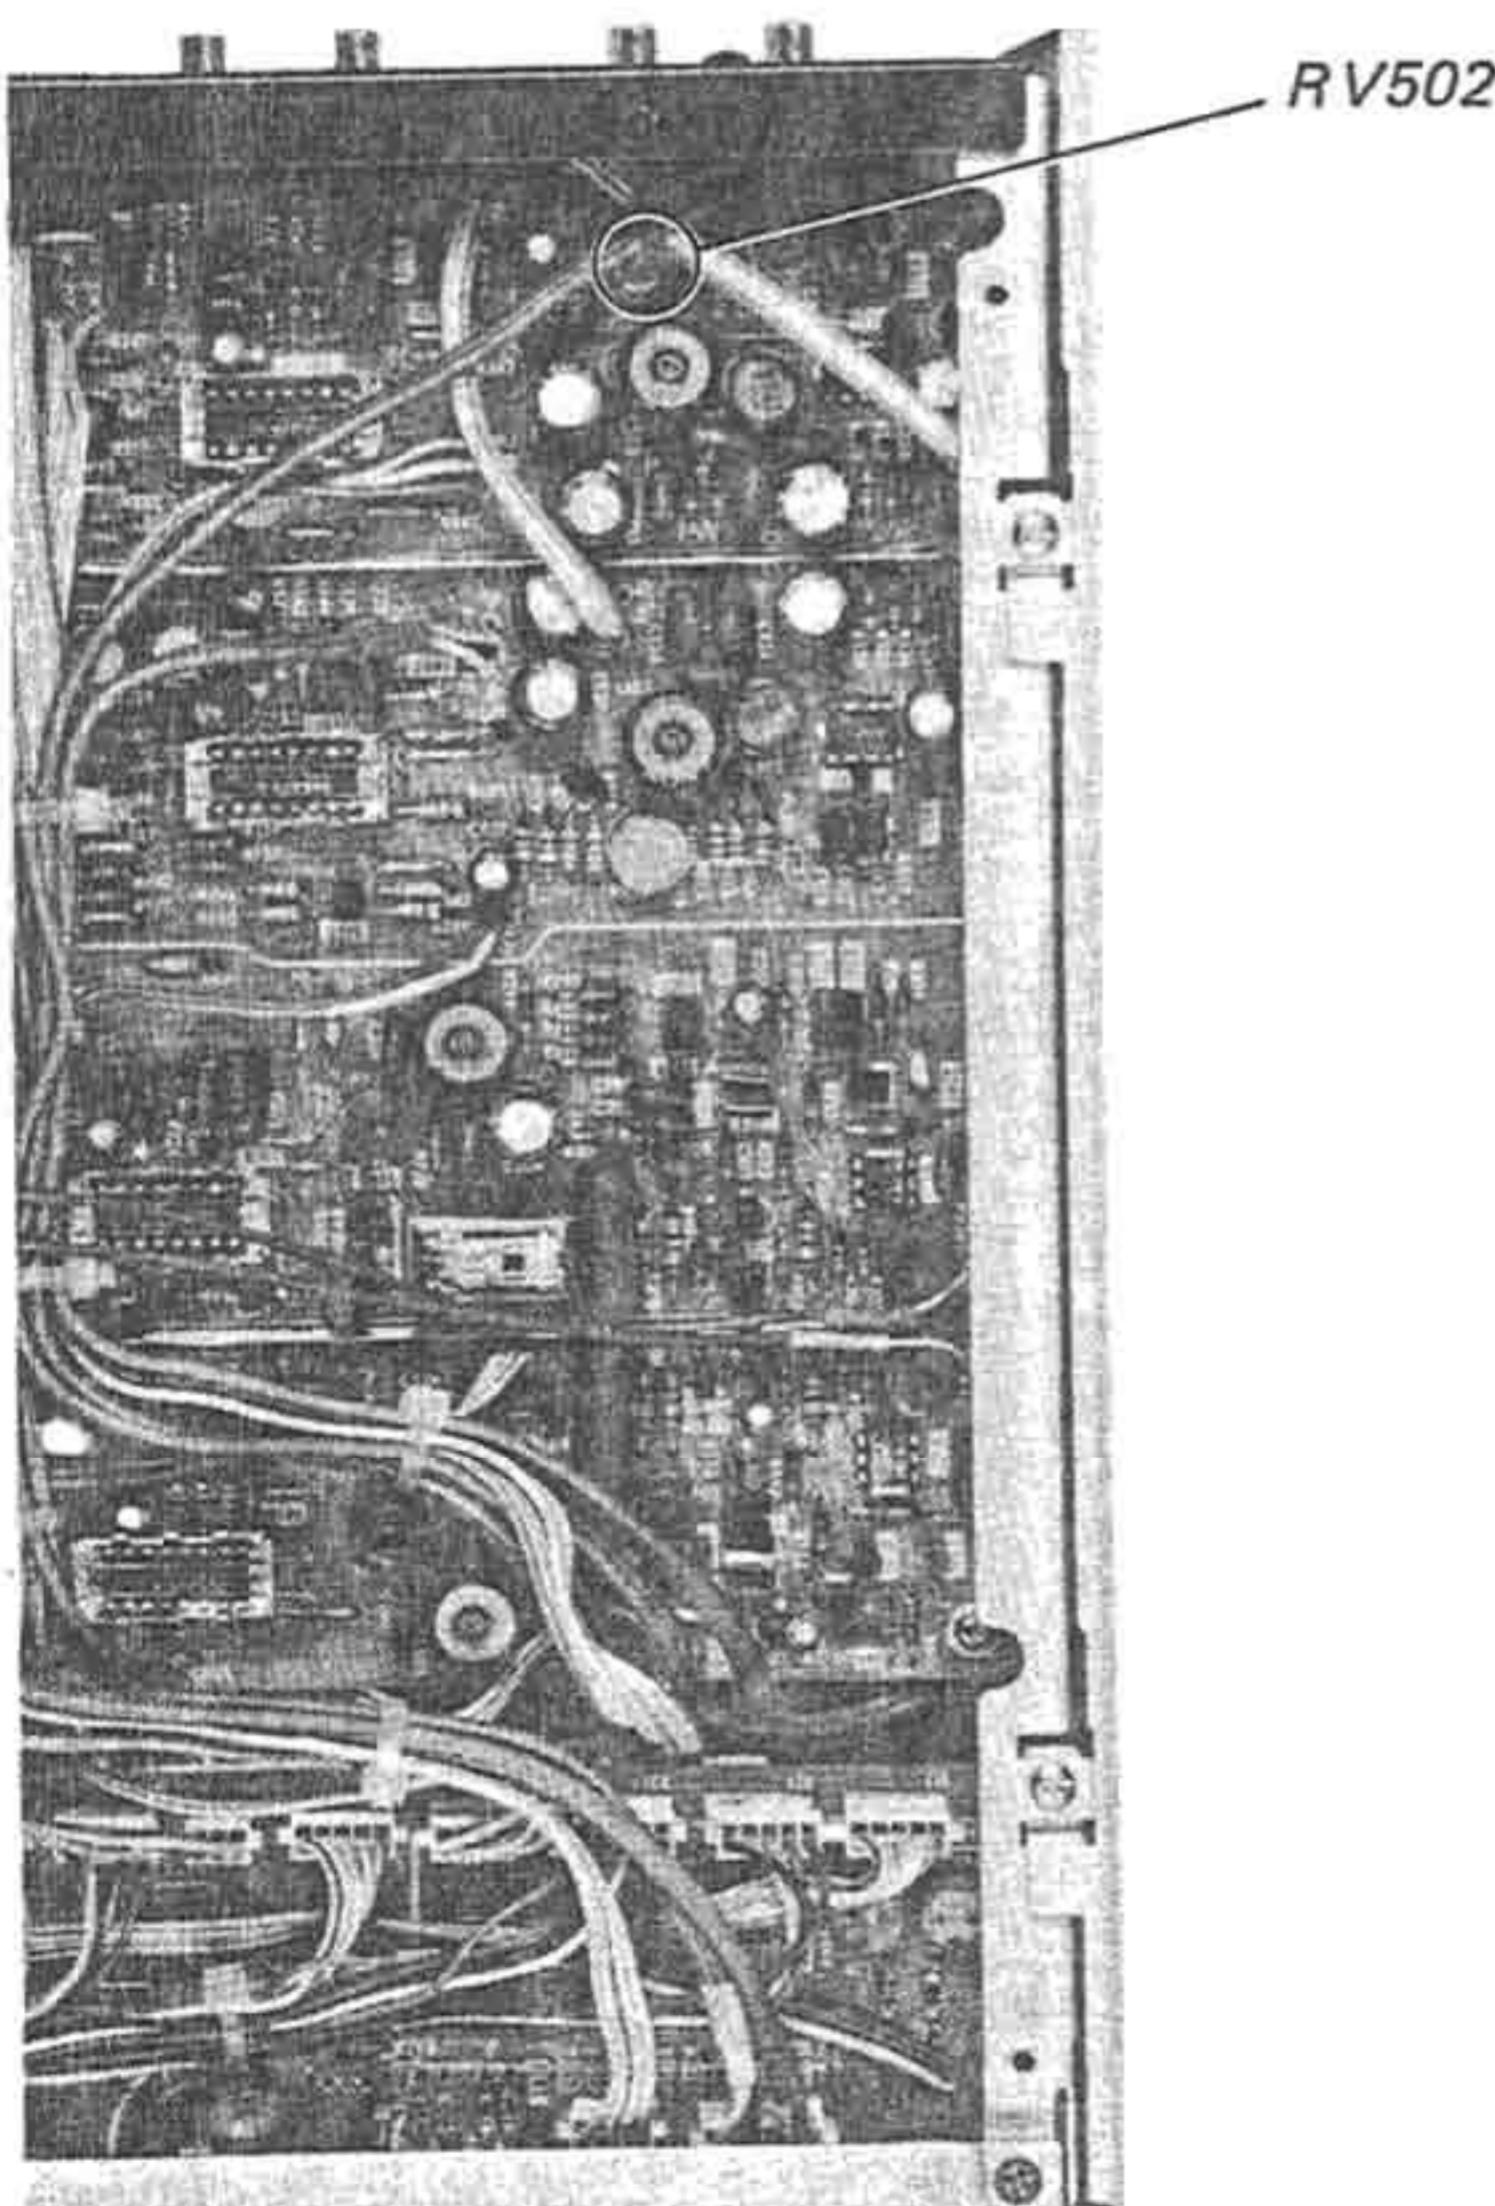

- Make sure that elements of HIGH FREQUENCY (upper side) vary when turning BIAS CAL control from the mechanical center to MIN and to MAX.

Relative to level at BIAS CAL control center:

MIN : +6 element
MAX: -6 element

Adjustment Location:

— record/playback board —

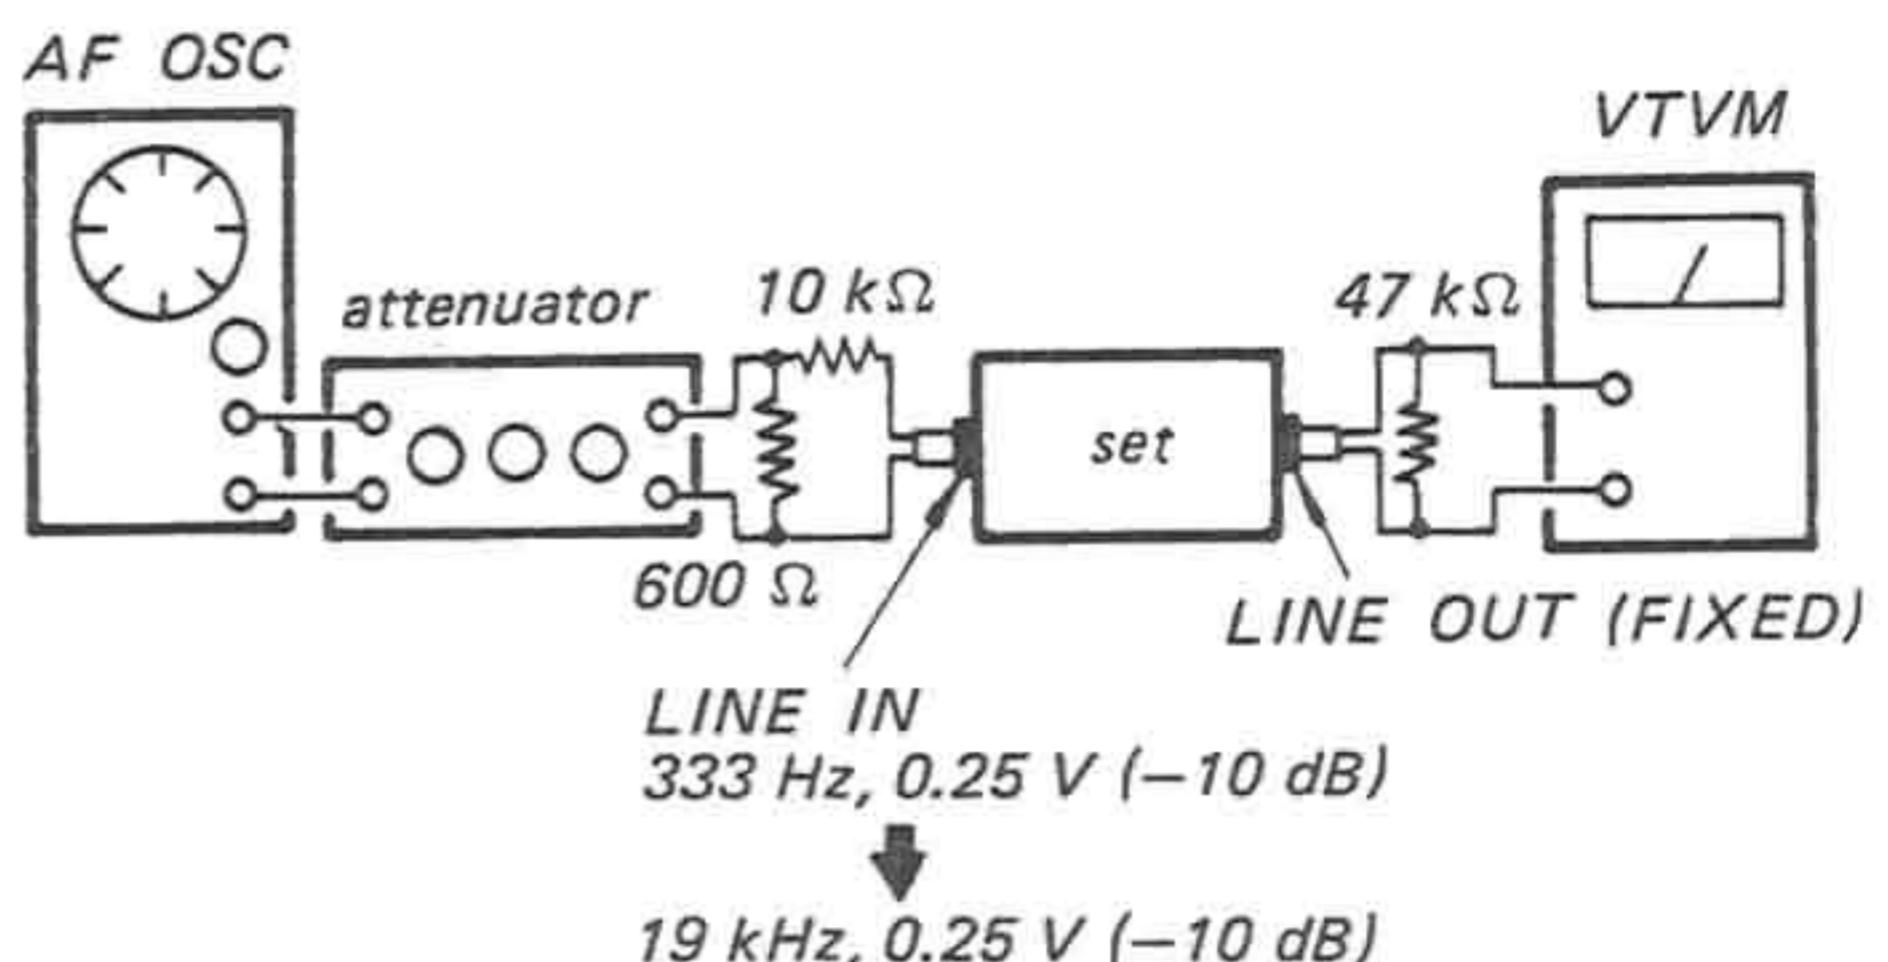

13. MPX Filter Adjustment

- Mode: record

MPX filter switch: ON

- Feed a signal of 333 Hz, 0.25 V (-10 dB) into the LINE IN jack.
- Adjust the REC LEVEL control for -5 dB (0.44 V) on the VTVM.
- Feed a signal of 19 kHz, 0.25 V (-10 dB) into the LINE IN jack.
- Adjust L103 (L-CH) and L203 (R-CH) for minimum reading on VTVM.

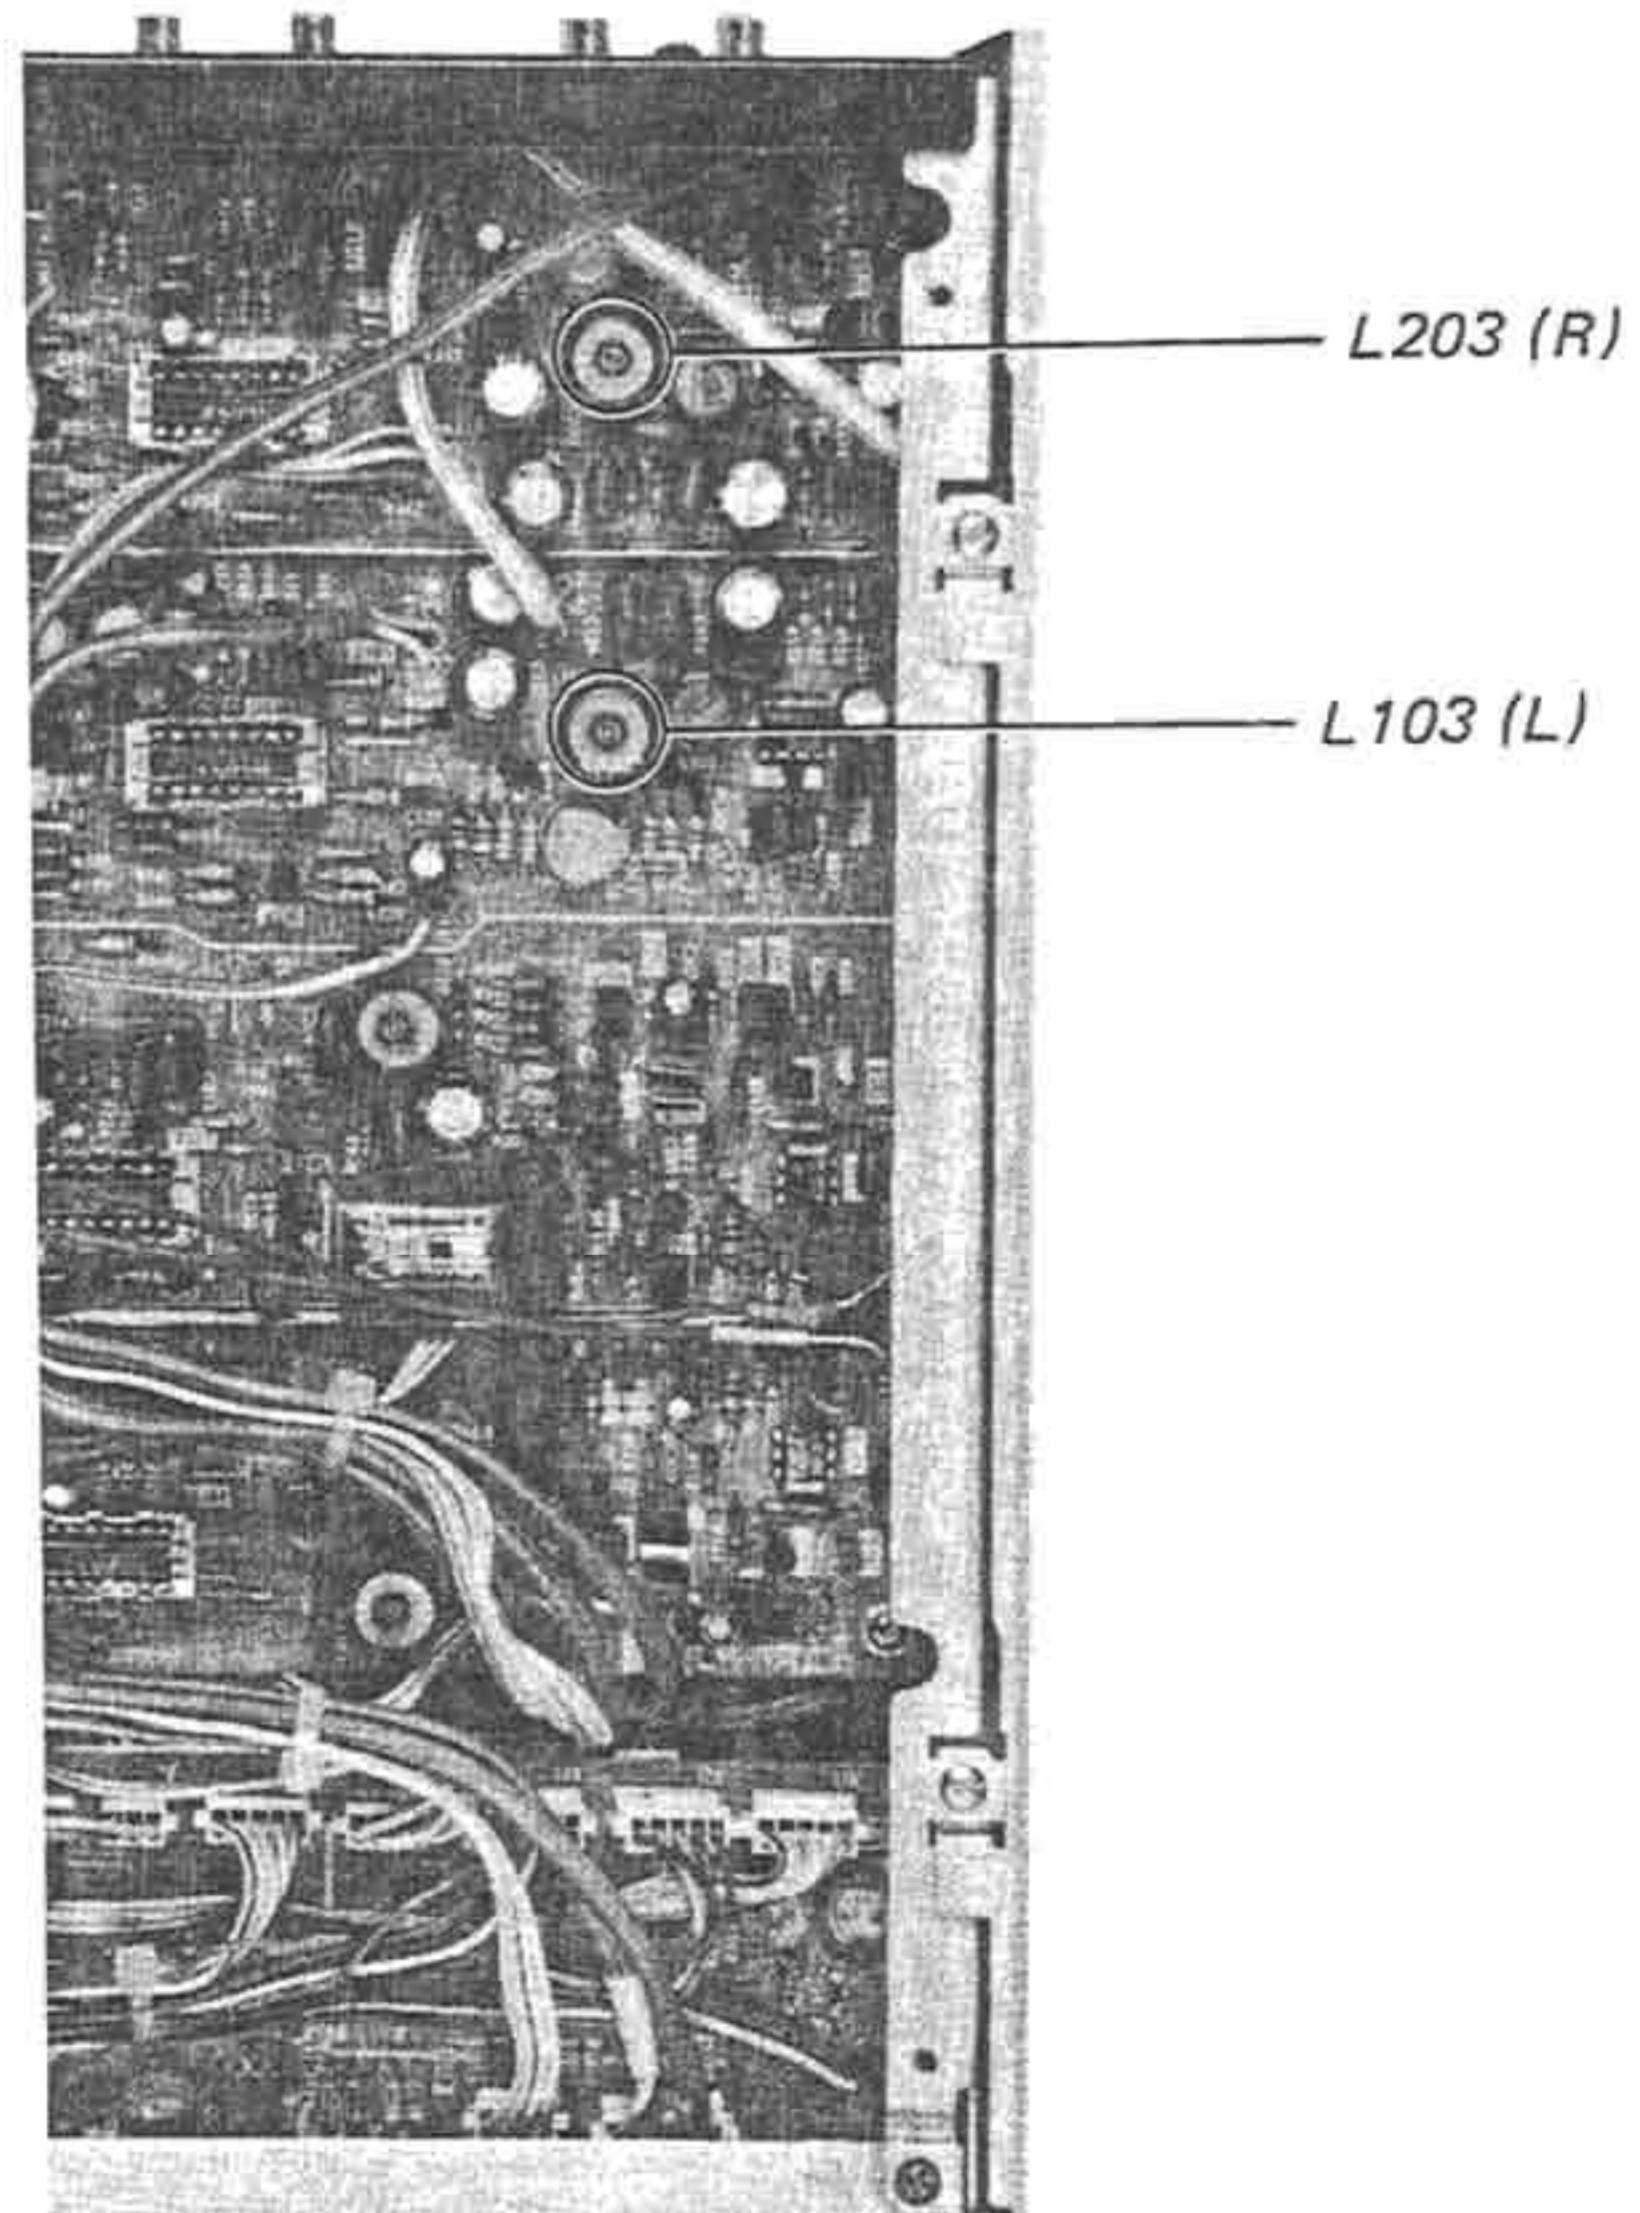

Specification:

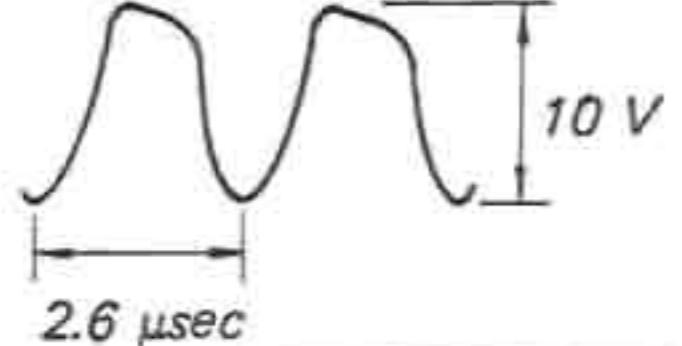

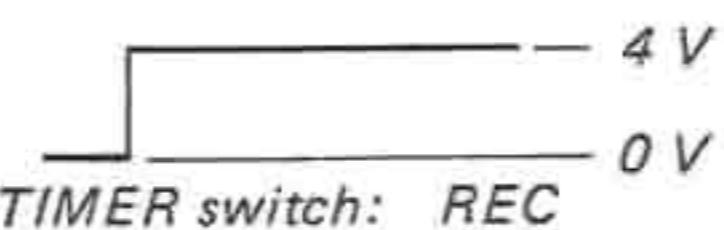

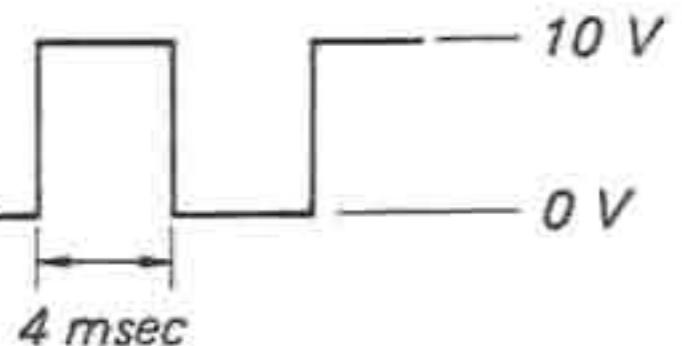

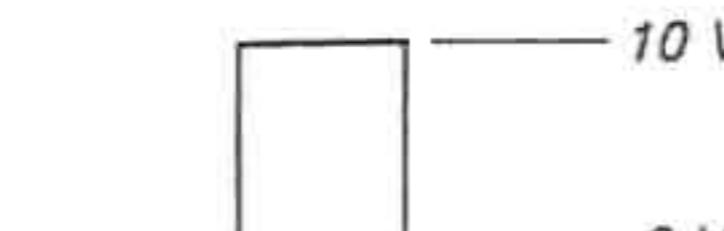

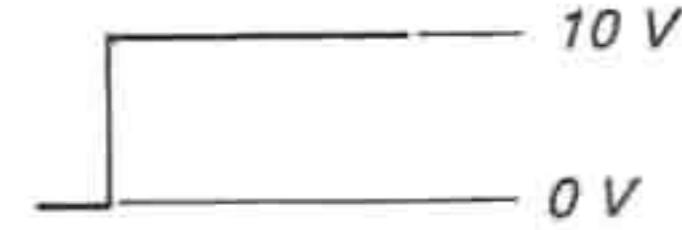

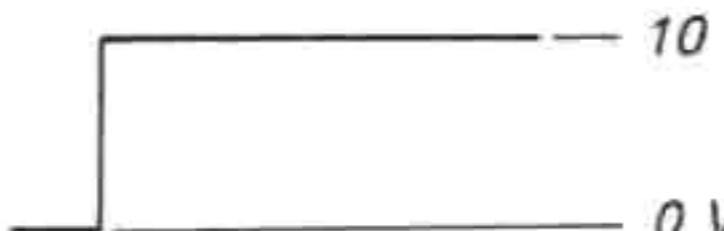

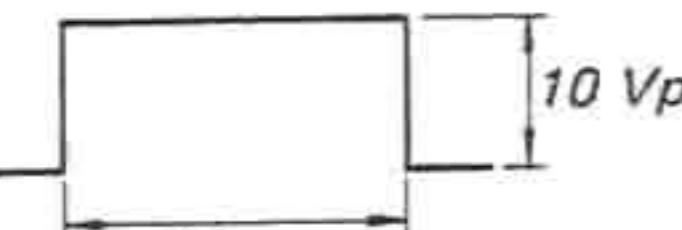

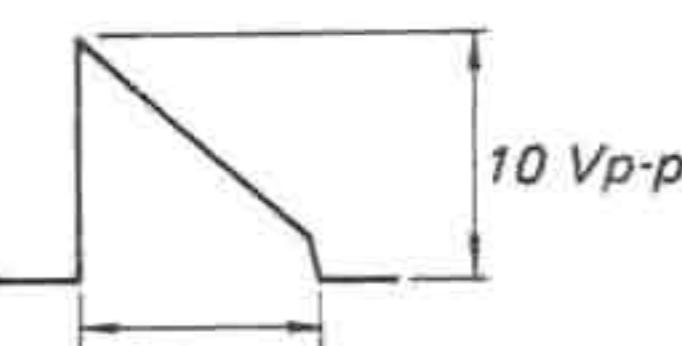

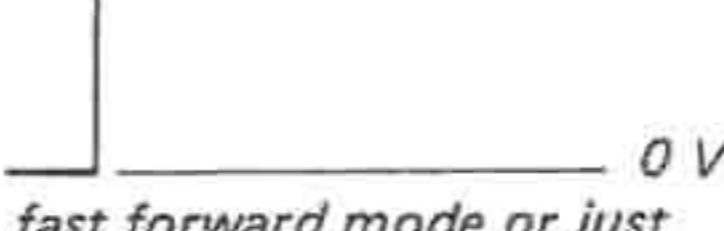

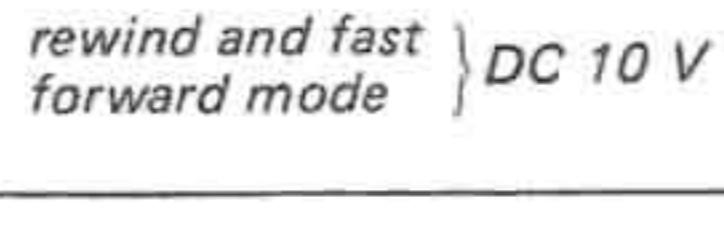

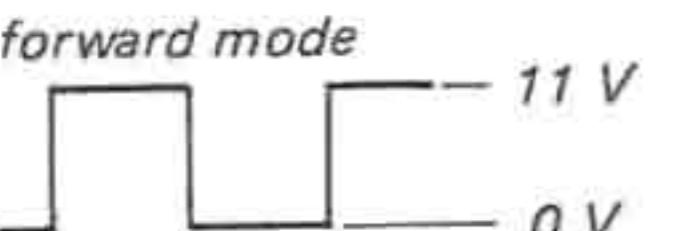

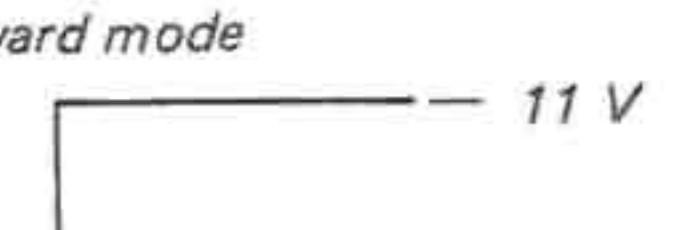

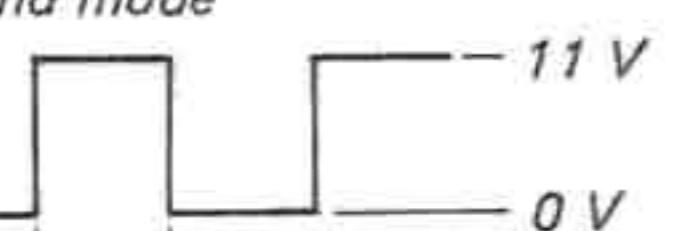

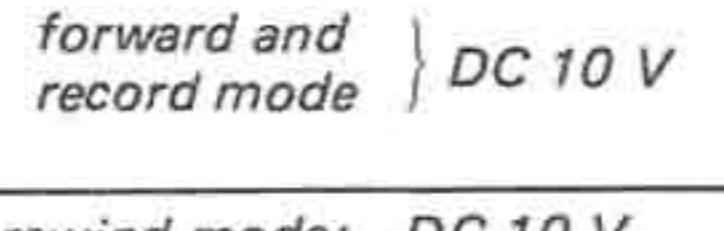

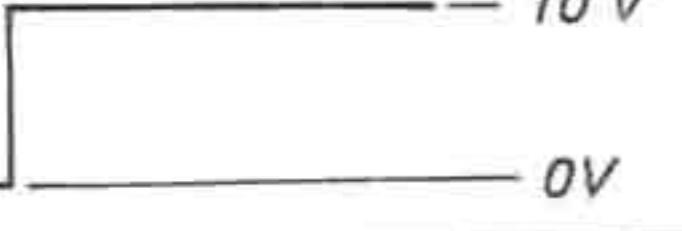

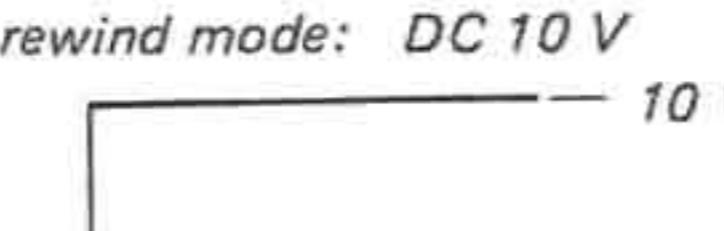

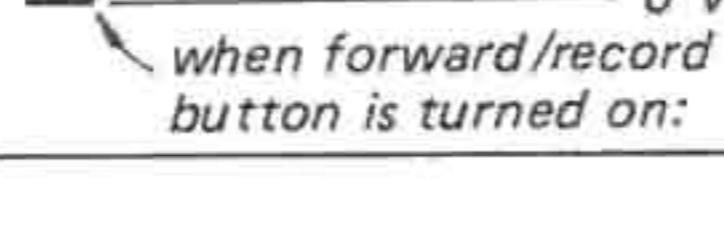

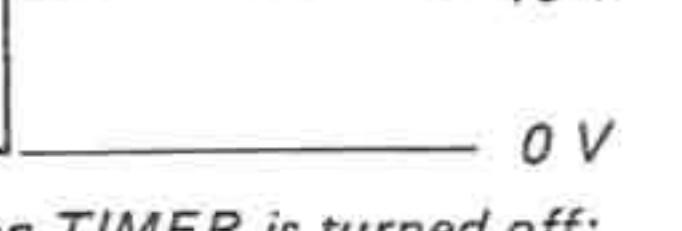

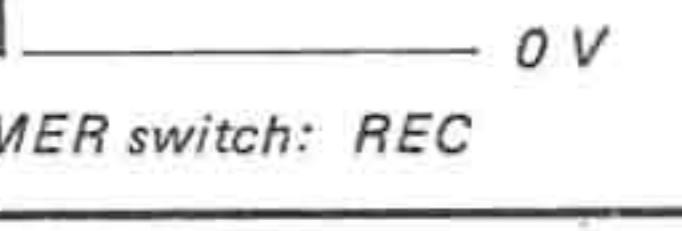

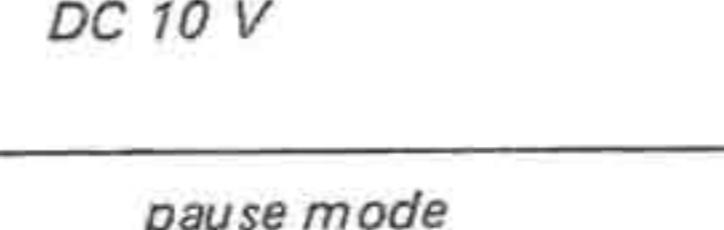

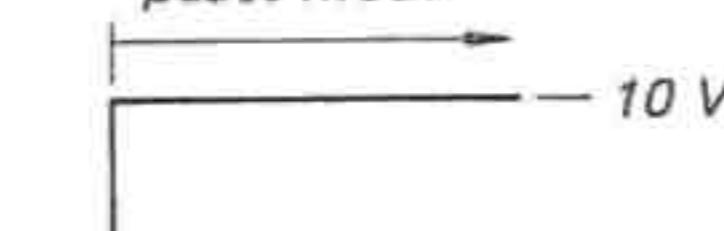

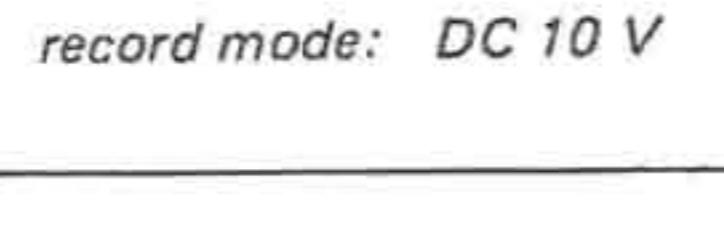

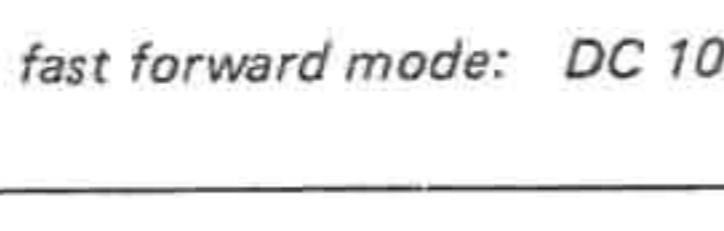

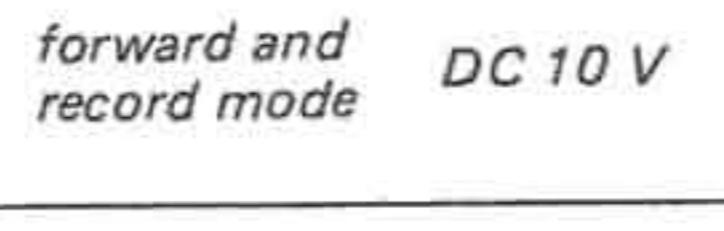

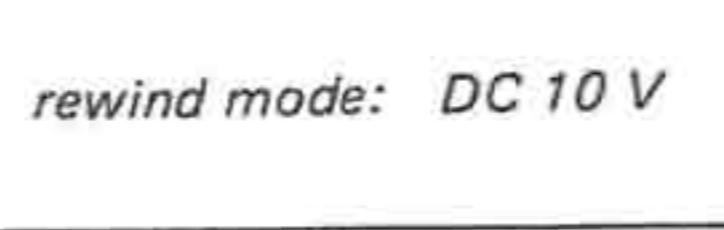

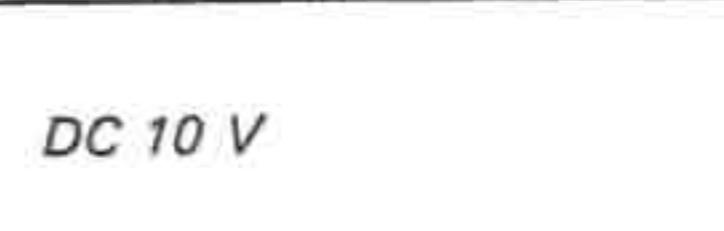

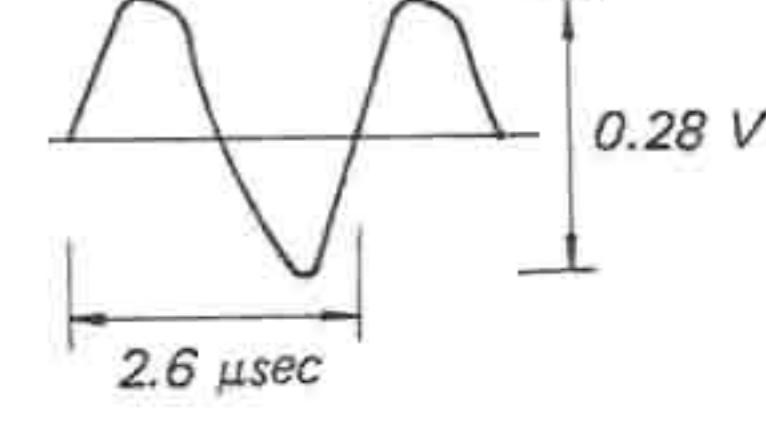

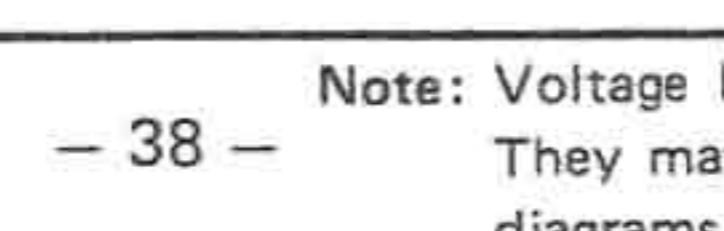

Less than 14 mV (-35 dB)

Adjustment Locations:

— record/playback board —

Voltages and Waveforms at the Terminals of IC801

Terminal No.	Waveform or Voltage	Terminal No.	Waveform or Voltage	Terminal No.	Waveform or Voltage
①		⑫		⑨	<i>forward and record mode DC 10 V</i>
②		⑬	 	⑩	<i>record mode: DC 10 V</i>

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "●" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers ($\Delta-\Delta\Delta-\Delta\Delta\Delta-XX$ or $\Delta-\Delta\Delta\Delta-\Delta\Delta\Delta-X$) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μF . Common capacitors are omitted. Refer to the following lists for their part numbers.
MF: μF , PF: $\mu\mu\text{F}$.

RESISTORS:

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

• F : nonflammable

COILS

• MMH : mH, UH : μH

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "●" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μF . Common capacitors are omitted. Refer to the following lists for their part numbers.
MF: μF , PF: $\mu\mu\text{F}$.

RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

• F : nonflammable

COILS

- MMH : mH, UH : μH

The components identified by shading and mark are critical for safety. Replace only with part number specified.

Les composants identifiés par une trame et une marque sont critiques pour la sécurité. Ne les remplacer que par une pièce portant le numéro spécifié.

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "●" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers ($\Delta-\Delta\Delta-\Delta\Delta\Delta-XX$ or $\Delta-\Delta\Delta\Delta-\Delta\Delta\Delta-X$) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μF . Common capacitors are omitted. Refer to the following lists for their part numbers.
- MF: μF , PF: $\mu\mu F$.

RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.
- F : nonflammable

COILS

- MMH : mH, UH : μH
