Areas

- * [E] is available in Scandinavia and Switzerland.
- * [EK] is available in United Kingdom.
- * [EF] is available in France.
- * [EB] is available in Belgium.
- * [EH] is available in Holland.
- * [Ei] is available in Italy.
- * [XA] is available in Southeast Asia, Oceania, Africa, Middle Near East and Central South America.
- * [XL] is available in Australia.
- * [PA] is available in Far East PX.
- * [PE] is available in European Military.
- * [PC] is available in European Audio Club.

- * The cabinet and front panel are available in black color and silver types.
- * The black type model is provided with (K) in the Service Manual.

LOCATION OF CONTROLS

- The power supply for this unit varies depending upon the areas. Also, the parts used for power supply are different. So, refer to the circuit diagram and the replacement parts list.
- * 220V (50/60Hz) for continental Europe. (Except for United Kingdom)
- * 240V (50/60Hz) for Australia and United Kingdom.
- * 110V/120V/220V/240V (50/60Hz) for other areas. (For other areas are provided with voltage selector)
- * Phono input capacitance is about 150pF.

PROTECTION CIRCUITRY

The protection circuitry may have operated if either of the following conditions is noticed:

- No sound is heard when the power is turned on.
- Sound stops during performance.

The function of this circuitry is to prevent circuitry damage if, for example, the positive and negative speaker with an impedance less than the indicated rated impedance of the amplifier are used.

If this occurs, follow the procedure outlined below:

- Turn off the power.
- Determine the cause of the problem and correct it.
- Turn on the power once again.

Note:

When the protection circuitry functions the unit will not operate unless the power is first turned off and then on again.

FREQUENCY RESPONSE

PHONO	RIAA standard curve ±0.8 dB (30 Hz~15 kHz)
TUNER, AUX/CD/VIDEO, TAPE	5 Hz~140 kHz (-3 dB) +0 dB, -0.2 dB (20 Hz~20 kHz)
Tone controls	
BASS	50 Hz, +10 dB~ -10 dB
TREBLE	20 kHz, +10 dB~ -10 dB
Subsonic filter	30 Hz, -6 dB/oct.
Loudness control (volume at -30 dB)	50 Hz, +9 dB
Output voltage and impedance	
REC OUT	150 mV
Channel balance, AUX/CD/VIDEO	250 Hz~6,300 Hz ±1 dB
Channel separation, AUX/CD/VIDEO	1 kHz 63 dB
Headphones output level and impedance	420 mV/330Ω
Load impedance	
MAIN or REMOTE	4Ω~16Ω
MAIN and REMOTE	8Ω~16Ω

GENERAL

Power consumption	340W
Power supply	
For Australia	AC 50 Hz/60 Hz, 240V
For continental Europe	AC 50 Hz/60 Hz, 220V
For others	AC 50 Hz/60 Hz, 110V/120V/220V/240V
Dimensions (W×H×D)	430 × 109 × 290 mm (16-15/16" × 4-9/32" × 11-13/32")
Weight	6.7 kg (14.8 lb.)

Note:
Total harmonic distortion is measured by the digital spectrum analyzer (H.P. 3045 system).

SAFETY PRECAUTION

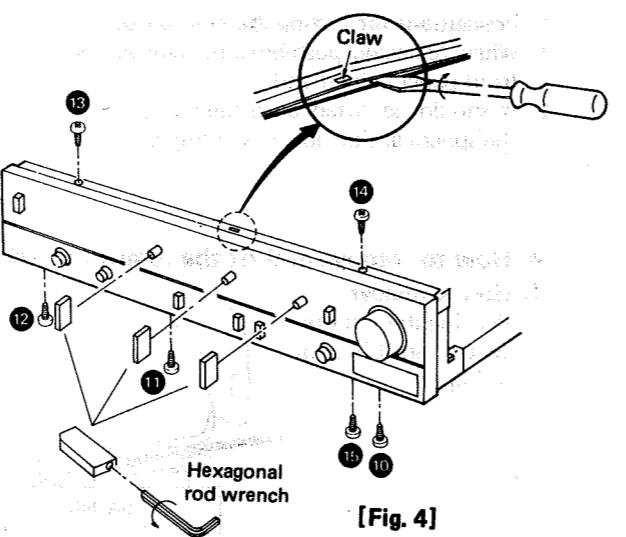

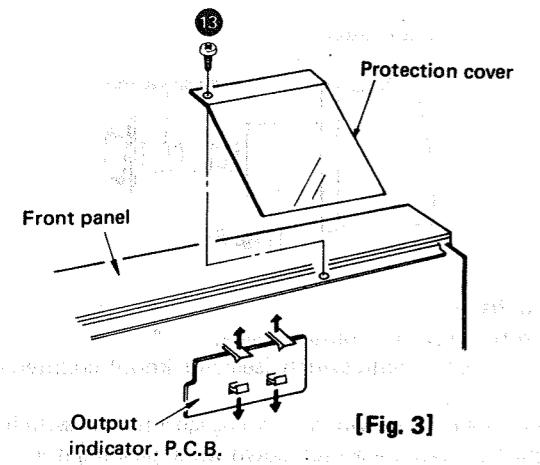

- Before servicing (such as replacement of components), unplug the power supply cord to prevent an electric shock.
- Use only manufacturer's recommended components for safety. Check condition of power cord and replace if wear or damage is evident.
- After servicing, be sure to restore the following to the condition in which they were originally installed.
 - the lead dress and
 - insulation barriers, insulation papers, shields and the like.
- Before returning a serviced apparatus to a customer, make the following insulation resistance test to prevent a customer from being exposed to a shock hazard.

Insulation resistance test (See figure below.)

- Unplug the power supply cord and connect a jumper wire between the two prongs on the plug.
 - Turn on the power switch of the apparatus.
 - Measure the resistance value (with an ohmmeter) between the jumpered AC plug and each exposed metalic cabinet part on the apparatus, such as screwheads, antenna, control shafts, handle brackets, etc.
- The reading should be as shown in figure below. In case a measurement is outside of the limits specified, there is a possibility of a shock hazard, and the apparatus should be repaired and rechecked before it is returned to a customer.

where, R: resistance value

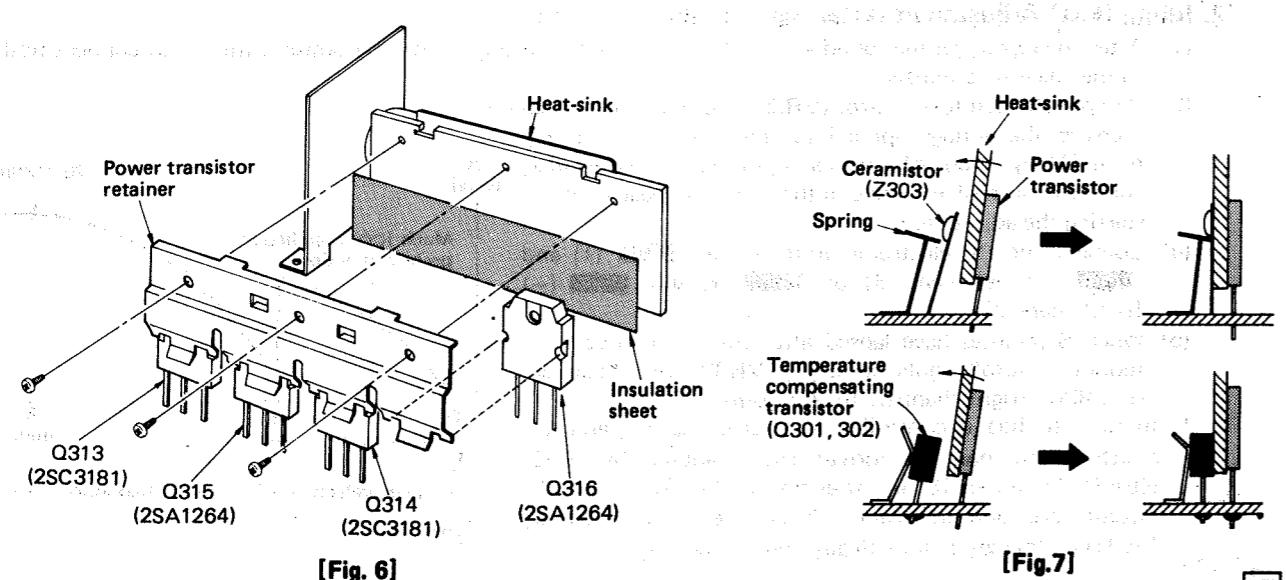

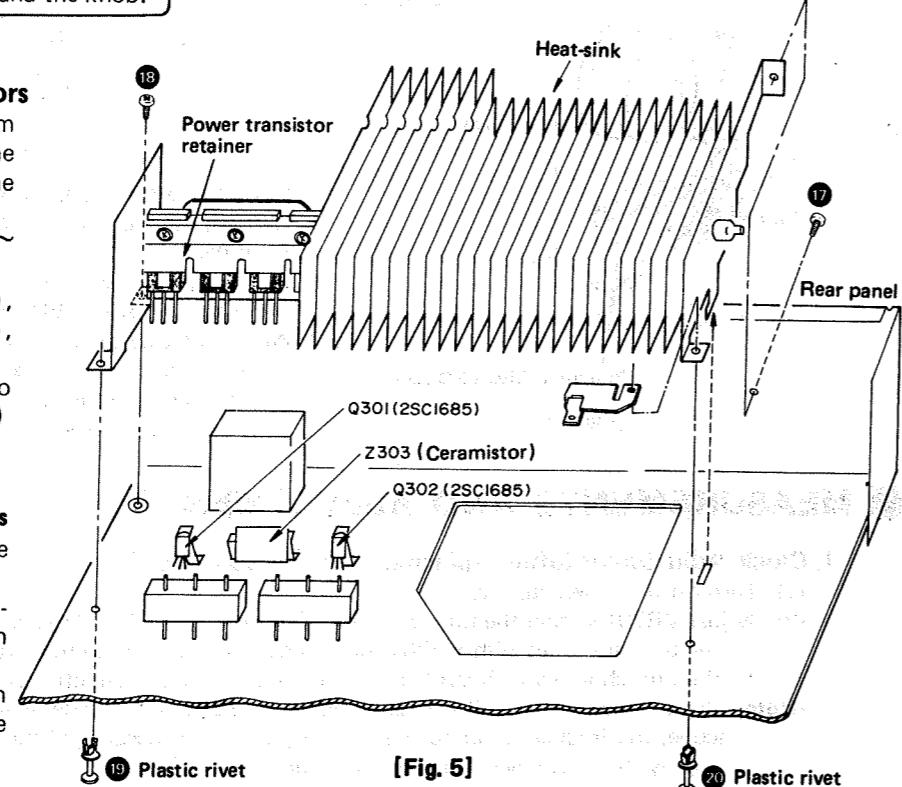

NOTE:
When fitting the selector knob, provide a clearance of about 0.7mm between the front panel and the knob.

● How to remove the power transistors

1. Remove the cabinet and the bottom board (Refer to "How to remove the cabinet" and "How to remove the bottom board").
2. Unsolder the power transistors Q313~Q316.
3. Remove the 2 setscrews [Fig. 5: 17, 18] and 2 plastic rivets [Fig. 5: 19, 20] which secure the heat-sink.
4. Remove the power transistor retainer to remove the power transistors. (See Fig. 6)

* Precautions for Fitting the Power Transistors

1. Do not apply a heat diffuser or the like to the insulation sheet. [Fig. 6]
 2. Make sure that the ceramistor and temperature compensating transistors are in tight contact with the heat-sink. [Fig. 7]
- * Ceramistor: Element whose change in temperature and resistance is positive (proportional).

5

5

■ BEFORE REPAIR AND ADJUSTMENT

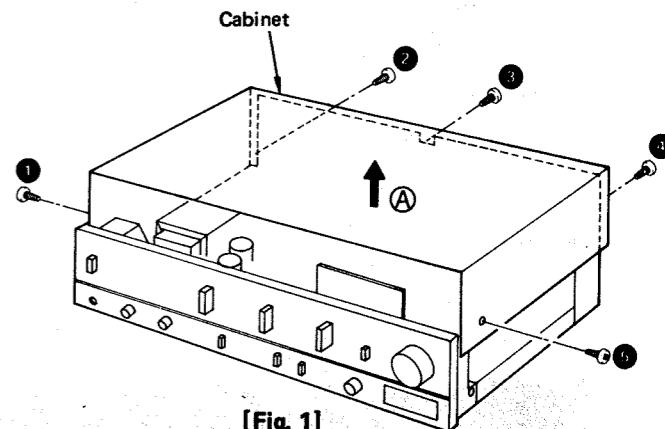

1. Turn off the power supply and short-circuit both ends of power supply capacitors (C401, C402, 6800μF) at resistance (about 10Ω , 5W) in order to discharge the charged voltage. Both ends do not short between C401 and C402 by screwdriver. It may damage the component.
2. Before turning on the power supply after completion of repair, slowly apply the primary voltage by using a power supply voltage controller to make sure that the consumed current is free of abnormality. The consumed current at 60Hz/50Hz in no signal mode is shown below with respect to supply voltage 110V/120V/220V/240V.

Power supply voltage	AC110V	AC120V	AC220V	AC240V
Consumed current	50 Hz 250 ~ 500mA	240 ~ 480mA	130 ~ 260mA	120 ~ 250mA
	60 Hz 230 ~ 470mA	220 ~ 450mA	120 ~ 250mA	115 ~ 235mA

■ DISASSEMBLY INSTRUCTIONS

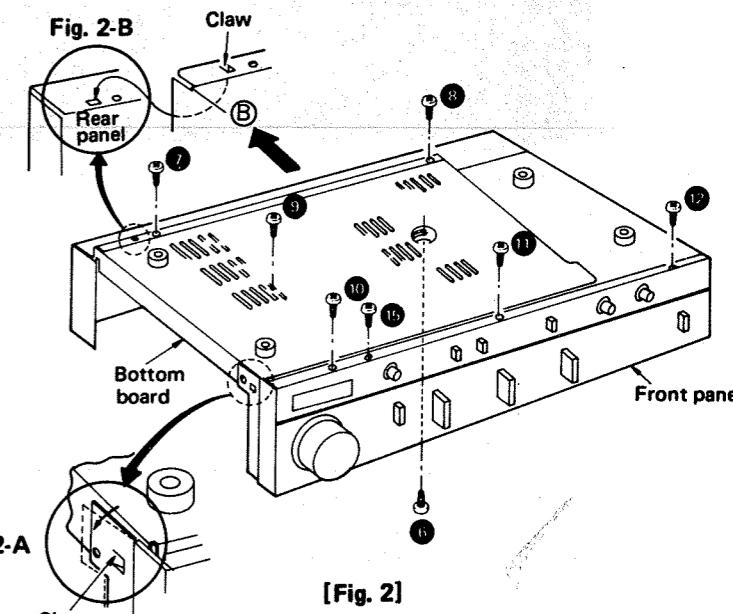

● How to remove the cabinet

1. Remove the 5 setscrews (Fig. 1: ① ~ ⑤) of the cabinet.
2. Move the cabinet in the direction of the arrow ④ in Fig. 1.

● How to remove the bottom board

1. Remove the cabinet.
2. Remove the setscrew [Fig. 2: ⑥] of the P.C.B.
3. Remove the 6 setscrews [Fig. 2: ⑦ ~ ⑪, ⑯] of the bottom board.
4. Raise the rear of the bottom board, and shift the side board a little outward to release the claw from the bottom board. [Fig. 2-A]
5. Remove the bottom board in the direction of the arrow ⑤ in Fig. 2.
6. To install the bottom board, fit the claw of the bottom board into the hole in the rear panel. [Fig. 2-B]

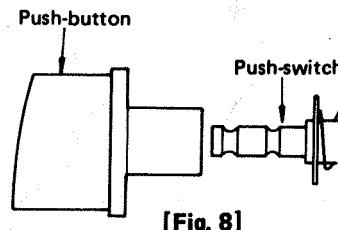

● How to remove the front panel

1. Remove the cabinet.
2. Remove the setscrew [Fig. 3: ⑬] on the left-hand side of the front panel, and then remove the protection cover. (Protection cover is not used in sets for [XA], [PA], [PE] and [PC].)
3. Push up the upper 2 claws which fasten the output indicator P.C.B., then remove the top of the P.C.B. Next, release the lower 2 claws and remove the P.C.B. (See Fig. 3).
4. Loosen the selector knob screw by hexagonal rod wrench (M3), and pull out the knob.
5. Remove the 5 setscrews [Fig. 4: ⑩ ~ ⑫, ⑭, ⑮] of the front panel.
6. Insert a flat-head screwdriver between the chassis and front panel as in Fig. 4, and then pry open to release the claw from the panel top.
7. Remove the front panel from the chassis.

4

* **Precautions for Fitting the Push-buttons**

1. When replacing push-button, remove the front panel beforehand.
2. It should be fitted onto the switch with the spherical side down as in Fig. 8.

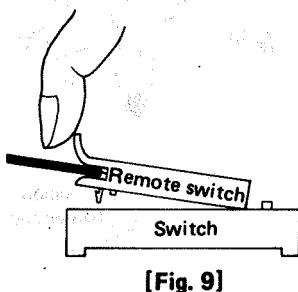

[Fig. 8]

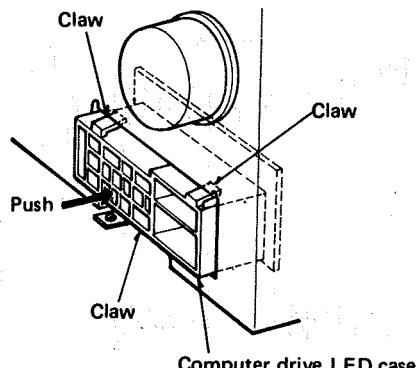

● **How to remove and fit the remote switch**

1. How to remove —

Pushing the remote switch, shift it up as in Fig. 9.

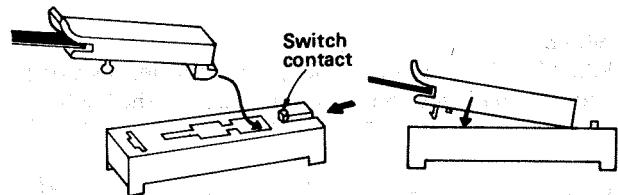

[Fig. 9]

[Fig. 11]

2. How to fit —

- (1) Shift the switch contact inside.
- (2) Turn the remote switch (selector knob) counterclockwise.
- (3) Let the remote switch claw engage with the switch, and shift the remote switch down while pushing it in.

[Fig. 10]

* **How to remove the computer drive LED case**

1. Remove the cabinet and front panel. (Refer to "How to remove the front panel.")
2. Release the 3 claws of computer drive LED case (Fig. 11) to remove the computer drive LED case.
3. When replacing the computer drive LED indicators, unsolder the LED's of D712 ~ 718 and remove them from the printed circuit board along with the computer drive LED case because the case and LED's are set up into an assembly.

■ MEASUREMENTS AND ADJUSTMENTS

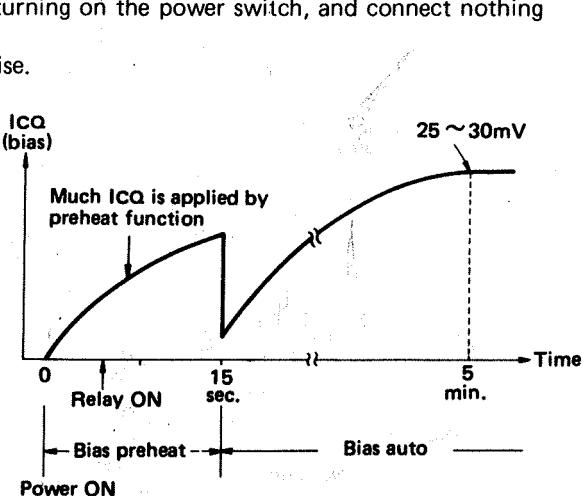

1. Clock Adjustment (after replacing the microcomputer)

- (1) Turn off the power supply.
- (2) Adjust VR701 so that the time until the relay turns ON is 5 ~ 7 sec. after power ON.
 - * The time elongates with VR701 turned counterclockwise (in the direction of A). (Frequency decreases.)
 - * The time shortens with VR701 turned clockwise (in the direction of B). (Frequency increases.)

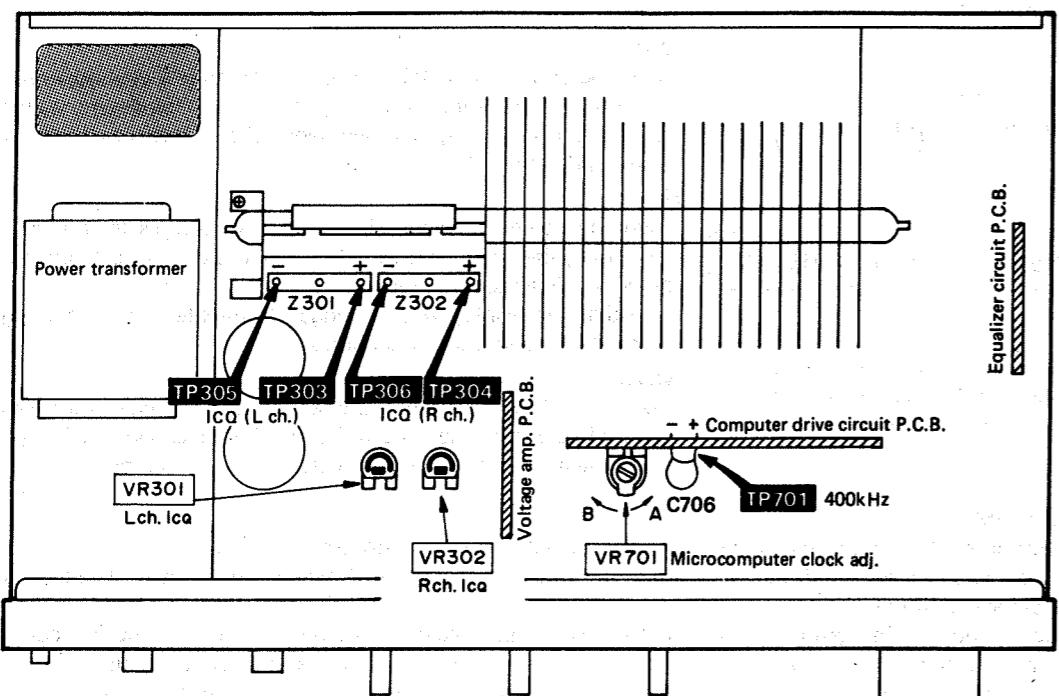

(Note) Clock frequency of 400 kHz is obtained at VR701 . In the case of an ordinary frequency counter and oscilloscope, the frequency cannot be correctly measured because of the probe capacity. So, it is recommended to employ the above-mentioned method during servicing.

2. Idling (ICQ) Adjustment (after repairing the main amp.)

- (1) After the repair, set the sound volume to minimum before turning on the power switch, and connect nothing to the speaker terminals.
 - (2) Completely turn ICQ control (VR301, 302) counter-clockwise.
 - (3) Increase the voltage applied to the amplifier gradually from 0V by means of a power supply voltage controller, and make sure of the value in the Figure on page 4 before starting the adjustment.
 - (4) Connect the DC electronic voltmeter to TP-304 (+) and TP-305 (-) [left channel] or TP-304 (+) and TP-306 (-) [right channel].
 - (5) When 5 minutes have lapsed after computer drive monitor "auto" lights up, adjust VR301 [left channel] or VR302 [right channel] to 25~30mV.
- * In this set, ICQ is controlled by microcomputer, and ICQ a little more than the normal level is applied by "PRE-HEAT" for about 15 sec. after power ON. After that, the output level and transistor temperature are detected by "AUTO", thereby automatically controlling ICQ.

• Adjustment points

* Checks of Protection Circuit After Repair and Adjustment

• Check of Muting with Power On/Off.

- (1) Connect AC voltmeter and 8Ω load (resistor or speaker) to main speaker terminals.
- (2) Set the sound volume to a proper level.
- (3) Apply 1 kHz 100 mV signal to AUX. input terminal.
- (4) Make sure that output is gained 4 ~ 7 sec. after power switch "on", and that the output goes out immediately after power switch "off".

• Check of Overload Detection and Protection Circuit

- (1) Apply output signal of about 1.5V at 1kHz to AUX. input terminal.
- (2) With main speaker terminals (left channel) short-circuited by lead wire (as thick and short as possible):

Make sure
 [— relay is off.
 — output indicator "on" goes out.
 — output indicator "stand by" blinks.

- (3) Make sure the state of (2) is gained with output circuit opened. Similarly, check the right channel as well.

* When relay is off, turn power "off" and unit for a while before turning it "on".

Otherwise, the original conditions are not restored even when the circuit and load are normal.

■ TECHNICAL INFORMATION

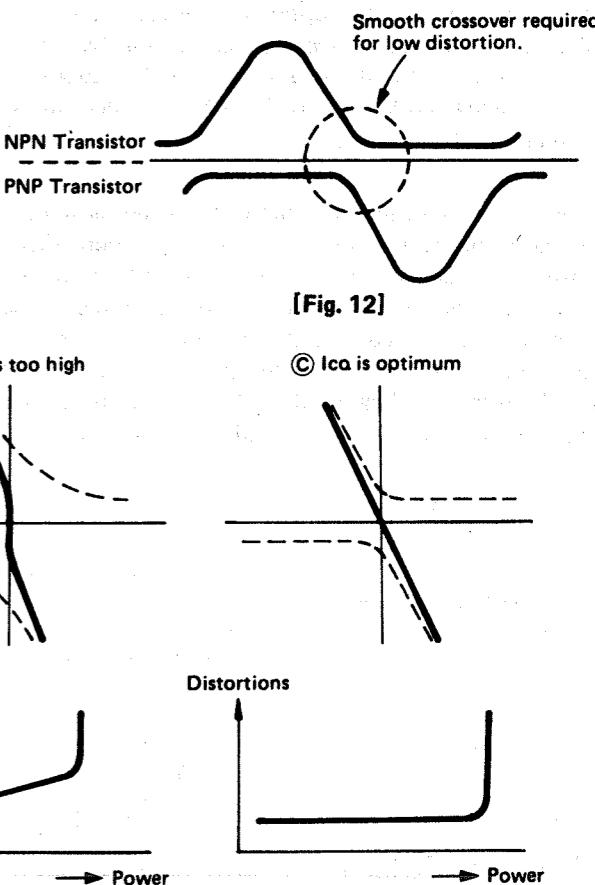

1. Description of Computer drive system

Technics' New Class A amplifier circuitry eliminates switching and crossover distortion. To further improve fidelity a "computer drive" circuit has been incorporated to eliminate transient distortion in music signal reproduction.

• Power transistor idling current (I_{ca})

The idling current through the power transistors is adjusted so that crossover distortion is minimized when switching from the NPN transistor to the PNP transistor in a complimentary design (Fig. 12).

If I_{ca} is not adjusted properly, distortion will result as in Fig. 13.

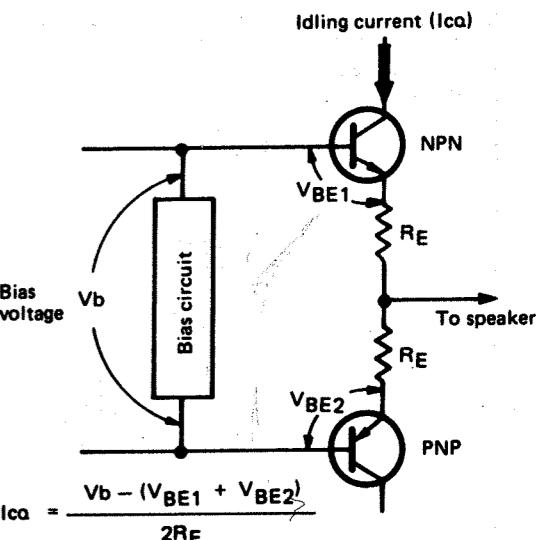

Relationship between idling current level and cross-over distortion.

[Fig. 13]

• Idling current and bias current

Idling current is determined by the bias voltage (V_b) of the bias circuit and the V_{BE} of each power transistor (Fig. 14). The V_{BE} varies according to the temperature of the transistor. This temperature varies instantaneously with the music signal. Unfortunately, with current designs, these instantaneous fluctuations cannot be detected due to the placement of the thermal sensor and the slow temperature change of the heat sink. Attempts have been made to include a thermal sensor as part of the output power pack. However, most power packs do not include a thermal sensor. Also, this method does not work if discrete components are used. We are still faced with the problem of stable bias operation and fast response to abrupt changes in temperature.

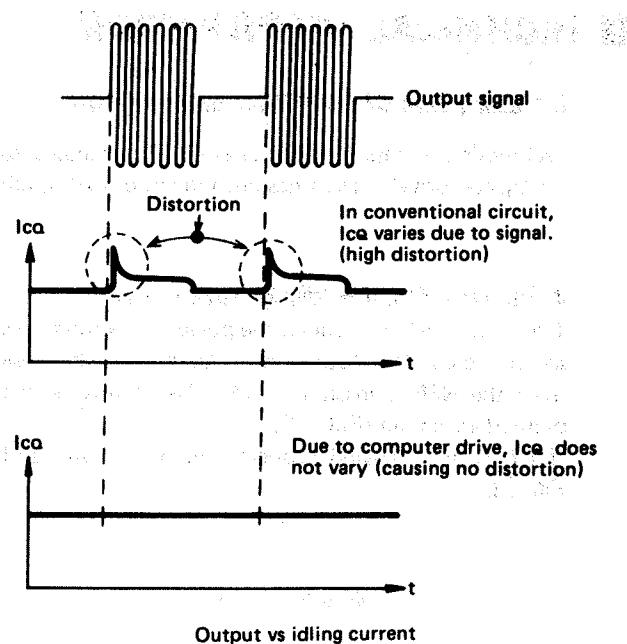

[Fig. 14]

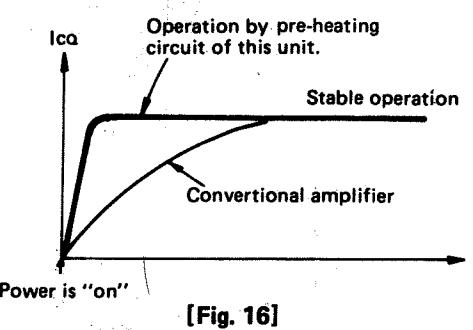

• Computer drive system

Knowing the thermal and signal characteristics of the power transistors, a system can be designed to calculate the instantaneous temperature changes and adjust for the optimum idling current. Information regarding the transistor ambient temperature and the input music signal is obtained through sensors and fed to a computer. The computer calculates the optimum idle current and maintains it at a constant level by varying the bias voltage. Figure 15 illustrates the relationship of the output signal and the idling current. Figure 17 is a block diagram of the "computer drive" system.

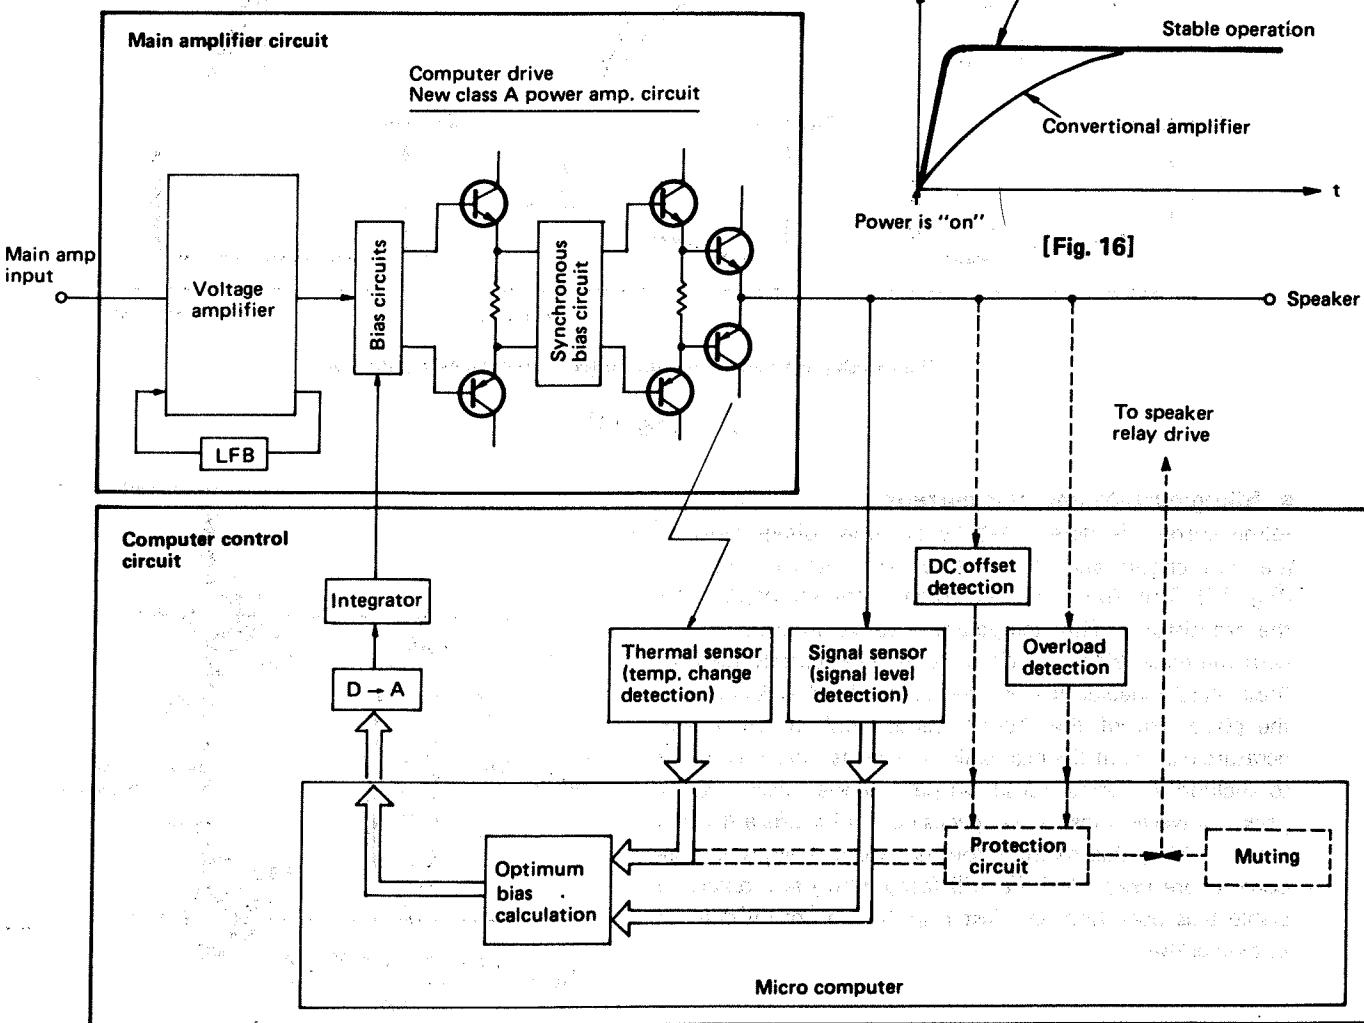

Generally, it takes several minutes for the power transistors to reach the temperature of stable operation after the power is turned on. To ensure stable and optimum performance quickly, the microcomputer forces a large amount of idling current through the power transistors for a short time. This rapidly "preheats" the transistors and the heat sink. Figure 16 illustrates the stable operation level for the conventional and new computer drive system.

[Fig. 15]

[Fig. 16]

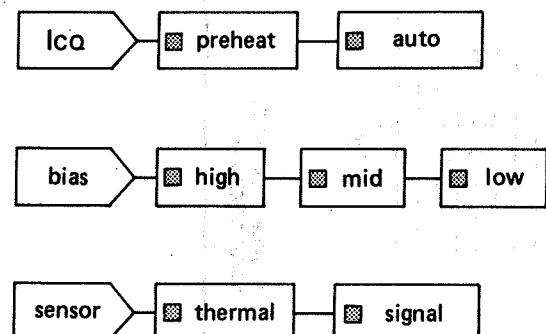

[Fig. 17]

■ OPERATION OF ICQ CONTROLLER

• Computer drive monitor indicators

These indicators are used to check that stable idling current flows from the bias circuit in order to prevent transient crossover distortion.

• Output indicators

These indicators show the condition of the signal sent to speakers or headphones.

When the power switch is switched on, the "stand by" indicator flashes, and, when the unit is operating normally, the "on" indicator will illuminate.

Note that the "stand by" indicator will flash if the positive and negative speaker terminals or speaker connection cords are short-circuited, or if some other circuit abnormality which causes the protection circuit to function is detected. If this occurs, switch the power switch off, and then on again after first determining the cause of the problem and correcting it.

• ON-time of each indicator, and output generated at pin terminal of microcomputer (IC702)

"ON" (light up) time

							L	H	H	

* 130°C (266°F) sensor is for protection of circuit. ICQ is not controlled.

[Fig. 18]

1) Preheat

When power supply is turned ON, the level of IC702 pin ② becomes low. At the same time, preheat LED (D717) lights up, Q707 turns OFF and so does the computer drive lamp. Also, Q709 turns ON, then voltage is applied to LED's (D712), (D713), (D714). Each of D712, D713 and D714 is controlled by IC702 terminals ②, ③ and ④ respectively. The output voltages are shown in Fig. 18. The "high" LED lights up first, followed by "mid" LED, and then "low" LED. IC702 Pin ⑦ turns power supply ON as in Fig. 18. It becomes "H" 0.4 sec. later, then IC701 pin ① also becomes "H". IC701 pin ⑯ changes to "L" and it is applied to Q712 and Q713 through D708 and D709, causing Q712 and Q713 to turn ON. IC701 pin ⑯ delivers a large ICQ for 6 sec. after power ON (while pin ⑯ is "L"), and after that, pin ⑯ become "H". ICQ is controlled by the output of IC702 pin ②, ③, ④.

2) Signal sensor and thermal sensor

The musical signal from power amplifier is applied to IC702 pin ⑪ (pin ⑬) through D705 (D706) and IC701. When the signal changed to DC by D705 (D706) and C703 (C704), becomes higher than about 2V, then "L" input is applied to IC702 pin ⑪ (pin ⑬), and the output is delivered to IC702 pin ②, ③, ④. Also, when the temperature of heat-sink becomes higher than 60°C(122°F) the resistance of the thermistor (Z303) increases and IC701 pin ⑤ becomes "H". IC701 pin ⑫ changes to "L", then "L" input is applied to IC702 pin ⑩ . The output is delivered to IC702 pin ⑪ , ⑬ (signal sensor input) and IC702 pin ⑩ (thermal sensor input), thereby controlling ICQ through R715~719, 741 and Q712, 713.

3) Power on/off muting

When power supply is turned ON, the output of IC702 pin ⑥ is "L" for about 6 sec. as in Fig. 18, then relay RLY301 turns OFF, and D710 output "on" LED also turns OFF. The voltage of IC702 pin ⑯ alternately becomes "L" and "H" for 6 sec. after power ON as in Fig. 18, causing D719 "stand by" LED to blink. IC702 pin ⑥ output becomes "H" 6 sec. after power ON, then relay RLY301 turns ON and D710 output "on" LED lights up.

When power supply is turned OFF, "H" is applied to IC701 pin ② and IC701 pin ⑮ output changes to "L" because the time constant of C410 (3.3μF) and R414 (15kΩ) is smaller than that of C401 (6800μF) and R411 (100kΩ). The signal is put into IC702 pin ⑯ while "L" output is delivered to IC702 pin ⑥ . When pin ⑥ becomes "L", Q706 turns OFF and so does relay RLY301.

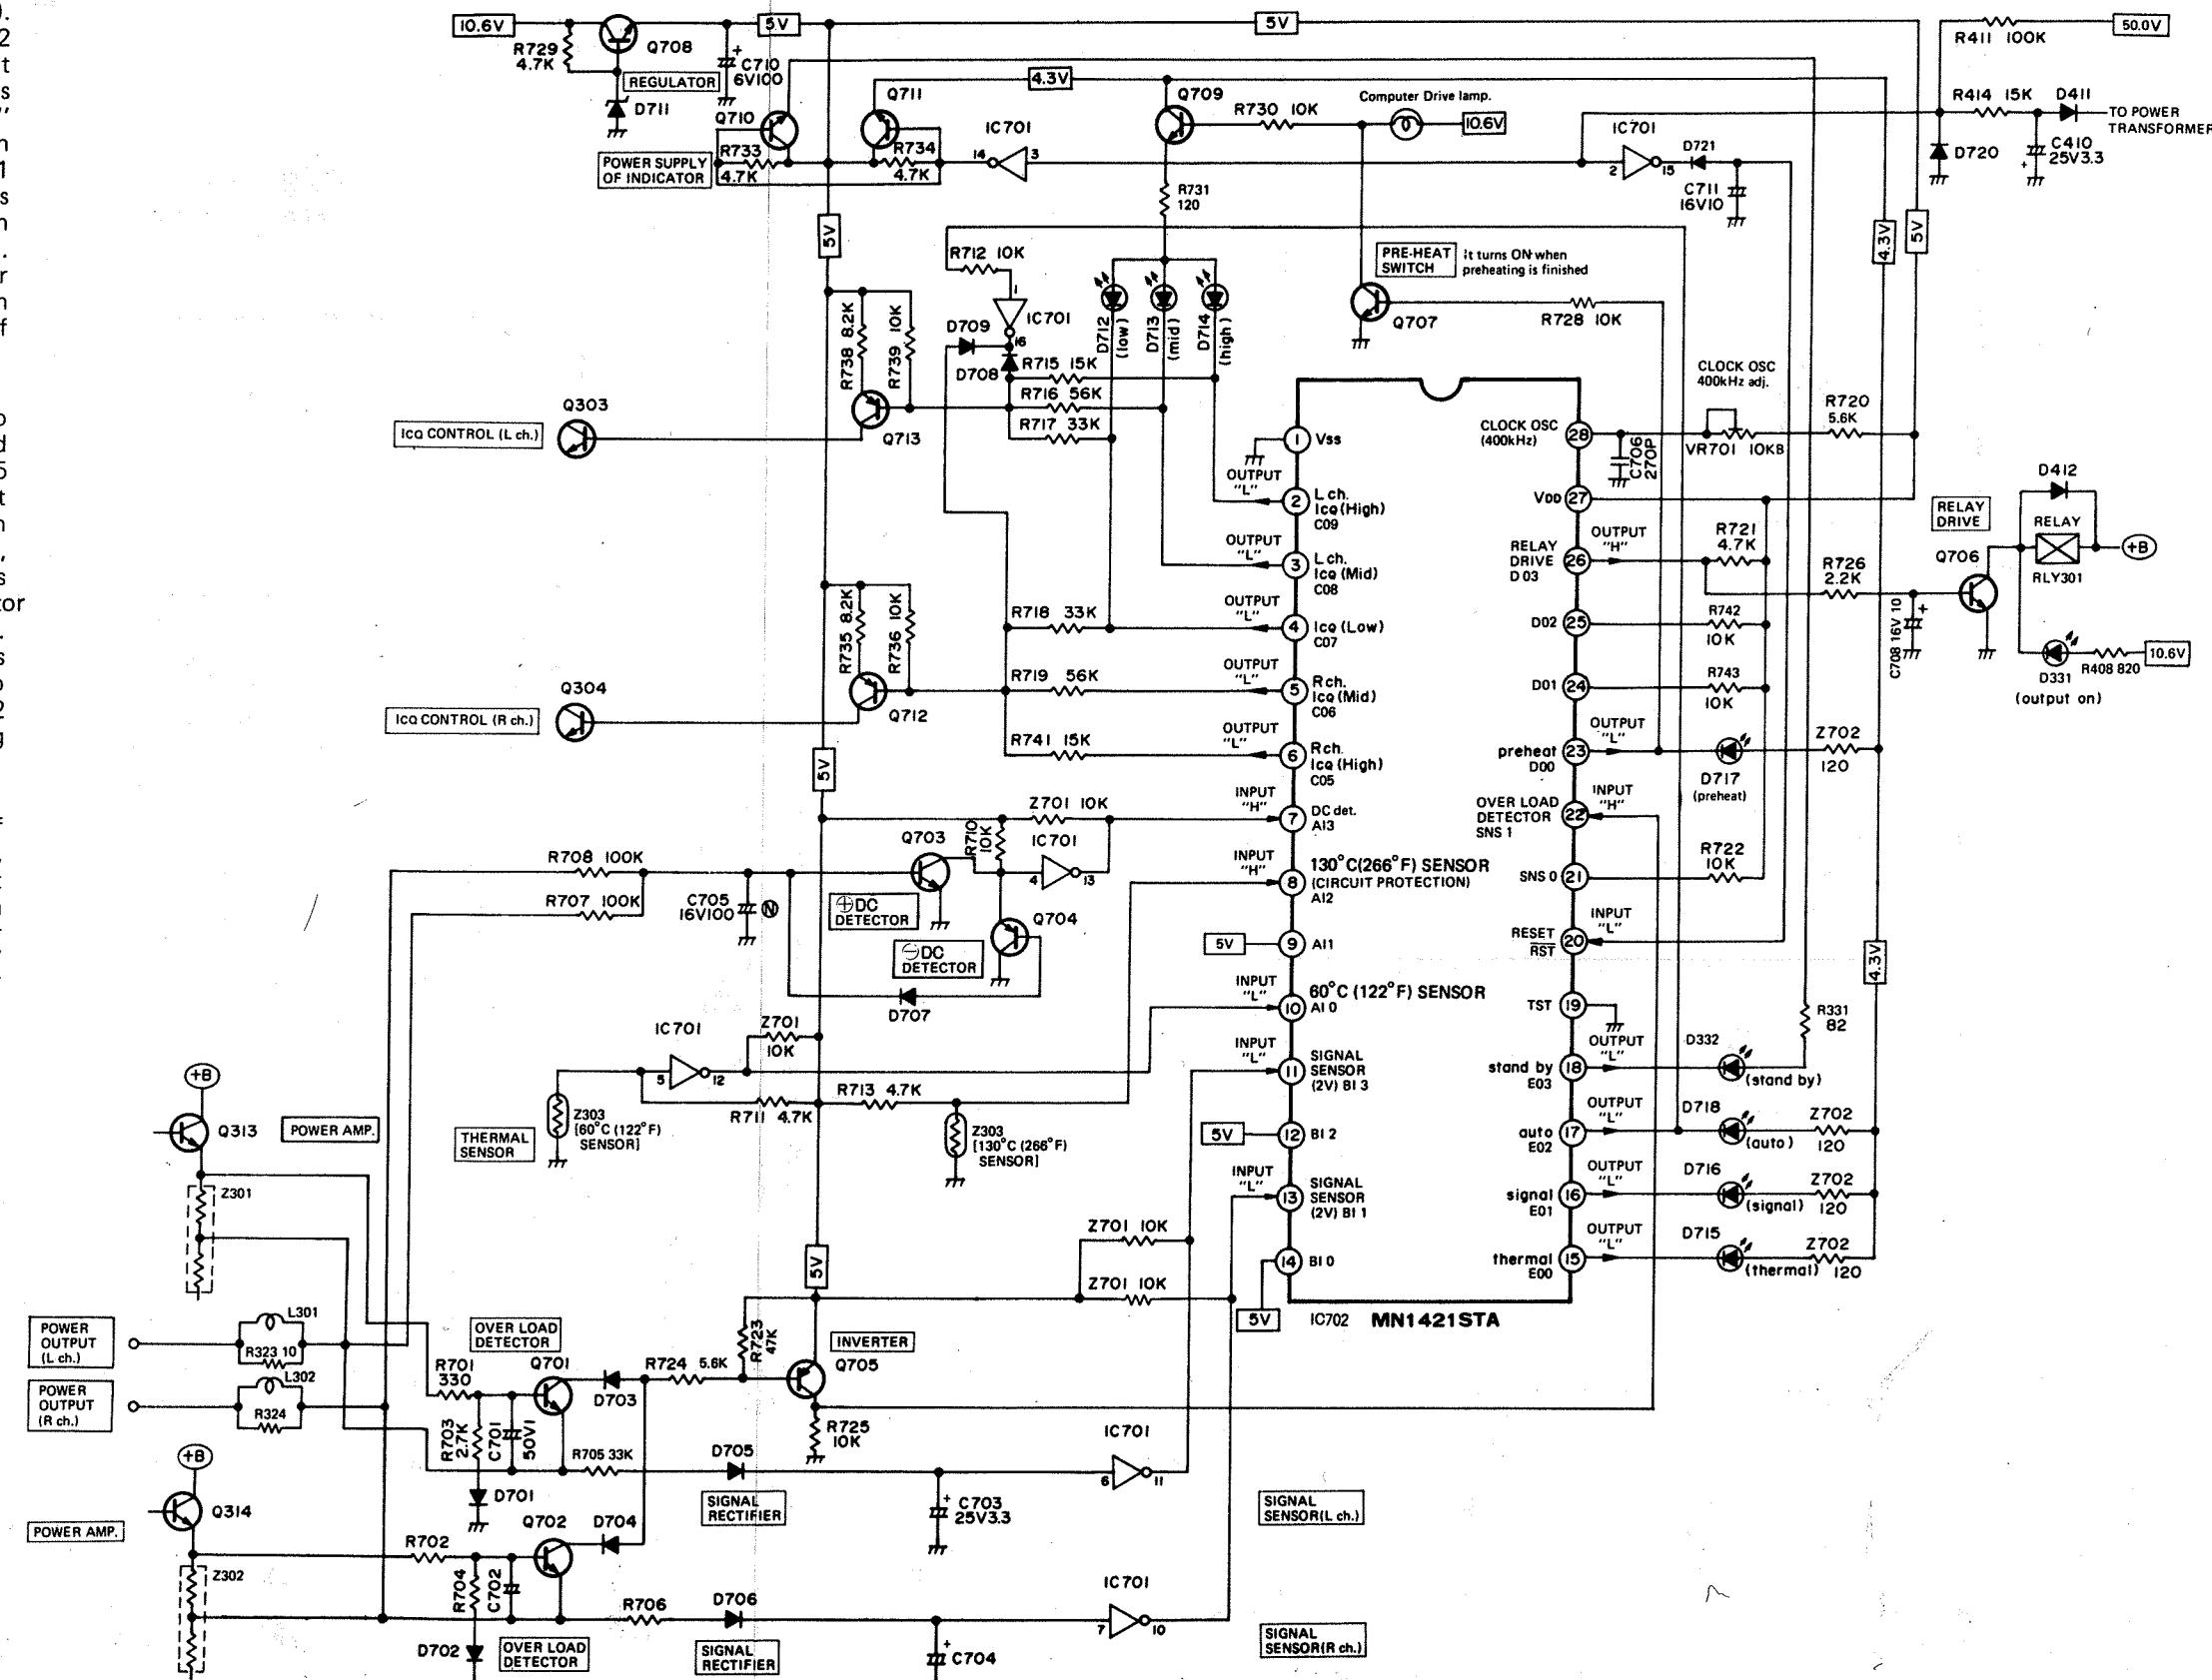

4) DC detection circuit

When the power amplifier voltage is over 2V DC, Q703 (+DC detection) and Q704 (-DC detection) are turned ON, then "H" input is applied to IC702 pin ⑦ , and "L" output is delivered to IC702 pin ⑯ . When pin ⑯ becomes "L", relay RLY301 turns OFF the same as in power-off muting.

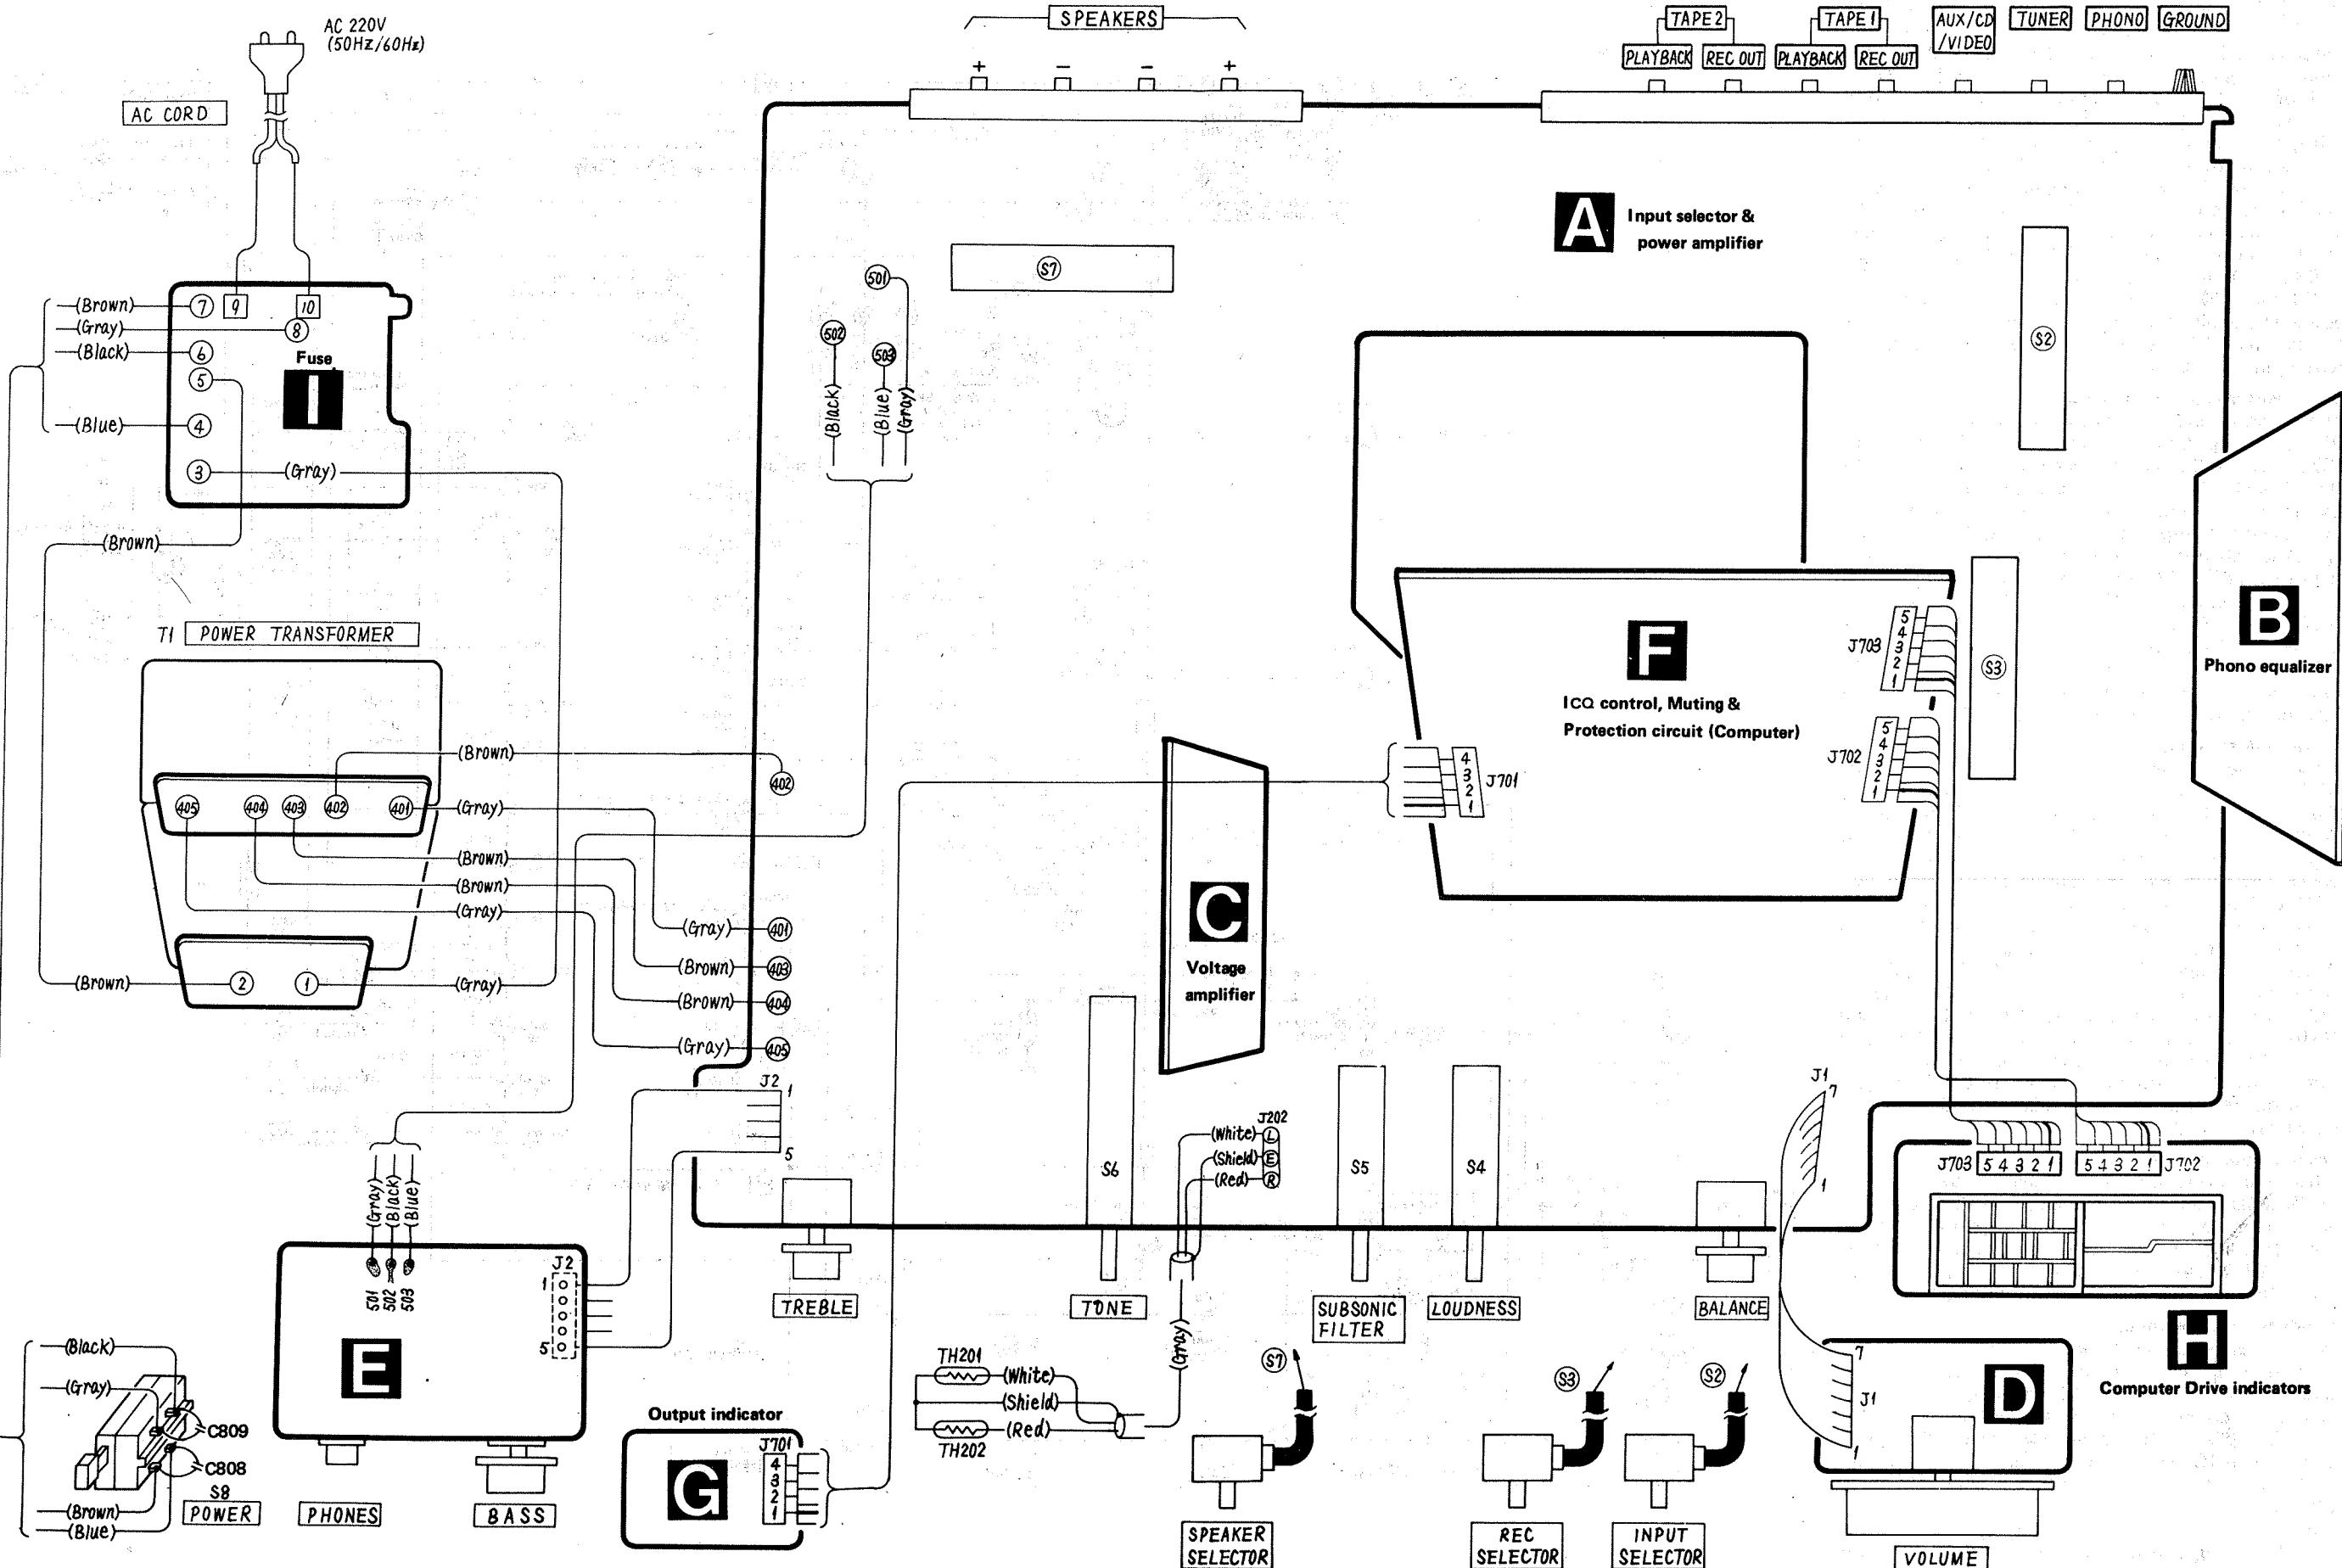

5) Overload detector circuit

When speaker terminals are short-circuited, a large amount of current flows into Z301 (Z302), and the base voltage of Q701 (Q702) increases, causing Q701 (Q702 and Q705 to turn ON. As Q705 turns ON, "H" input is applied to IC702 pin ⑯ , and "L" output is delivered to IC702 pin ⑥ . When pin ⑥ becomes "L", relay RLY301 turns OFF the same as in power off muting.

When "H" is applied to IC701 pin ⑯ , the output of IC702 pin ⑯ is held. Therefore, turn off the power switch and check the set beforehand. Otherwise, relay RLY301 will not turn ON.

■ FUNCTION OF TERMINAL (ICQ CONTROLLER IC702)

Pin No.	Mark	Name of block	Description of terminal
1	Vss	Power supply input terminal	Grounded (0V)
2	CO ₉	Output port C	It delivers ICQ control signal through input port A (thermal sensor) and input port B (signal sensor). [Output "L"]
3	CO ₈		
4	CO ₇		
5	CO ₆		
6	CO ₅		
7	AI ₃		When DC detection circuit of power amplifier operates, the input level becomes "H".
8	AI ₂	Input port A	When 130°C (266°F) sensor of power amplifier operates, the input level becomes "H".
9	AI ₁		Not used in this unit
10	AI ₀		When 60°C (122°F) sensor of power amplifier operates, the input level becomes "L".
11	BI ₃	Input port B	Input level changes to "L" as effective output 2V signal sensor of power amplifier operates. (L ch.)
12	BI ₂		Not used in this unit
13	BI ₁		Input level changes to "L" as effective output 2V signal sensor of power amplifier operates (R ch.)
14	BI ₀		Not used in this unit.
15	EO ₀	Output port E	Indicator "thermal" lights up at "L" output.
16	EO ₁		Indicator "signal" lights up at "L" output.
17	EO ₂		Indicator "auto" lights up at "L" output.
18	EO ₃		Indicator "stand by" lights up at "L" output.
19	TST	Test input terminal	Terminal for testing LSI (Grounded)
20	RST	Reset input terminal	All outputs are cleared or reset with input at "L". (It is connected to power supply circuit)
21	SNS ₀	Sensor input terminal	Conditional transfer (branch) is performed according to the input level.
22	SNS ₁		Input level changes to "H" as power amplifier output short-circuit operates.
23	DO ₀	Output port D	Output terminal for indicator "preheat" and preheating circuit operation. [Output "L"]
24	DO ₁		Not used in this unit.
25	DO ₂		Output relay turns ON with output at "H".
26	DO ₃		
27	VDD	Power supply input terminal	Apply 5V.
28	OSC	OSC input terminal	Clock signal (about 400 kHz) can be obtained by internal oscillation circuit.

SCHEMATIC DIAGRAM

(This schematic diagram may be modified at any time with the development of new technology.)

- The part No. of transistors, IC and diodes mentioned in the schematic diagram stand for production part No. Regarding the part No. with **●** mark, the production part No. are different from the replacement part No. Therefore, when placing an order for replacement parts, please use the part No. in the replacement parts list.
- This is the basic circuit diagram (For continental Europe) of this unit. Note that part of the circuit is subject to change depending on the areas.
- Regarding the circuits to be changed in the basic circuit diagram (For continental Europe) and related areas (EF), (EH), (Ei), (XL), (XA), (PA), (PE) and (PC) refer to the separate service manual (Order No. SD83012364C9-A).

Notes:

- S2-1 ~ S2-4**: Input selector switch in "phono" position.
① aux ↔ ② tuner ↔ ③ phono ↔ ④ tape 1 ↔ ⑤ tape 2
- S3-1 ~ S3-4**: Recording-mode selector switch in "off" position.
① aux ↔ ② tuner ↔ ③ phono ↔ ④ off ↔ ⑤ tape dubbing 1 ▶ 2 ↔ ⑥ tape dubbing 2 ▶ 1
- S4**: Loudness switch in "off" position.
- S5**: Subsonic filter switch in "off" position.
on ↔ off
- S6**: Tone switch in "defeat" position.
defeat ↔ on
- S7**: Speaker selector switch in "main" position.
① speakers off ↔ ② main ↔ ③ remote ↔ ④ main and remote
- S8**: Power source switch in "on" position.
- S9[XA, PA, PE, PC] only**: Voltage selector switch in "240V" position
120V ↔ 110V ↔ 220V ↔ 240V
- The headphone jack switch is being short-circuited.
(With the headphone plug not inserted)
- Important safety notice:**
Components identified by **△** mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.
- indicated voltage values are the standard values for the DC electronic circuit tester (high impedance) with the ground point taken as standard. Therefore, there may exist some errors in the voltage values, depending on the internal impedance of the DC circuit tester. (high tap)
- ◆** Phono signal lines
- Positive (+B) voltage lines
- Negative (-B) voltage lines

■ RESISTORS & CAPACITORS

Notes: 1. Part numbers are indicated on most mechanical parts.
Please use this part number for parts orders.

2. Important safety notice:

Components identified by Δ mark have special characteristics important for safety. When replacing any of these components use only manufacturer's specified parts.

3. The "S" mark is service standard parts and may differ from production parts.
4. The unit of resistance is Ω (ohm),
 $K = 1000\Omega$, $M = 1000K\Omega$.
5. The unit of capacitance is μF (microfarad).
 $P = 10^{-6} \mu F$
6. Bracketed indications in Ref. No. Columns specify the area. Parts without these indications can be used for all areas.

Resistor Type	Wattage	Tolerance
ERD : Carbon	10 : 1/8W	J : $\pm 5\%$
ERG : Metal Oxide	25 : 1/4W	
1 : 1W		
2 : 2W		
3 : 3W		
S1 : 1/2W		

ERD10TLJ□□□ → Chip type carbon
ERO10MKG□□□ → Chip type metal film

Capacitor Type	Voltage		Tolerance
	ECEA Type	Others	
ECEA : Electrolytic	OJ : 6.3V	1H : 50V	C : $\pm 0.25\mu F$

REPLACEMENT PARTS LIST

- Notes:**
- Part numbers are indicated on most mechanical parts. Please use this part number for parts order.
 - Important safety notice: Components identified by **▲** mark have special characteristics important for safety. When replacing any of these components, use only manufacturer's specified parts.
 - (X)** -marked parts are used for black only, while **O** -marked parts are for silver type only.
 - Part other than **(X)** - and **O**-marked are used for both black and silver type.
 - Bracketed indications in Ref. No. Columns specify the area. Parts without these indications can be used for all areas.
 - The "S" mark is service standard parts and may differ from production parts.
 - The parenthesized numbers in the column of description stand for the quantity per set.

Black type model No. : SU-V303(K)
