# 1. SAFETY

1. The design of this product contains special hardware, many circuits and components specially for safety purposes. For continued protection, no changes should be made to the original design unless authorized in writing by the manufacturer. Replacement parts must be identical to those used in the original circuits. Service should be performed by qualified personnel only.
2. Alterations of the design or circuitry of the products should not be made. Any design alterations or additions will void the manufacturer's warranty and will further relieve the manufacturer of responsibility for personal injury or property damage resulting therefrom.
3. Many electrical and mechanical parts in the products have special safety-related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in the parts list of Service manual. Electrical components having such features are identified by shading on the schematics and by ( ! ) on the parts list in Service manual. The use of a substitute replacement which does not have the same safety characteristics as the recommended replacement part shown in the parts list of Service manual may cause shock, fire, or other hazards
4. Don't short between the LIVE side ground and ISOLATED (NEUTRAL) side ground or EARTH side ground when repairing. Some model's power circuit is partly different in the GND. The difference of the GND is shown by the LIVE: ( ) side GND, ISOLATED (NEUTRAL) : ( ) side GND and EARTH : ( ) side GND. Don't short between the LIVE side GND and ISOLATED (NEUTRAL) side GND or EARTH side GND and never measure with a measuring apparatus (oscilloscope etc.) the LIVE side GND and ISOLATED (NEUTRAL) side GND or EARTH side GND at the same time. If above note will not be kept, a fuse or any parts will be broken.
5. If any repair has been made to the chassis, it is recommended that the B1 setting should be checked or adjusted (See ADJUSTMENT OF B1 POWER SUPPLY).
6. The high voltage applied to the picture tube must conform with that specified in Service manual. Excessive high voltage can cause an increase in X-Ray emission, arcing and possible component damage, therefore operation under excessive high voltage conditions should be kept to a minimum, or should be prevented. If severe arcing occurs, remove the AC power immediately and determine the cause by visual inspection (incorrect installation, cracked or melted high voltage harness, poor soldering, etc.). To maintain the proper minimum level of soft X-Ray emission, components in the high voltage circuitry including the picture tube must be the exact replacements or alternatives approved by the manufacturer of the complete product.
7. Do not check high voltage by drawing an arc. Use a high voltage meter or a high voltage probe with a VTVM. Discharge the picture tube before attempting meter connection, by connecting a clip lead to the ground frame and connecting the other end of the lead through a 10k 2W resistor to the anode button.
8. When service is required, observe the original lead dress. Extra precaution should be given to assure correct lead dress in the high voltage circuit area. Where a short circuit has occurred, those components that indicate evidence of overheating should be replaced. Always use the manufacturer's replacement components.
9. manufacturer's replacement components.
10. Isolation Check

# PRECAUTIONS

(Safety for Electrical Shock Hazard)

After re-assembling the product, always perform an isolation check on the exposed metal parts of the cabinet (antenna terminals, video/audio input and output terminals, Control knobs, metal cabinet, screwheads, earphone jack, control shafts, etc.) to be sure the product is safe to operate without danger of electrical shock.

11. The surface of the TV screen is coated with a thin film which can easily be damaged. Be very careful with it when handle the TV. Should the TV screen become soiled, wipe it with a soft dry cloth. Never rub it forcefully. Never use any cleaner or detergent on it.

- (1) Dielectric Strength Test

The isolation between the AC primary circuit and all metal parts exposed to the user, particularly any exposed metal part having a return path to the chassis should withstand a voltage of 3000V AC (r.m.s.) for a period of one second.

(...Withstand a voltage of 1100V AC (r.m.s.) to an appliance rated up to 120V, and 3000V AC (r.m.s.) to an appliance rated 200V or more, for a periode of one second.)

This method of test requires a test equipment not generally found in the service trade.

- (2) Leakage Current Check

Plug the AC line cord directly into the AC outlet (do not use a line isolation transformer during this check.). Using a "Leakage Current Tester", measure the leakage current from each exposed metal part of the cabinet, particularly any exposed metal part having a return path to the chassis, to a known good earth ground (water pipe, etc.). Any leakage current must not exceed 0.5mA AC (r.m.s.).

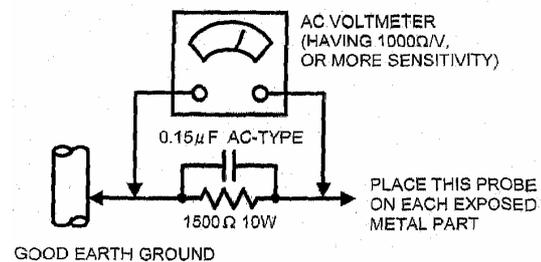

However, in tropical area, this must not exceed 0.2mA AC (r.m.s.).

Alternate Check Method

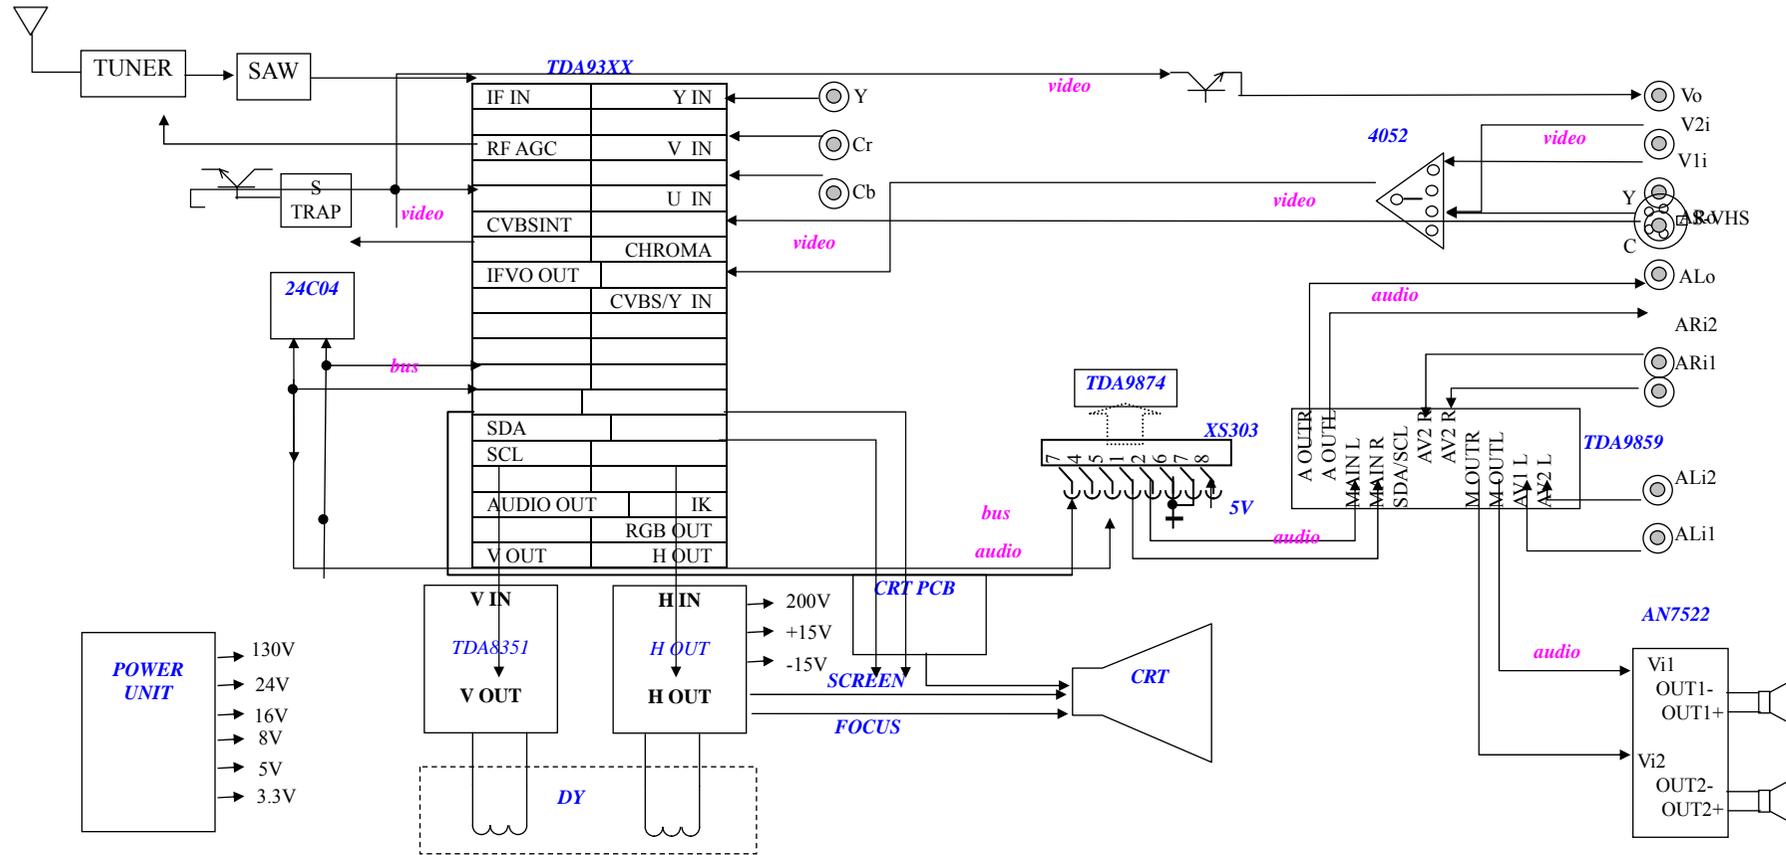

Plug the AC line cord directly into the AC outlet ( do not use a line isolation transformer during this check.). Use an AC voltmeter having 1000 ohms per volt or more sensitivity in the following manner. Connect a 1500 10W resistor paralleled by a 0.15  $\mu$ F AC-type capacitor between an exposed metal part and a known good earth ground (water pipe, etc.). Measure the AC voltage across the resistor with the AC voltmeter. Move the resistor connection to each exposed metal part, particularly any exposed metal part having a return path to the chassis, and measure the AC voltage across the resistor. Now, reverse the plug in the AC outlet and repeat each measurement. Any voltage measured must not exceed 0.75V AC (r.m.s.). This corresponds to 0.5mA AC (r.m.s.).

However, in tropical area, this must not exceed 0.3V AC (r.m.s.).

This corresponds to 0.2mA AC (r.m.s.)

BLOCK DIAGRAM

# 3.REPLACEMENT OF MEMORY IC

## 1. MEMORY IC.

This TV uses memory IC. In the memory IC are memorized data for correctly operating the video and deflection circuits.

When replacing memory IC, be sure to use IC written with the initial value of data.

## 2. PROCEDURE FOR REPLACING MEMORY IC

- (1) Power off  
Switch the power off and unplug the power cord from AC outlet.
- (2) Replace IC  
Be sure to use memory IC written with the initial data values.
- (3) Power On  
Plug the power cord into the AC outlet and switch the power On.
- (4) Check and set SYSTEM default value:
  - 1) Press “QV” key holding about 4 second and then press “MENU1” key on the Remote control unit.  
Or Press “TEST” key on the Remote control unit for factory used.
  - 2) The “TEST” will be displayed on the screen.
  - 3) Press digital key, (Mkey) and corresponding on-screen display will be appeared.  
Some time “PASSWORD” on-screen display will be appeared, you need to input 828.
  - 4) Check the setting value of the SYSTEM default value of Table below. If the value is different, select items by [CH+]/[CH-] keys and set value by [VOL+]/[VOL-] keys.
  - 5) Press “STANDBY” key again and return to the normal screen.

# 4.SERVICE ADJUSTMENT

## B1 POWER SUPPLY

1. Receive normal colour bar signal.
2. Connect DC voltmeter to VD541- and isolated ground.
3. Adjust potentiometer in power unit to get the voltage as 110V ±1.0V for 21 inch hereinafter,

130 ±1.0V for 25 inch upwards.

## FOCUS ADJUSTMENT

1. Receive a crosshatch signal.
2. While watching the screen, adjust the FOCUS VR to make the vertical and horizontal lines as fine and sharp as possible.

## BUS CONTROL ADJUSTMENT

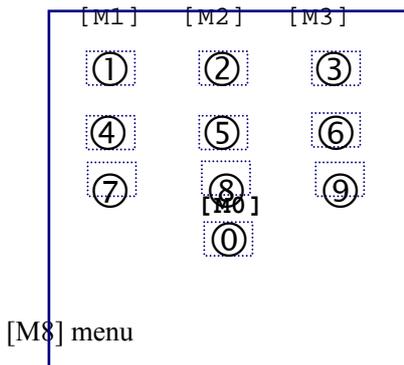

To enter BUS control mode, Press “TEST” key on the Remote control unit of factory.

Press “0” to “9” key, (Mkey) and corresponding on-screen display will be appeared.

On TV screen “TEST” will be indicated, this means entered bus control mode.

And press following key, each function will be available.

Remote Hand Unit keys

	MENU8
V	SLOPE
31	
V	SHIFT
31	
V	AMP
31	
V	SCOR
.	

## MENU0 Geometrical adjustment

Receive PAL standard Complete pattern signal.

Adjustment steps :

- Adjust V. SLOPE, to the center horizontal line just appear from half bottom shadow.
- Adjust V. SIZE, to get 90% of vertical picture contents would be displayed on CRT.
- Adjust V. SHIFT, the center horizontal line correspond to CRT vertical center.
- Adjust H.SHIFT, to get the picture horizontal center correspond to CRT horizontal center.

Receive NTSC signal and repeat above [M0] and [M1] adjustment.

[M7] Menu

### AGC Adjustment.

Receive 60dB  $\mu$  (1mV) $V_H$  colour bar pattern signal , adjust AGC value ( voltage from high to low ), to noise reduce gradually and just disappeared point.

[M9] Menu

### CRTcut off and white balance adjustment.

Receive white signal.

- CRT cut off adjustment.
  - Select "SC", then automatically vertical scan will be stopped.
  - Adjust SCREEN control on Flyback transformer to get the darkest single horizontal line (red, green, or blue, sometimes shows more yellow, more purple or more white).
- White balance adjustment.
  - Select RD/BD menu.
  - Adjust RD/BD to get colour temperature as x=281, y=311
- Sub-Brightness adjustment. (Use stair case signal)
  - Select SB menu.
  - Adjust SB to get the darkest step being cutoff.

## 5. ICs functional description

UOC TDA93XX

SYMBOL	PIN	DESCRIPTION
STAND BY output.	1	In STAND BY mode, high level (Power OFF). For Power ON this pin will be reduced to low.
SCL	2	I <sup>2</sup> C-bus clock line
SDA	3	I <sup>2</sup> C-bus data line
TUNING	4	tuning Voltage (Vt) PWM output
P3.0/NTSC SW	5	Port 3.0 or NTSC output/SCART SW input, Forced NTSC selection, Low-level output, otherwise High output.
KEY	6	Control keys input *3
VOL	7	Sound Volume control PWM output
MUTE	8	Sound mute output
VSSC/P	9	Digit ground for $\mu$ -controller core and periphery
BAND1	10	Tuner Band selection output
BAND2	11	Tuner Band selection output
VSSA	12	Analog ground of teletext decoder and digital ground of TV-processor
SECPLL	13	SECAM PLL decoupling
VP2	14	2 <sup>nd</sup> supply voltage TV-processor(+8V)
DECDIG	15	decoupling digital supply of TV-processor
PH2LF	16	Phase-2 filter
PH1LF	17	Phase-1 filter
GND3	18	Ground 3 for TV-processor
DECBG	19	Band gap decoupling
AVL/EWD	20	Automatic volume leveling /EAST-WEST drive output
VDRB	21	Vertical drive B output
VDRA	22	Vertical drive A output
IFIN1	23	IF input 1
IFIN2	24	IF input 2
IREF	25	Reference current input
VSC	26	Vertical sawtooth capacitor
TUNER AGC	27	Tuner AGC output
AUDEEM/SIFIN1 *1	28	Audio deemphasis or SIF input
DECSDEM/SIFIN2	29	decoupling sound demodulator or SIF input 2
GND2	30	ground 2 for TV processor
SNDPLL/SIFAGC *1	31	narrow band PLL filter or AGC sound IF
AVL/SNDIF/REF0/ AMOUT *1	32	Automatic Volume Levelling / sound IF input / subcarrier reference output / audio deemphasis
HOUT	33	horizontal output
FBISO	34	flyback input/sandcastle output

AUDEXT/QSSO/ AMOUT *1	35	external audio output / QSS intercarrier out
EHTO	36	EHT/overvoltage protection input
PLL IF	37	IF-PLL loop filter
IFVO/SVO	38	IF video output / selected CVBS output
VP1	39	supply voltage TV processor
CVBS INT	40	internal CVBS input
GND1	41	ground for TV processor
CVBS/Y	42	CVBS/Y input
CHROMA	43	C input
AUDOUT/AMOUT *1	44	audio output /AM audio output (volume controlled)
INSSW2	45	2 <sup>nd</sup> RGB / YUV insertion input
R2/VIN	46	2 <sup>nd</sup> R input / V (R-Y) input / Pr input

<b>G2/YIN</b>	<b>47</b>	<b>2<sup>nd</sup> G input / Y input</b>
<b>B2/UIIN</b>	<b>48</b>	<b>2<sup>nd</sup> B input / U (B-Y) input / Pb input</b>

<b>BLKIN</b>	<b>50</b>	<b>black current input / V-guard input</b>
<b>RO</b>	<b>51</b>	<b>Red output</b>
<b>GO</b>	<b>52</b>	<b>Green output</b>
<b>BO</b>	<b>53</b>	<b>Blue output</b>
<b>VDDA</b>	<b>54</b>	<b>analog supply of Closed Caption decoder and digital supply of TV-processor (3.3 V)</b>
<b>VPE</b>	<b>55</b>	<b>OTP Programming Voltage</b>
<b>VDDC</b>	<b>56</b>	<b>digital supply to core (3.3 V)</b>
<b>OSCGND</b>	<b>57</b>	<b>oscillator ground supply</b>
<b>XTALIN</b>	<b>58</b>	<b>crystal oscillator input</b>
<b>XTALOUT</b>	<b>59</b>	<b>crystal oscillator output</b>
<b>RESET</b>	<b>60</b>	<b>reset</b>
<b>VDDP</b>	<b>61</b>	<b>digital supply to periphery (+3.3 V)</b>
<b>P1.0/INT1</b>	<b>62</b>	<b>TV/AV (AV1) / AV2 /S-VHS mode Output.</b>
<b>P1.1/T0</b>	<b>63</b>	<b>TV/AV (AV1) / AV2 /S-VHS mode Output.</b>
<b>P1.2/INT0</b>	<b>64</b>	<b>Remote control signal input.</b>

**Note**

1. The function of pin 20, 28, 29, 31, 32, 35 and 44 is dependent on the IC version (mono intercarrier FM demodulator /QSS IF amplifier and East-West output or not) and on some software control bits. The valid combinations are given in table 1.
2. the vertical guard function can be controlled via pin 49 or pin 50. the selection is made by means of the IVG bit in subaddress 2BH.

TABLE 1

IC version	FM-PLL version				QSS version					
	N		Y		N			Y		
East-West Y/N	N		Y		N			Y		
CMB1/CMB0 bits	00	01/10/11	00	01/10/11	00	01/10/11		00	01/10/11

## 8. PURITY / CONVERGENCE ADJUSTMENT

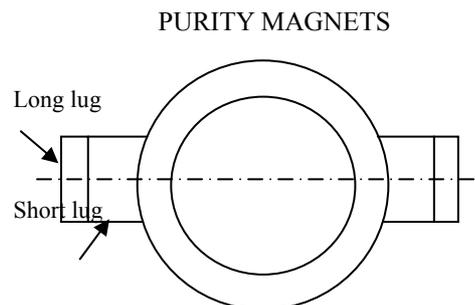

### PURITY ADJUSTMENT

1. Demagnetize CRT with the demagnetizer.
2. Loosen the retainer screw of the deflection yoke.
3. Remove the wedges.
4. Input a green raster signal from the signal generator, and turn the screen to green raster.
5. Move the deflection yoke backward.
6. Bring the long lug of the purity magnets on the short lug and position them horizontally. (Fig2)
7. Adjust the gap between two lugs so that the GREEN RASTER will come into the center of the screen. (Fig. 3)
8. Move the deflection yoke forward, and fix the position of the deflection yoke so that the whole screen will become green.
9. Insert the wedge to the top side of the deflection yoke so that it will not move.
10. Input a crosshatch signal.
11. Verify that the screen is horizontal.
12. Input red and blue raster signals, and make sure that purity is properly adjusted.

**P: PURITY MAGNET**  
**4: 4-POLES (convergence magnets)**  
**6: 6-POLES (convergence magnets)**

Fig. 1

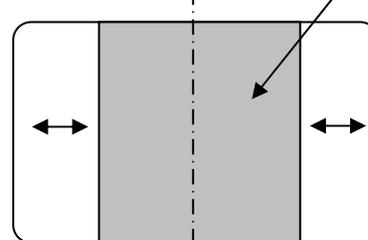

Bring the long lug over the short lug and position them horizontally.

Fig. 2

(FRONT VIEW)

GREEN RASTER

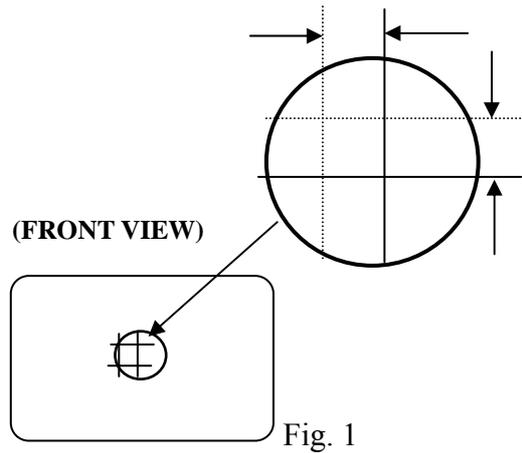

CENTER

Fig. 3

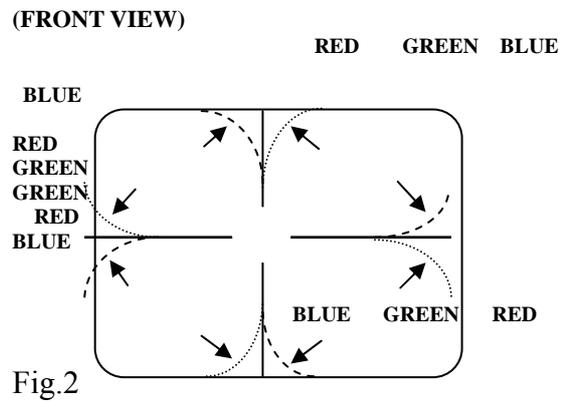

### STATIC CONVERGENCE ADJUSTMENT

1. **Input a crosshatch signal.**
2. **Using 4-pole convergence magnets, overlap the red and blue lines in the center of the screen (Fig. 1) and turn them to magenta (red/blue).**
3. **Using 6-pole convergence magnets, overlap the magenta (red/blue) and green lines in the center of the screen and turn them to white.**
4. **Repeat 2 and 3 above, and make the best convergence.**

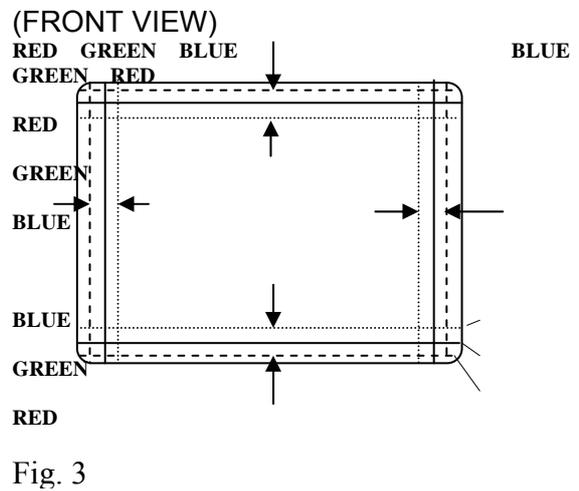

### DYNAMIC CONVERGENCE ADJUSTMENT

1. **Move the deflection yoke up and down and overlap lines in the periphery. (Fig. 2)**
2. **Move the deflection yoke left to right and overlap the lines in the periphery. (Fig. 3)**
3. **Repeat 1 and 2 above, and make the best convergence.**

**After adjustment, fix the wedge at the original position.  
Fasten the retainer screw of the deflection yoke.  
Fix the 6 magnets with glue.**

- Illustration:
1. The unit of all resistors is  $\Omega$ . K=1000, M=1,000,000
  2. The power of all unmarked resistors is 1/6W.
  3. The unit of capacitors is  $\mu$ F commonly. "p" represents for pF. If there is no additional illustration, the working voltage of capacitors is 63V.
  4. This diagram only illustrates the basic and typical model. Exceptional parts or part circuits may be different from the fact circuit.

- Note:
1. As the parts marked with  $\triangle$  are relevant to the whole-set's safety, the replaced ones must be the same with Service Manual.
  2. The circuit enclosed by  $\equiv$  is connected to the AC power directly. While repairing, the service man should connect a buffer transformer between TV and AC power to avoid electrical shock.

# 1. SAFETY

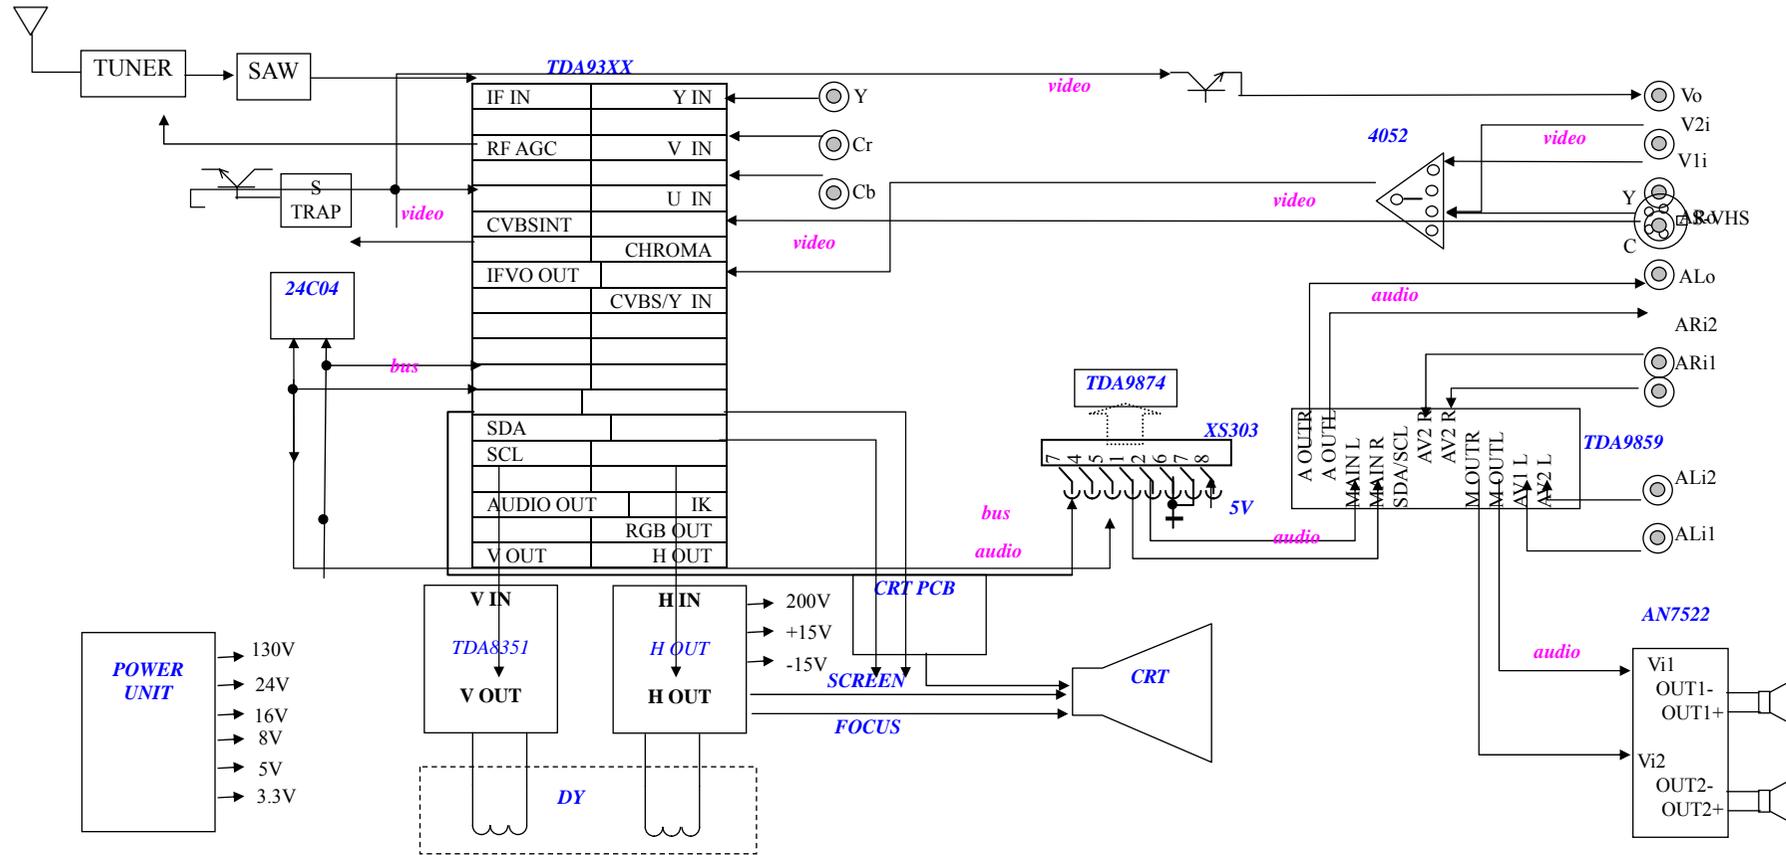

1. The design of this product contains special hardware, many circuits and components specially for safety purposes. For continued protection, no changes should be made to the original design unless authorized in writing by the manufacturer. Replacement parts must be identical to those used in the original circuits. Service should be performed by qualified personnel only.
2. Alterations of the design or circuitry of the products should not be made. Any design alterations or additions will void the manufacturer's warranty and will further relieve the manufacturer of responsibility for personal injury or property damage resulting therefrom.
3. Many electrical and mechanical parts in the products have special safety-related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in the parts list of Service manual. Electrical components having such features are identified by shading on the schematics and by ( ! ) on the parts list in Service manual. The use of a substitute replacement which does not have the same safety characteristics as the recommended replacement part shown in the parts list of Service manual may cause shock, fire, or other hazards
4. Don't short between the LIVE side ground and ISOLATED (NEUTRAL) side ground or EARTH side ground when repairing. Some model's power circuit is partly different in the GND. The difference of the GND is shown by the LIVE: ( ) side GND, ISOLATED (NEUTRAL) : ( ) side GND and EARTH : ( ) side GND. Don't short between the LIVE side GND and ISOLATED (NEUTRAL) side GND or EARTH side GND and never measure with a measuring apparatus (oscilloscope etc.) the LIVE side GND and ISOLATED (NEUTRAL) side GND or EARTH side GND at the same time. If above note will not be kept, a fuse or any parts will be broken.
5. If any repair has been made to the chassis, it is recommended that the B1 setting should be checked or adjusted (See ADJUSTMENT OF B1 POWER SUPPLY).
6. The high voltage applied to the picture tube must conform with that specified in Service manual. Excessive high voltage can cause an increase in X-Ray emission, arcing and possible component damage, therefore operation under excessive high voltage conditions should be kept to a minimum, or should be prevented. If severe arcing occurs, remove the AC power immediately and determine the cause by visual inspection (incorrect installation, cracked or melted high voltage harness, poor soldering, etc.). To maintain the proper minimum level of soft X-Ray emission, components in the high voltage circuitry including the picture tube must be the exact replacements or alternatives approved by the manufacturer of the complete product.
7. Do not check high voltage by drawing an arc. Use a high voltage meter or a high voltage probe with a VTVM. Discharge the picture tube before attempting meter connection, by connecting a clip lead to the ground frame and connecting the other end of the lead through a 10kΩ 2W resistor to the anode button.
8. When service is required, observe the original lead dress. Extra precaution should be given to assure correct lead dress in the high voltage circuit area. Where a short circuit has occurred, those components that indicate evidence of overheating should be replaced. Always use the manufacturer's replacement components.
9. manufacturer's replacement components.

# PRECAUTIONS

10. Isolation Check  
(Safety for Electrical Shock Hazard)  
After re-assembling the product, always perform an isolation check on the exposed metal parts of the cabinet (antenna terminals, video/audio input and output terminals, Control knobs, metal cabinet, screwheads, earphone jack, control shafts, etc.) to be sure the product is safe to operate without danger of electrical shock.
11. The surface of the TV screen is coated with a thin film which can easily be damaged. Be very careful with it when handle the TV. Should the TV screen become soiled, wipe it with a soft dry cloth. Never rub it forcefully. Never use any cleaner or detergent on it.
  - (1) Dielectric Strength Test  
The isolation between the AC primary circuit and all metal parts exposed to the user, particularly any exposed metal part having a return path to the chassis should withstand a voltage of 3000V AC (r.m.s.) for a period of one second. (...Withstand a voltage of 1100V AC (r.m.s.) to an appliance rated up to 120V, and 3000V AC (r.m.s.) to an appliance rated 200V or more, for a periode of one second.)  
This method of test requires a test equipment not generally found in the service trade.
  - (2) Leakage Current Check  
Plug the AC line cord directly into the AC outlet (do not use a line isolation transformer during this check.). Using a "Leakage Current Tester", measure the leakage current from each exposed metal part of the cabinet, particularly any exposed metal part having a return path to the chassis, to a known good earth ground (water pipe, etc.). Any leakage current must not exceed 0.5mA AC (r.m.s.).  
However, in tropical area, this must not exceed 0.2mA AC (r.m.s.).  
•Alternate Check Method  
Plug the AC line cord directly into the AC outlet ( do not use a line isolation transformer during this check.). Use an AC voltmeter having 1000 ohms per volt or more sensitivity in the following manner. Connect a 1500Ω 10W resistor paralleled by a 0.15μF AC-type capacitor between an exposed metal part and a known good earth ground (water pipe, etc.). Measure the AC voltage across the resistor with the AC voltmeter. Move the resistor connection to each exposed metal part, particularly any exposed metal part having a return path to the chassis, and measure the AC voltage across the resistor. Now, reverse the plug in the AC outlet and repeat each measurement. Any voltage measured must not exceed 0.75V AC (r.m.s.). This corresponds to 0.5mA AC (r.m.s.).  
However, in tropical area, this must not exceed 0.3V AC (r.m.s.).  
This corresponds to 0.2mA AC (r.m.s.)

BLOCK DIAGRAM

# 3. REPLACEMENT OF MEMORY IC

## 1. MEMORY IC.

This TV uses memory IC. In the memory IC are memorized data for correctly operating the video and deflection circuits.

When replacing memory IC, be sure to use IC written with the initial value of data.

## 2. PROCEDURE FOR REPLACING MEMORY IC

- (1) **Power off**  
Switch the power off and unplug the power cord from AC outlet.
- (2) **Replace IC**  
Be sure to use memory IC written with the initial data values.
- (3) **Power On**  
Plug the power cord into the AC outlet and switch the power On.
- (4) **Check and set SYSTEM default value:**
  - 1) Press "QV" key holding about 4 second and then press "MENU1" key on the Remote control unit.  
Or Press "TEST" key on the Remote control unit for factory used.
  - 2) The "TEST" will be displayed on the screen.
  - 3) Press digital key, (Mkey) and corresponding on-screen display will be appeared.  
Some time "PASSWORD" on-screen display will be appeared, you need to input 828.
  - 4) Check the setting value of the SYSTEM default value of Table below. If the value is different, select items by [CH+]/[CH-] keys and set value by [VOL+]/[VOL-] keys.
  - 5) Press "STANDBY" key again and return to the normal screen.

# 4. SERVICE ADJUSTMENT

## B1 POWER SUPPLY

1. Receive normal colour bar signal.
2. Connect DC voltmeter to VD541- and isolated ground.
3. Adjust potentiometer in power unit to get the voltage as 110V ±1.0V for 21 inch hereinafter,

130 ±1.0V for 25 inch upwards.

## FOCUS ADJUSTMENT

1. Receive a crosshatch signal.
2. While watching the screen, adjust the FOCUS VR to make the vertical and horizontal lines as fine and sharp as possible.

## BUS CONTROL ADJUSTMENT

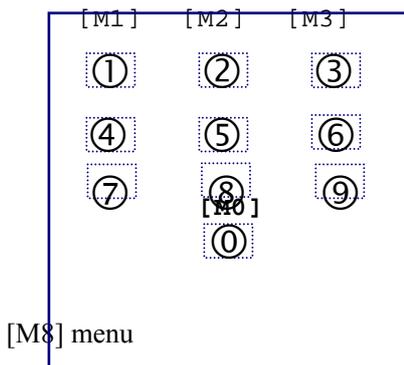

To enter BUS control mode, Press "TEST" key on the Remote control unit of factory.

Press "0" to "9" key, (Mkey) and corresponding on-screen display will be appeared.

On TV screen "TEST" will be indicated, this means entered bus control mode.

And press following key, each function will be available.

Remote Hand Unit keys

	MENU8
V	SLOPE
31	
V	SHIFT
31	
V	AMP
31	
V	SCOR
.	

## MENU0 Geometrical adjustment

Receive PAL standard Complete pattern signal.

Adjustment steps :

- a) Adjust V. SLOPE, to the center horizontal line just appear from half bottom shadow.
- b) Adjust V. SIZE, to get 90% of vertical picture contents would be displayed on CRT.
- c) Adjust V. SHIFT, the center horizontal line correspond to CRT vertical center.
- d) Adjust H.SHIFT, to get the picture horizontal center correspond to CRT horizontal center.

Receive NTSC signal and repeat above [M0] and [M1] adjustment.

[M7] Menu

**AGC Adjustment.**

Receive 60dB $\mu$ (1mV) $V_H$  colour bar pattern signal , adjust AGC value ( voltage from high to low ), to noise reduce gradually and just disappeared point.

[M9] Menu

**CRTcut off and white balance adjustment.**

Receive white signal.

- a) **CRT cut off adjustment.**
  1. Select "SC", then automatically vertical scan will be stopped.
  2. Adjust SCREEN control on Flyback transformer to get the darkest single horizontal line (red, green, or blue, sometimes shows more yellow, more purple or more white).
- b) **White balance adjustment.**
  1. Select RD/BD menu.
  2. Adjust RD/BD to get colour temperature as x=281, y=311
- c) **Sub-Brightness adjustment. (Use stair case signal)**
  1. Select SB menu.
  2. Adjust SB to get the darkest step being cutoff.

## 5. ICs functional description

UOC TDA93XX

SYMBOL	PIN	DESCRIPTION
STAND BY output.	1	In STAND BY mode, high level (Power OFF). For Power ON this pin will be reduced to low.
SCL	2	I <sup>2</sup> C-bus clock line
SDA	3	I <sup>2</sup> C-bus data line
TUNING	4	tuning Voltage (Vt) PWM output
P3.0/NTSC SW	5	Port 3.0 or NTSC output/SCART SW input, Forced NTSC selection, Low-level output, otherwise High output.
KEY	6	Control keys input *3
VOL	7	Sound Volume control PWM output
MUTE	8	Sound mute output
VSSC/P	9	Digit ground for $\mu$ -controller core and periphery
BAND1	10	Tuner Band selection output
BAND2	11	Tuner Band selection output
VSSA	12	Analog ground of teletext decoder and digital ground of TV-processor
SECPLL	13	SECAM PLL decoupling
VP2	14	2 <sup>nd</sup> supply voltage TV-processor(+8V)
DECDIG	15	decoupling digital supply of TV-processor
PH2LF	16	Phase-2 filter
PH1LF	17	Phase-1 filter
GND3	18	Ground 3 for TV-processor
DECBG	19	Band gap decoupling
AVL/EWD	20	Automatic volume leveling /EAST-WEST drive output
VDRB	21	Vertical drive B output
VDRA	22	Vertical drive A output
IFIN1	23	IF input 1
IFIN2	24	IF input 2
IREF	25	Reference current input
VSC	26	Vertical sawtooth capacitor
TUNER AGC	27	Tuner AGC output
AUDEEM/SIFIN1 *1	28	Audio deemphasis or SIF input
DECSDEM/SIFIN2	29	decoupling sound demodulator or SIF input 2
GND2	30	ground 2 for TV processor
SNDPLL/SIFAGC *1	31	narrow band PLL filter or AGC sound IF
AVL/SNDIF/REF0/ AMOUT *1	32	Automatic Volume Levelling / sound IF input / subcarrier reference output / audio deemphasis
HOUT	33	horizontal output
FBISO	34	flyback input/sandcastle output

AUDEXT/QSSO/ AMOUT *1	35	external audio output / QSS intercarrier out
EHTO	36	EHT/overvoltage protection input
PLL IF	37	IF-PLL loop filter
IFVO/SVO	38	IF video output / selected CVBS output
VP1	39	supply voltage TV processor
CVBS INT	40	internal CVBS input
GND1	41	ground for TV processor
CVBS/Y	42	CVBS/Y input
CHROMA	43	C input
AUDOUT/AMOUT *1	44	audio output /AM audio output (volume controlled)

<b>INSSW2</b>	<b>45</b>	<b>2<sup>nd</sup> RGB / YUV insertion input</b>
<b>R2/VIN</b>	<b>46</b>	<b>2<sup>nd</sup> R input / V (R-Y) input / Pr input</b>
<b>G2/YIN</b>	<b>47</b>	<b>2<sup>nd</sup> G input / Y input</b>
<b>B2/UIIN</b>	<b>48</b>	<b>2<sup>nd</sup> B input / U (B-Y) input / Pb input</b>
<b>BCLIN</b>	<b>49</b>	<b>beam current limiter input</b>
<b>BLKIN</b>	<b>50</b>	<b>black current input / V-guard input</b>
<b>RO</b>	<b>51</b>	<b>Red output</b>
<b>GO</b>	<b>52</b>	<b>Green output</b>
<b>BO</b>	<b>53</b>	<b>Blue output</b>
<b>VDDA</b>	<b>54</b>	<b>analog supply of Closed Caption decoder and digital supply of TV-processor (3.3 V)</b>
<b>VPE</b>	<b>55</b>	<b>OTP Programming Voltage</b>
<b>VDDC</b>	<b>56</b>	<b>digital supply to core (3.3 V)</b>
<b>OSCGND</b>	<b>57</b>	<b>oscillator ground supply</b>
<b>XTALIN</b>	<b>58</b>	<b>crystal oscillator input</b>
<b>XTALOUT</b>	<b>59</b>	<b>crystal oscillator output</b>
<b>RESET</b>	<b>60</b>	<b>reset</b>
<b>VDDP</b>	<b>61</b>	<b>digital supply to periphery (+3.3 V)</b>
<b>P1.0/INT1</b>	<b>62</b>	<b>TV/AV (AV1) / AV2 /S-VHS mode Output.</b>
<b>P1.1/T0</b>	<b>63</b>	<b>TV/AV (AV1) / AV2 /S-VHS mode Output.</b>
<b>P1.2/INT0</b>	<b>64</b>	<b>Remote control signal input.</b>

**Note**

1. The function of pin 20, 28, 29, 31, 32, 35 and 44 is dependent on the IC version (mono intercarrier FM demodulator /QSS IF amplifier and East-West output or not) and on some software control bits. The valid combinations are given in table 1.
2. the vertical guard function can be controlled via pin 49 or pin 50. the selection is made by means of the IVG bit in subaddress 2BH.

TABLE 1

IC version	FM-PLL version				QSS version					
	N		Y		N			Y		
East-West Y/N	N		Y		N			Y		
CMB1/CMB0 bits	00	01/10/11	00	01/10/11	00	01/10/11		00	01/10/11	
AM bits	-	-	-	-	-	0	1	-	0	1
Pin 20	AVL		EWD		AVL			EWD		
Pin 28	AUDEEM				SIFIN1					
Pin 29	DECSDEM				SIFIN2					
Pin 31	SNDPLL				SIFAGC					
Pin 32	SNDIF(1)	REFO(2)	AVL/SNDIF(1)	REFO(2)	AMOUT	REFO(2)		AMOUT	REFO(2)	
Pin 35	AUDEXT				AUDEXT	QSSO	AMOUT	AUDEXT	QSSO	AMOUT
Pin 44	AUDOUT				Controlled AM or audio out					

**Note**

1. When additional (external) selectivity is required for FM-PLL system pin 32 can be used as sound IF input. This function is selected by means of SIF bit in subaddress 28H.
2. the reference output signal is only available for the CMB1/CMB0 setting of 0/1. for the other settings this pin is a switch output(see also 5 table 67).

**Pin No. 6:** Control keys input (Max. Limit voltage)

Function	POWER	MENU	TV/AV	V-	V+	P-	P+

## 8. PURITY / CONVERGENCE ADJUSTMENT

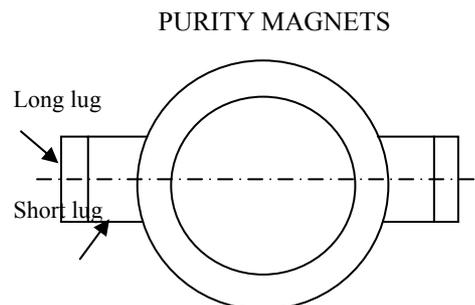

### PURITY ADJUSTMENT

1. Demagnetize CRT with the demagnetizer.
2. Loosen the retainer screw of the deflection yoke.
3. Remove the wedges.
4. Input a green raster signal from the signal generator, and turn the screen to green raster.
5. Move the deflection yoke backward.
6. Bring the long lug of the purity magnets on the short lug and position them horizontally. (Fig2)
7. Adjust the gap between two lugs so that the GREEN RASTER will come into the center of the screen. (Fig. 3)
8. Move the deflection yoke forward, and fix the position of the deflection yoke so that the whole screen will become green.
9. Insert the wedge to the top side of the deflection yoke so that it will not move.
10. Input a crosshatch signal.
11. Verify that the screen is horizontal.
12. Input red and blue raster signals, and make sure that purity is properly adjusted.

**P: PURITY MAGNET**  
**4: 4-POLES (convergence magnets)**  
**6: 6-POLES (convergence magnets)**

Fig. 1

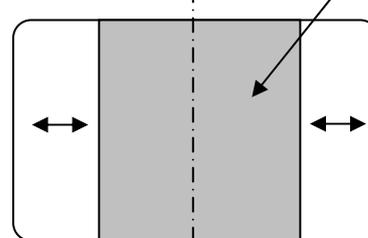

Bring the long lug over the short lug and position them horizontally.

Fig. 2

(FRONT VIEW)

GREEN RASTER

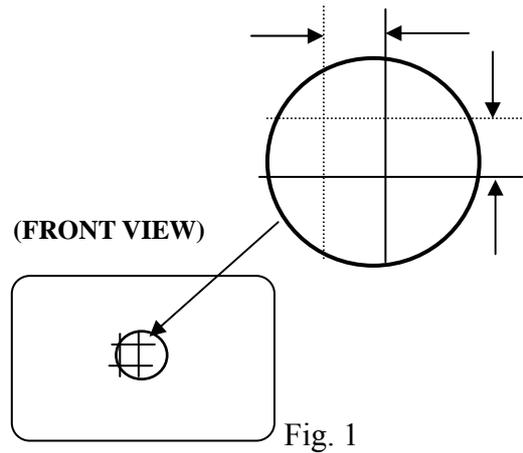

CENTER

Fig. 3

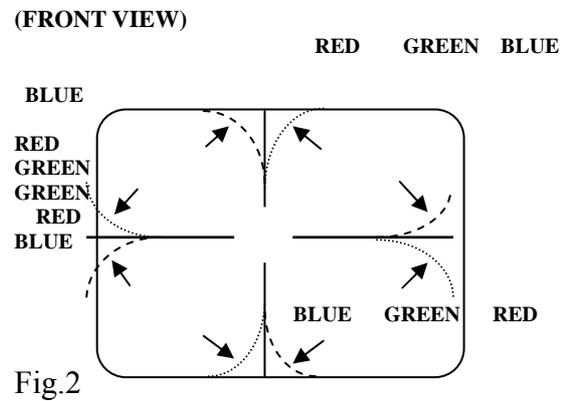

## STATIC CONVERGENCE ADJUSTMENT

1. Input a crosshatch signal.
2. Using 4-pole convergence magnets, overlap the red and blue lines in the center of the screen (Fig. 1) and turn them to magenta (red/blue).
3. Using 6-pole convergence magnets, overlap the magenta (red/blue) and green lines in the center of the screen and turn them to white.
4. Repeat 2 and 3 above, and make the best convergence.

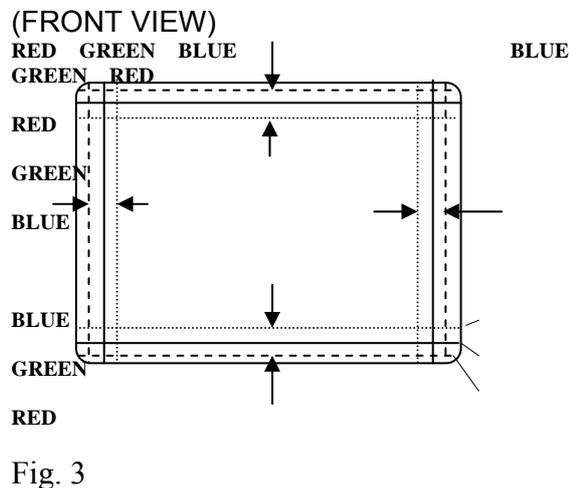

## DYNAMIC CONVERGENCE ADJUSTMENT

1. Move the deflection yoke up and down and overlap lines in the periphery. (Fig. 2)
2. Move the deflection yoke left to right and overlap the lines in the periphery. (Fig. 3)
3. Repeat 1 and 2 above, and make the best convergence.

After adjustment, fix the wedge at the original position.  
Fasten the retainer screw of the deflection yoke.  
Fix the 6 magnets with glue.

### 警告

该机电源部分带电，维修本机时，请使用隔离变压器。  
为了防止电的危险，不要去拆下机盖。必须委托够格的维修人员来进行维修。

### WARNING

The power part in this receiver is electrical .  
Please use an isolative transformer in servicing.  
To prevent electric shock don't remove cover,  
Refer servicing to qualified service personnel.

## Overall Configuration:

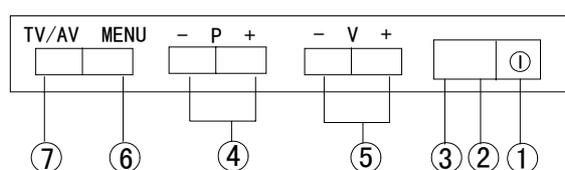

In this chassis, the single-chip IC OM8838/TDA8842 for color TV small signal processing with I<sup>2</sup>C bus control of the Phillips is used. It can be used on all models from 14" to 29". It has a number of expansion functions, and a series of color TV sets, from simple to high grade and of a number of systems, such as PAL, NTSC and SECAM can be made on a single PCB master board

## Specification

TV system	TV, PAL, AV, PAL , NTSC
Power consumption	14" ≥ 65W、 21" ≥ 70W、 25" ≥ 110W、 29" ≥ 120W
Power supply range	AC/ 150V ----- AC/ 260V
Tuning range	Full frequency band: VHF, UHF, CATV
Medium band	38.0MHz, 38.9MHz or others
Wireless input impedance	75 Ω unbalanced
AV input	AV1 and AV2
AV output	1 channel
Audible output	>3W
Loudspeaker impedance	8 Ω

(Note: It may differ depending on types)

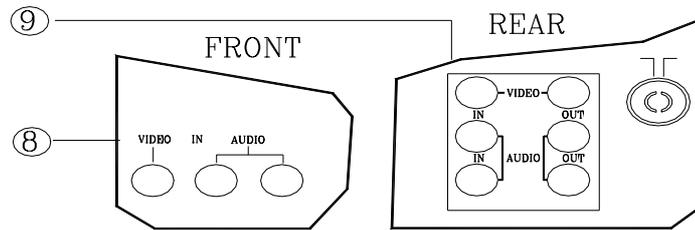

## Control panel diagram

The adjusting buttons and some sockets are in the front of the TV, other sockets are in the rear of the TV.

- ① Main power switch
- ② Remote control sensor
- ③ Power indicator
- ④ Program number down (P-) and up (P+)
- ⑤ Volume decrease (V-) and increase (V+)
- ⑥ Menu button
- ⑦ TV/AV button

## Remote controller diagram

## —. Introduction to IC's

### 1. TDA8842 (OM8838) multi-system small signal processing IC

TDA8842 (OM8838) is the new type Video/Chroma/Deflection (V/C/D) processing chip developed by the Phillips in 1998, i.e., the Video/Chroma/Deflection small signal processing IC. By fully adopting the I<sup>2</sup>C bus control technique and integrating a number of unique circuits into the chip, it has greatly simplified the elements external to the IC and achieved overall improvement in the picture and sound quality of the popular model color TV sets.

**TDA8842 (OM8838)** was developed on the basis of its **TDA8362/8361** single-chip IC, therefore it has retained the main functional circuits in the ordinary single-chip IC **TDA8362/8361**, and it mainly includes: phase-locked loop (PLL) synchronized detection and picture intermediate frequency (PIF) signal processing module; the second sound intermediate frequency (SIF2) signal processing module centered with PLL frequency discrimination; the commissioning free scanning deflection indirect triggering pulse forming module with the dual PLL as the core; the brightness signal processing module with a number of measures to improve picture quality; the chroma signal decoding module suiting the selection of a number of systems; and the matrix circuit module satisfying the conversion and transfer of multi-channel basic color levels.

**TDA8842 (OM8838)** series IC's have introduced the I<sup>2</sup>C bus "Read/Write" technique, the frequency synthesis technique (FS), charge coupling switch capacitance network technique (CCD), and digital signal processing technique (DSP). Also inside the chip, circuits such as bus controlled matrix switch, 1H delay horizontal and comb filter are integrated. All functions traditionally accomplished by cooperation with external circuits can all be performed inside the chip, thus greatly increasing the signal processing ability of the chip, realizing the self-adapting adjustment for the control objects. Especially, the "Read" technique of I<sup>2</sup>C bus is used, so that the **TDA8842 (OM8838)** series IC's have advanced functions such as automatic fault diagnosis. The internal block diagram of **TDA8842 (OM8838)** series IC is as shown in Fig. 1.

#### **(I) It mainly consists of the following function sections:**

##### 1. **Video intermediate frequency (VIF) unit circuit**

This circuit consists of the video intermediate amplification, adjustment free VCO, PLL demodulator, video buffer, automatic frequency control circuit AFC, automatic gain control circuit AGC and video signal identification circuit, as detailed in Fig. 2.

##### 2. **Sound intermediate amplification unit circuit**

The sound intermediate amplifier consists of the PLL demodulator, preamplifier and muting circuit, volume control circuit and audio switch, as detailed in Fig. 3.

##### 3. **Horizontal and vertical synchronization unit circuit**

The horizontal and vertical synchronization unit circuit consists of the horizontal synchronization separator, vertical synchronization separator, horizontal oscillation circuit and correction system, PHI-1 and PHI-2 detectors, sandcastle pulse generator, the horizontal output circuit with slow start and slow stop devices, noise detector and vertical frequency divider, as detailed in Fig. 4.

##### 4. **Horizontal and vertical geometric correction and deflection driving unit circuit**

This unit circuit consists of four sections, i.e., vertical serrated wave generator, vertical geometric correction processor, horizontal (E-W) geometric correction processor, EHT follow-up and over-voltage protection circuit, as detailed in Fig. 5.

#### 5. **Filter CVBS/Y/C switching unit circuit**

The filter CVBS/Y/C switching unit circuit has such main functions: selective filtering correction for input composite video signal CVBSINT, output composite video signal CVB-SEXT, CVB/Y and chroma signal C; chroma signal processing and brightness signal processing, as detailed in Fig. 6.

#### 6. **Color decoder unit circuit**

The color decoder unit circuit consists of the PLL/VCXO circuit, PAL/NTSC identification circuit, SECAM identification circuit, (R-Y)/(B-Y) demodulator and automatic system manager ASM, as detailed in Fig. 7.

#### 7. **RGB primary signal processor and control unit circuit**

This unit circuit mainly consists of two parts, the processing of YUV/RGB video component signal and primary signal, and RGB control, as detailed in Fig. 8.

### **(II) Main composition and functions of main pins**

#### **1. Main composition**

This chassis is in standard single-board structure in the overall layout, the mature Sanyo power supply is used, and the position numbers are arranged to international standard. Its main IC's and their functions are as follows:

Position No. 0- AV unit

Position No. 1- small signal unit

Position No. 2- video amplification unit

Position No. 3- vertical unit

Position No. 4- horizontal unit

Position No. 5- intermediate amplification and decoding unit

Position No. 6- sound unit

Position No. 7- remote control unit

Position No. 8- power supply unit

Position No. 9- other units

①N701 MTV880C.V1.1 (CPU)

②N702 PCF8594/24C04 (E<sup>2</sup>PROM)

③N501 OM88388 (color single-chip small signal processor)

④N601 TDA7056B (single-channel power amplification)  
N602 TDA7057AQ (stereo power amplification)

⑤N301 TDA8351 (large screen vertical module)  
TDA8356 (small screen vertical module)

⑥N201 TDA6108JF/TDA6107JF (only for some models)

⑦N001 HEF4053 (AV switch, only for models with AV stereo)

⑧V101 ENV59D68F1G (38MHz)/ENV9D68FIE (38.9MHz)

⑨T402 FBT (flyback transformer)

#### **2. Functions of main pins of ICs'**

[1]CPU MTV880C.V1.1 (Note: 0—low level, 1— high level)

Pin ① Tuning voltage output (functioning only to VST tuner, and it has no output when the IIC bus has identified the presence of a FST tuner.)

Pin ② left channel volume control output

Pin ③ right channel volume control output (Note: Pins ② and ③ have PWM output only when there is no output from IIC)

Pin ④ woofer switch (Note: there is level output only when IIC has not identified the presence of the TDA9680 sound chip) 0=OFF 1=ON

Pin ⑤ sound system identification circuit input, can be used as automatic identification function for sound system (Note: not used in this machine)

Pin ⑥ video signal identification output, when there is video signal in the current program signal (including AV): 1=presence of video signal 0=no video signal (not used in this chassis)

Pin ⑦ 1=switching to S-VHS signal input at port 0=switching to other signal source (not used in this chassis)

Pin ⑧ for control of the working status of comb filter  
0=NTSC 1=PAL/SECAM status

It is used in 25" and 29" models, for control of pillow distortion equalizing circuit in N system

Pin ⑨ local key

Pin ⑩ local key

Pin ⑪ not used

Pin ⑫ AV/TV status output 1=TV 0=AV

Pin ⑬ sound system output

Pin ⑭ sound system output mainly as follows:

(13) system	(14) system	Sound system
0	0	M
0	1	D/K
1	0	I
1	1	BG

Pin ⑮ mute (not used in this chassis as under mute status, the N701①② pin DC control level automatic output is 0)

1=no mute 0=mute

Pin ⑯ LED driven output

0=LED highly lit, indicating a stand-by status or is receiving remote control signal

1=LED slightly lit, indicating usual status

Pins ⑰ ⑱ Band control output, only to VST tuner

(17)	(18)	Band
0	0	VHF-L
1	0	VHF-H
1	1	UHF

Pin ⑲ AV3 status not used at present

1=AV3 status 0=other status

Pin ⑳ AV1 and AV2 status

1=AV1 TV/AV2=0

- Pin ⑳ Ground
- Pins ㉒ ㉓ ㉔ are respectively for B,G,R screen character display output (Note: the blue background in this machine is produced inside OM8838)
- Pin ㉕ blanking signal output
- Pin ㉖ horizontal synchronization signal input (positive polarity)
- Pin ㉗ vertical synchronization signal input (positive polarity)
- Pin ㉘ +5V
- Pin ㉙ ground
- Pin ㉚ not used in this machine
- Pins ㉛ ㉜ 12MHz
- Pin ㉝ reset            1=reset    0=general status
- Pin ㉞ vertical frequency identification output    1=60Hz    0=50Hz
- Pin ㉟ forced to AV2 when the level is changed from high to low
- Pin ㊱ forced to AV1 when the level is changed from low to high
- Pin ㊲ infrared remote signal input    effective for high level
- Pin ㊳ factory production mode control (not used in this machine)
- Pin ㊴ clock line    SCL
- Pin ㊵ data line    SDA
- Pin ㊶ stand-by status (stand-by)  
0=working status    1= stand-by status
- ㊷ Pin            +5V power supply

Pin ④	Sound working voltage (+15V-18V)
Pin ⑤	Audio signal R input
Pin ⑥	Ground
Pin ⑦	Sound volume DC level 2 control
Pins ⑧⑩	Sound signal output (8 as positive and 10 as negative)
Pin ⑨	Ground

Pins ⑪ ⑬	Sound signal output (11 as positive and 13 as negative)
Pin ⑫	Ground

**TDA7056 (mono)**

Pin No.	Function
Pin ①	Blank
Pin ②	Sound working power supply (+14V-16V)
Pin ③	Audio signal input
Pin ④	Ground
Pin ⑤	Sound volume DC level control
Pins ⑥⑧	Loudspeaker output (6 as positive and 8 as negative)
Pin ⑦	Ground
Pin ⑨	Blank

**[5] Vertical block TDA8356/TDA8351**

Pin No.	Function
Pins ①②	Vertical drive signal input
Pin ③	Vertical working power supply (+16V negative pulse)
Pins ④⑦	Vertical output
Pin ⑤	Ground
Pin ⑥	Pump power supply (+45V negative pulse)
Pin ⑧	Vertical protection
Pin ⑨	Vertical feedback

The pins functions of 8356 and 8351 are all the same  
 only 8356 I=2A  
 8351 I=3A

**[6] Video amplification TDA6107Q/TDA6108JF**

Pin No.	Function
Pins ①②③	R,G and B input
Pin ④	Ground
Pin ⑤	Dark balance testing output
Pin ⑥	Working voltage +180V
Pins ⑦⑧⑨	R,G and B output

6107 and 6108 pins are all the same, 6107 has a bandwidth of 4.5MHz and 6108 has a bandwidth of 8MHz

**[7] T402 Flyback transformer**

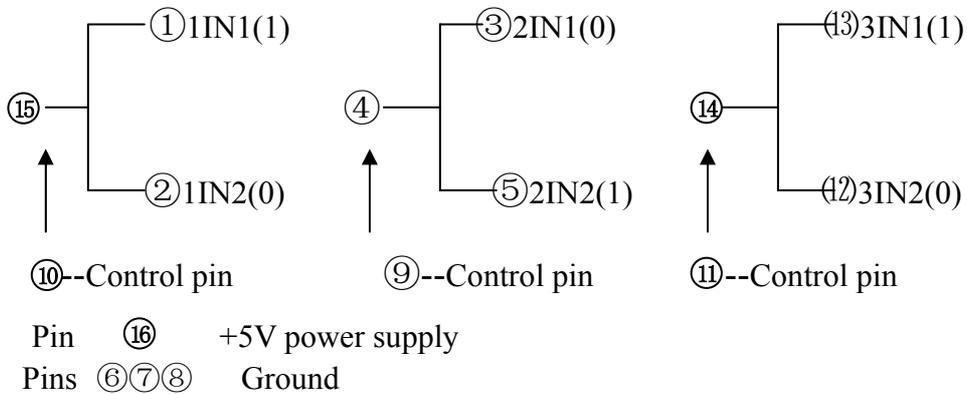

Pin No.	Function
Pin ①	Horizontal collector
Pin ②	+B
Pin ③	Vertical power supply (+45V)
Pin ④	Vertical power supply (+16V)
Pin ⑤	Ground
Pin ⑥	AFC $V_{p-p}=150V$
Pin ⑦	ABL
Pin ⑧	Heater

Pin ⑨	Video amplification voltage (+180V)
Pin ⑩	Blank

Output 1

## II. Description of adjustment

### Factory status data for 8838/8842 chassis

A special remote controller for factory use must be used to enter the factory adjustment status of the 8838/8842 chassis, as detailed below:

You can enter the factory status by pressing continuously the “Maintenance” and “mute” keys on the factory remote controller. Now you can see the first menu display under factory status as follows:

<b>MTV880C.</b>			
<b>OSDORGH</b>	<b>56</b>	<b>35-120</b>	
<b>OSDORGV</b>	<b>13</b>	<b>0-45</b>	
<b>OSDPLL</b>	<b>120</b>	<b>35-205</b>	

Remarks:

OSDORGH: for adjusting left and right positions of characters

OSDORGV: for adjusting up and down positions of characters

\*OSDPLL: set value 120.

**Note: The characters positions for PAL system signal and NTSC system signal should be adjusted separately.**

Press the “Maintenance” key twice to enter the second menu under factory status, which gives the following display:

<b>MTV880C.</b>			
<b>V-SLOPE</b>	<b>37</b>	<b>0-63</b>	
<b>V-AMPL</b>	<b>20</b>	<b>0-63</b>	
<b>V-S.CORR</b>	<b>17</b>	<b>0-63</b>	
<b>V-SHIFT</b>	<b>29</b>	<b>0-63</b>	
<b>V-ZOOM</b>	<b>25</b>	<b>0-63</b>	
<b>V-SCROLL</b>	<b>31</b>	<b>0-63</b>	

Remarks:

V-SLOPE: Vertical semi-blanking adjustment, specifically as follows:

First receive the signal from the PHILIPS card to adjust this value, and adjust so that a horizontal line just appears in the center of the P card.

V-AMPL: vertical magnitude adjustment

V-S.CORR: vertical S-correction adjustment

V-SHIFT: vertical center adjustment

- \*V-ZOOM: set value 25
- \*V-SCORLL: set value 31

**Note: The vertical adjustment for PAL system signal and NTSC system signal should be adjusted separately.**

Press the “Maintenance” key three times to enter the third menu under factory status, which gives the following display:

<b>MTV880C.</b>		
<b>H-SHIFT</b>	<b>36</b>	<b>0-63</b>
<b>H-WIDTH</b>	<b>31</b>	<b>0-63</b>
<b>H-PARAB</b>	<b>31</b>	<b>0-63</b>
<b>H-CORNER</b>	<b>31</b>	<b>0-63</b>
<b>H-TRAP</b>	<b>31</b>	<b>0-63</b>

Remarks:

H-SHIFT: horizontal center position adjustment.

\*H-WIDTH set value 31.

\*H-PARAB set value 31.

\*H-CORNER set value 31.

\*H-TRAP set value 31.

**Note: The horizontal center for PAL system signal and NTSC system signal should be adjusted separately.**

Press the “Maintenance” key four times to enter the fourth menu under factory status, which gives the following display:

<b>R-31</b>
<b>G-31</b>
<b>B-31</b>
<b>C-4</b>

Remarks: R: brightness balance red gun adjustment

G: brightness balance green gun adjustment

B: brightness balance blue gun adjustment

C: set value is adjustable between 1-6, is determined by CRT driving voltage and has been set as a fixed value when leaving the factory.

Press the “Maintenance” key five times to enter the fifth menu under factory status, which gives the following display:

<b>MTV880C.</b>		
<b>AGC-TAK</b>	<b>3</b>	<b>0-63</b>
<b>VOLUME-CON</b>	<b>40</b>	<b>0-63</b>
<b>Y-DELAY</b>	<b>7</b>	<b>0-15</b>
<b>IF-FRE</b>	<b>38.00</b>	<b>0-5</b>
<b>IN WINDOW ABOVE</b>		

Remarks:

\*AGC-TAK: set value 3

VOLUME-CON: set value 35-45 (This adjustment can change the volume, and has been set as a fixed value according to power requirement after leaving the factory)

\*Y-DELAY: set value 7

\*IF-FRE: set value 38 or 38.9 (set as a fixed value when leaving the factory)

IN WINDOW ABOVE: indicating MF is within the range.

Press the “Maintenance” key six times to enter the sixth menu, which gives the following display:

<b>MTV880C .</b>		
<b>Y-CTI-DELAY</b>	<b>4</b>	<b>0-7</b>
<b>ADAP. BLACK</b>	<b>32</b>	<b>0-63</b>
<b>LUM. LINER</b>	<b>32</b>	<b>0-63</b>
<b>GAMMA</b>	<b>32</b>	<b>0-63</b>
<b>PEARING</b>	<b>32</b>	<b>0-63</b>
<b>STEEPNESS</b>	<b>32</b>	<b>0-63</b>
<b>CORE</b>	<b>32</b>	<b>0-63</b>
<b>LINE WIDTH</b>	<b>32</b>	<b>0-63</b>

Remarks:

No item in this menu will function in the adjustment of this chassis.

Press the “Maintenance” key seven times to enter the seventh menu, which gives the following display:

<b>OPTION 0</b>	
<b>WOOFER</b>	<b>1</b>
<b>WOOFER VOL</b>	<b>0</b>
<b>COMB FILTER</b>	<b>0</b>
<b>AUTO SOUND</b>	<b>0</b>
<b>DIRECT SWITCH</b>	<b>1</b>
<b>TUNE SPEED</b>	<b>0</b>
<b>STERO</b>	<b>1</b>

Remarks: \*WOOFER: set value 1 (0 for 21” and 14”)

\*WOOFER VOL: set value 0

\*COMB FILFER: set value 0

\*AUTO SOUND: set value 0

\*DIRECT SWITCH: set value 1

\*TUNE SPEED: set value 0

\*STERO: set value 1 (0 for machines with single audio channel)

Press the “Maintenance” key eight times to enter the level eighth menu, which gives the following display:

<b>OPTION 1</b>	
<b>PAL 4.43</b>	<b>1</b>
<b>NTSC 3.58</b>	<b>1</b>
<b>NTSC 4.43</b>	<b>1</b>
<b>SECAM</b>	<b>0</b>
<b>DK</b>	<b>0</b>
<b>BG</b>	<b>0</b>
<b>I</b>	<b>0</b>
<b>M</b>	<b>0</b>

Remarks:

\*PAL 4.43: set value 1

\*NTSC 3.58: set value 1

\*NTSC 4.43: set value 1

\*SECAM: set value 0 (it is a set value for 8842)

\*DK: set value 0 (1 for full system)

\*BG: set value 0 (1 for full system)

\*I: set value 0 (1 for full system)

\*M: set value 0 (1 for full system)

Press the “Maintenance” key nine times to enter the ninth menu, which gives the following display:

OPTION2	
AV1	1
AV2	1
AV3	0
SVHS	1
UI MODE	2
MESH MODE	0
IF	1
REVERSE SEARCH	0

Remarks:

- \* AV1: set value 1
- \*AV2: set value 1 (0 for one channel of AV input)
- \*AV3: set value 0
- \*SVHS: set value 1 (0 for 21” and 14”)
- \*UI MODE: set value 2
- \*MESH MODE: set value 0
- \*IF: set value 1
- \*REVERSE SEARCH: set value 0

Press the “Maintenance” key ten times to enter the tenth menu, which gives the following display:

OPTION3	
AV SOUND	
AV1	0
AV2	0
AV3	0
SVHS	0

Remarks: all being set value 0

*Note:*

1. Those with “\*” are factory set values and must not be altered.
2. You can exit from the factory status by pressing the “TV” key on the remote controller in any level of factory menu.

### III. Repair for common faults

#### 1. Fault principle and analysis for video amplification section

##### ① Characteristics and principle of automatic white balance adjustment of 8838/8842 series TV set

The primary colors R, G and B from the decoding circuit, after passing three independent video amplifiers, are applied to the cathodes of three independent electron guns, to control three independent electron beams, which are converged to hit the respective fluorescent materials. They should show white when mixed, but the luminous efficiency of the fluorescent materials cannot be the same due to the characteristics of elements in the three amplifiers and the electron emitting ability of the electron gun cathodes. Therefore balance adjustment must be performed to display a white color, hence it is referred to as white balance adjustment. In an ordinary color TV set, white balance is adjusted by adjusting the bias resistance of the video amplification, i.e., the static bias of video amplification pole and signal amplitude amplification ability, to control the balance of the three current beams. Despite careful adjustment before leaving the factory, after long-time service, any change in any parameter of the three independent channels will break the white balance, resulting in “color cast”. It can be restored to normal only after re-adjustment by specialized personnel. The

white balance is classified as “dark white balance” and “bright white balance”. Dark white balance means the white balance when the screen is in dark condition because of high cathode voltage of the electron gun and low electron beam current, it corresponds to the color cast resulted from different electron flow cut-off characteristics of the beams from three guns, therefore dark white balance adjustment is actually an adjustment of the static bias voltage of the video amplifier. The bright white balance is the white balance when the display screen is in bright status because of low cathode voltage of the electron gun and high electron beam current, it corresponds to the color cast resulted from different grid cathode transconductance characteristics of the three guns, therefore bright white balance adjustment is actually an adjustment of the output signal amplitude of the video amplifier.

In 8838/8842 series color TV set, the automatic white balance adjustment technique is adopted to achieve a good solution to the color cast problem. At the instance of each time when the machine is turned on, it automatically check and adjust the static bias voltage and output signal amplitude of the video amplification circuit, so that genuine, clear and bright colors can be maintained even after long time use of the TV set. The schematic diagrams of video amplification and white balance automatic check circuit of 8838/8842 color TV set is as shown in Fig. 9. Figs. 10 and 11 are the simplified schematics. The automatic adjustment method for white balance is: while the video amplifier and display with basically the same structure, bias and gain remaining fixed unchanged, the “dark voltage” and “bright voltage” permitting slight correction is fed respectively into the three independent amplifiers from the primary color R, G, B output ports of the TDA8842/8838, then the cathode current (electron beam current) of the three guns of the CRT is checked and compared with the same standard, to correct the output of R, G and B by negative feedback mode according to their difference, until the cathode current of the three guns are equalized (showing white). The entire adjustment is automatically performed under the control by the IIC bus.

With Figs. 9 and 10, we can analyze the automatic adjustment process of white balance. As the video amplifier is a horizontal amplifier, the grid cathode transconductance of the CRT electron guns after  $\gamma$  correction can be regarded as horizontal, because the respective cathode current is proportional to the driving voltages  $U_R$ ,  $U_G$  and  $U_B$ . It can be known from Fig. 10 that, the cathode current of three electron guns is collected in the form of added sum. The cathode current of the three electron guns can only be checked with the “10-score method” respectively. Refer to Fig. 11, sandcastle pulse is generated according to horizontal return and vertical return pulses, and the leak current of the three guns are measured first with its timing control, which is completed during “LM” period, then the cathode current of dark white balance of the three electron guns for R, G and B is measured in turn, each for two scanning cycles, i.e., the “BM” period; with the same method, the respective cathode current is measured in turn during the “WM” period. The whole test takes 13 scanning cycles and is completed in 0.832ms.

The processing of the test results is as shown in Fig. 12, where only the comparison and adjustment principle block diagram for blue (B) is shown. The block diagrams for comparison and adjustment of R and G are identical and omitted. As the comparison standard for dark and bright is  $V_{REF1} < V_{REF2}$ , therefore the result of A1 is used to correct the output of bias circuit, and the comparison result of A2 used to correct the gain of the amplifier. Any time of test failure or adjustment beyond the specified range, R, G and B will output the blanking level.

## ② Main points in color cast and retrace fault repair in 8838/8842 series color TV

The traditional method to repair a color cast fault in color TV is to adjust the saturation, then observe if the picture turns to black and white after cutting off the saturation. If so, the fault is in the video amplification circuit or there is color cast in the CRT. With a color TV set with automatic white balance adjustment function, if the color cast remains after turning off the saturation, the check should be focused on the elements of video amplification circuit and the associated elements of 8838 main chips.

In case of a retrace fault, first analyze the cause of the fault according to the color of the retrace horizontal appearing. For example, if it is too blue, the video amplification circuit should be checked to see if the video amplification output voltage is too low, or any element such as the video amplification transistor is damaged. The video amplification circuit element for the color with problem should be checked. In most cases, it is damaged video amplification circuit element that lead to retrace and color cast, only in extreme few cases the CRT is damaged. In case of retrace fault without color cast, it is usually due to abnormality in the supply system for video amplification circuit and CRT acceleration pole voltage. Often open R215 or D490 and damaged D407 will result in retrace fault. Of course, sometimes the transistors in the video amplification circuit will damage at the same time.

### 2. Circuit analysis and maintenance for “three no’s” fault

The fault of “no picture, no sound and no power supply indication” (hereinafter referred to as “three no’s” fault) is a fault with high probability of occurrence in TDA8842/OM8838 series chassis. The following faults can be repaired using the methods described below:

① Indicator is not ON. The fault is mainly in the power supply circuit section.

In this circuit, there are the following main voltage power supply systems:

#### ● The power transformer T801 outputs the following voltage:

a. +B (main power supply)

b. +24V (power supply to horizontal drive and pillow distortion equalizing)

c. +15V

- 7805 → +5V (supply to CPU, indicator and remote control head)
- V809 → +12V (12V supply to tuner)
- 7805 (5V supply to tuner)
- 7808 (supply to N501, N001)

② The indicator is ON and the power supply output voltage is normal. The fault is mainly in the horizontal section, vertical section and video amplification section as follows:

In the fault automatic protection circuit in an ordinary color TV set, normally some external sampling circuits triggers a testing port of the thyristor or microprocessor, and after logic operation and determination by the microprocessor, a cut-off (waiting) signal level is output from a specific pin position of the microprocessor, to cut off the switching stabilized power supply +B voltage or horizontal scan triggering signal power supply output, to realize automatic protection cut-off for the main circuit of the color TV set.

OM8838/TDA8842 series color TV sets rely more on the “soft start and slow stop” function set inside the IC chip and the “automatic fault diagnosis” or logic protection function on some ports to realize protection for the circuit. In case of a fault in horizontal scanning, vertical scanning and video amplification circuits, the whole machine will be in the faulty status of “three no’s” fault.

The primary meaning of “soft start and slow stop” function is that, in case of oscillation stop in horizontal scanning output, excessive electron beam current, oscillation stop in vertical scanning output, it will immediately enter the “slow stop” process from the internal horizontal triggering output, and finally cut off the triggering output, resulting in the “three no’s” fault. Because of the internal protection provisions, even if the microcomputer-based monitoring system fails at this time, it will not damage other elements. Therefore for the repair of this “three no’s” fault in the chassis, it is permitted to cut off the power supply protection system of the microcomputer (CPU), then to monitor the change in voltage at various critical points quickly after “forced on”, so as to analyze the location of the fault. The “soft start” means in each turning on, there is a transition period from start to normal, without exception even for a TV set with fault. “Slow stop” means there is a transition period from normal to turning off once a fault functions. During the transition period, the voltage at a point without fault changes in the order of starting, normal and waiting, and the voltage at a point with fault changes in the order of starting, abnormal and waiting. Therefore each time after turning on again, check is started, the variation range of instrument measured values are observed in time within the valid time period, then any circuit or element with fault is determined according to the monitoring results during the transition period following turning on.

For the flow diagram of “three no’s” fault, see Fig. 13.

### 3. Quick checklist for common faults in TDA8842/OM8838 series color TV sets:

Fault symptom	Faulty unit circuit	Faulty element
Three no's, the indicator is not ON	Power supply section	Fuse F801 damaged, and resistor R802 damaged
Three no's, the indicator is not ON	Power supply section	Fuse F801 damaged, and diodes D801, D802, D805 and D806 damaged
Three no's, the indicator is not ON	Power supply section	Fuse F801 damaged, and transistors V802 and V805 damaged
Three no's, the indicator is ON	Horizontal section	V402 damaged, and C413 damaged
Three no's, the indicator is ON	Horizontal section	V402 damaged, and D412 damaged
Three no's, the indicator is ON	Power supply section	N807 damaged, and V809 damaged
Three no's, the indicator is not ON	Power supply section	N805 damaged
Top retrace horizontal	Vertical section	D406 damaged, and R307 damaged
Top retrace horizontal	Vertical section	N301 damaged, and R307 damaged
Three no's, the indicator is ON	Horizontal section	V401 damaged
Horizontal bright horizontal	Vertical section	R306 damaged, and D405 damaged
Three no's, the indicator is ON	Power supply section	V808 damaged
Three no's, the indicator is ON	Video amplification section	N201 damaged
No AV input	AV section	N001 damaged, and ZD001 damaged
Pillow distortion	Pillow distortion equalizing section	V452 radiator copper foil broken
Three no's, the indicator is ON	Power supply section	V801 damaged
Three no's, the indicator is ON	Video amplification section	V206, V201, V210 damaged
