## MAINTENANCE

**"CAUTION** — THESE SERVICE INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID ELECTRIC SHOCK DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN THE OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO. REFER ALL SERVICING TO QUALIFIED SERVICE PERSONNEL."

### **INSTRUCTIONS FOR SERVICE PERSONNEL**

BEFORE RETURNING APPLIANCE TO THE CUSTOMER, MAKE LEAKAGE-CURRENT OR RESISTANCE MEASUREMENTS TO DETERMINE THAT EXPOSED PARTS ARE ACCEPTABLY INSULATED FROM THE SUPPLY CIRCUIT.

### **NOTES**

- ★ Parts marked with \* require longer delivery time.
- ★ All resistors are 1/4 watt, 5 % unless marked otherwise. Resistor values are in ohms (K=1,000 ohms, M=1,000,000 ohms).
- ★ All capacitor values are in microfarads (p=pico-farads)
- ★ △ Parts marked with this sign are safety critical components. They must always be replaced with identical components — refer to the TEAC Parts List and ensure exact replacement.
- ★ 0 dB is referenced to 1 V in this manual unless otherwise specified.
- ★ PC boards shown viewed from electro-parts side.

## 2. TEST EQUIPMENT

<b>Wow &amp; Flutter Meter :</b>	Minicom Division, 3M Co., Model 8155
<b>Audio Oscillator :</b>	Hewlett Packard, Model 204C or equivalent
<b>Digital Frequency Counter :</b>	Range :10 Hz to 1 MHz; Sensitivity : 0.1 Vrms; Imp.: > 1M ohms, < 25 pF
<b>Band-pass Filter :</b>	1 kHz narrow band pass type
<b>AF Level Meter :</b>	Range : -80 dB to +40 dB ; Imp.: > 1M ohms, < 25 pF (such as HP 400GL)
<b>Distortion Meter :</b>	General type (400 Hz, 1 kHz)
<b>Oscilloscope :</b>	General type
<b>Attenuator :</b>	General type
<b>Tool:</b>	
<b>Spring scale :</b>	0 to 8 lbs (0 to 4 kg)
<b>Tentelometer :</b>	0 to 2.2 lbs (0 to 1 kg)
<b>Hex head Allen wrenches</b>	Model TS-H20-1 or TS-H20-M2
<b>Plastic alignment tool</b>	
<b>Cleaning Fluid :</b>	TEAC TZ-261 or equivalent
<b>Head Demagnetizer :</b>	TEAC E-3 or equivalent
<b>1/4" Test Tape :</b>	
<b>Tape speed/Wow flutter test tape :</b>	TEAC YTT-2004 (for 15 ips); TEAC YTT-2003 (for 7-1/2 ips).
<b>Reproduce alignment test tape :</b>	
<b>NAB Equalization:</b>	TEAC YTT-1004 (for 15 ips); TEAC YTT-1003 (for 7-1/2 ips). Reference fluxivity: 185 nWb/m Time constant : 3,180 +50 usec.
<b>IEC Equalization:</b>	TEAC YTT-1064 (for 15 ips) Reference fluxivity: 320 nWb/m Time constant : ∞ +35 μsec. TEAC YTT-1063 (for 7-1/2 ips) Reference fluxivity: 320 nWb/m Time constant : ∞ +70 μsec.
<b>Blank test tape (for recording) :</b>	AMPEX 456

## 3. VOLTAGE CONVERSION

This machine is adjusted to operate on the electric voltage specified on the machine, power cord tag, or packing carton.

**NOTE :** This voltage conversion is not possible on models sold in the U.S.A., Canada, UK, Australia or Europe.

For general export models, if it is necessary to change the voltage requirements of your machine to match the line voltage at the installation site, use the following procedure.

### ALWAYS DISCONNECT THE POWER LINE CORD BEFORE MAKING THESE CHANGES.

1. Remove the right side panel by removing six screws (see Figure 4-2).
2. Locate the voltage selector plug (see Figure 3-1).
3. Pull out to remove the plug, and reinsert it so that the required voltage is indicated in the cut-out section of the plug.

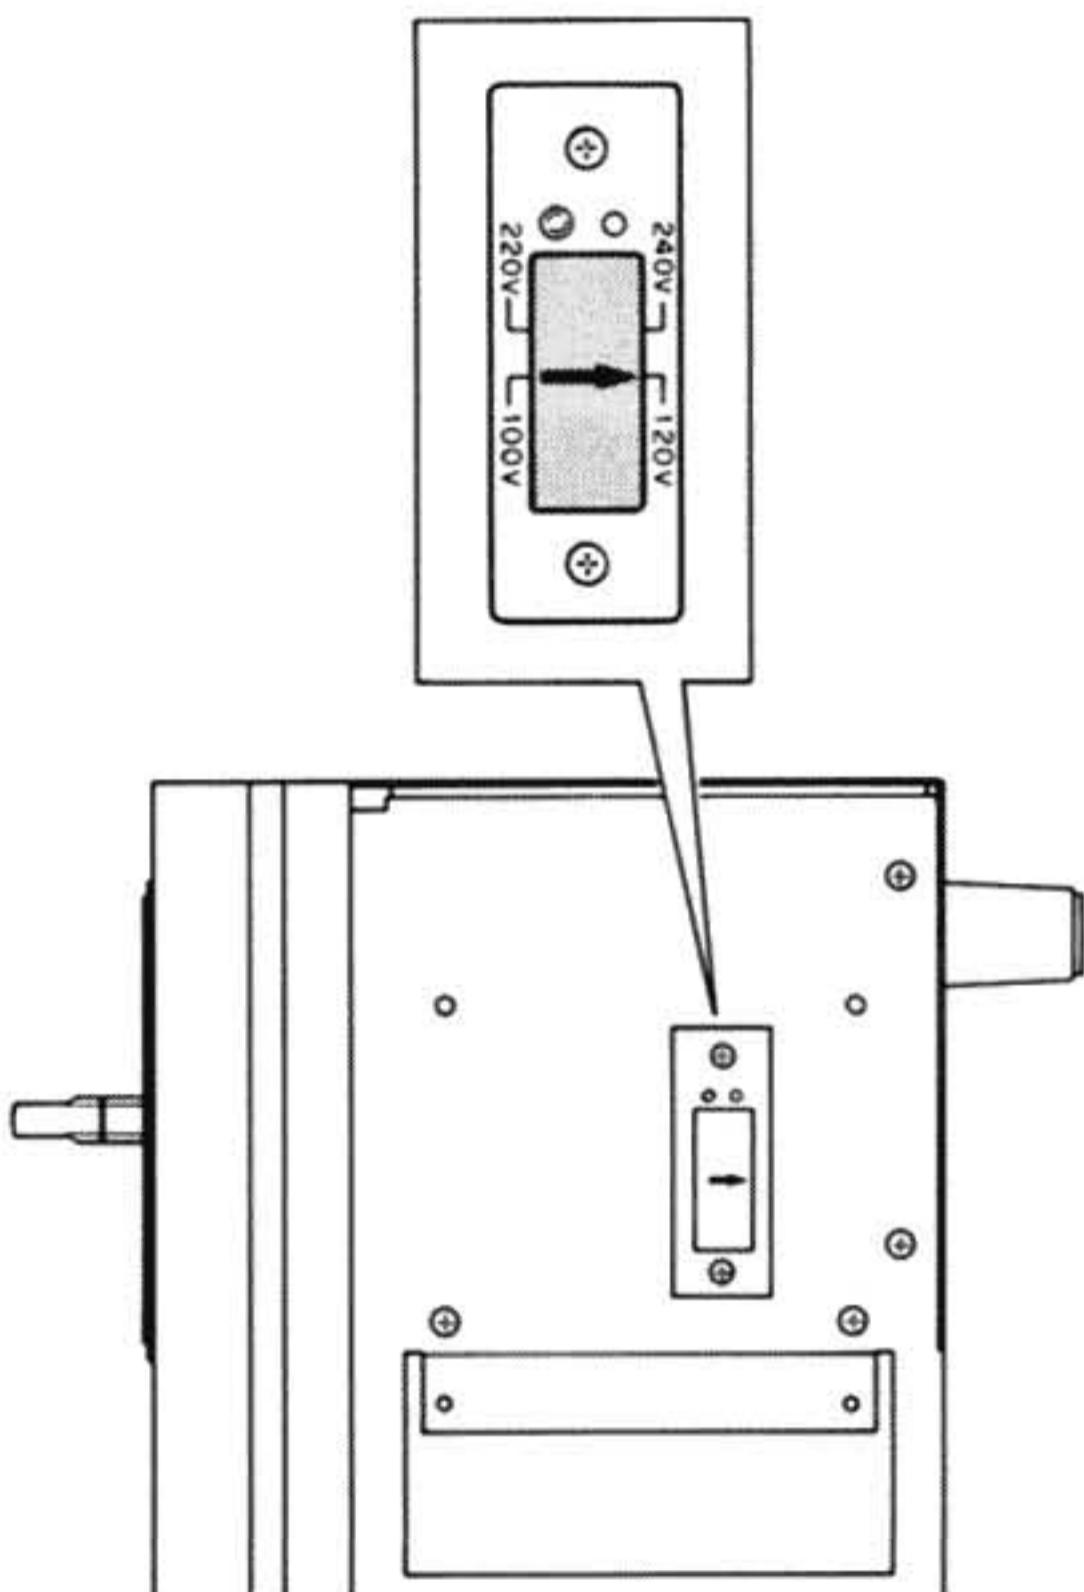

Figure 3-1. Voltage Selector Location

#### 4. PANEL REMOVAL

**WARNING :** To avoid electric shock, be sure to unplug power cord prior to removing or replacing any parts.

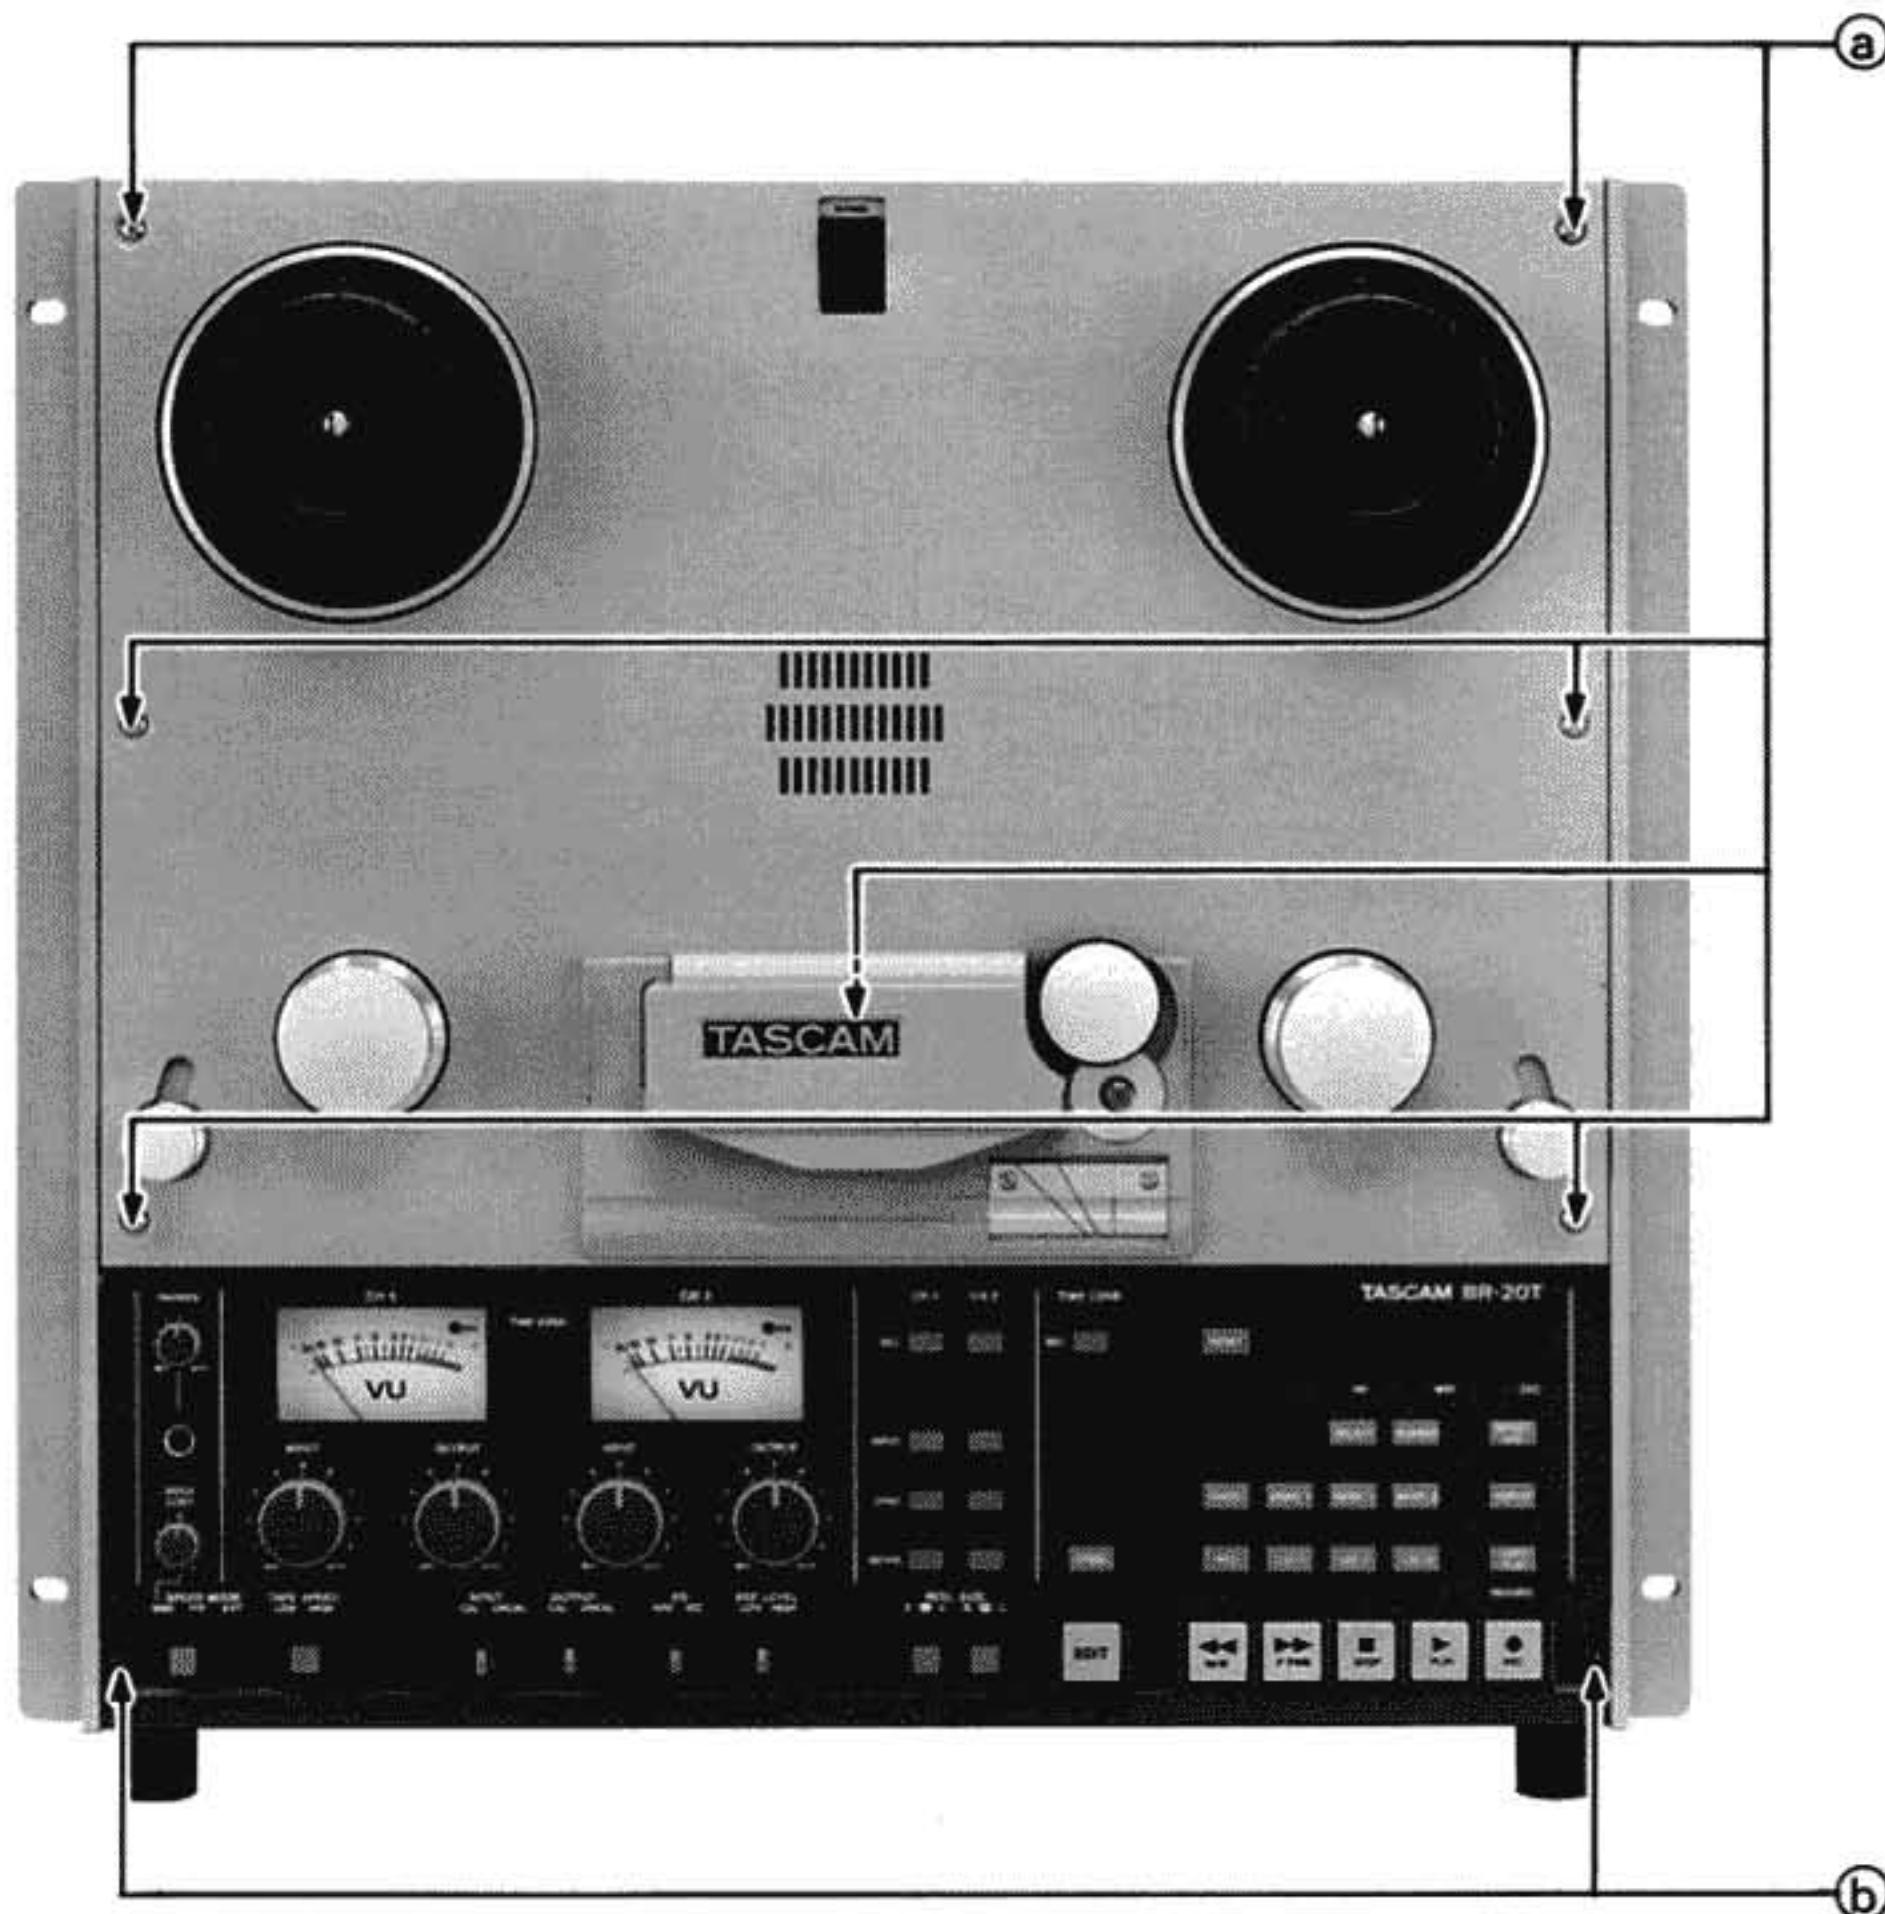

Figure 4-1. Screw Locations for Removing Front Panel and Pushing Control Panel Open

##### 4-1. Front Panel

1. Remove the head housing (access cover) and the pinch roller as follows :

To remove the head housing, gently press the left side of the cover to the right and lift the left side up slightly. Then pull and lift to the left to release fully. When replacing the cover, first insert the tab into the slot on the right side of the head assembly, then gently press the left side in to lock it into position. DON'T FORCE IT. Carefully handle both in removing and replacing.

To remove the pinch roller, unscrew its cap by turning it counterclockwise and remove the cap and pinch roller.

2. Remove the seven "a" screws (Figure 4-1).

##### 4-2. Control Panel

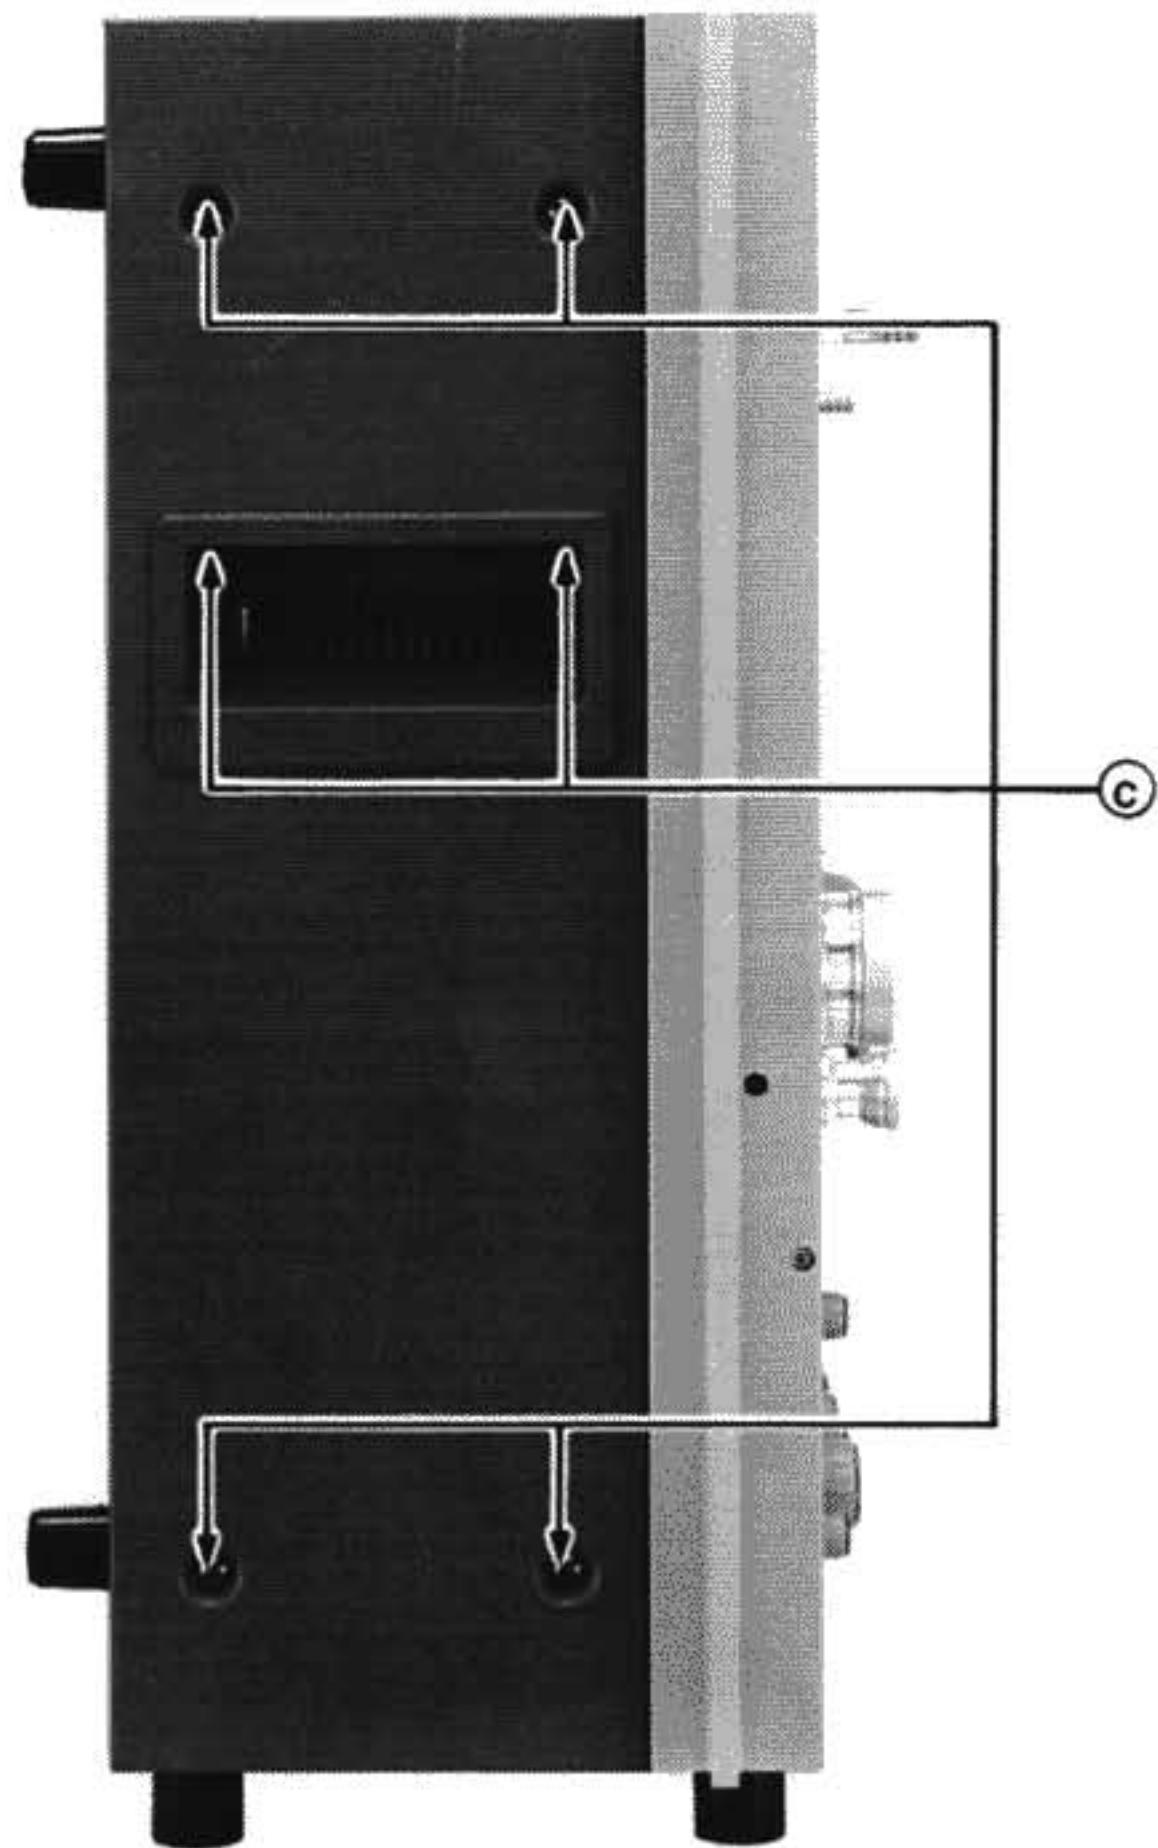

Remove the two "b" screws (Figure 4-1). The panel can then open as shown in Figure 1-1.

#### 4-3. Side Panels

Remove the six "c" screws (Figure 4-2).

#### 4-4. Top Rear Panel

Remove the four "d" screws, two of which hold the feet in place (Figure 4-3).

#### 4-5. Connector Panel

Remove the four "e" screws (Figure 4-3).

#### 4-6. Lower Rear Panel

Remove the four "f" screws (Figure 4-3).

Figure 4-2. Screw Locations for Side and Top Rear Panel Removal

Figure 4-3. Screw Locations for Connector and Lower Rear Panel Removal

#### **4-7. Bottom Panel**

Remove the eight "g" screws, four of which hold the feet in place (Figure 4-4).

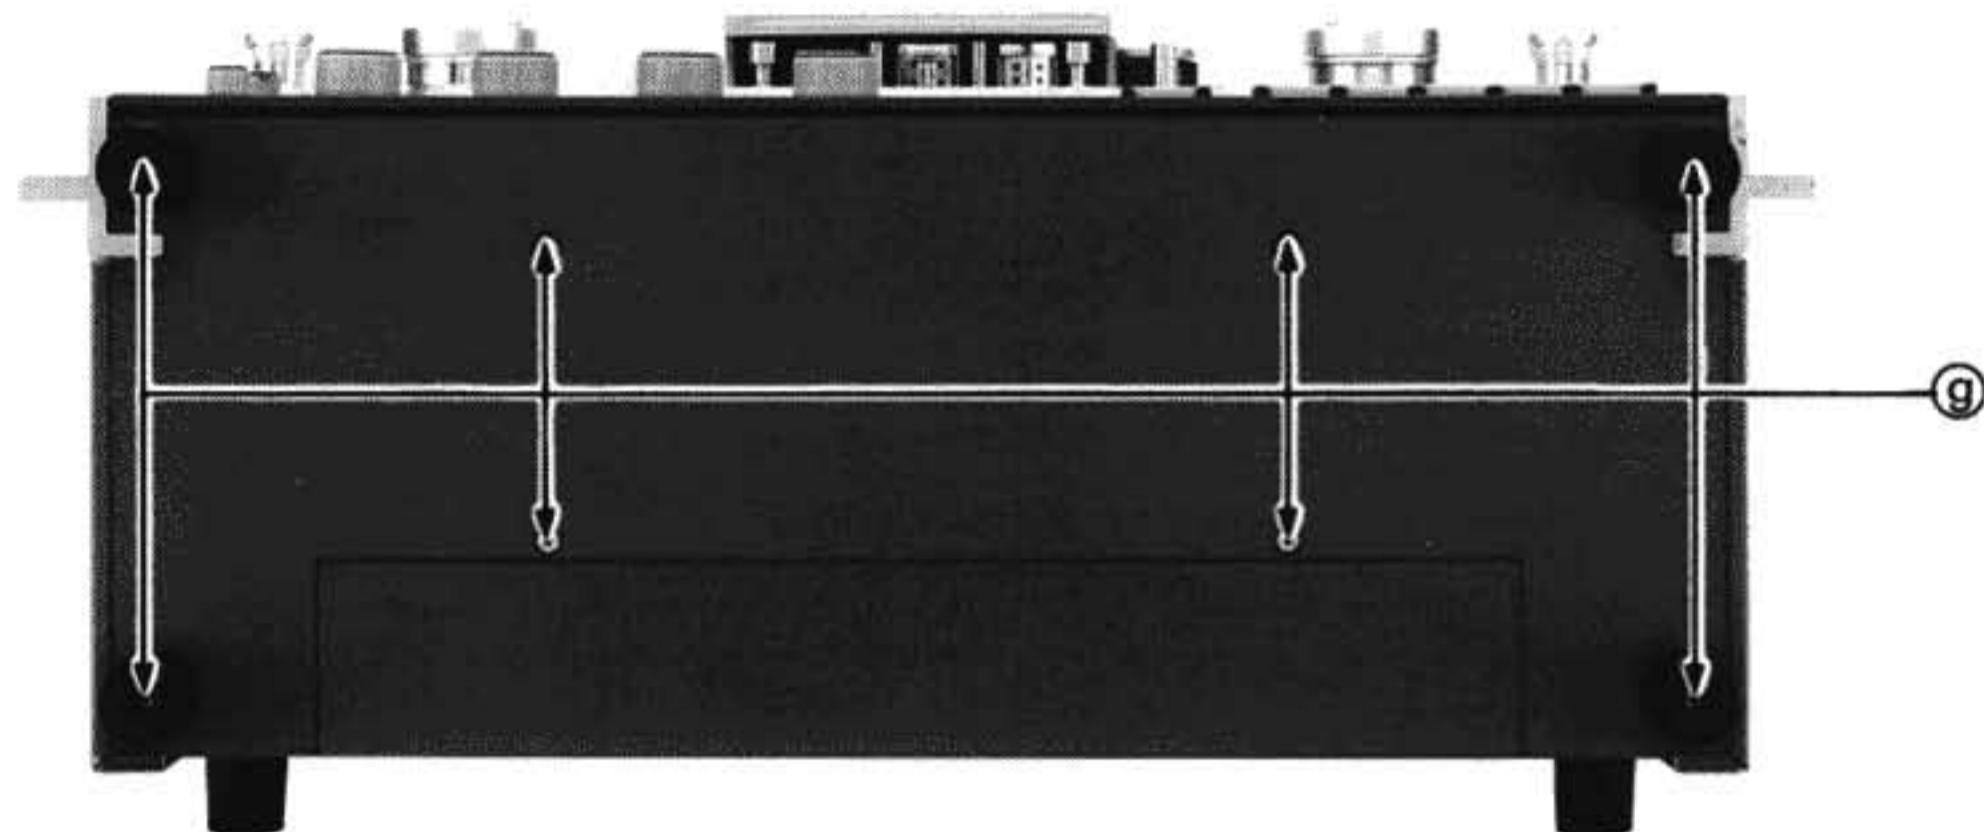

Figure 4-4. Screw Location for Bottom Panel Removal

#### **4-8 Fuse Replacement**

**CAUTION :** First, check to make sure the power is turned off.

If a fuse has blown, retrace the cause and eliminate it before replacing it with a new one.

**NOTE :** Replacement fuse must have the same amperage and other specifications as the original.

Access to the fuses (see Figure 1-2) is provided by removing the top rear panel as explained in paragraph 4-4.

## 5. MECHANICAL CHECKS AND ADJUSTMENTS

### 5-1. Brake Mechanism

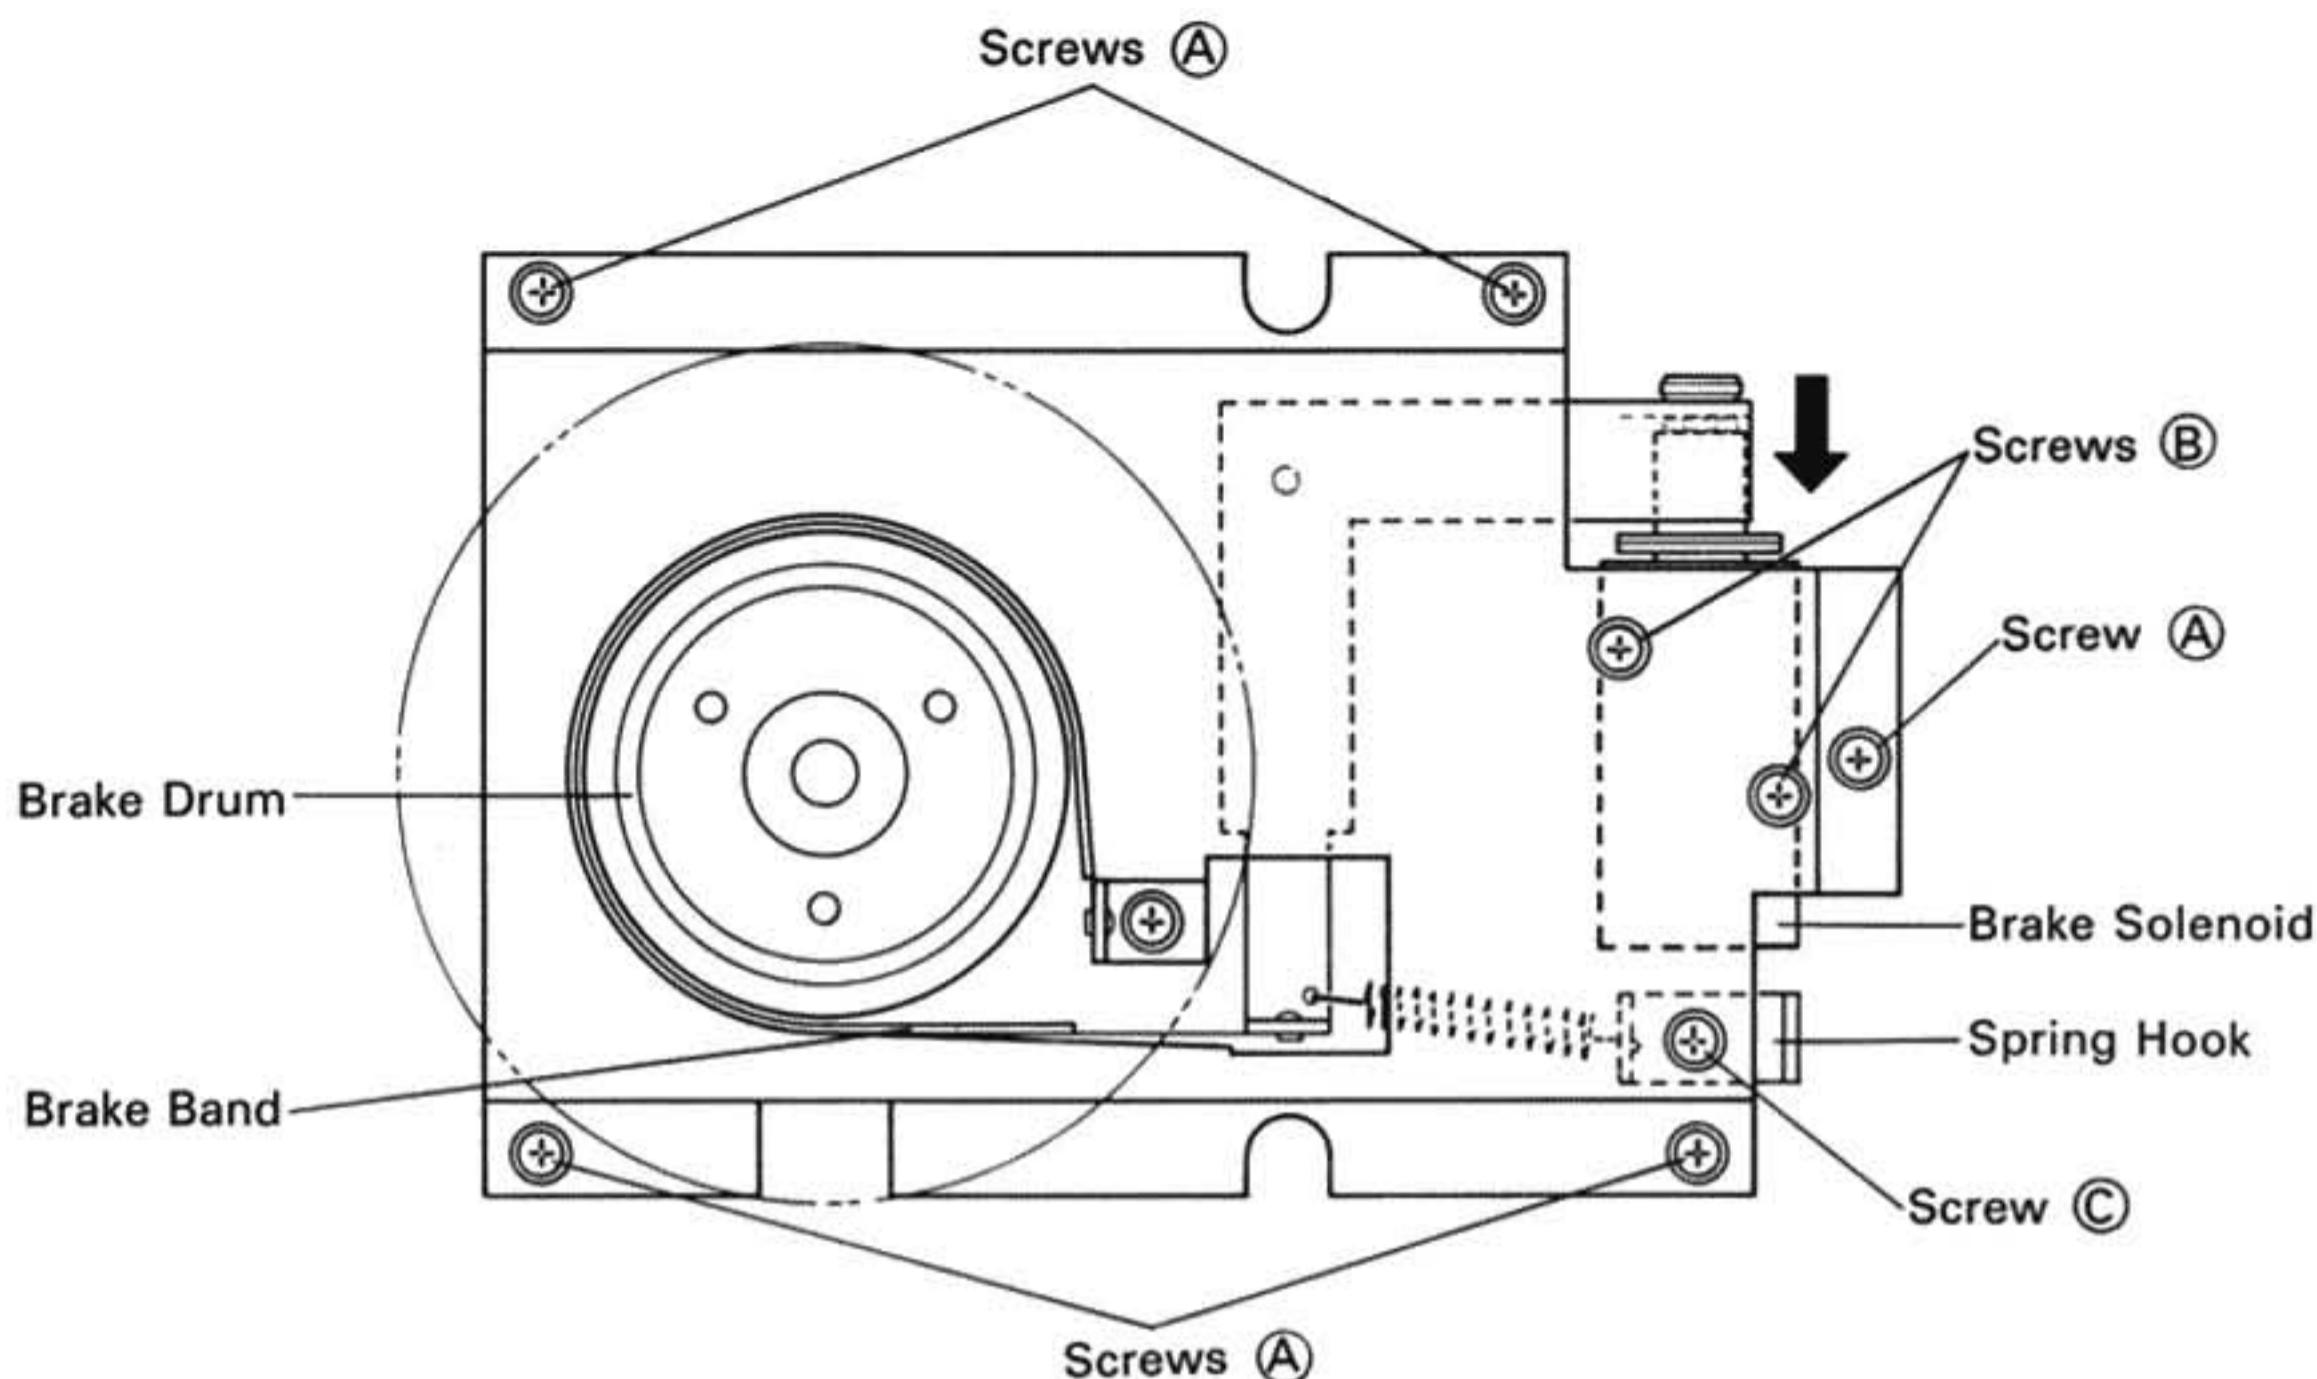

Figure 5-1. Brake Band-Drum Clearance Adjustment

Normally, the brake mechanism does not require to be checked and adjusted. However, if its mechanical parts or solenoids have been replaced, the following should be performed.

Refer to Figure 5-1.

1. Turn off power.
2. Remove both reel tables by removing three screws on each.
3. Move the brake solenoid plunger so it retracts and check for an even clearance between the brake drum and band. If necessary loosen five mount screws "A" and adjust the positioning of the brake assembly block for correct proper brake drum-band clearance.
4. Move the plunger and slightly turn the reel table, to visually check that the brake band does not contact the brake drum. Check both right and left brake assemblies.

If the brake band touches the brake drum when you move the plunger and rotate the reel table, loosen screws "B" and move the solenoid until the brake band and drum do not make contact. Adjust the solenoid position so the brake band drum clearance is as tight as possible. Don't allow too a loose clearance between the brake band and drum.

### 5-2. Brake Torque

Brake torque needs to be adjusted when brake related parts such as brake felt, brake arm assembly, brake spring... have been replaced or whenever the following check procedure reveals "out of spec" torque.

The following check procedure is performed with reel stopped and in the direction in which brake torque is applied.

#### A. Check

1. Turn off power.
2. Refer to Figure 5-2. Connect string to reel hub and wind clockwise several times around the reel hub as shown. Then, attach a spring scale to the string.
3. Slowly pull the spring scale in direction shown and note the scale when the reading becomes steady. Repeat the measurement two or three times and calculate the mean value.  
The mean value of the scale readings should be within the following :

1,600 to 1,800 g.cm

Torque calculating formula :  $\text{Torque (g.cm)} = \text{scale reading (g)} \times \text{reel hub radius (cm)}$

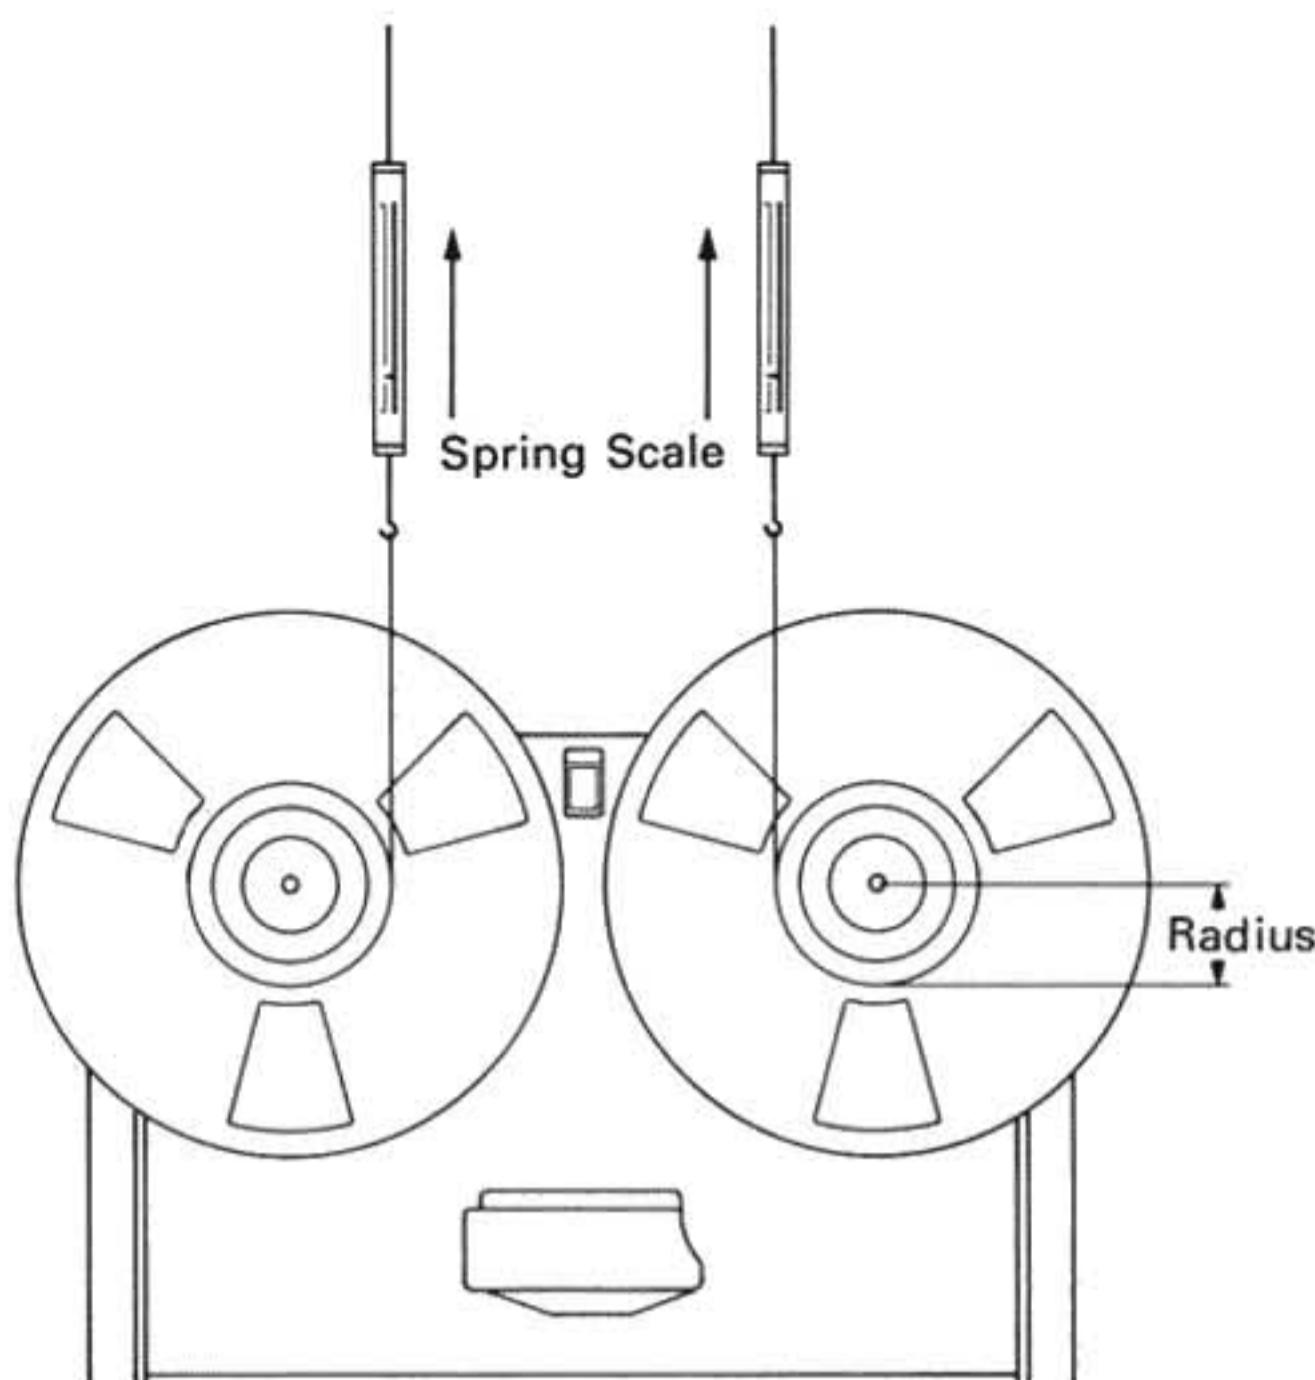

Figure 5-2. Brake Torque Measurement

#### B. Adjustment

Loosen the three mounting screws (Figure 5-3) in the solenoid and adjust the solenoid position.

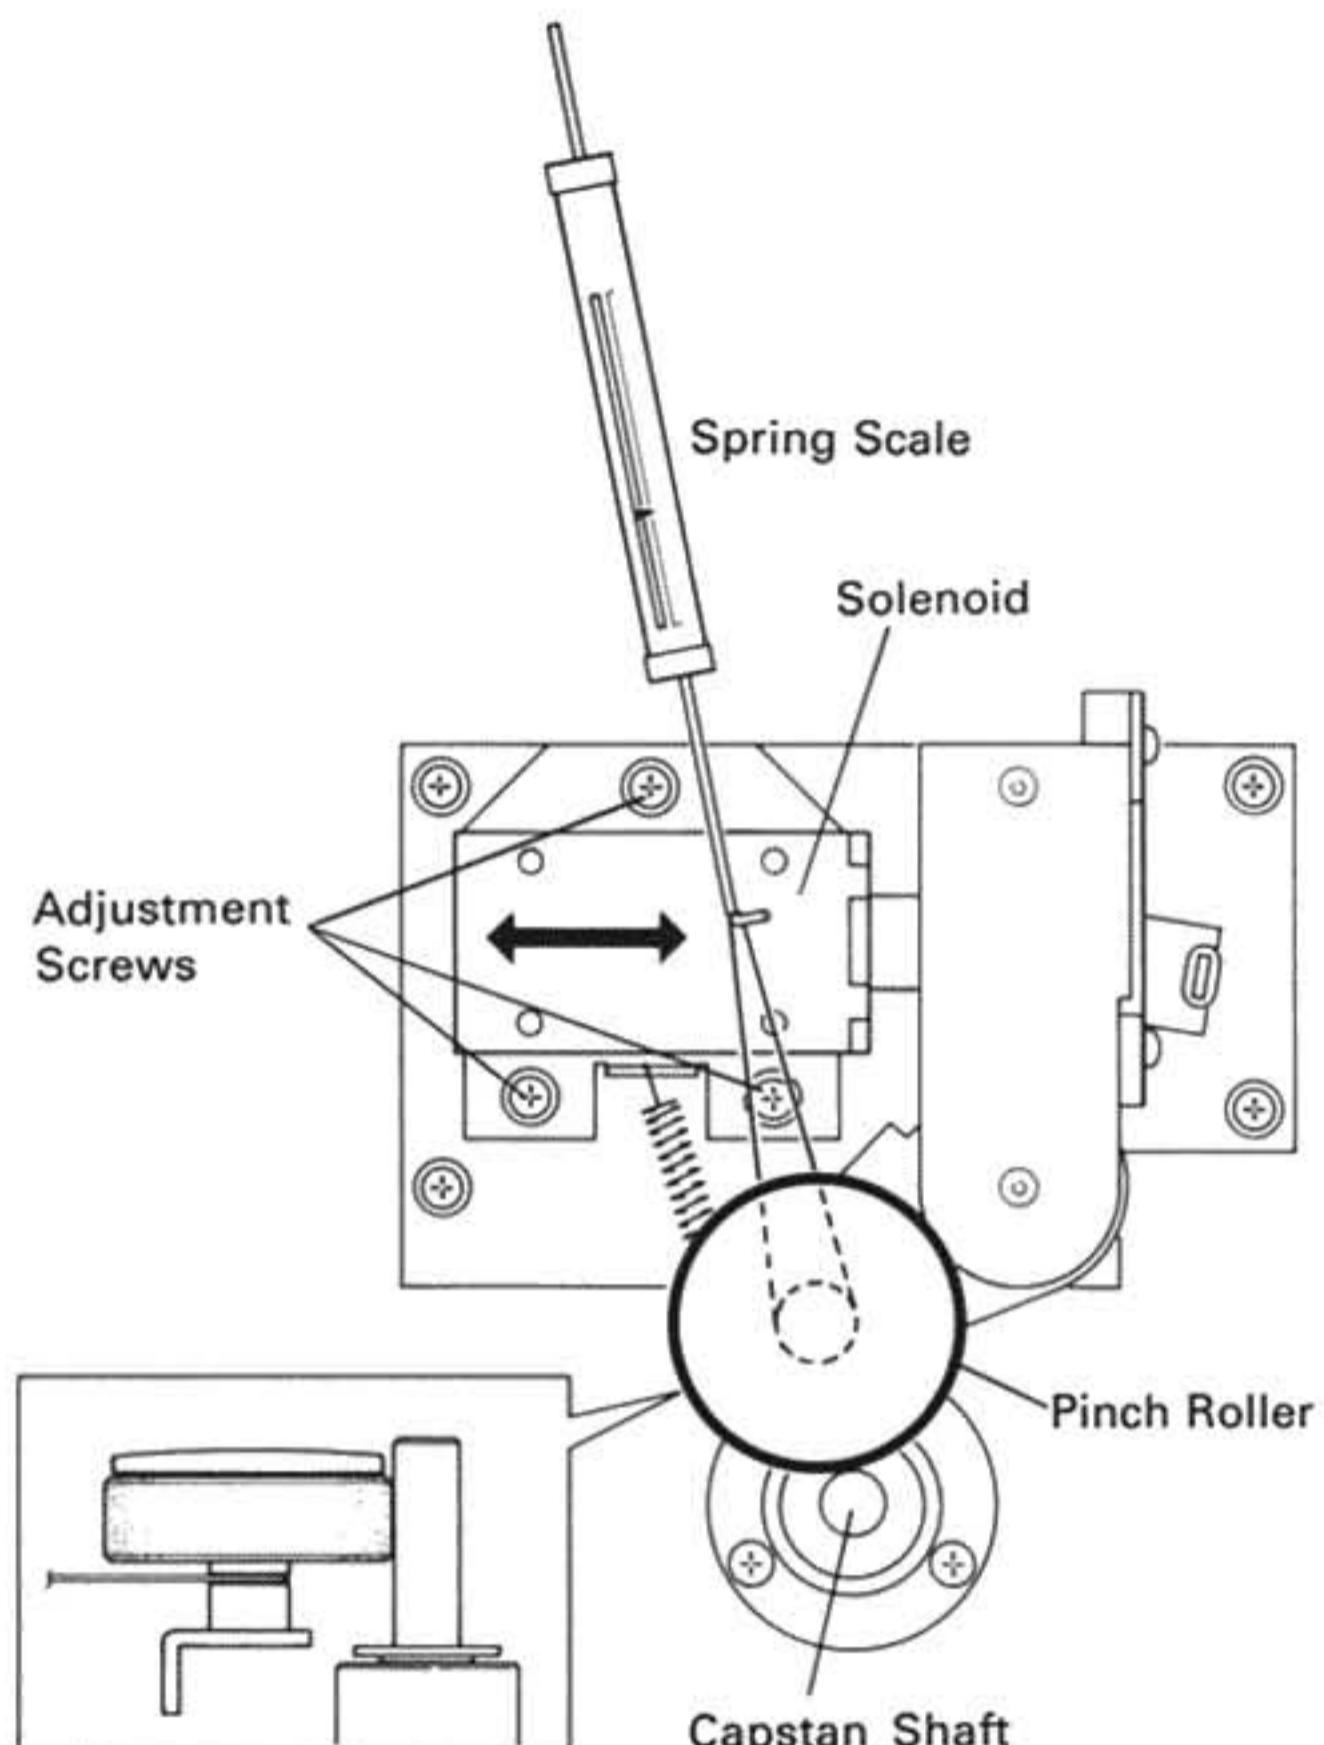

Figure 5-3. Pinch Roller Pressure Measurement and Adjustment

#### 5-3. Pinch Roller Pressure

##### A. Check

1. Block the right tension arm (shut-off arm) in its up/on position.
2. Attach a spring scale to the pinch roller shaft as shown in Figure 5-3.
3. Press PLAY and slowly pull the spring scale perpendicularly to the pinch roller arm as shown in Figure 5-3.
4. When the pinch roller loses contact with the capstan shaft and stops turning, slowly ease the spring scale and note the reading on the scale at the moment that the pinch roller starts again turning.

Specifications : 1.5 to 1.7 kg

#### 5-4. Capstan Shaft Tolerance

Refer to Figure 5-4 and check for a clearance of 0.1 to 0.2 mm as shown. If necessary, turn in or out the adjustment screw as shown.

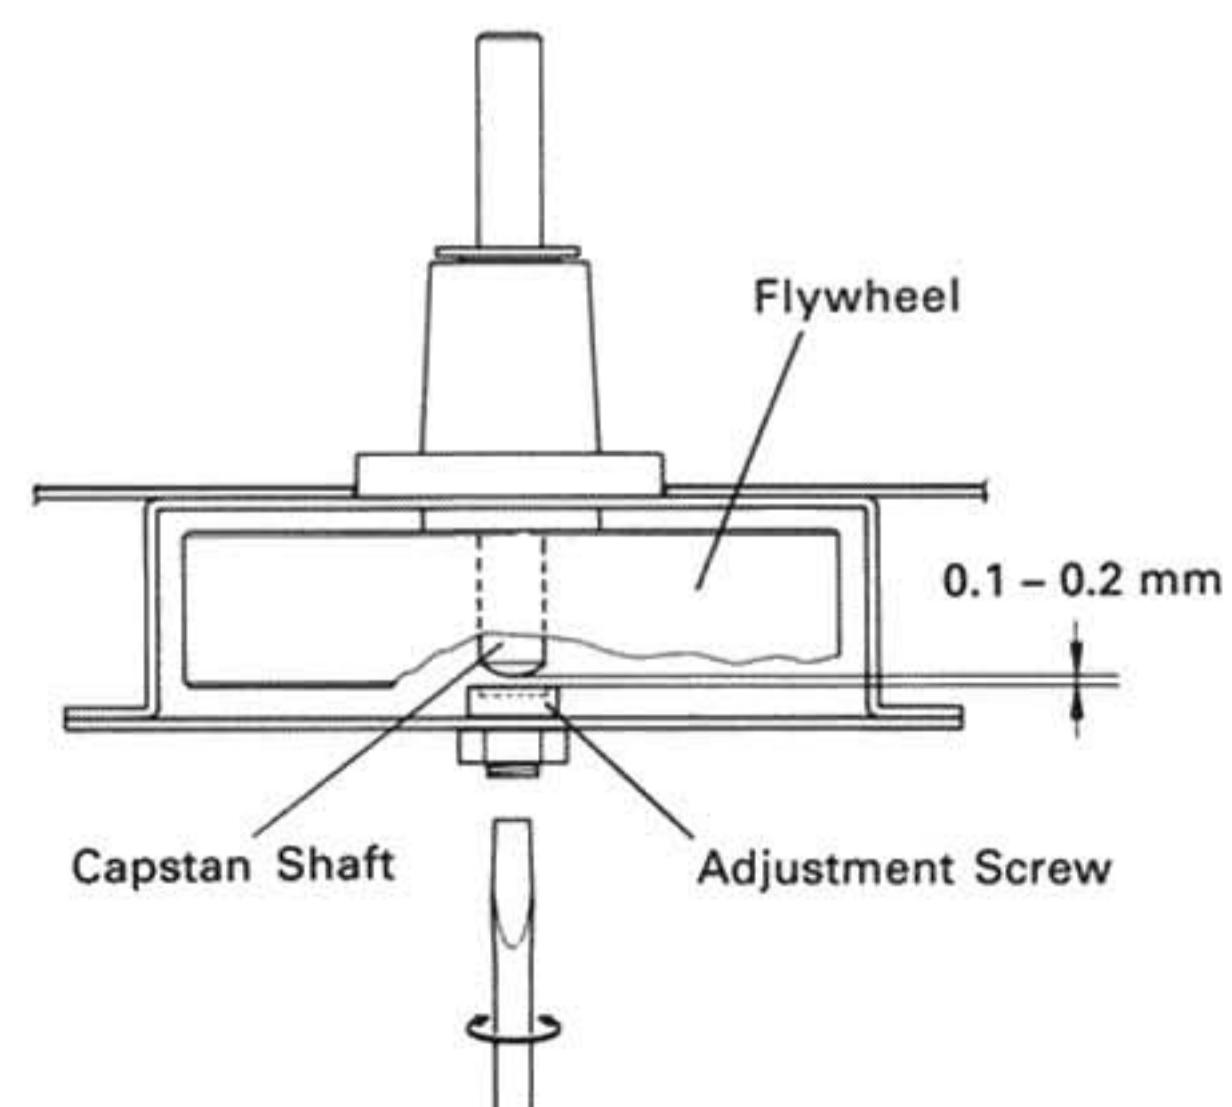

Figure 5-4. Capstan Shaft Tolerance Adjustment

## 5-5. Reel Table Height

The reel tables are each held to the reel motor shaft by two screws as shown in Figure 5-5. Run tape in F.FWD and REW to check to see that the tape does not rub against both reels. If adjustment is necessary, loosen the two set screws and move the reel table in and out to adjust height.

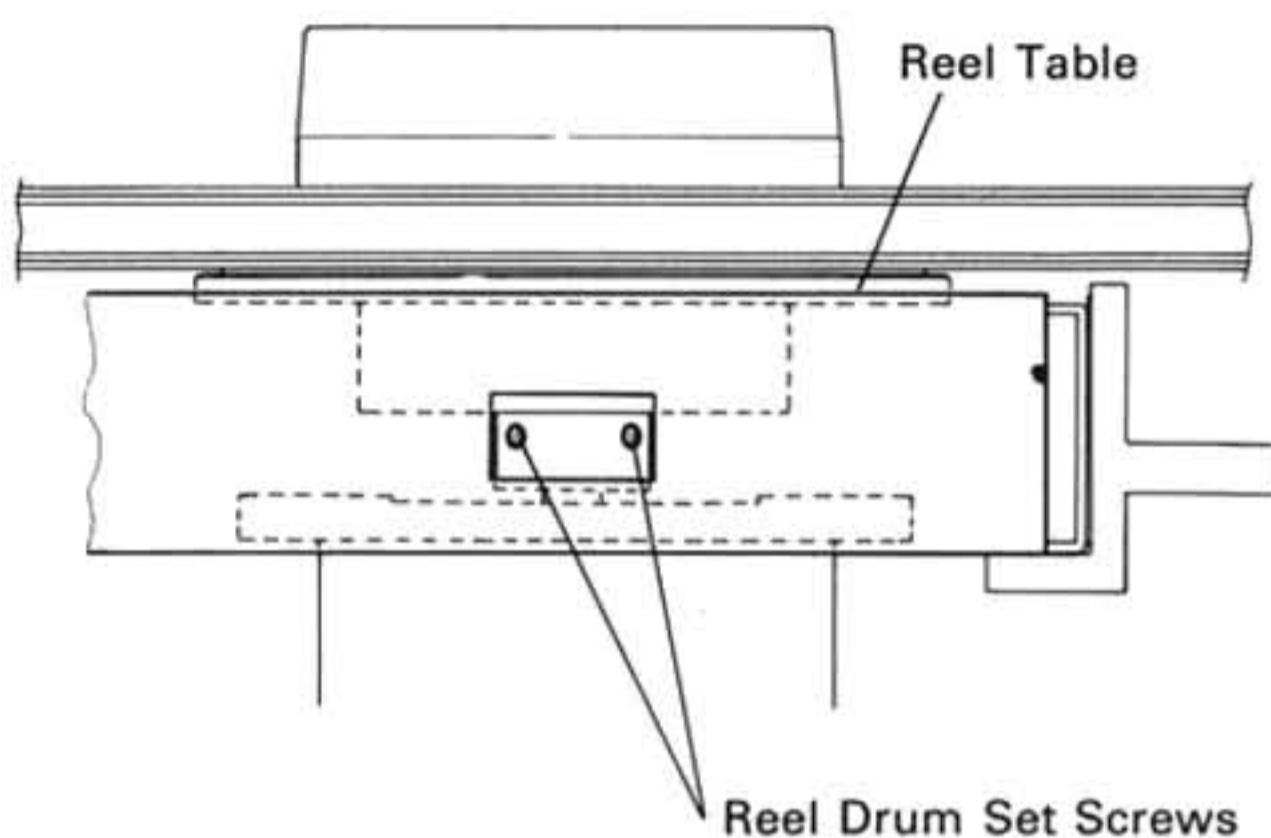

Figure 5-5. Reel Table Height Adjustment

## 5-6. Tape Tension Servo

Tape tension is constantly detected and controlled by the left and right tension sensor PCB assemblies inside the front panel. Both assemblies are identical in construction, each including a generator and two coils. Between the coils moves in and out an aluminum plate as tape tension varies and, accordingly, mutual inductance between the coils varies, so the tape tension arm movements are detected.

### 5-6-1. Tape Tension in Edit Mode

#### A. Check

1. Load a blank tape and wind until there is almost the same tape pack on both reels.
2. Enter EDIT mode, and, using a tentelometer T2-H20-M2, measure tape tension both at the supply (test point A) and the takeup (test point B) side (for test point locations, see Figure 5-6). Readings should be as follows :

Specifications :  $40 \pm 5\text{g}$ , at both sides

If necessary, proceed to the next procedure.

#### B. Adjustment

Locate the following resistors on the Control PCB (Figure 5-7) and adjust them.

R54 for the supply tape tension (T.T)  
R53 for the takeup tape tension (B.T)

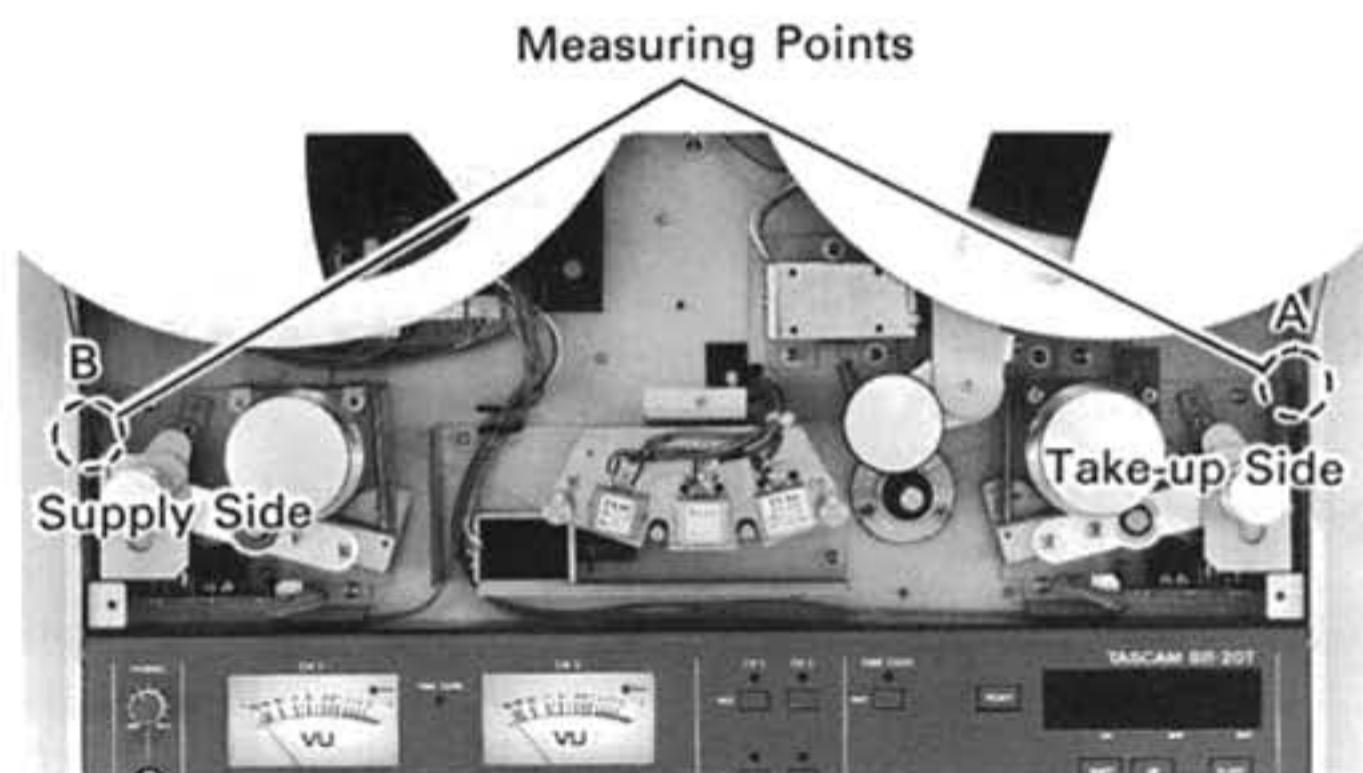

Figure 5-6. Tape Tension Measurement Points

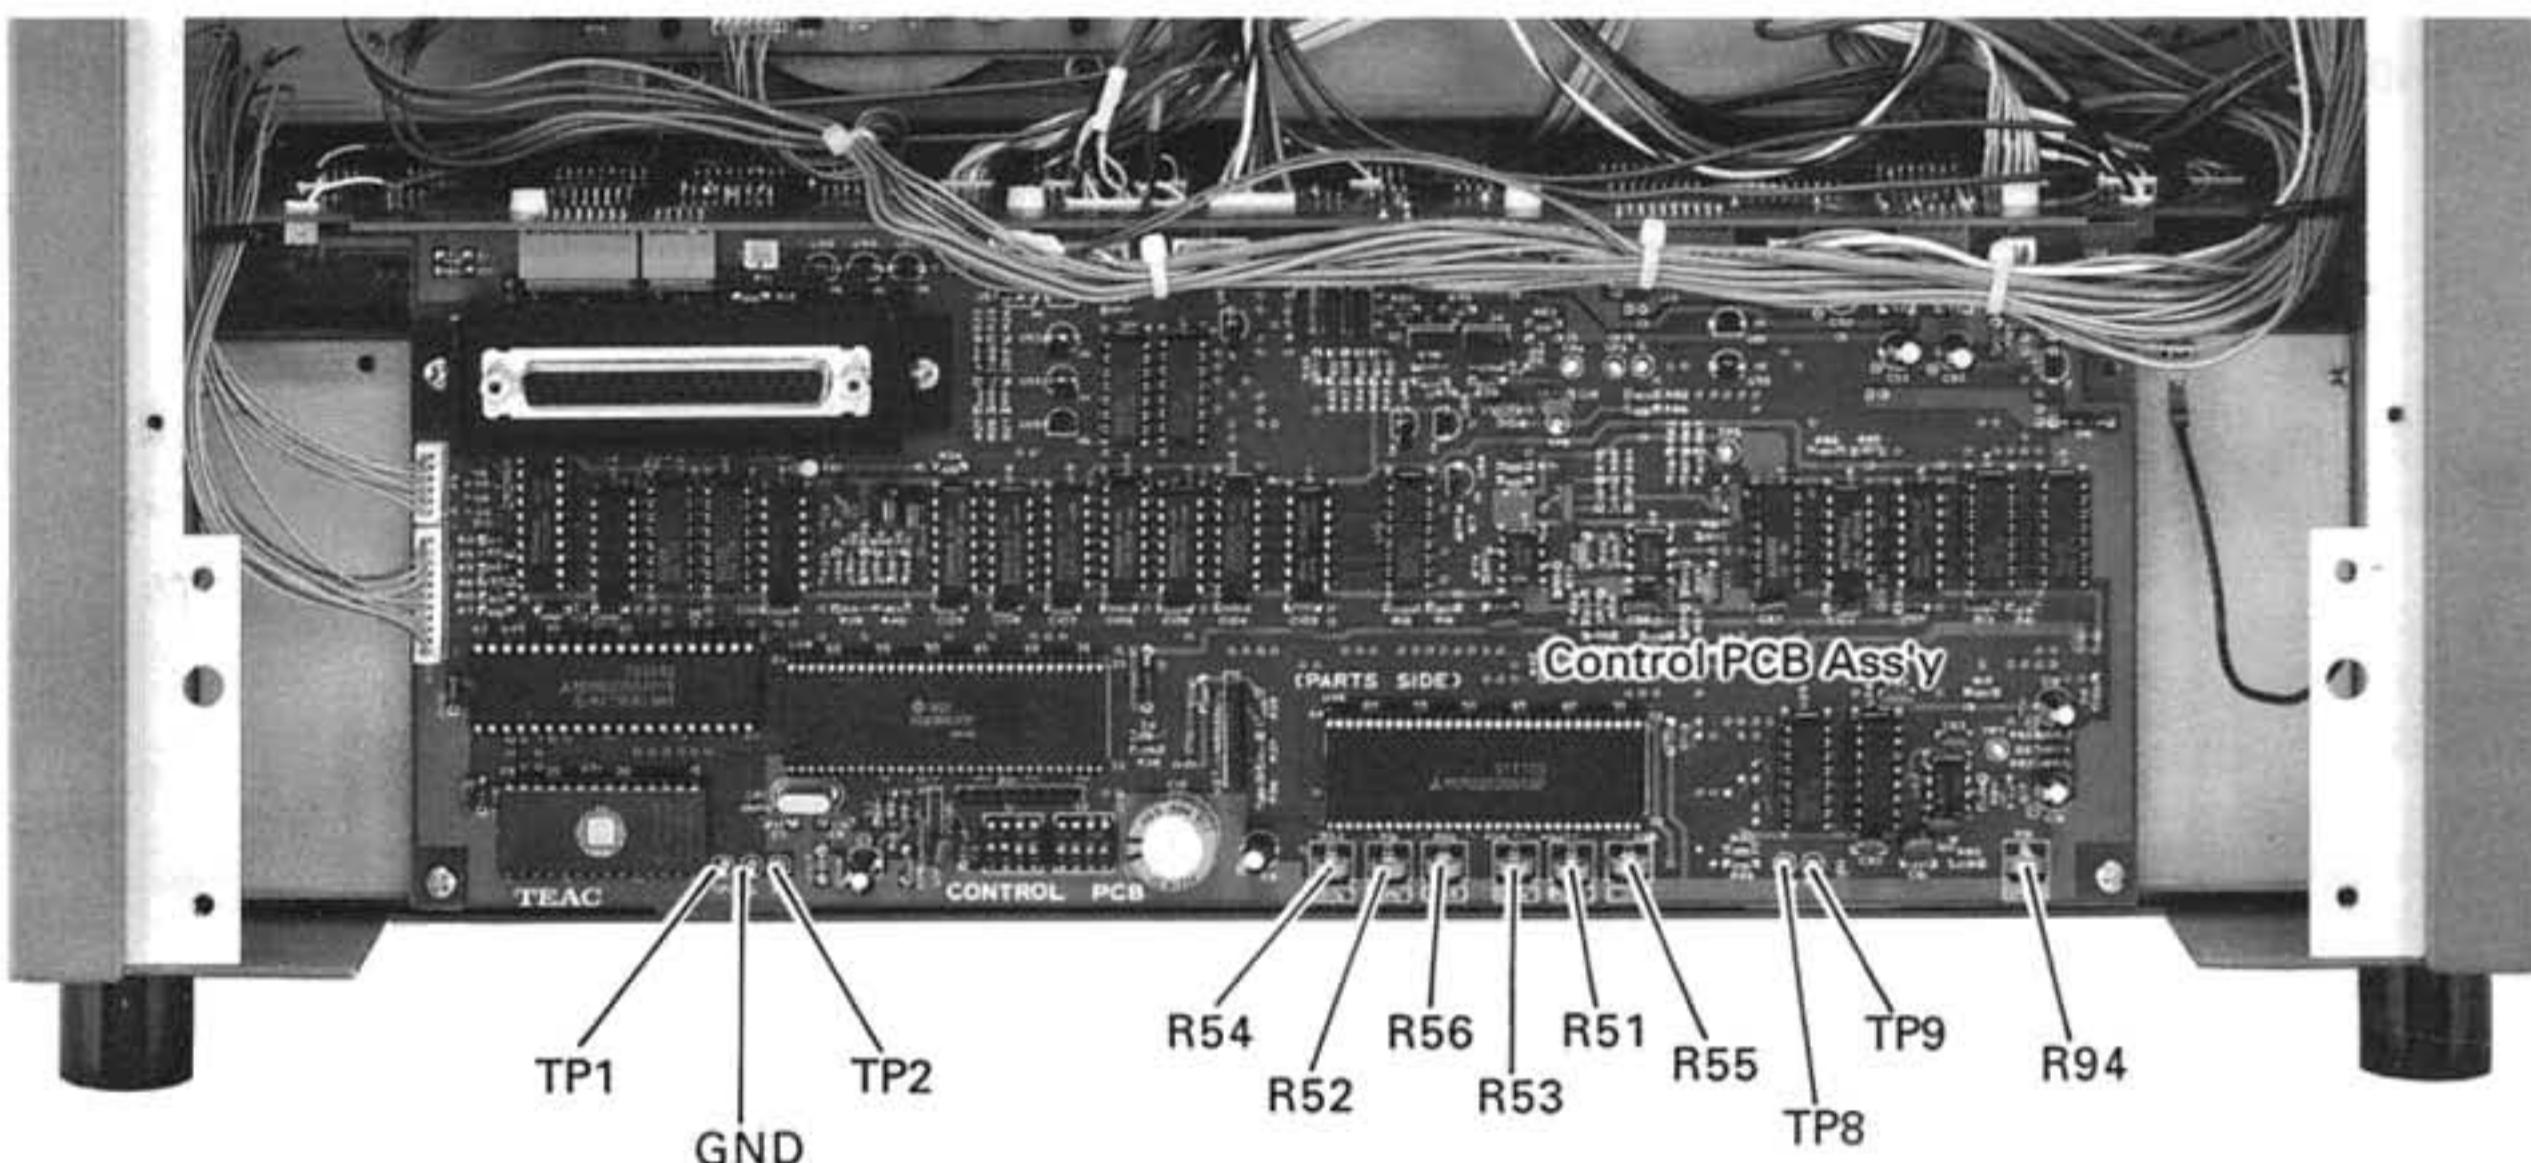

Figure 5-7. Tape Tension Adjustment Resistors

## 5-6-2. Play Tape Tension

### A. Check

Run tape in PLAY and measure tape tension at A (takeup) and B (supply) test points shown in Figure 5-6.

Specifications : Supply side, 40 +/-5g  
Takeup side, 50 +/-5g

### B. Adjustment

Locate the following resistors on the Control PCB (Figure 5-7) and adjust them until tape tension is within specifications.

R52 for the supply side (T.T)  
R51 for the takeup side (B.T)

## 5-6-3. Fast Forward/Rewind Tape Tension

### A. Check

Short-circuit between TP-8 and TP-9 on the Control PCB (Figure 5-7), enter EDIT mode, and read the tensiometer at test points A (F.FWD, B.T) and B (REW, T.T) shown in Figure 5-6.

Specifications : 30 to 40 g at both test points

### B. Adjustment

Locate the following resistors on the Control PCB (Figure 5-7) and adjust them until tension is within specifications.

R55 for F.FWD tension (B.T)  
R56 for REW tension (B.T)

## 5-7. Tape Speed

Tape speed is measured using a wow/flutter test tape containing a 3000 Hz reference signal.

Tape speed is affected by pinch roller pressure, tape tension, etc.

### 5-7-1. "FIX" Tape Speed

#### A. Check

1. Connect a frequency counter to the OUTPUT connectors, and thread a test tape.
2. Set the SPEED MODE selector switch to FIX.
3. Run the tape in PLAY and read the frequency counter.  
Check both at HIGH and LOW speeds.

Specifications : 3000 Hz +/-0.8%

#### B. Adjustment

1. Run the tape until both the left and right tape packs are almost the same, and adjust the following resistors on the Capstan Servo PCB

(Figure 5-8) until the frequency counter reads 3000 Hz.

R51 for HIGH speed  
R50 for LOW speed

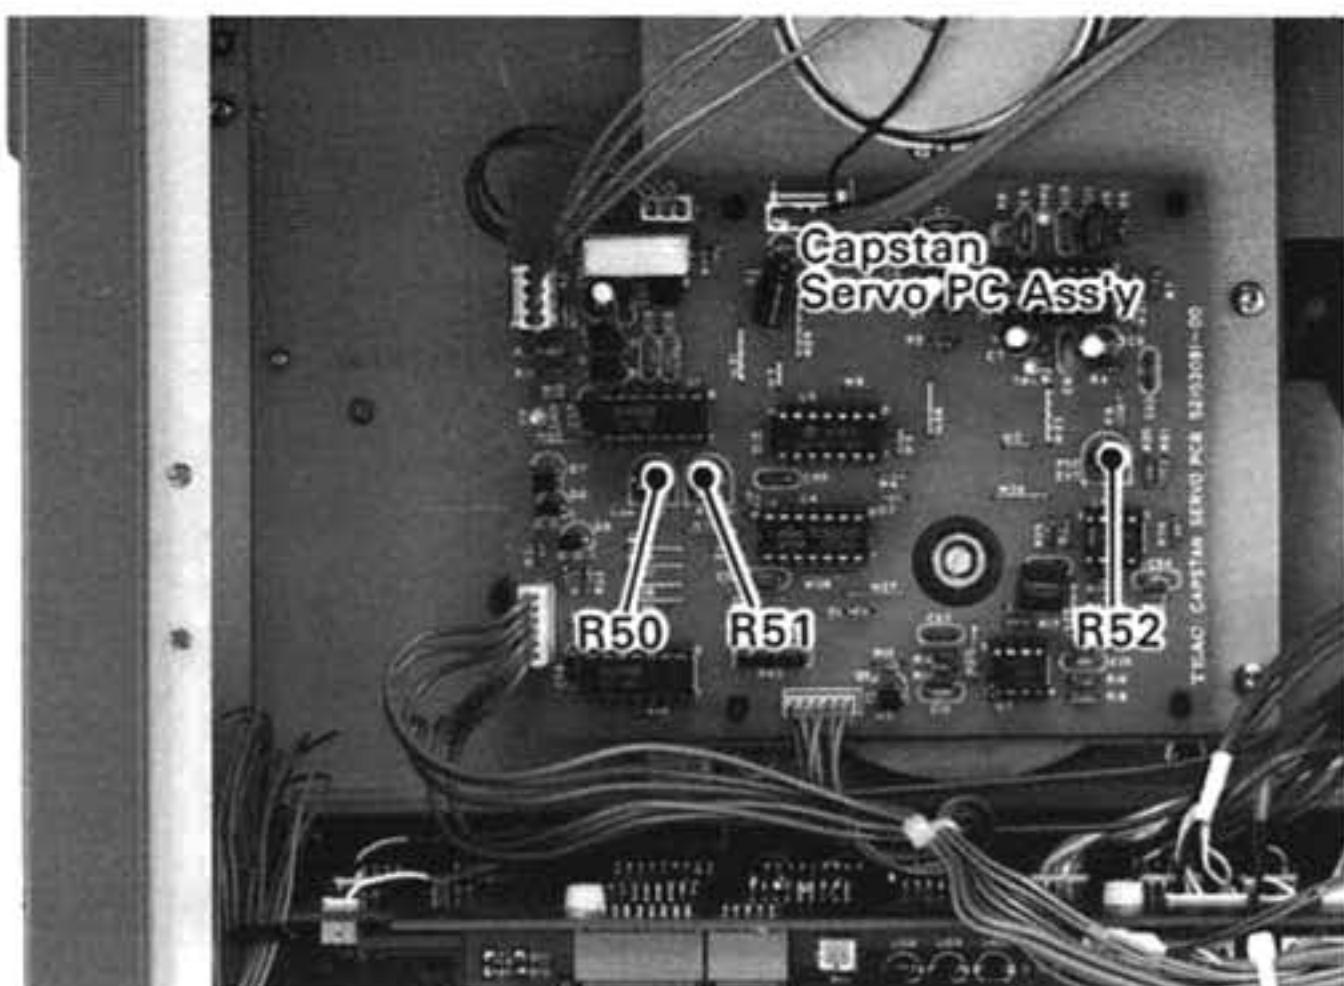

Figure 5-8. Tape Speed Adjustment Resistors

2. After the above adjustments, play the beginning (then the end) of the test tape, to check to see readings on the frequency counter are within specifications. If the readings don't meet the specifications, check Pinch Roller Pressure (paragraph 5-3) and Tape Tension (paragraph 5-6).

### 5-7-2. "EXT" Speed

#### A. Check

1. Use jumper wires to connect pin 13 of the ACCESSORY 1 connector to GND, and connect an external oscillator to pins 7 (Hot, High) and 14 (Cold, Low).
2. Play the test tape and check the frequency counter reads 3000 Hz when a 9.6 kHz pulse signal is fed into the recorder from the external oscillator.
3. Adjust the oscillator so it provides a 30 % (approx.) increment/decrement in its output frequency, to check to see tape speed varies proportionally.

#### B. Adjustment

Locate resistor R52 on the Capstan Servo PCB (Figure 5-8) and adjust that resistor for correct readings on the frequency counter.

## 5-8. Fast Winding Speeds

### A. Check

1. Connect an oscilloscope between TP-1 and GND on the Control PCB (Figure 5-7).
2. Load a 10.5" reel tape, and run its mid point (approx.) to check that the TP-1 wave form shows 4.1 to 4.2 msec. cycle.

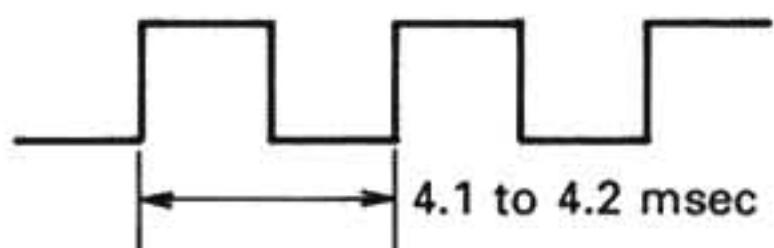

Figure 5-9. Fast Winding Speed Measurement

### B. Adjustment

Adjust resistor R94 located on the Control PCB (Figure 5-7).

## 5-9. Wow and Flutter

Wow and flutter are effectuated by a complex, mutual influence of the transport-related various mechanical parts.

1. Connect a wow/flutter meter to the OUTPUT connectors, and load a tape speed test tape.

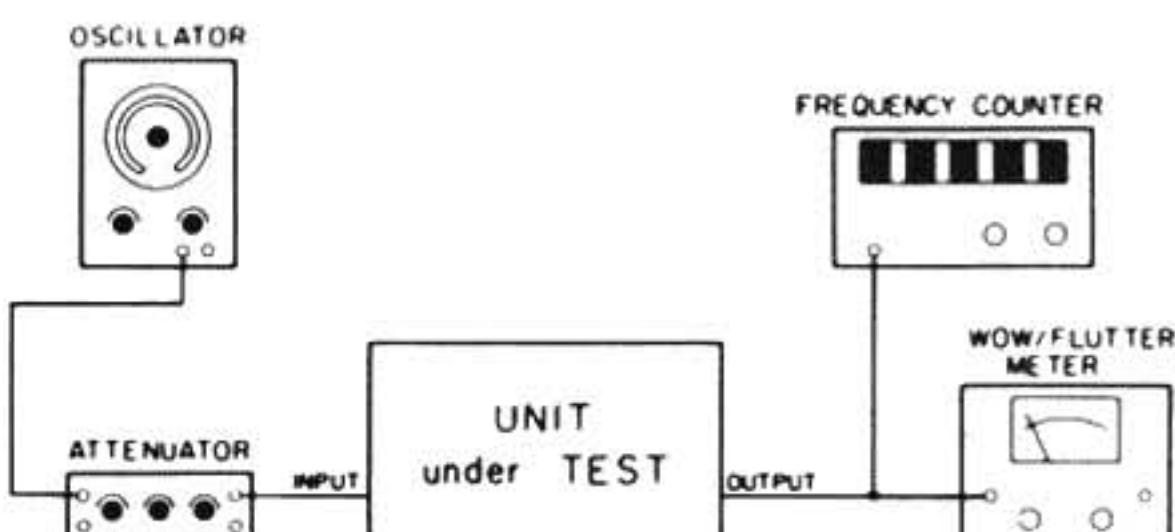

Figure 5-10. Wow/Flutter Test Connections

2. Make the following switch settings :

PITCH CONTROL to FIX ;  
Output Source Selector Switch to REPRO.

3. Run the tape in PLAY and read the wow/flutter meter both at the beginning and the end of the tape.

Specifications are as follows :

DIN/IEC/ANSI (PEAK), Weighted (2 σ)  
HIGH : +/-0.06%  
LOW : +/-0.09%

## 5-10. Tape Positioning, Check and Fine Adjustment

Tape positioning is influenced by various parts of these : head assembly, tension arm, pinch roller, capstan motor, etc.

The center of each head serves as the reference for correct tape running height.

Tape positioning is checked by running tape in PLAY, F.FWD and REW, to see the tape runs at the head center height, without rubbing against any tape guide edge. Proceed as follows :

### A. Check

1. Thoroughly clean the heads and tape path using a good cleaner.
2. Load a blank tape on the machine, run it in PLAY, and check the tape is running at the center height of each of the three heads (at the center of the core). Repeat the check in F.FWD and REW.
3. Check also the tape is running at the center of the left and right tension rollers.

### B. Fine Adjustment

Tension roller height is adjusted by first loosening the set screw with a hexagonal wrench then moving the tension roller in and out (see Figure 5-12).

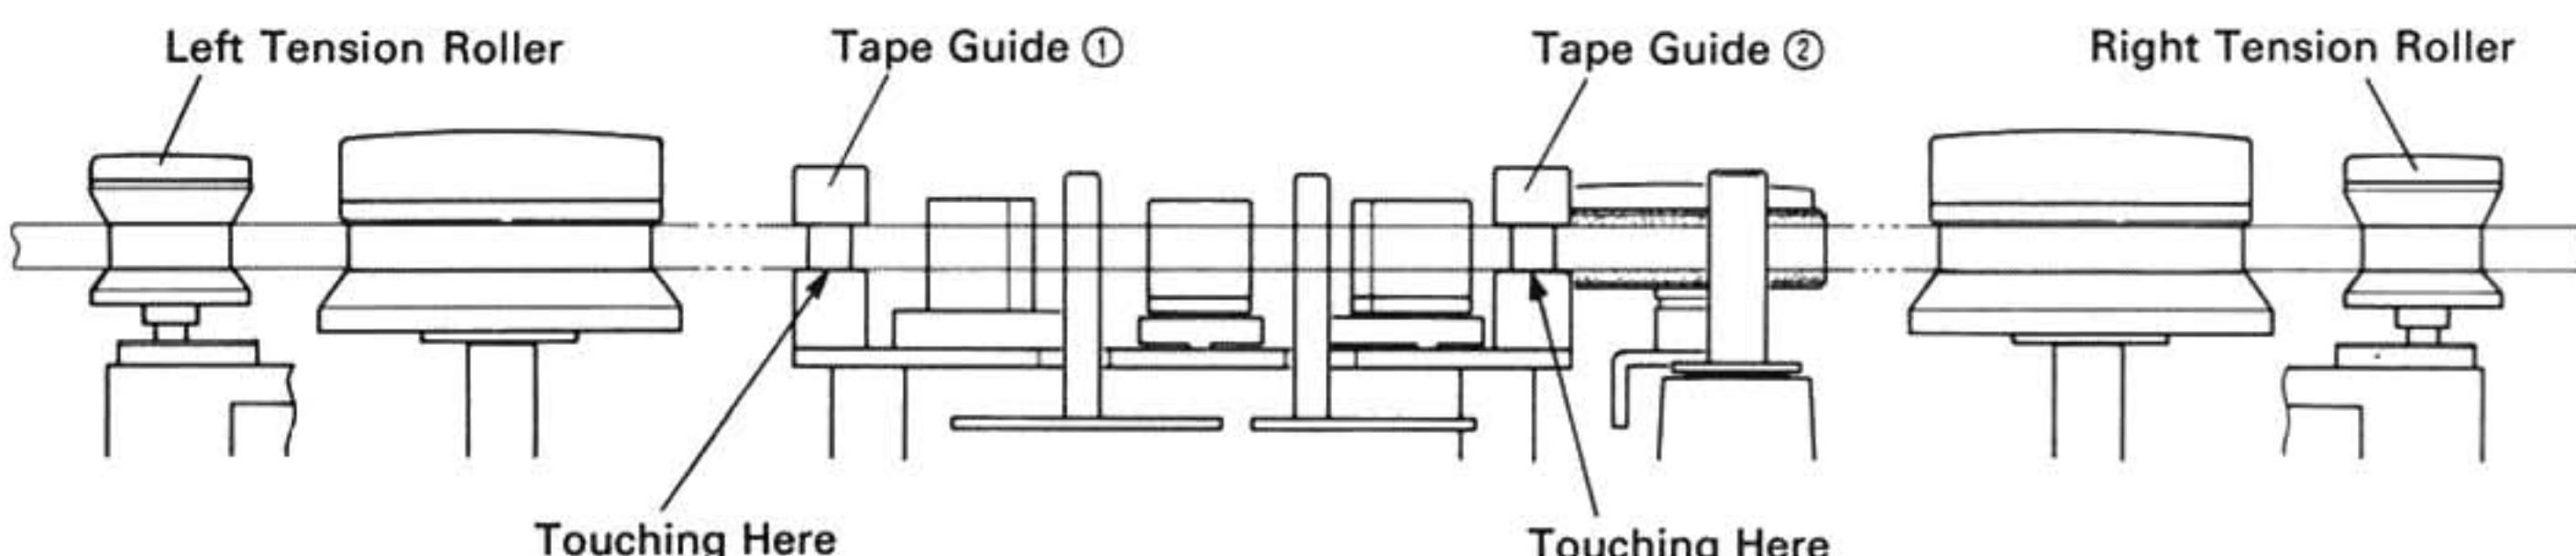

Figure 5-11. Tape Positioning

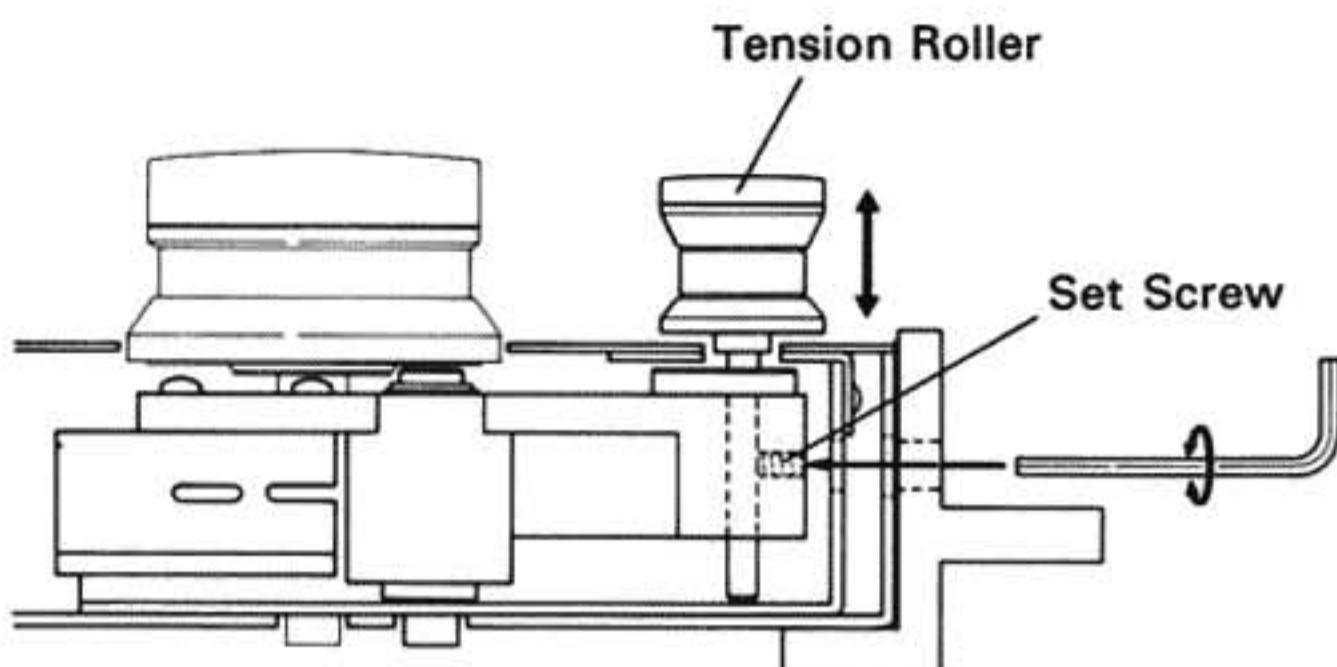

Figure 5-12. Tension Roller Height Adjustment

1. Run the tape in PLAY.
2. Refer to Figure 5-12 and adjust the height of the left and right tension rollers until the tape lower edge slightly contacts the lower flange of the tape guides "1" and "2" shown in Figure 5-11.  
Repeat adjustment by running the tape in F.FWD and REW as well.
3. After adjustments, retighten the lock screw.

**NOTE :** Tape running height adjustments significantly affect head-tape contact. After tape running height has been adjusted, be sure to recheck these : Head-to-tape contact, Head azimuth (see below).

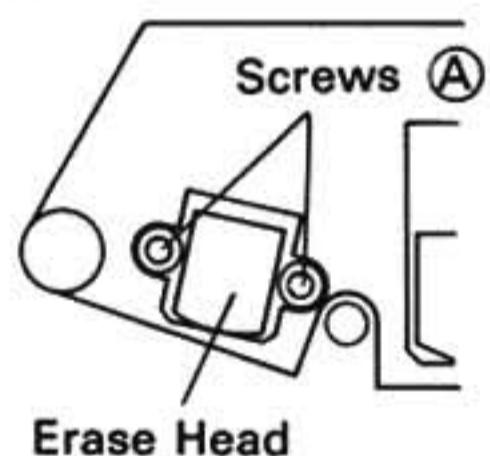

## 5-11. Head Alignment

### 5-11-1. Head-Tape Contact

#### A. Erase Head

The erase head requires only its tape contact adjustment and has no azimuth adjustment.

**BR-20N, D**

**BR-20T**

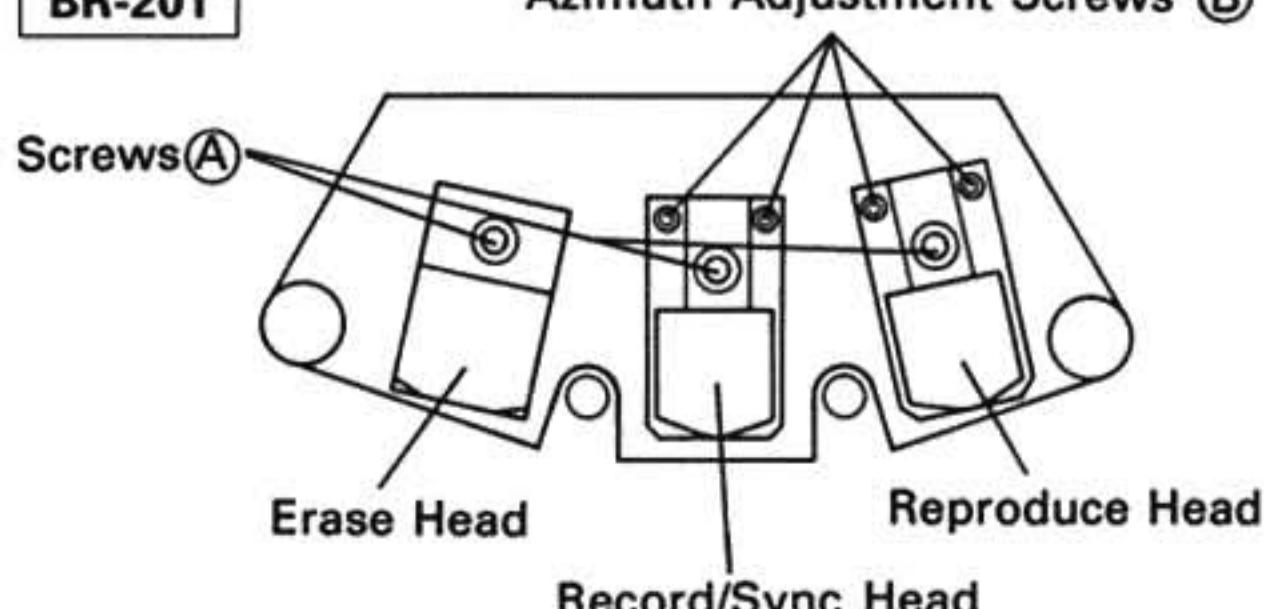

Figure 5-13. Head Adjustment Screws

The tape must contact the erase head so that the double gap is centered in the tape contact area. A poor tape contact appears as a poor erasure performance of the head.

If a poor tape contact is revealed (see 6-13, Erasure), perform the following :

1. While measuring erasure, run tape.
2. Loosen the "A" screw(s) shown in Figure 5-13, and, holding the upper area of the erase head, tilt left and right for best erasure, and retighten the "A" screw(s) to block the head where a maximum erasure is measured.
3. Recheck for best erasure.

**NOTE :** Erase head replacement entails the following re-adjustments :

- Bias tuning of all channels' R/P amplifiers.
- Record bias adjustment of all channels (this adjustment is not necessary for the gapless punch-in versions)

## B. Record and Sync Repro Heads

Both heads are the same in characteristics. Check and adjustments are performed by reproducing a high frequency recording on a test tape (16 kHz recording), with the Output Source Selector switch set to REPRO for the reproduce head check and adjustment, and to SYNC for the rec/sync head check and adjustment. The tracks' REC switches must be set to OFF.

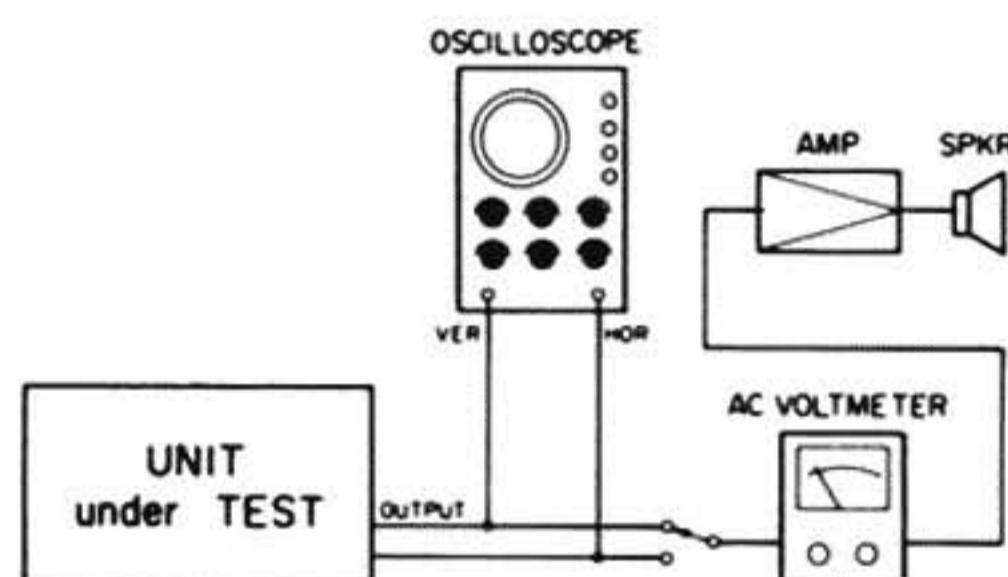

Figure 5-14. Head Alignment Test Connections

1. Connect an AC level meter to the OUTPUT connector of both channels as shown in Figure 5-14.
2. Load a frequency response test tape (YTT-1004) and reproduce its 16 kHz recording at HIGH speed.
3. Watching the output level of both channels, manually apply a slight back tension to the left reel.

If the head correctly contacts the tape, the output level must not vary when you push the reel. If the level readings increase, it shows a poor tape contact. Then, proceed to the following:

- Refer to Figure 5-13. Loosen tape contact adjustment screw "A" and azimuth adjustment screws "B" on the head being checked.
- Reproduce the test tape, and tilt left and right the head for highest output level, as in step 2 under paragraph 5-11-1 above.
- Block the head where best output level is read by retightening screw "A".
- After adjustment of head-tape contact, proceed to the following procedure to adjust azimuth.

**NOTE :** Be sure to perform head azimuth adjustment whenever tape contact is adjusted.

#### 5-11-2. Head Azimuth

There is no azimuth adjustment for the erase head ; adjustment is for the reproduce and the rec/sync head only.

Check and adjustments are done by reproducing a high frequency recording on the test tape (16 kHz recording). For the reproduce head, the Output Source Selector switch is to set to REPRO, and, for the rec/sync head, to SYNC. The track REC switches must be set to OFF.

- As shown in Figure 5-14, connect the channel 1 output to the vertical input of the oscilloscope, and the channel 2 output to the horizontal input of the scope. Also connect an AC level meter to measure the channels' output levels.
- Load a test tape on the machine, and reproduce the 400 Hz then the 16 kHz recording on the test tape at HIGH speed.  
While doing so perform the next step.
- Adjust the azimuth adjustment screws for a phase difference of 90 degrees or less between both channel outputs (refer to Figure 5-15) and, at the same time, for highest output level readings (from both channels).

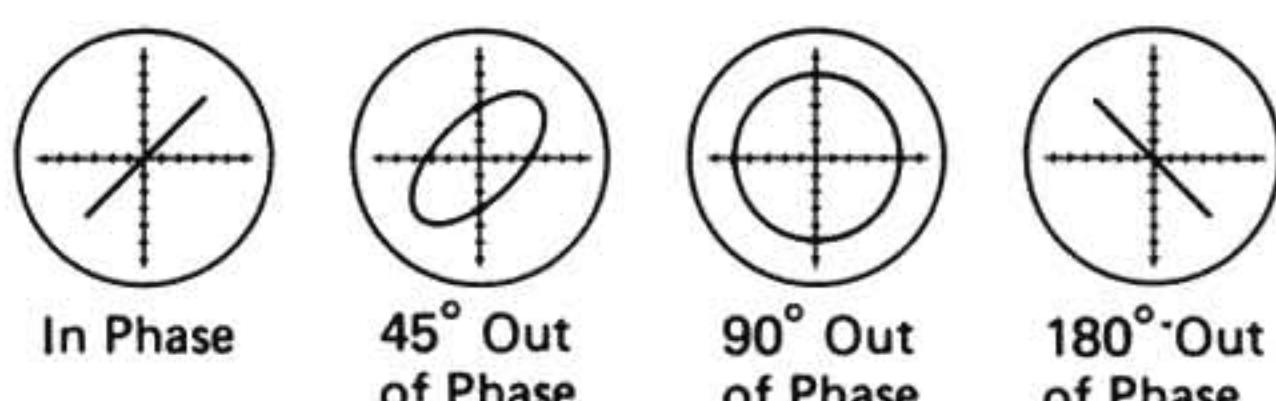

Figure 5-15. Phase Difference Between Both Channels

**NOTE :** If the vertical and horizontal input connections to the scope are reversed, the phase also is.

- To adjust the azimuth adjustment screws "B" shown in Figure 5-13, note the following;

Slightly loosen one of the "B" screws and tighten the other, inch by inch (in step 3 above), and when an optimum azimuth is obtained, tighten the two screws paying attention not to undo the adjustment as monitored by the scope.

## 6. AMPLIFIER CHECKS AND ADJUSTMENTS

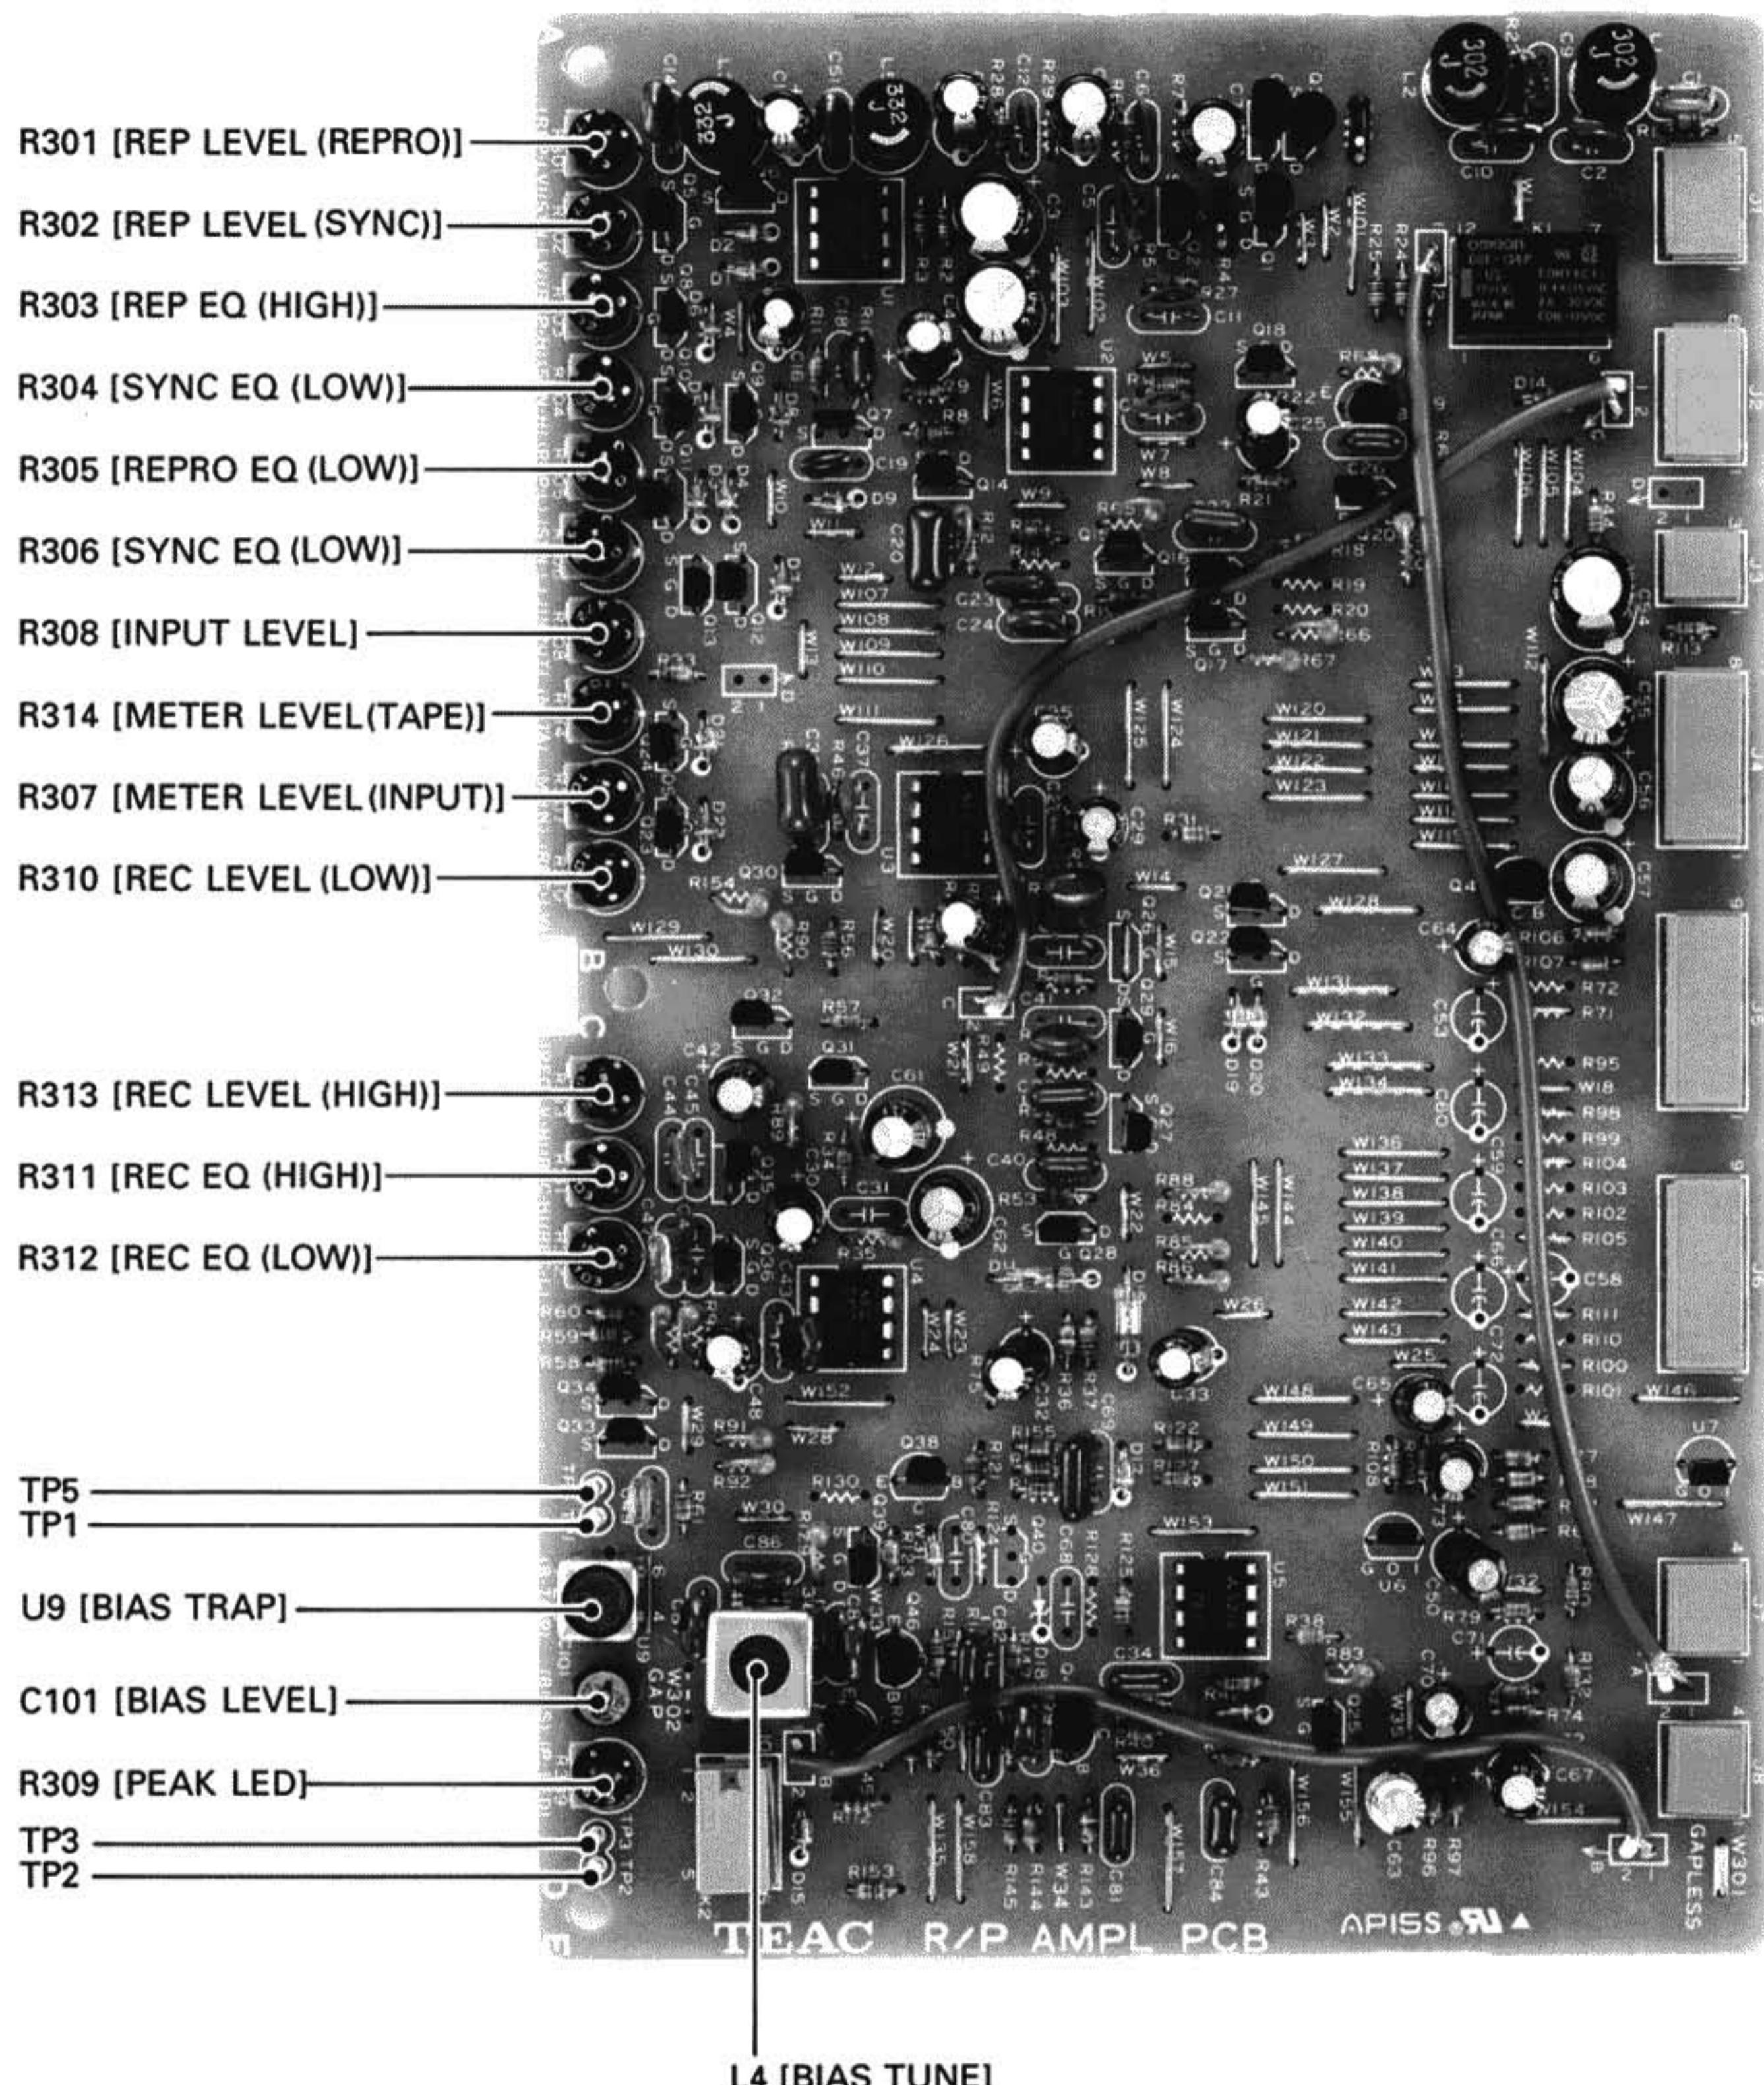

Figure 6-1. Amplifier Adjustments

## 6-1. Preliminary Notes

### 6-1-1. Nominal Input/Output Levels

In the following, we use the XLR type input and output connectors whose nominal output and input levels are +4 dBm (1.23 V).

The output level remains the same even if the XLR type input is made unbalanced, with a jumper wire connected between pin 1 (ground) and pin 2 (cold, low) or 3 (hot, high).

In addition, the RCA jacks has a nominal level of -10 dBV (0.3 V).

### 6-1-2. Level Controls

Although the input and output levels can be controlled by the INPUT and OUTPUT knobs, all checks and adjustments are made (unless otherwise noted) with the INPUT and OUTPUT CAL/UNCAL switches set to CAL.

### 6-1-3. Others

- Perform each check (and adjustment if necessary) for channel 1 first; then repeat the procedure for channel 2.
- Be sure to turn power off when replacing the REC/REPRO PCB assembly or any other electrical parts.

## 6-2. Input Level

Adjustment is made for nominal output level when nominal input signal is fed into the INPUT connectors.

### A. Check

1. Connect test equipment as shown in Figure 6-2.

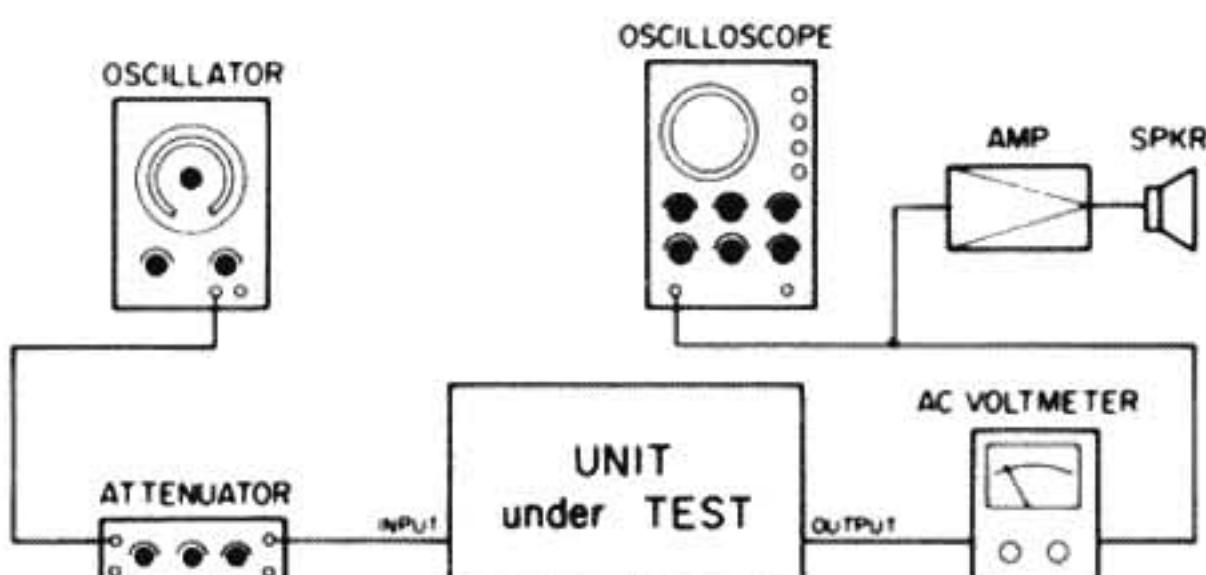

Figure 6-2. Level and Frequency Response Test Connections

2. Connect a 1 kHz, +4 dBm (1.23 V) signal to the INPUT XLR type connectors.
3. Set the Output Source Selector switch to INPUT.
4. Check for +4 dBm (1.23 V) at the OUTPUT connectors. If necessary, proceed to the next step.

### B. Adjustment

Adjust resistor R308 for +4 dBm output.

### 6-3. VU Meters

The VU meters must read "0 VU" when fed with the nominal level input (6-2 above) and with the nominal level output (6-5 below).

### A. Check

1. When the nominal input level of +4 dBm (step 4, paragraph 6-2 above) is coming into the machine, check to see the VU meters read "0 VU".
2. Check to see the VU meters read "0 VU" when a reference test tape is reproduced (step 3, paragraph 6-5 below).

**NOTE :** When the test tape YTT-1003 (7-1/2 inch/s, 185 nWb/m) is used — ;

The reading must be :

- 2.6 VU for the REF LEVEL of 250 nWb/m.
- 3.9 VU for the REF LEVEL of 320 nWb/m.

### B. Adjustment

Adjust the following resistors :

R307 for the input level reading  
R314 for the output level reading.

## 6-4. Peak LED

The peak LED is designed to light up at +12 VU for 250 nWb/m and at +10 VU for 320 nWb/m.

### A. Check

With the same conditions as in paragraph 6-2 above, switch the REF LEVEL to LOW, and check the peak LED lights when the input level is increased until the VU meters read the values specified above and turns off when decreased by 1 dB.

### B. Adjustment

Use resistor R309.

## 6-5. Reproduce Level

Reproduce level is checked by reproducing a reference record level NAB 250 nWb/m or 320 nWb/m.

### A. Check

1. Connect an AC level meter and an oscilloscope to the rear OUTPUT XLR type connectors.
2. Make the following switch settings :

INPUT and OUTPUT CAL/UNCAL Switches to CAL;

Output Source Selector Switch to REPRO;  
REF LEVEL Switch to LOW;  
SPEED switch to LOW;  
EQ switch to NAB.

- Reproduce the reference level recording on the test tape and check for nominal output level reading.

**NOTE :** When the test tape YTT-1003 (7-1/2 inch/s, 185 nWb/m) is used — ;

- The output level drops by 2.6 dB from the nominal level (+4 dBm) when REF LEVEL is at 250 nWb/m.
- The output level drops by 3.9 dB from the nominal level (+4 dBm) when REF LEVEL is at 320 nWb/m.

- Set the Output Source Selector switch to SYNC, and repeat the above procedure.

#### B. Adjustment

Use the following resistors :

R301 for REPRO  
R302 for SYNC

#### 6-6. Reproduce Frequency Response

##### A. Check

##### At HIGH tape speed

- Make the following switch settings :

INPUT and OUTPUT CALUNCAL switches to CAL;  
Output Source Selector Switch to REPRO;  
SPEED switch to HIGH;  
EQ switch to NAB, IEC.

- Reproduce the test tape, and check the output level readings meet specifications for each of the frequencies specified in Figure 6-3.

HIGH Speed (15ips.)  
LOW Speed (7-1/2ips.)

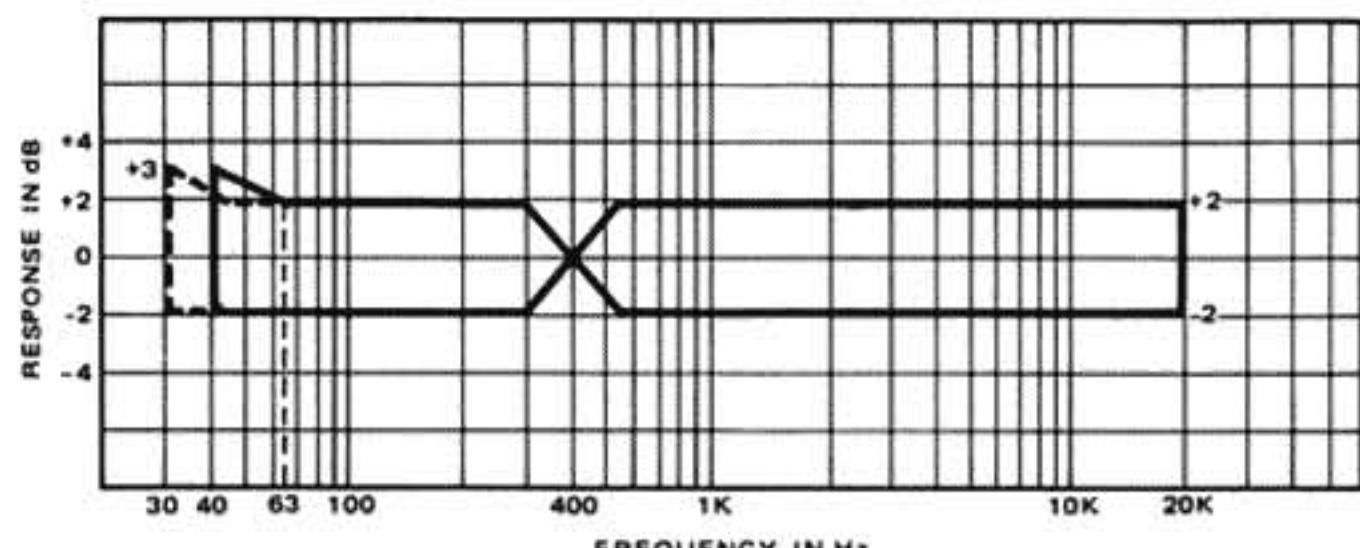

Figure 6-3. Reproduce Frequency Response

Output level from the 400 Hz recording serves as the reference. (See Figure 6-3 for specifications.)

**NOTE :** Use the test tape YTT-1004 (15 inch/s) when the EQ switch is set to NAB ; and the test tape YTT-1064 (15 inch/s) when the EQ switch is set to IEC.

- Switch the output source selector from REPRO to SYNC, and repeat step 2. Specifications are the same as in step 2.

##### At LOW tape speed

- Switch the SPEED switch from HIGH to LOW.
- Reproduce the test tape, and check the output level readings are within specifications. See Figure 6-3 for specifications.

**NOTE :** Use test tape YTT-1003 (7-1/2 inch/s) when the EQ switch is set to NAB ; and YTT-1063 (7-1/2 inch/s) when the EQ is at IEC.

- Switch the output source selector switch from REPRO to SYNC, and read the output levels as in step 5 above. Specifications are the same as in step 5.

#### B. Adjustment

Tape Speed	Adjustment REPRO SYNC		Adjust so that :
HIGH	R303	R304	Level at 16 kHz becomes the same as at 400 Hz.
LOW	R305	R306	Level at 16 kHz becomes the same as at 400 Hz.

If specifications are not met, check the following :

- Cleanness of the heads, correct head-tape contact
- If only either channel is out of specs, replace or repair the REC/REPRO AMP PCB of that channel.
- If both channels are out of specs, check the aging of the test tape being used, the correct power connection, etc.
- As a final measure, replace the head assembly.

#### 6-7. Bias Tuning and Bias Trap Adjustment

Bias tuning refers to a tuning of the bias driver amplifier against the master bias signal.

Bias trap refers to a trap adjustment of the bias signal in the record amplifier.

Bias tuning and bias trap adjustment have correctly been achieved before shipment, and are necessary to be repeated only when the following are replaced :

- REC/SYNC head, or ERASE head
- Bias oscillator

### 6-7-1. Bias Tuning (L4)

#### Preliminary Notes :

- In the following, don't allow the voltmeter to show maximum reading, which overloads the bias drive amplifier, causing damage to it.
  - Use a non-inductive screwdriver (plastic or wooden).
- Connect a DC voltmeter between TP-3 (HOT) and TP-2 (COLD) on the R/P AMP PCB.
  - Engage the REC enable switch of both channels and put the transport into Record mode.
  - Adjust L4 for minimum reading on the voltmeter. Reading you could achieve must be about 0.2 V.
  - (For the gapless punch-in models only) Connect the DC voltmeter between TP-1 (CH 1)/TP-2 (CH 2) on the AMP CONT PCB (Figure 6-4) and TP-2 on the R/P AMP PCB.  
Then, adjust L101 (CH 1)/L201 (CH 2) for minimum reading on the voltmeter.

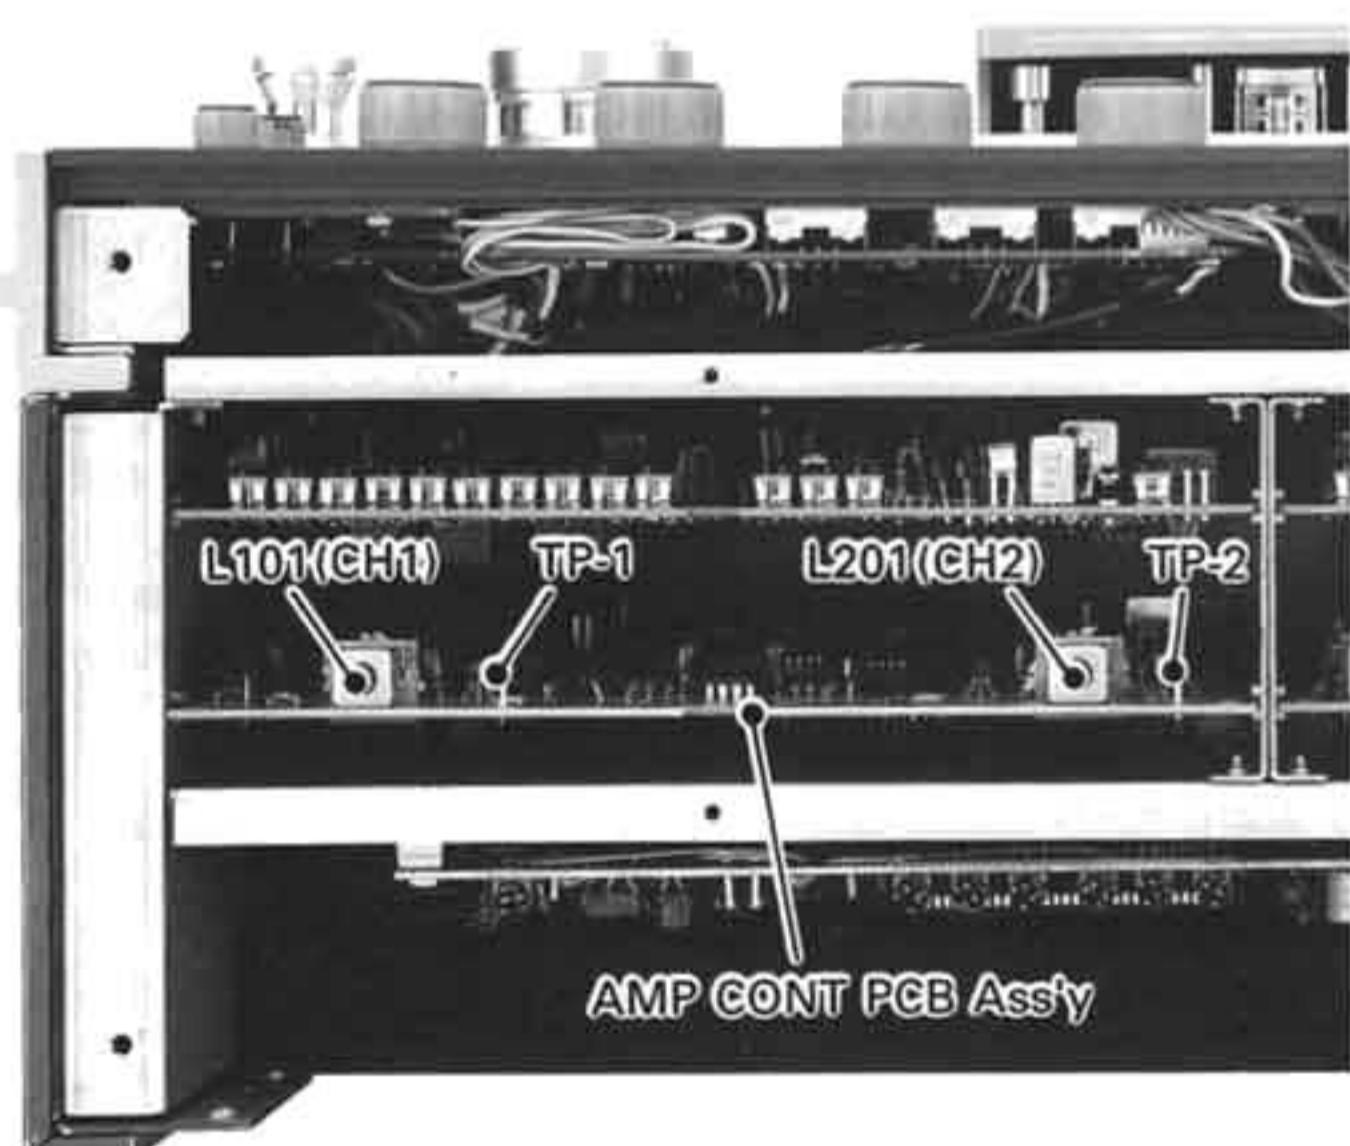

Figure 6-4. Test Points on AMP CONT PCB

### 6-7-2. Bias Trap Adjustment (U9)

- Connect an AC level meter between TP-1 and TP-5 (GND) on the R/P AMP PCB of the channel to be tested.
- Make the following switch settings :  
Track REC switch to ON (both channels); UNCAL/CAL switch to CAL (both INPUT and OUTPUT).
- Put the transport into Record mode.

- Increase the sensitivity of the AC level meter and adjust the trap coil U9 of the channel being tested for minimum reading on the level meter.

### 6-8. Record Bias

Record bias *must* be adjusted after the bias tuning and bias trap adjustment (see above).

Perform the following procedure when —

- It is necessary to fine adjust record bias to suit the type of tape being used for actual recording.
- The following have been replaced :

REC/SYNC head or ERASE head

Rec/repro amplifier, bias drive amplifier, master bias unit

When performing record bias adjustment, understand this : record bias has a significant effect on the high frequency response and distortion, and on the record level too.

Adjustment is done for 6.5–7.5 dB below the peak level at 10 kHz to ensure minimum distortion and optimum output level.

- Connect test equipment to the inputs and outputs of the machine as shown in Figure 6-2.
- Make the following switch settings :  
CAL/UNCAL switch to CAL (both INPUT and OUTPUT); Monitor Source Selector switch to REPRO; SPEED switch to LOW; Track REC switch to ON (both channels).
- Apply a 10 kHz, -6 dBm (388 mV, -10 VU) input signal and start recording it on a blank tape.
- While the recording is taking place, perform the following :

Refer to Figure 6-5. Slowly turn trim capacitor C101 clockwise until the level on the AC level meter connected to the outputs rises to a peak. Two peaks may be observable. When the second peak occurs, continue rotating C101 in a clockwise direction until reading decreases by 6.5–7.5 dB from the second peak level.

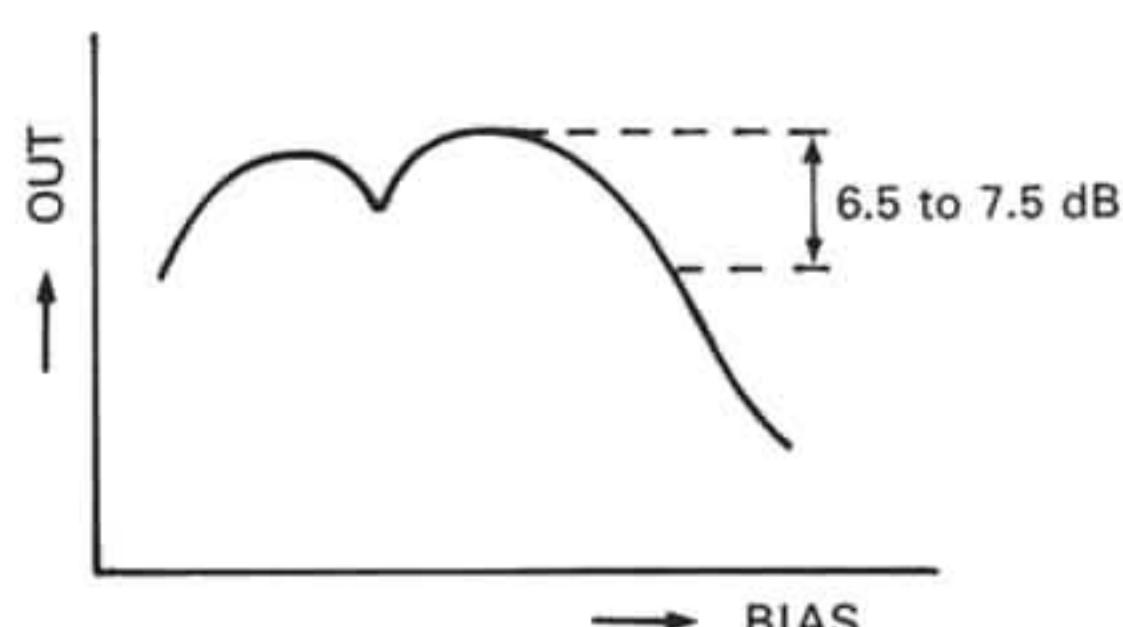

Figure 6-5. Bias Setting Adjustment

## 6-9. Record Level

Record level is adjusted so the nominal input level of +4 dBm causes the VU meters to read "0 VU."

The following procedure must be performed AFTER these have been adjusted : Reproduce level, Reproduce Frequency Response, Bias Tuning, Bias Trap, and Record Bias.

### A. Check

1. Connect test equipment to the inputs and outputs of the machine as shown in Figure 6-2.

2. Make the following switch settings :

UNCAL/CAL switch to CAL (both INPUT and OUTPUT);

Monitor Source Selector switch to REPRO;

SPEED switch to LOW;

Track REC switch to ON (both channels).

3. Apply a 1 kHz, +4 dBm (1.23 V) signal to the inputs and record it on a blank tape.

4. While the recording is taking place, check to see the AC level meter reads +4 dBm and the VU meters read 0 VU.

5. Similarly, set SPEED to HIGH and repeat the check.

### B. Adjustment

**NOTE :** Adjustment must first be done at LOW, then at HIGH.

Adjust resistors R310 (for LOW SPEED) and R313 (for HIGH SPEED).

As for the VU meter adjustment, see paragraph 6-3.

## 6-10. Overall Frequency Response

Overall frequency response affects the record bias and must be rechecked if bias adjustments (paragraphs 6-7, and 6-8) are performed.

### A. Check

1. Connect test equipment as shown in Figure 6-2.

#### At HIGH SPEED

2. Apply a +4 dBm (1.23 V, 0 VU) signal to the XLR type INPUT of the channel being tested.

3. Make the following switch settings :

REF LEVEL switch to LOW;

UNCAL/CAL switch to CAL (both INPUT and OUTPUT);

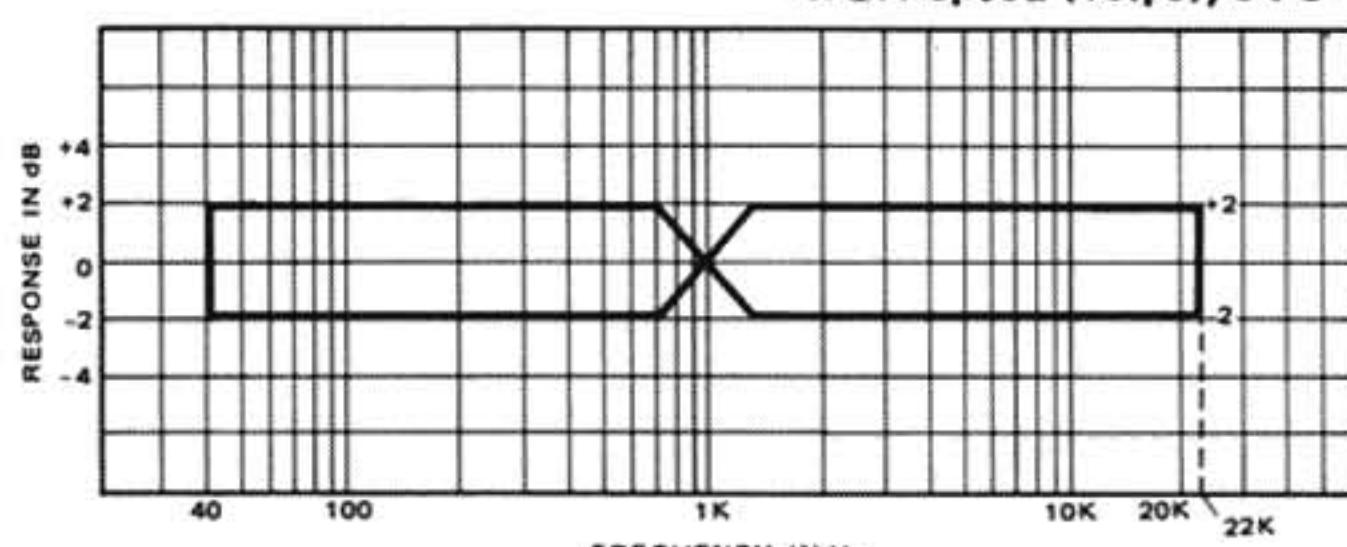

Monitor Source Selector switch to REPRO;

SPEED switch to HIGH;

Track REC switch to ON (both channels).

4. Load a blank tape, enter Record mode and sweep the input signal frequency over the range 40 Hz to 22 kHz. While doing so, watch the voltmeter and check that the frequency response is within the tolerance specified in Figure 6-6.

HIGH Speed (15ips), 0VU

LOW Speed (7-1/2ips), -10VU

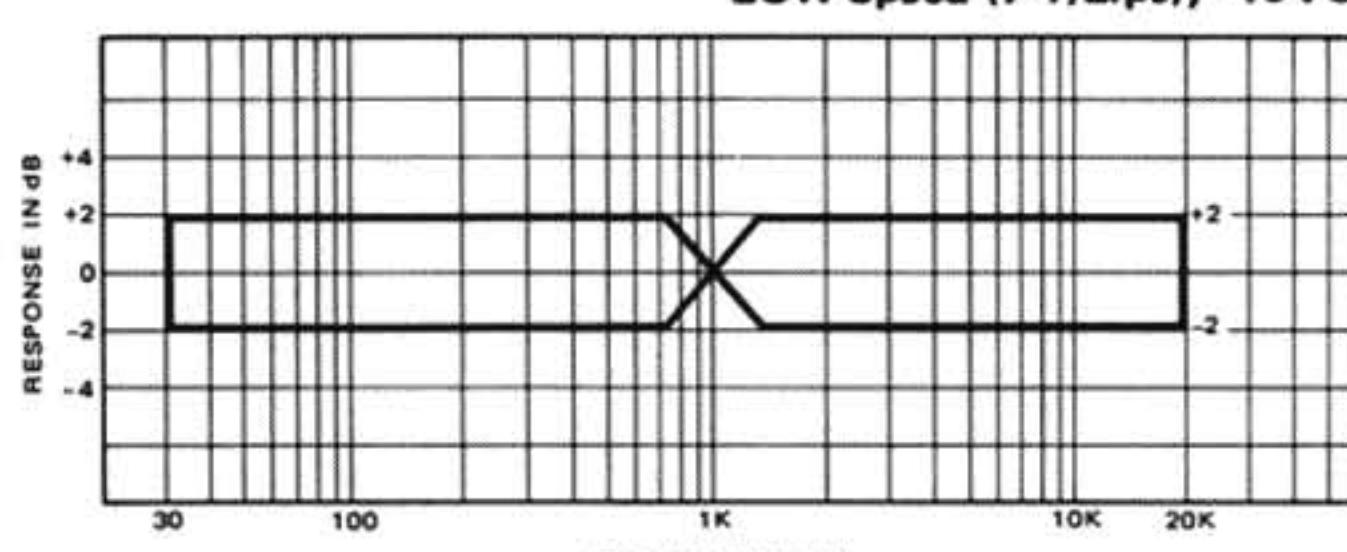

Figure 6-6. Overall Frequency Response

5. In a similar way, check frequency response for Sync Reproduce ; set the Monitor Source to SYNC and play the recording again from the beginning.

#### At LOW SPEED

6. Change the input signal level to -6 dBm (388 mV, -10 VU).

7. Set the SPEED switch to LOW.

8. Put the deck into record mode and sweep the input signal frequency over the range 30 Hz to 20 kHz. Rewind the tape, play the recording, watch the voltmeter and check that the frequency response is within the tolerance specified in Figure 6-6.

9. Repeat check with the Monitor Source switch set to SYNC.

### B. Adjustment

If adjustment is necessary, proceed as follows :

1. Record bias check

Is record bias set as specified under paragraph 6-8? If it is, adjust the record equalizer as follows:

2. Record equalizer adjustment

#### At HIGH SPEED :

While recording a  $-6$  dBm ( $388$  mV,  $-10$  VU),  $22$  kHz signal, adjust R311 for the same output level as at  $1$  kHz.

After adjustment, repeat check A above.

#### At LOW SPEED :

While recording a  $-16$  dBm ( $123$  mV,  $-20$  VU),  $20$  kHz, adjust R312 for the same level as at  $1$  kHz.

After adjustment, repeat check A above.

#### **6-11. Overall Distortion**

Overall distortion is checked by recording a nominal level signal and reproducing it. Use an oscillator whose distortion is less than  $0.1\%$ .

1. Connect test equipment as shown in Figure 6-7 to the inputs and outputs of the machine.

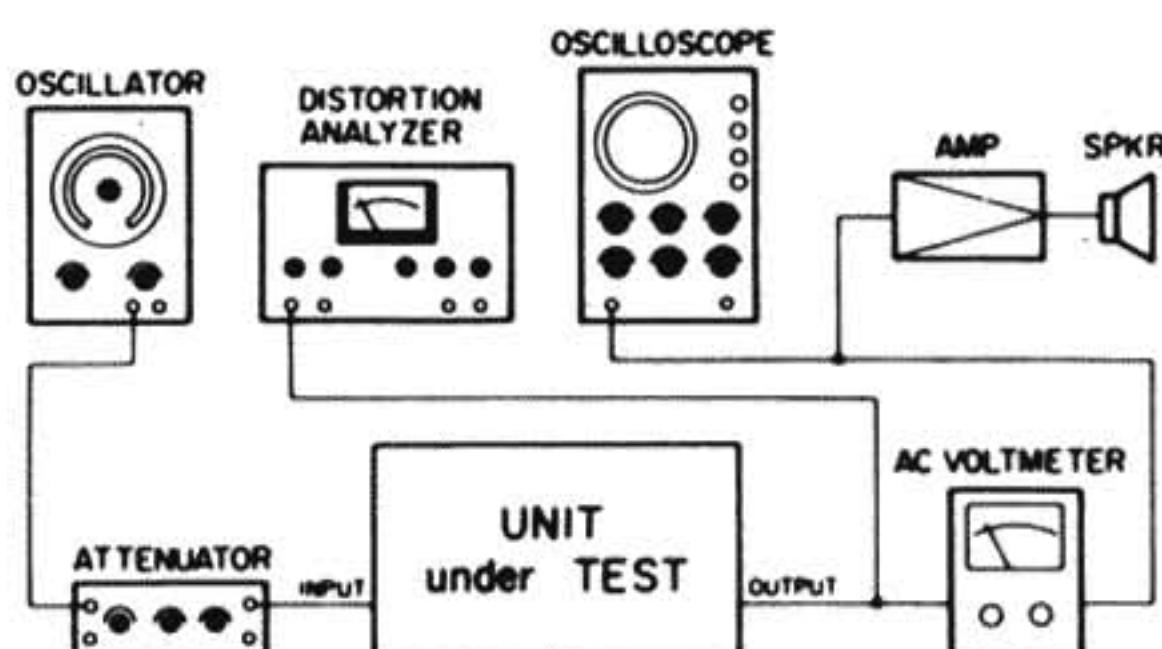

Figure 6-7. Distortion Test Connections

2. Connect a  $1$  kHz,  $-6$  dBm ( $1.23$  V) signal to the XLR type INPUT connector to be checked.

3. Make the following switch settings :

UNCAL/CAL switch to CAL (both INPUT and OUTPUT);

Monitor Source Selector switch to REPRO;

SPEED switch to HIGH;

Track REC switch to ON.

4. Record the input signal on a blank tape.

5. Rewind the tape, play the recording and read the output on the distortion meter. Distortion should be  $0.8\%$  or less.

6. Set the SPEED switch to LOW and repeat the above procedure to check for distortion of  $0.8\%$  or less as at HIGH speed.

7. If distortion does not meet specifications, proceed as follows :

- If only either channel is out of specs, check -

1. Record bias, and
2. Rec/repro amplifier

- If both channels are out of specs, perform the following :

1. Head demagnetization, and
2. +B power supply check

- As a final measure, replace the record head.

#### **6-12. Overall Signal-To-Noise Ratio**

Signal-to-noise ratio is checked by recording the nominal level signal of  $4$  dBm,  $1$  kHz and reproducing the recording to read the output level. This reading serves as a reference with which is compared the output level read when a no-signal recording is played back.

**NOTE :** Before performing the following procedure, be sure to demagnetize the entire tape path.

1. Connect test equipment to the inputs and outputs of the machine as shown in Figure 6-2.

Insert a  $20$  Hz- $20$  kHz band pass filter between the XLR type OUTPUT connector under test and the AC level meter.

2. Make the following switch settings :

UNCAL/CAL switch to CAL (both INPUT and OUTPUT);

Monitor Source Selector switch to REPRO;

SPEED switch to HIGH;

Track REC switch to ON.

3. Record the nominal signal of  $1$  kHz,  $+4$  dBm ( $1.23$  V), then, switch the INPUT UNCAL/CAL switch to UNCAL, turn the INPUT level control all the way to the left (to minimum), and record again.

4. Rewind the tape to the beginning of the recording, play the tape and read on the AC level meter the output level of both the "signal" and "no-signal" recordings. The level difference between the two recordings should be  $50$  dB or more.

5. Set the SPEED switch to LOW and repeat procedure to check for signal-to-noise ratio of  $50$  dB or more as at HIGH speed.

6. If adjustment is necessary, proceed as follows :

- If only either channel is out of specs, check (and adjust if necessary) the following :

- Record equalizer
- Repro equalizer

- If both channels are out of specs, check the following:

- +B power supply
- Head demagnetization
- Erasure

- If there is no problem in the machine, use a new blank tape to measure again signal-to-noise.

### 6-13. Erasure

The tape used for this test should be bulk erased. Any residual signal may affect the measurement.

1. Connect test equipment to the input and output of the channel being tested as shown in Figure 6-8.

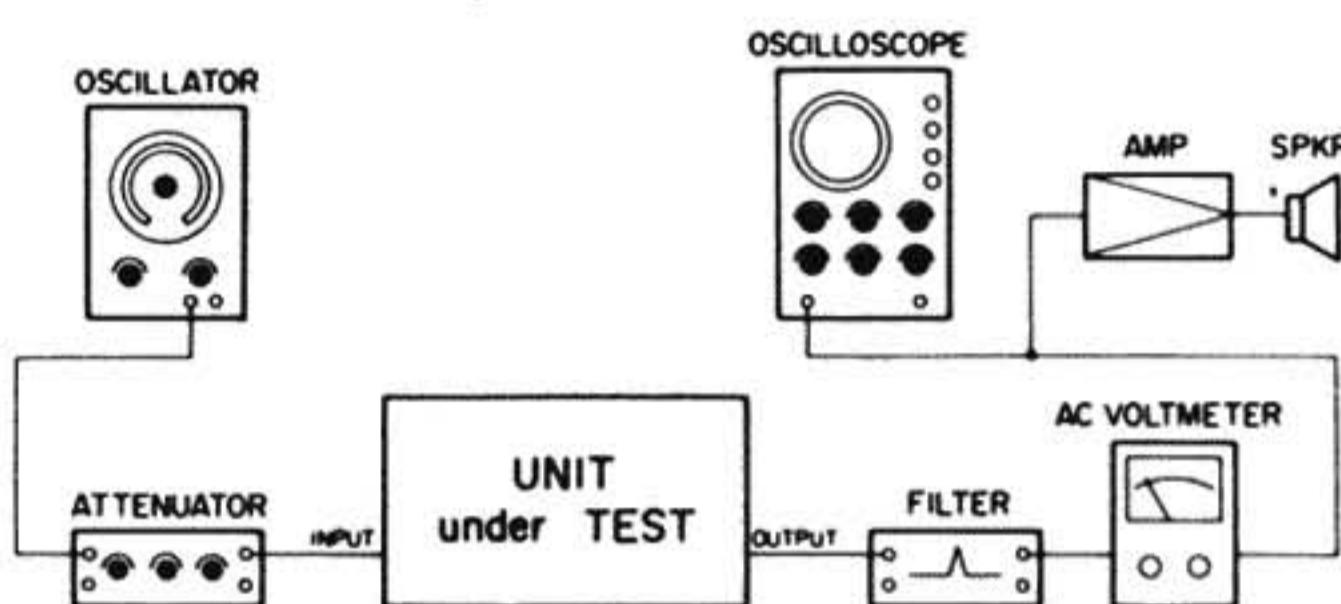

Figure 6-8. Erasure Test Connections

Insert a 1 kHz band pass filter between the OUTPUT connector and the AC level meter.

2. Make the following switch settings :

REF LEVEL switch to LOW;  
UNCAL/CAL switch to CAL (both INPUT and OUTPUT);  
Monitor Source Selector switch to REPRO;  
Track REC switch to ON (only the switch of the channel under test).

3. Record a 1 kHz, +14 dBm (3.88 V) (i.e., 10 dB higher than the nominal +4 dBm).
4. Disconnect the oscillator.
5. Rewind the tape to about half way through the recorded portion of the tape, and enter again Record mode to erase the tape by recording through the previously recorded section with no input signal.
6. Rewind the tape all the way back to the beginning of the recording, and play the tape to compare the level on the AC level meter from the original 1 kHz signal recording with the level from the "no-signal" recording. The level difference should be 70 dB or more.
7. If adjustment is necessary, perform the following :

- Clean the erase head
- Check the erase head alignment
- Check bias tuning

### 6-14. Headphones Output Level

1. Connect to the PHONES jack an 8-ohm load, AC level meter, and oscilloscope.
2. Set the Monitor Source Selector switch to INPUT and apply a 1 kHz, +4 dBm (1.23 V) signal to both CH 1 and CH 2 INPUTS.
3. Turn the headphone level control to maximum, and check the AC level meter reads 1.2 V +/-2dB.

### 6-15. Crosstalk

1. Connect an oscillator to the INPUT of the channel which is not under test, and connect a 1 kHz band filter and AC level meter to the OUTPUT of the channel under test.

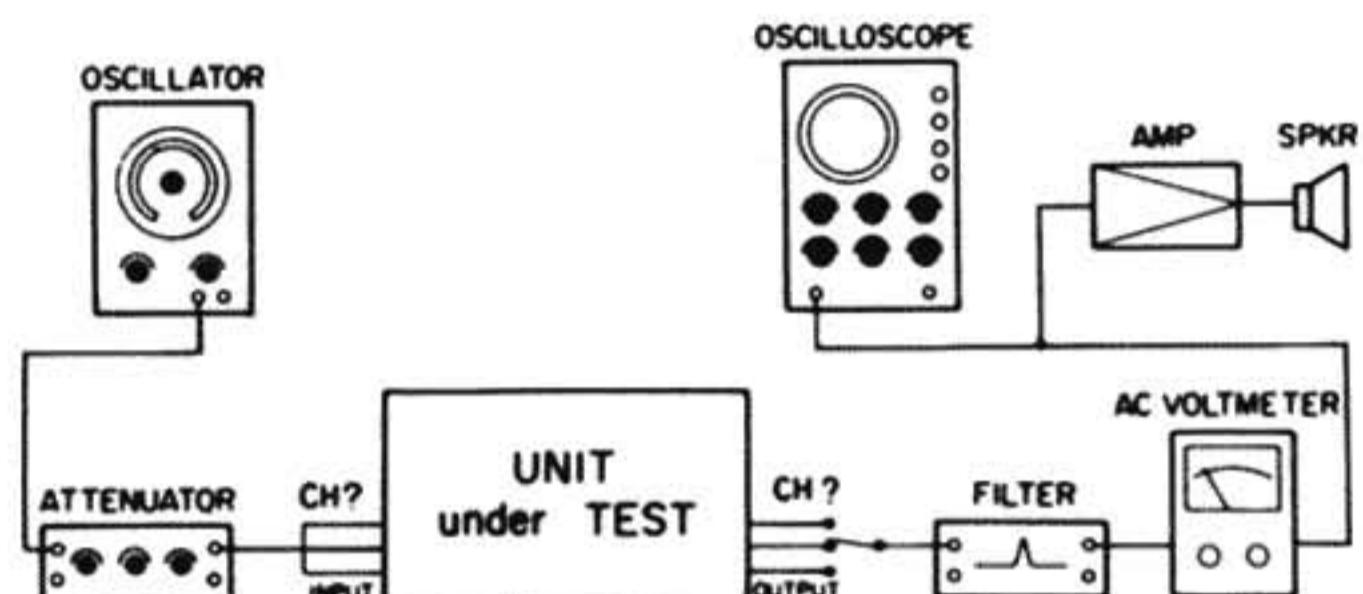

Figure 6-9. Crosstalk Test Connections

2. Load a blank tape on the machine, and make the following switch settings :

Monitor Source Selector switch to REPRO;  
Track REC switch to ON (both CH 1 and CH 2).

3. Apply the nominal 1 kHz, +4 dBm (1.23 V) signal to the INPUT for the channel adjacent to the channel being tested and put the machine into Record mode. Rewind the tape and play the recording.
4. Measure the output of the channel being tested to get a level reference, then measure the output of the channel through which "no signal" was recorded.

The difference between the two channels should be 60 dB or greater on NAB and TC models and 55 dB or greater on DIN models.

5. Rewind again the tape to the beginning of the recording.
6. Switch the monitor source from REPRO to SYNC.
7. Play the tape, and measure the output of both channels as in step 4 above.

The difference between the two channels should be 60 dB or greater on NAB and TC models and 55 dB or greater on DIN models.

## 6-16. Time Code Channel Adjustments (BR-20T only)

The following adjustments have been achieved before shipment and need to be performed only when — ;

- Rec/sync and/or Record heads are replaced.
- Time code amplifier is replaced.
- An error occurred in the time code recording and/or reproducing.

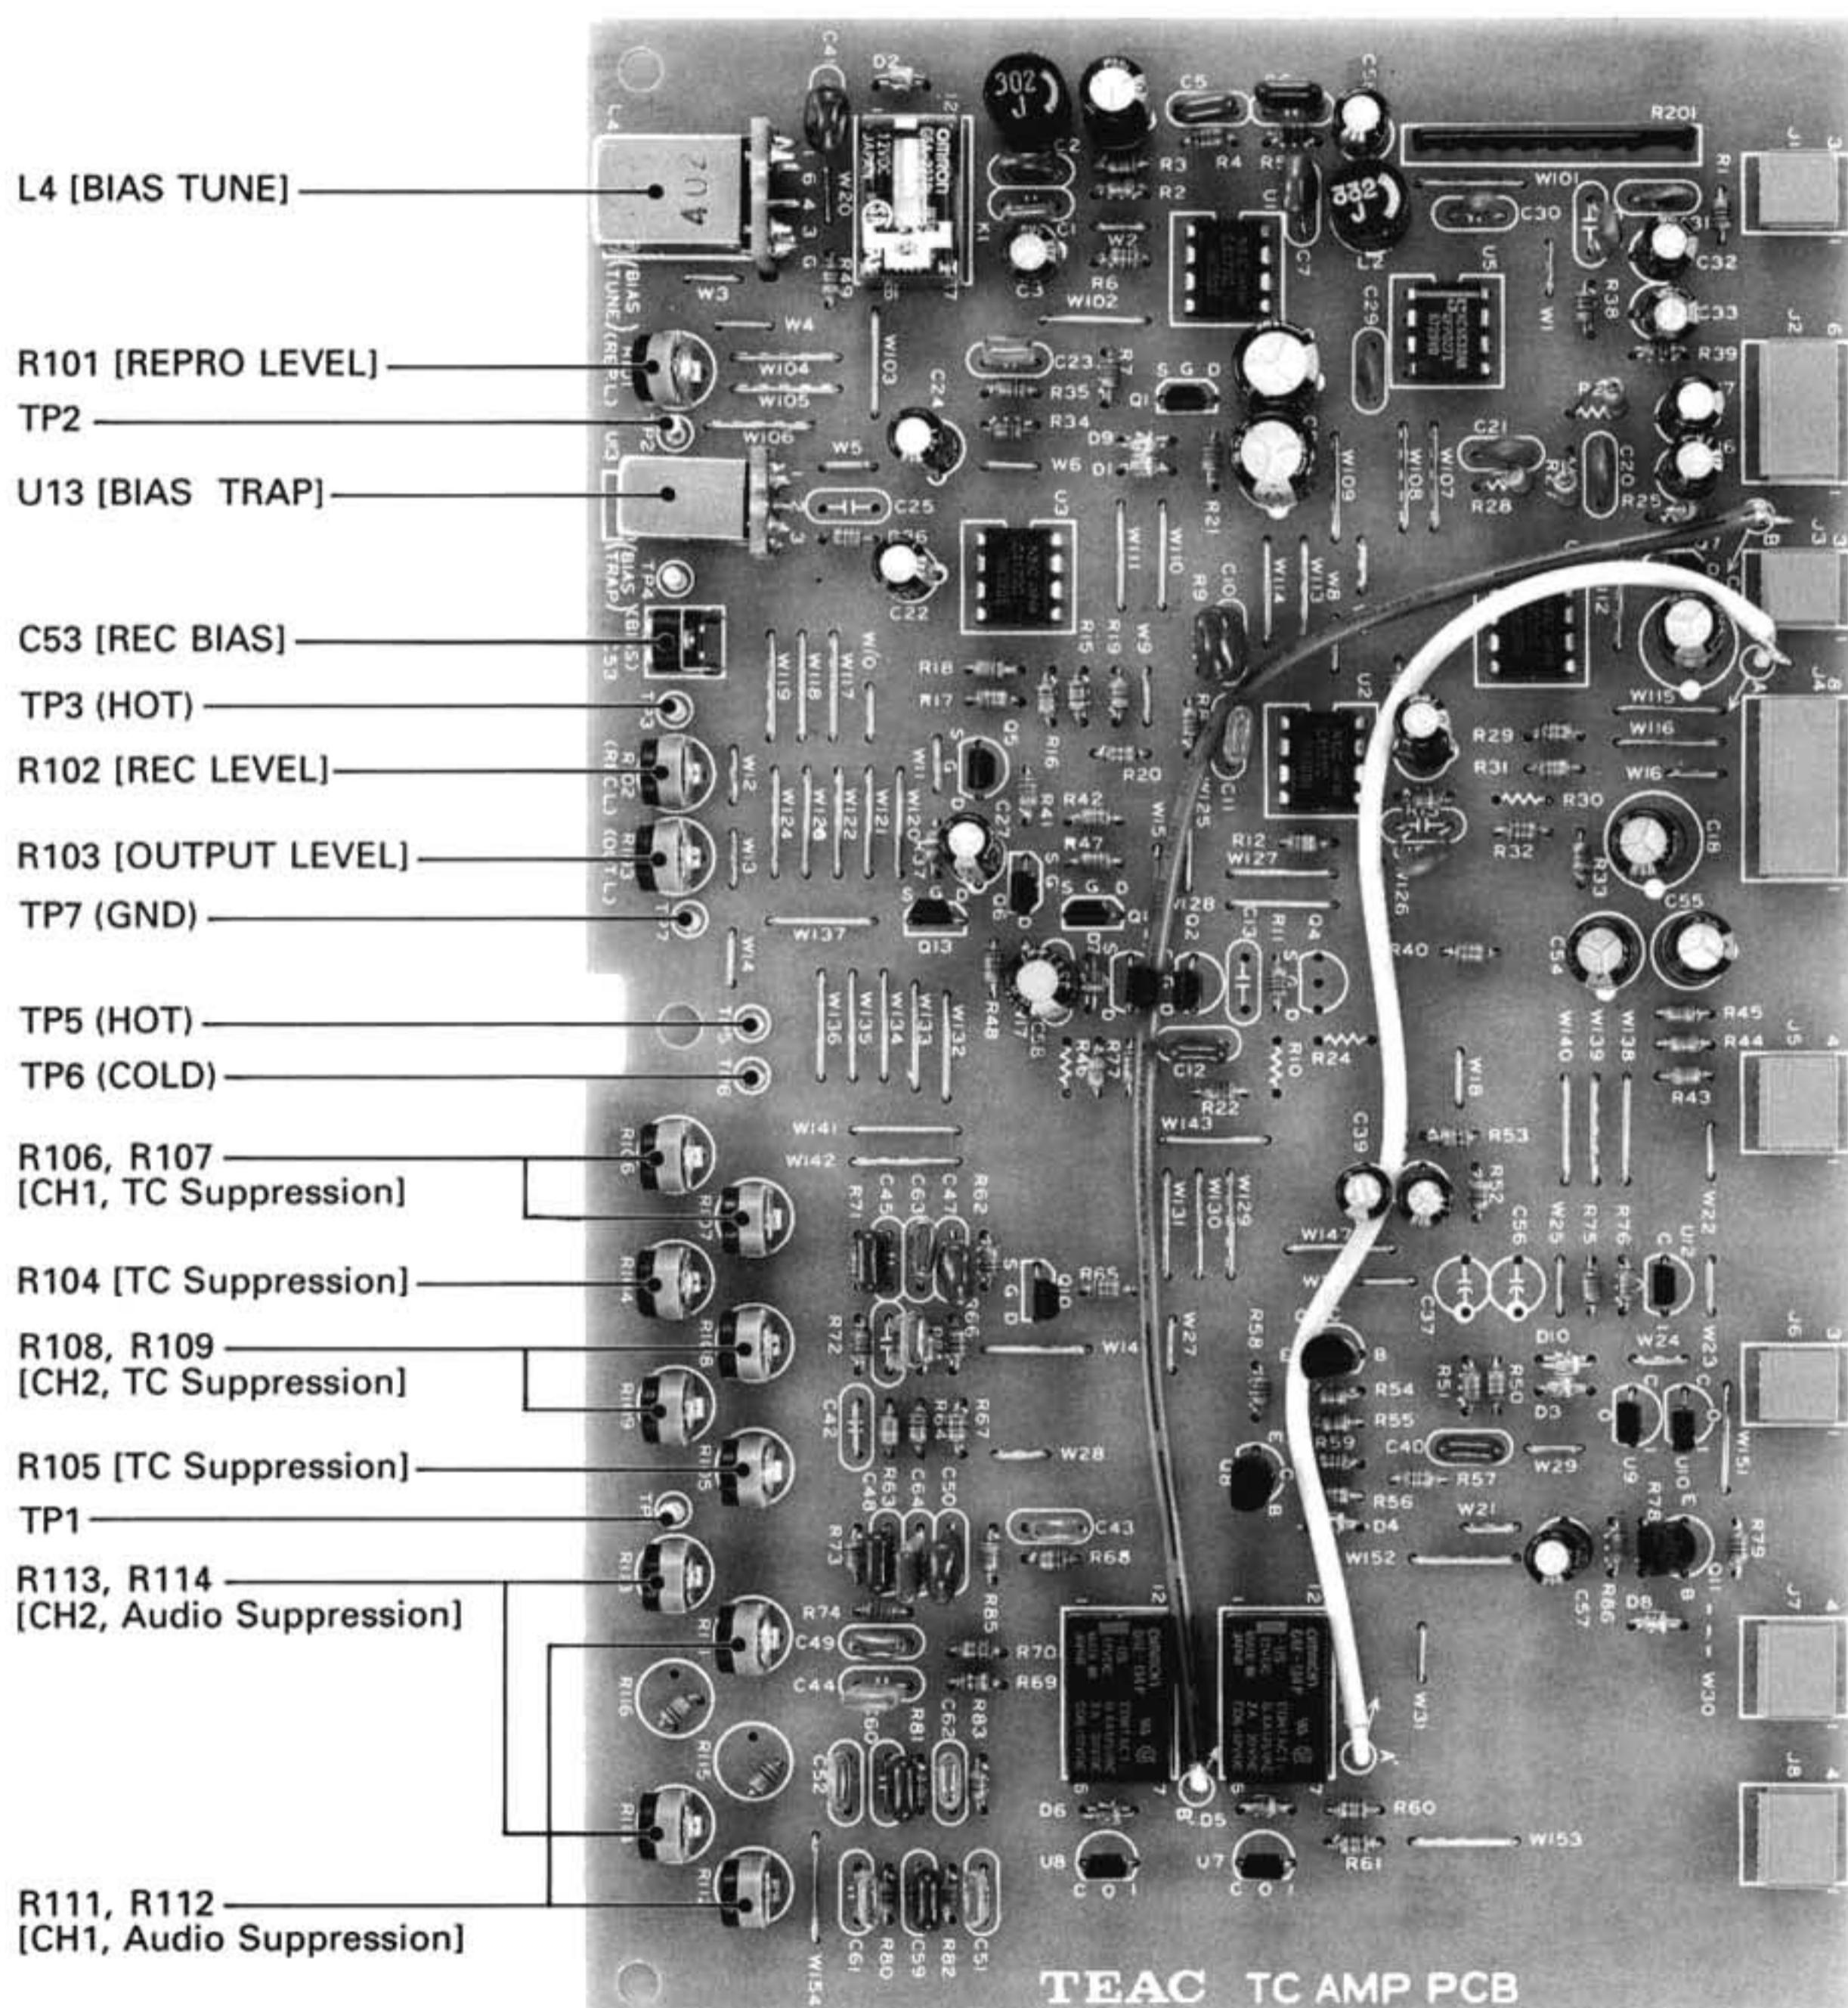

Figure 6-10. Time Code Amplifier Adjustments

#### **6-16-1. Reproduce Level Set**

1. Set the REF LEVEL switch to LOW, and the SPEED switch, to LOW.
2. Play a test tape recorded with a nominal level signal.
3. Adjust R101 on the Time Code Amp PCB for 6V p-p (-6.8 dBV) at TP-2 on the PCB.

**NOTE :** When the YTT-1003 test tape (7-1/2 ips, 185 nWb/m) is used, the level at TP-2 decreases by — ;

2.6 dB at 250 nWb/m of REF LEVEL  
3.9 dB at 320 nWb/m of REF LEVEL

#### **6-16-2. Output Level**

With the same conditions as in 6-16-1 above, adjust R103 on the Time Code Amp PCB for 2V p-p at the XLR type connector for the TIME CODE OUTPUT.

#### **6-16-3. Bias Tuning (L4)**

##### **Preliminary Notes :**

- In the following, don't allow the voltmeter to show maximum reading, which overloads the bias drive amplifier, causing damage to it.
  - Use a non-inductive screwdriver (plastic or wooden).
1. Connect a DC voltmeter between TP-5 (HOT) and TP-6 (COLD) on the Time Code Amp PCB.
  2. Engage the TIME CODE REC switch and put the machine into Record mode .
  3. Adjust L4 on the Time Code Amp PCB for minimum reading on the voltmeter. That should be about 0.7 V.

**NOTE :** After adjustment of L4, leave the machine for about 1 minute to check to see no variation in the reading on the voltmeter.

#### **6-16-4. Bias Trap (U13)**

1. Connect an AC level meter between TP-3 (HOT) and TP-7 (GND) on the Time Code Amp PCB.
2. Engage the TIME CODE REC switch and put the machine into Record mode.
3. Adjust U13 on the Time Code Amp PCB for minimum reading on the AC level meter.

#### **6-16-5. Input Level**

1. Connect a square wave oscillator to the INPUT for the TIME CODE channel and an oscilloscope to its OUTPUT.
2. Engage the TIME CODE REC switch and put the machine into Record mode.

3. Watch the scope and adjust the oscillator so its output (2 kHz) varies over the range from 0.3 V p-p to 6 V p-p, to check to see a display of 2 V p-p (+/-0.5 V p-p) on the scope does not vary.

#### **6-16-6. Record Bias**

1. Connect an AC level meter between TP-1 and TP-7 (GND) on the Time Code Amp PCB.
2. With no signal connected to the INPUT for the time code channel, adjust C53 on the Time Code Amp PCB for 20 mV (2 mA) on the AC level meter.

#### **6-16-7. Record Level**

With the same conditions as in 6-16-5 above, record square wave signal from the oscillator on the time code track, rewind the tape and play the recording. Check for 6 V p-p +/-0.5 V at TP-2 on the Time Code Amp PCB. If out of specs, adjust R102 on the Time Code Amp PCB.

#### **6-16-8. Crosstalk Suppression**

##### **I. Time Code Signal Leakage (Both Time Code and Audio Channels in Reproduce Mode)**

1. Connect an AC level meter to the OUTPUT for either audio channel (CH1 or CH 2). Or, you could connect headphones to the PHONES jack. Set the Monitor Source Selector switch to SYNC.
2. Record time code on the time code track.
3. Rewind the tape, play the recording in SYNC (the audio tracks should not contain any recording), and adjust R104 on the Time Code Amp PCB for minimum reading on the AC level meter or, if you are using headphones, until the audio track output melts into the tape hiss or only faintly distinctive from the hiss.

##### **II. Time Code Signal Leakage (Both Time Code and Audio Channels in Rec/Repro mode)**

1. As in I above, connect an AC level meter or headphones, and set the Monitor Source Selector switch to REPRO.
2. Record time code on the time code track and "no signal" on the audio track. While the recording is taking place, slowly turn R105 from the leftmost position in a clockwise direction until minimum leakage is read on the AC level meter or heard in the headphones, then slightly turn R105 back. Stop R105 where the same output level as in I above is obtained.
3. Rewind the tape, switch the monitor source to SYNC and play again the recording, to check to see the same output level as in I above. If not, repeat step 2.

### III. Time Code Signal Leakage ( Time Code Channel In Record and Audio Channel in Repro mode)

1. As in I above, connect the AC level meter or headphones.
2. Record time code on the time code track while reproducing an audio track in SYNC.
3. Adjust R106 and R107 (for CH 1) and R108 and R109 (for CH 2) on the Time Code Amp PCB for minimum leakage.

Adjust each pair of resistors above, alternately, several times.

### IV. Audio Signal Leakage (Time Code Channel in Reproduce and Audio Channel in Record)

Adjustment is repeated for each channel until minimum leakage level is read at TP-2 on the Time Code Amp PCB over the whole frequency range (100 Hz to 20 kHz).

1. Make the following switch settings :

TAPE SPEED to LOW;  
Monitor Source Selector switch to INPUT;  
Audio Track REC switch to ON;  
Time Code Track REC switch to OFF.

2. Record a 0 VU signal on an audio track, and adjust semi-fixed resistors several times as explained below, until signal whose characteristics are shown in Figure 6-11 appears at TP-2 on the Time Code Amp PCB.

### Adjustment Procedure

1. Suppose the level at TP-2 obtained under the same conditions as in 6-16-1 above to be 0 dB.
2. Change the audio signal frequency to 1 kHz and adjust R111 and R112 for CH 1 and R113 and R114 for CH 2 for -20 dB or less at TP-2.
3. While sweeping the audio signal frequency over the range 1 kHz to 15 kHz, adjust R111 for CH 1 and R113 for CH 2 for -20 dB or less at TP-2.
4. Change the audio signal frequency to 15 kHz and adjust R111 for CH 1 and R113 for CH 2 for around -24 dB at TP-2.
5. After adjustments, recheck the TP-2 level for the following :  
  
-30 dB or less (approx.) for 1 kHz  
-20 dB or less (approx.) for 1 kHz-15 kHz  
Around -25 dB for 15 kHz

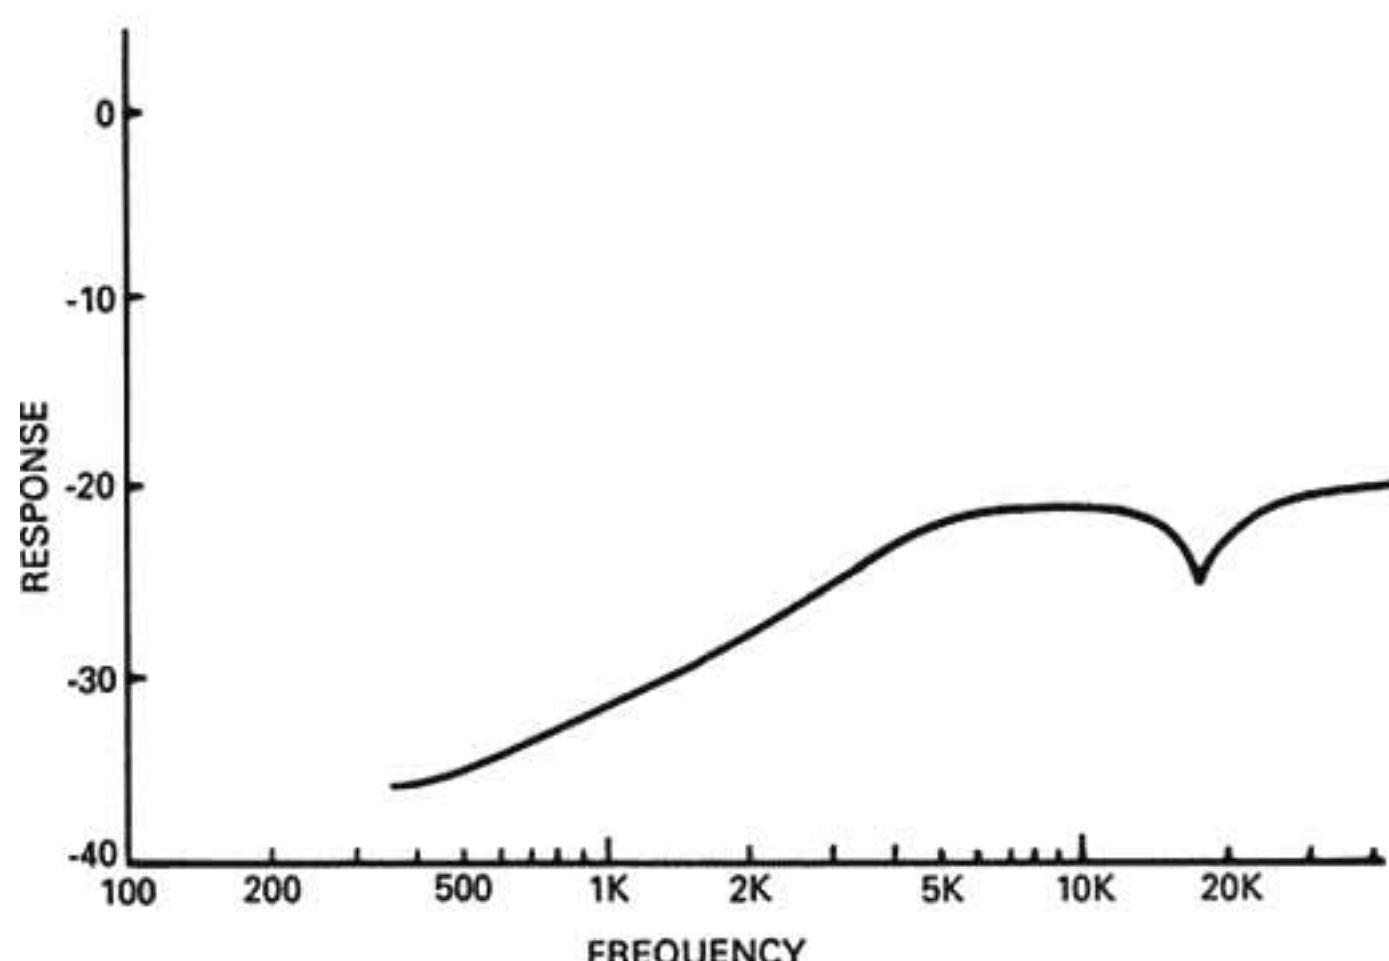

Figure 6-11. Crosstalk from Audio to Time Code Channels

As shown in the figure, TP-2 signal should present a slow upward curve starting from 1 kHz then a short downward curve bottomed out at 15 kHz point.

## CHECKS AND ADJUSTMENTS CHART (1/2)

ADJUSTMENT	WHAT IS IT CALLED	SIGNAL SOURCE AND AMOUNT	WHAT TEST GEAR TO USE	WHAT IS THE RECORDER DOING	POINT TO ADJUST	WHAT READING TO ADJUST FOR
1	Reproduce Head Alignment	Reproduce head alignment test tape	VTVM and oscilloscope with channel 1 out to vertical in and channel 2 out to horizontal in	Reproduce at 15 ips, Output Selector at REPRO	Repro head alignment adjustment screws	Maximum output, less than 90° out of phase between both channels (at 16 kHz)
2	Record/Sync Head Alignment	Same as above	Same as above	Reproduce at 15 ips, Output Selector at SYNC	Record/sync head alignment adjustment screws	Same as above
3	Input Level	1 kHz, +4 dBm signal from oscillator connected to INPUT	VTVM connected to OUTPUT	Stop mode, Output Selector at INPUT	R308	+4 dBm (1.23 V) on VTVM
4	VU-Meter Adjustment	Same as above, plus reference level signal from test tape	VU-meter	Same as above, but Output Selector at REPRO	R307 and R314	0 VU reading on VU meter
5	PEAK LED	1 kHz, +16 dBm (250 nWb/m)/+14 dBm (320 nWb/m) from oscillator	PEAK LED	Stop mode, Output Selector at INPUT	R309	Lighting up LEDs
6	Reproduce Level (via Repro Head)	Reproduce alignment test tape (7-1/2 ips)	VTVM connected to OUTPUTs	Reproduce at 7-1/2 ips, Output Selector at REPRO	R301	+4 dBm (1.23 V) on VTVM
7	Reproduce Level (via Record/Sync Head)	Same as above	Same as above	Reproduce at 7-1/2 ips, Output Selector at SYNC	R302	Same as above
8	Reproduce EQ at 15 ips (via Repro Head)	16 kHz signal on test tape	VTVM connected to OUTPUTs	Reproduce at 15 ips, Output Selector at REPRO	R303	Same reading on VTVM as for 400 Hz signal
9	Reproduce EQ at 7-1/2 ips (via Record/Sync Head)	Same as above	Same as above	Reproduce at 15 ips, Output Selector at SYNC	R304	Same as above
10	Reproduce EQ at 7-1/2 ips (via Repro Head)	Same as above	Same as above	Reproduce at 7-1/2 ips, Output Selector at REPRO	R305	Same as above
11	Reproduce EQ at 7-1/2 ips (via Record/Sync Head)	Same as above	Same as above	Reproduce at 7-1/2 ips, Output Selector at SYNC	R306	Same as above
12	Bias tuning	No input signal	VTVM connected to test points, negative lead to TP-2, positive lead to TP-3  (For gapless punch-in models : VTVM connected between TP-1 (CH1)/TP-2 (CH2) on AMP CONT PCB and TP-2 on R/P AMP PCB)	Repro mode with no input signal	L4  L101(CH1)/L202 (CH2)	Minimum output at test points  Minimum output at test points

## CHECKS AND ADJUSTMENTS CHART (2/2)

ADJUSTMENT	WHAT IS IT CALLED	SIGNAL SOURCE AND AMOUNT	WHAT TEST GEAR TO USE	WHAT IS THE RECORDER DOING	POINT TO ADJUST	WHAT READING TO ADJUST FOR
13	Bias Trap Adjustment	No input signal	VTVM connected to Bias trap test points TP-1 and TP-5 (GND)	Record mode with no input signal	U9	Minimum output at bias test points
14	Bias Level Adjustment	10 kHz, -6 dBm from oscillator connected to INPUTs	VTVM connected to OUTPUTs	Recording on the same type of tape as used for actual recording, at 7-1/2 ips, Output Selector at REPRO	C101	6.5 to 7.5 dB below the "second" peak level
15	Record Level at 7-1/2 ips	1 kHz, +4 dBm (0 VU on VU meter) connected to INPUTs	VTVM connected to OUTPUTs, or VU meter instead	Recording at LOW then its playback	R310	+4 dBm on VTVM, or 0 VU on VU meter
16	Record Level at 15 ips	Same as above	Same as above	Recording at HIGH then its playback	R313	Same as above
17	Overall Frequency at 15 ips	22 kHz, -6 dBm signal from oscillator connected to INPUTs	Same as above	Same as above	R311	Same reading on VTVM as for 1 kHz
18	Overall Frequency at 7-1/2 ips	22 kHz, -16 dBm signal from oscillator connected to INPUTs	Same as above	Recording at LOW then its playback	R312	Same as above
19	Overall Signal-To-Noise Ratio	No input signal	VTVM connected to OUTPUTs	Recording at 15 or 7-1/2 ips, Output Selector at REPRO	Check only	Check for 50 dB or better
20	Erasure	1 kHz, +14 dBm connected to INPUTs (i.e., +10 VU on VU meters). Apply signal for short time only.	VTVM and 1 kHz band pass filter connected to OUTPUTs	1 kHz signal recording, then no-signal recording over the 1 kHz recording. Output Selector at REPRO	Check only	Check for 70 dB or greater (through 1 kHz filter)

## 7. OPTIONAL MODIFICATIONS

There are two DIP-switches on the Control PC Board inside the BR-20. Their default settings and functions are as follows :

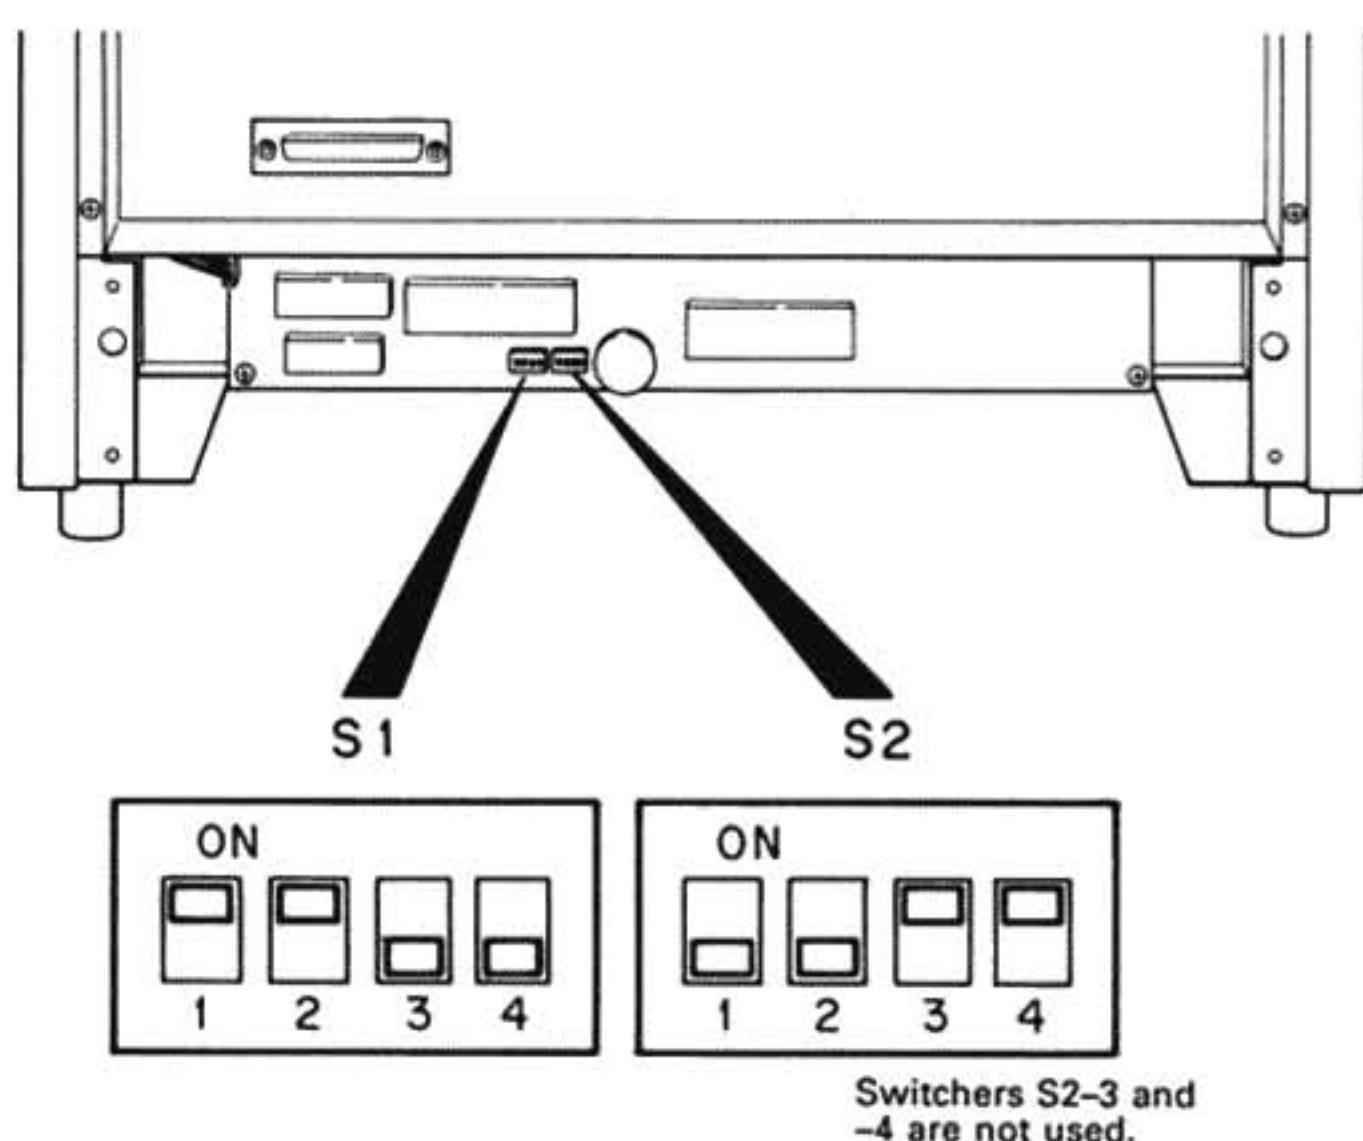

Figure 7-1. DIP-switch Locations

S1-1 : ON (Memory Back-up feature is active)  
S1-2 : ON (Fader Stop function is available)

- Fader Start function can also be switched on/off. As for the procedure, see the "Features and Controls" section of this manual, item 43.

The next S1-3 switch has no effect on the NAB standard U.S.A/Canada model.

S1-3 : OFF (Gapless punch-in and spot erase are active)

Note : S1-3 is a "defeat" switch and "OFF" means the function is NOT defeated.

S1-4 : OFF (Tape speed is switchable between 7.5 inch/s (19 cm/s) and 15 inch/s (38 cm/s))

- ON position is for 3-3/4 and 7-1/2 inch/s (9.5 and 19 cm/s) tape speeds. This entails installation of some internal parts. Consult TASCAM or your nearest TASCAM dealer.

S2-1 : OFF (On-the-fly tape point capture and its storage into memory are done at once by hitting a MEMO key alone.)

- With this switch set to ON, MEMO only captures the current tape point, and, when NUMBER is subsequently pressed, that point is actually memoized.

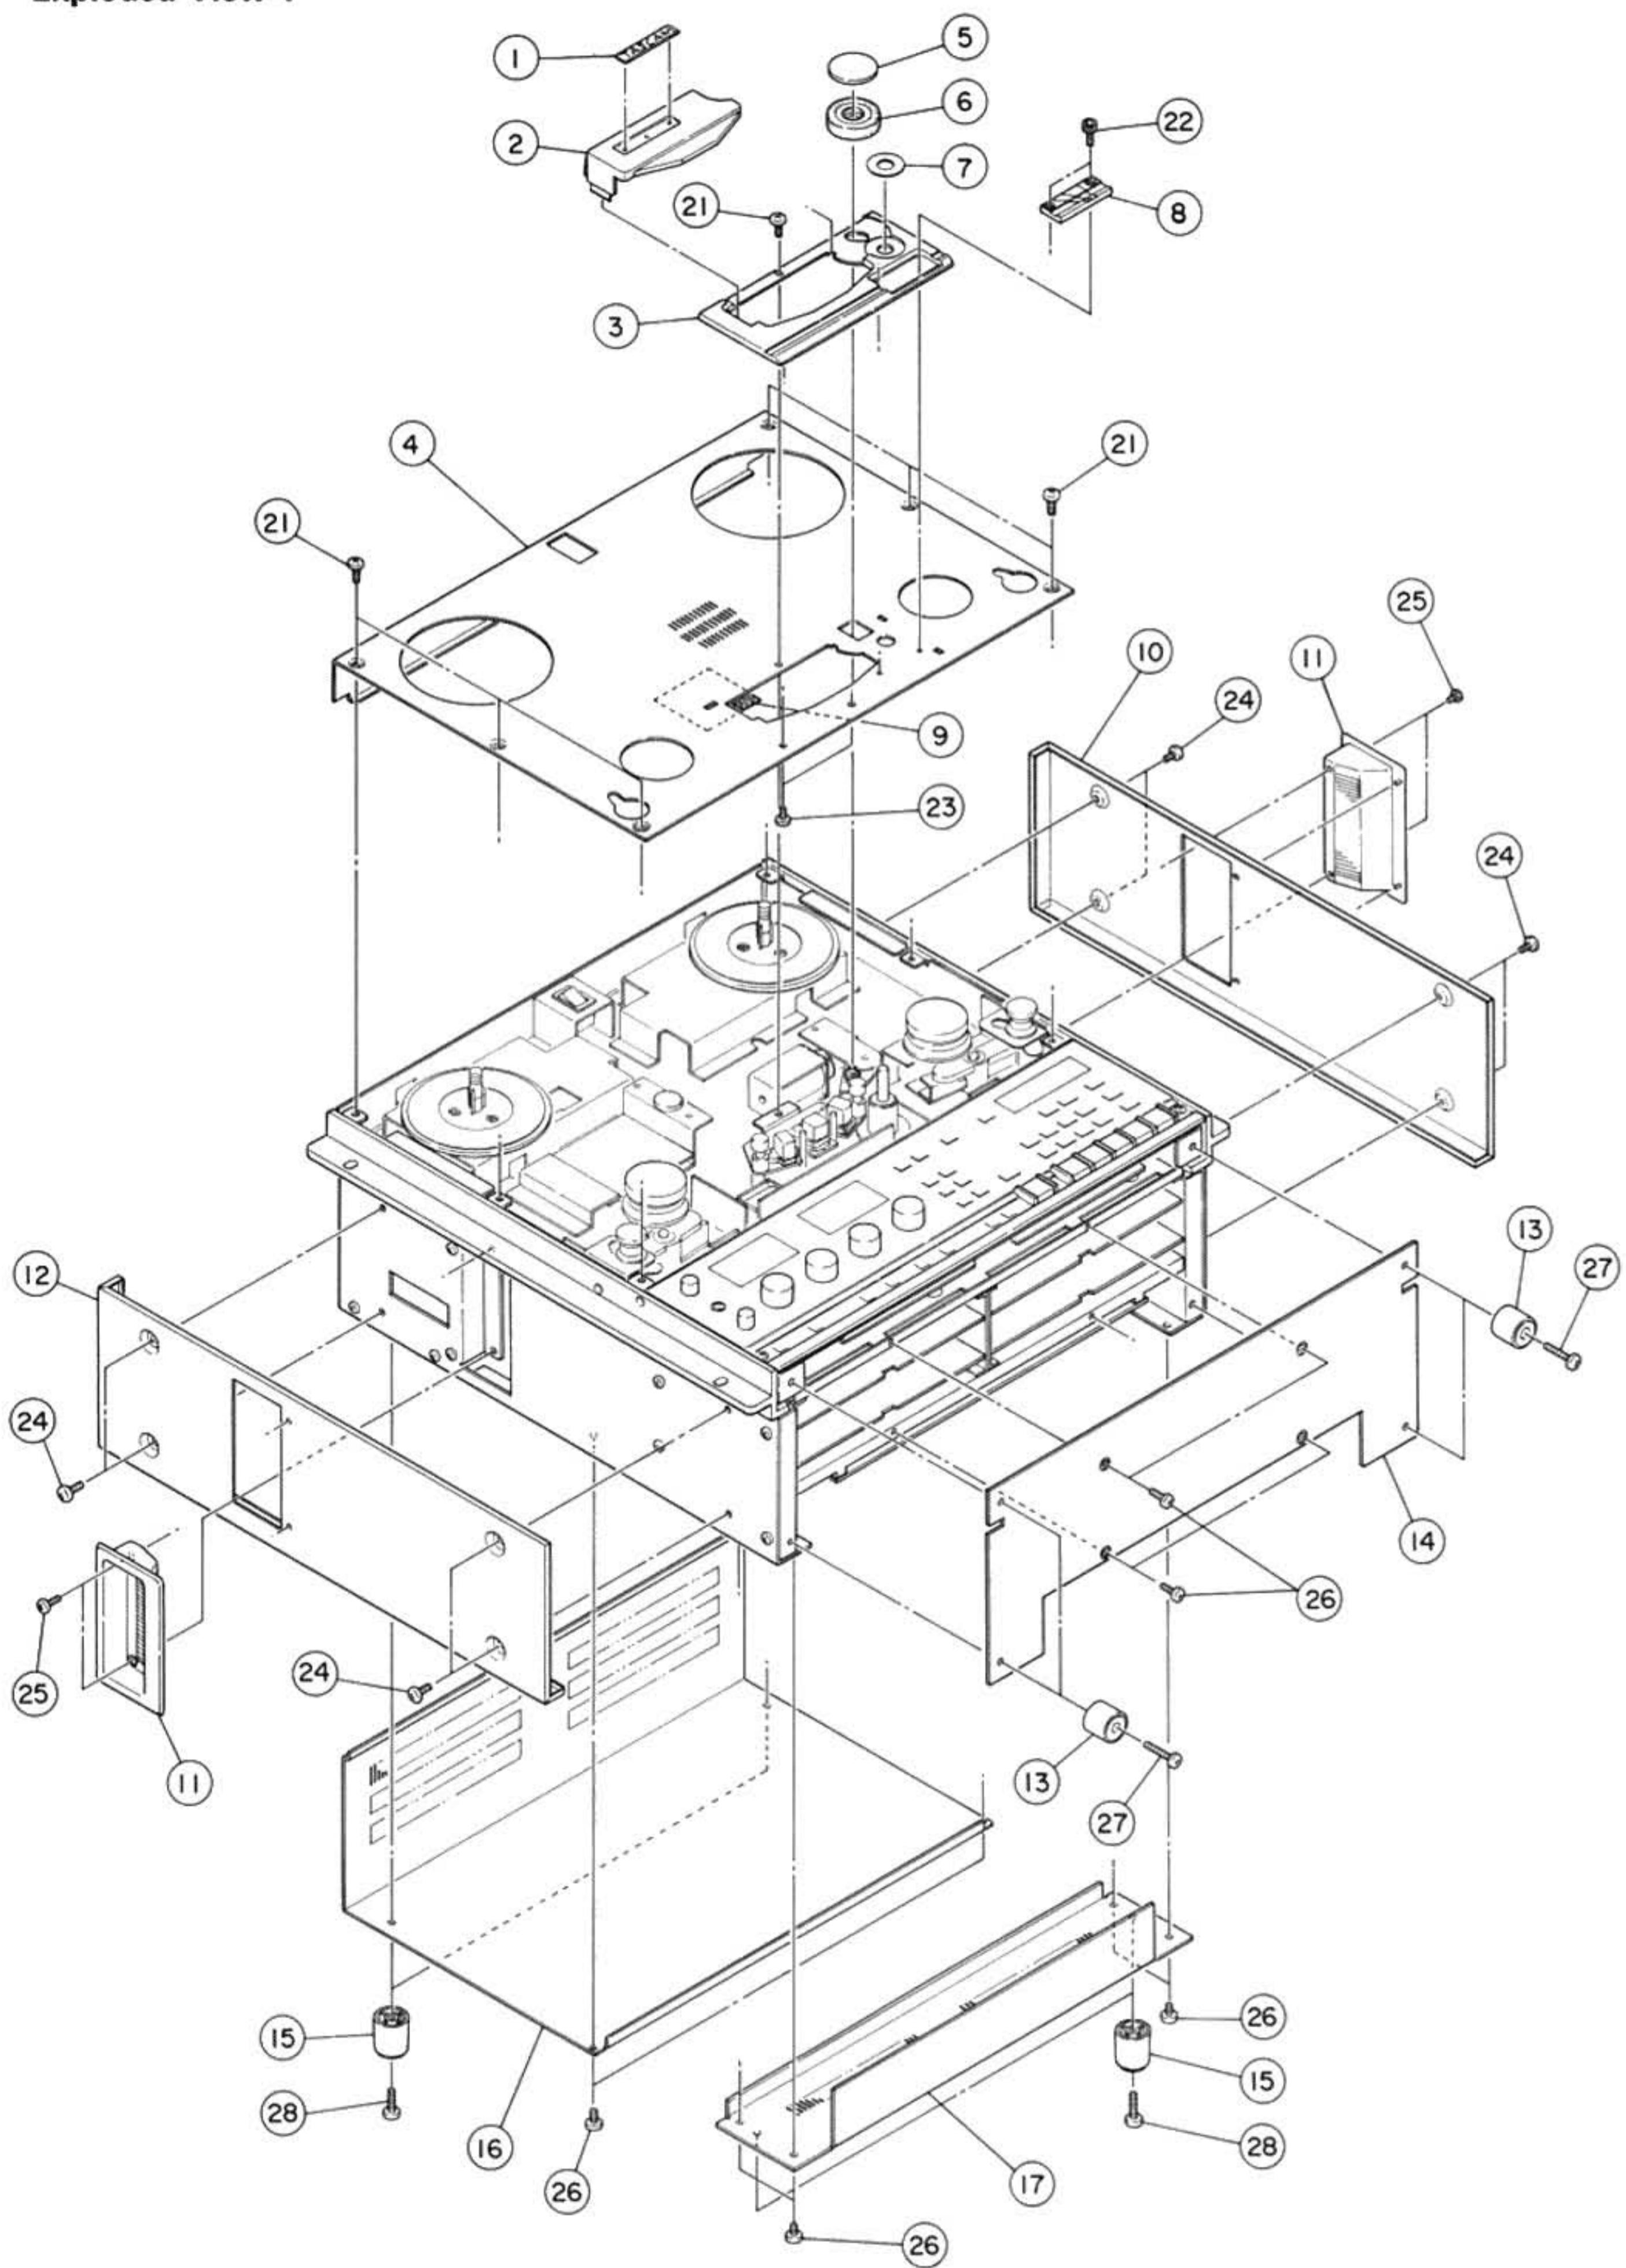

S2-2 : OFF (Monitor source : INPUT, SYNC, and REPRO, can be selected for the separate channels)

- With this switch set to ON, both channels' monitor sources are selected at once by either channel's selector switch.
