## SPECIFICATIONS

### TURNTABLE MOTOR SECTION

|                             |   |
|-----------------------------|---|
| Drive System                | FG Servo-control direct drive   |
| Motor                       | 12-Poles 24-slots DC Hall motor   |
| Motor Torque                | 1,000g-cm   |
| Turntable Platter           | 31.5 cm (12-1/4") die-cast aluminum, Weight, 2.7 kg (6 lbs). (including rubber mat) |
| Turntable Moment of Inertia | 360 kg-cm <sup>2</sup> (including rubber mat)                                       |
| Speed                       | 33-1/3 r.p.m. 45 r.p.m.   |
| Signal-to-Noise Ratio       | Better than 70 dB (DIN-B)   |
| Wow and Flutter             | Less than 0.03% (wrms)  |
| Fine Speed Adjustment       | ±3% (with strobo indicator)   |

### TONEARM SECTION

|                                    |   |
|------------------------------------|---|
| Arm Type                           | S-type static balance arm with gimbel supports  |
| Tonearm Effective Length           | 232 mm (9-1/8")   |
| Overhang                           | 16 mm (1/4")  |
| Tonearm Stand Base/Weight          | Diecast zinc/1,000g (2.2 lbs)   |
| Range of Tonearm Height Adjustment | ±3 mm (1/8")  |
| Inside Force Canceller             | Counterweight and string roller   |
| Sensitivity                        | Vertical; 3 mg, Horizontal; 5 mg.   |
| Arm Lifter                         | Oil dump system   |
| Auto-Up Stop                       | Non-contact photo-electric speed detector, linked with cueing lever and power OFF switch. |

### Headshell

Diecast aluminum alloy (interchangeable to EIA specs: weight 12g)  
2~15g. 9~23g (with subweight)  
Gold-plated plugs fitted, using NEGLEX type wire

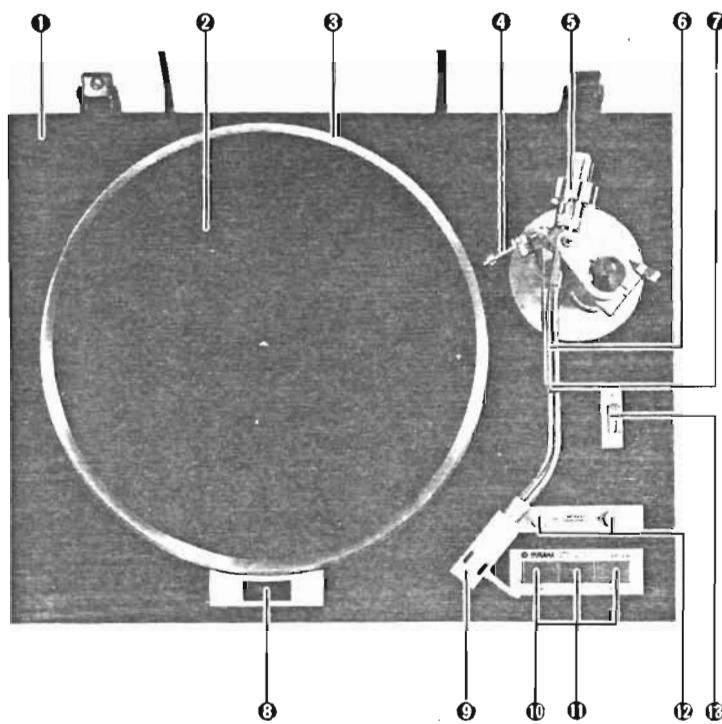

### GENERAL

|                        |  |
|------------------------|--|

- ⑦ Shield Plate
- ⑧ AC Cord

## ■ DISASSEMBLY PROCEDURES

Before disassembling the unit, remove the platter and headshell with cartridge, and securely tie the arm to the arm rest with string, etc. Then, gently turn the unit upsidedown and place it on books, etc. piled up on both sides to protect the arm and cabinet from damage.

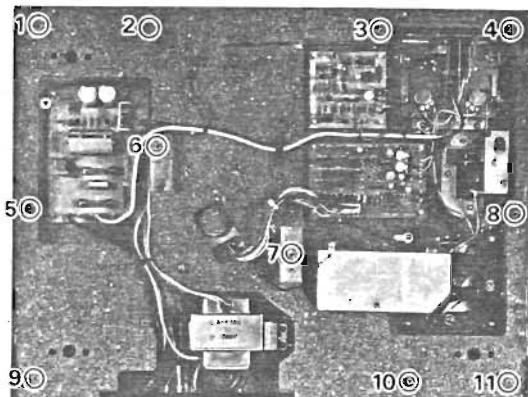

Photo 1

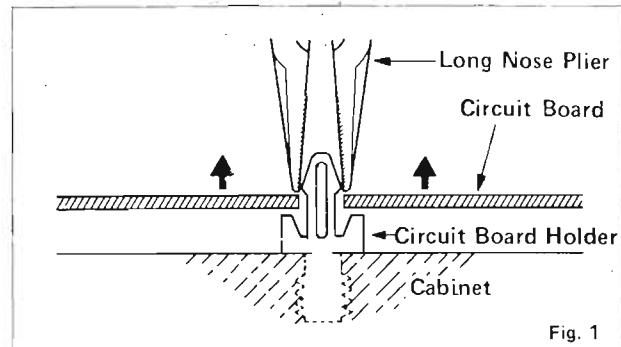

Fig. 1

### 2. Auto Up Circuit Board Removal

(shown in photo 3)

- Remove the bottom cover. (Refer to Step 1.)
- Remove the Auto Up Circuit Board. (Refer to Step 1.)

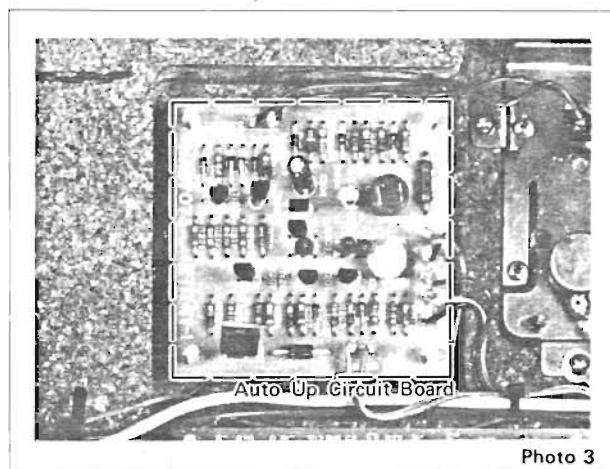

Photo 3

### 1. Power Supply Circuit Board Removal

(shown in photo 2)

- Remove screws 1 to 11 as shown in photo 1, then remove the bottom cover.
- Pinch the hooked end of Circuit Board Holders on each corner of Power Supply Circuit Board by means of Long Nose Plier and gently lift the corner to remove the Power Supply Circuit Board, as shown in Figure 1.

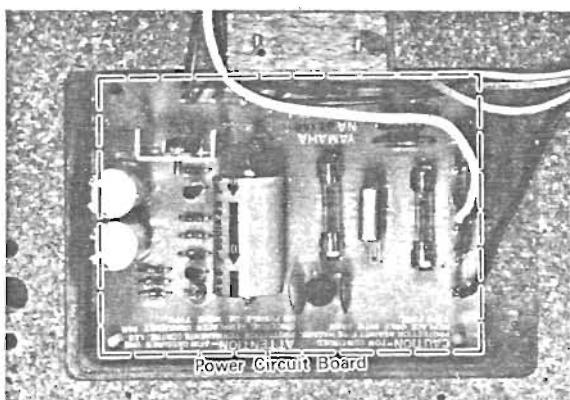

Photo 2

### 3. Motor Servo Circuit Board Removal

(shown in photo 4)

- Remove the bottom cover. (Refer to Step 1.)
- Remove the Motor Servo Circuit Board. (Refer to Step 1.)

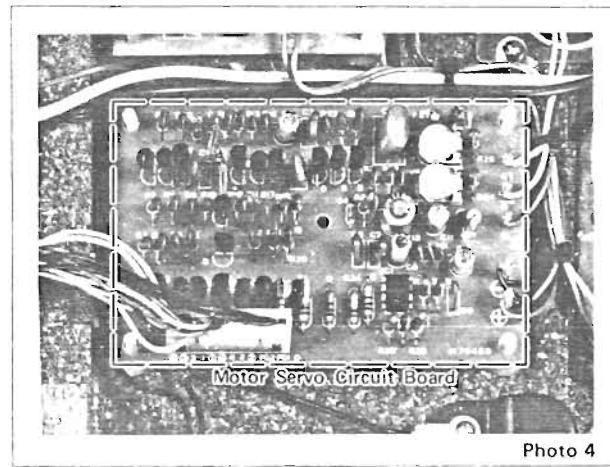

Photo 4

#### 4. Power Transformer Removal

(shown in photo 5)

- Remove the bottom cover. (Refer to Step 1.)
- Remove the screws 1 to 4 and lead wire in photo 5, and take them out.

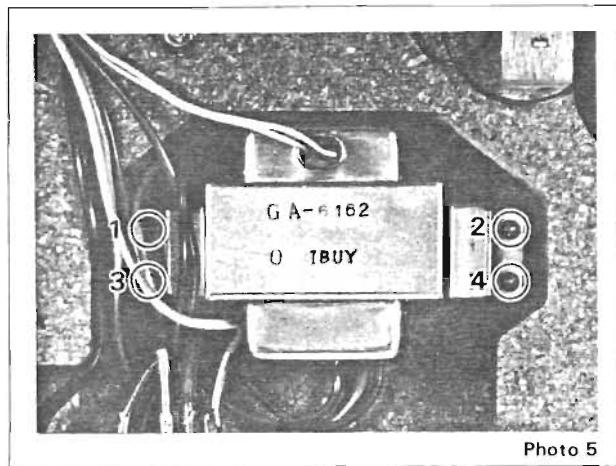

Photo 5

c. Remove the six lead wires on DET Circuit Board and lifter wire.

d. Remove screws 1 to 3, S-washers and flat washers, all securing the tonearm assembly.

**NOTE:** When the arm assembly is reattached, re-adjustment of the auto-return position is needed (see "ADJUSTMENTS"). Therefore, do not dismantle the arm assembly unless required.

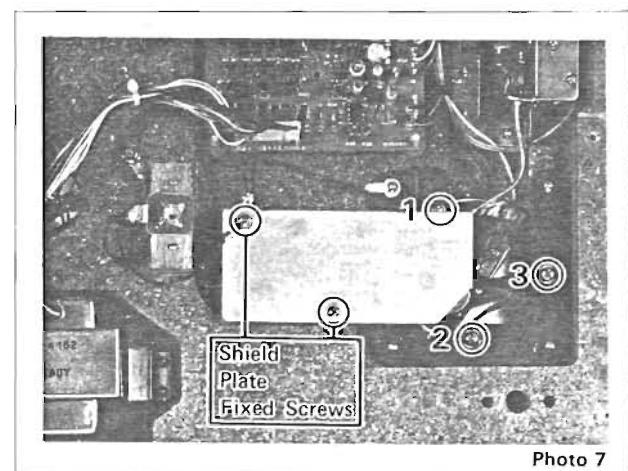

Photo 7

#### 5. Switch Assembly Removal

(shown in photo 6)

- Remove the bottom cover. (Refer to Step 1.)
- Pull out the two speed control knobs on the upper surface of the cabinet.
- Remove screws 1 to 4, then the Switch Assembly can be removed.

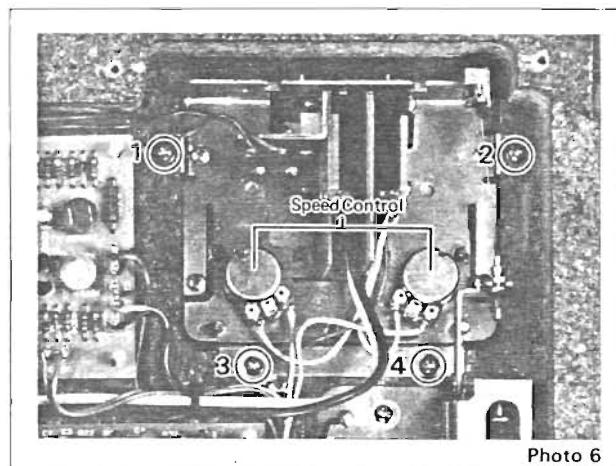

Photo 6

#### 7. Motor Removal

(shown in photo 8)

- Remove the bottom cover. (Refer to Step 1.)
- Remove the motor-shielding board from the Cabinet surface.
- Disconnecting the connector to the motor Servo Circuit Board.
- Remove screws 1 to 3, then motor can be removed.

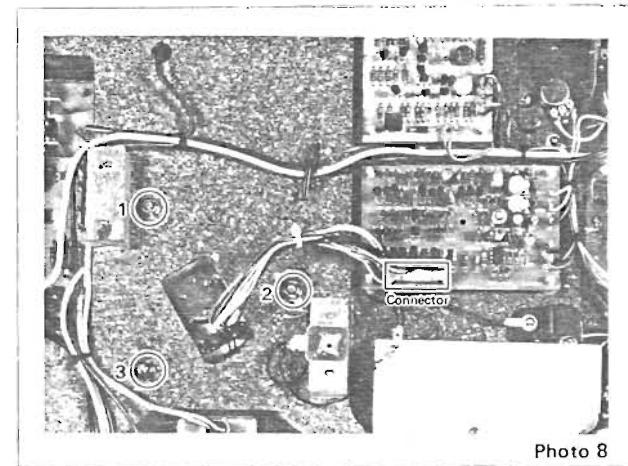

Photo 8

#### 6. Tone Arm Assembly Removal

(shown in photo 7)

- Remove the bottom cover. (Refer to Step 1.)
- Remove the shield plate by unscrewing two screws.

## 8. Stroboscope Assembly Removal

(shown in photos 9 and 10)

- a. Remove screws 1 and 2, then the Strobo cover can be removed, as shown in photo 9.
- b. Remove screws 1, 2 and 3, then the Strobo case and Neon Lamp can be removed, as shown in photo 10.

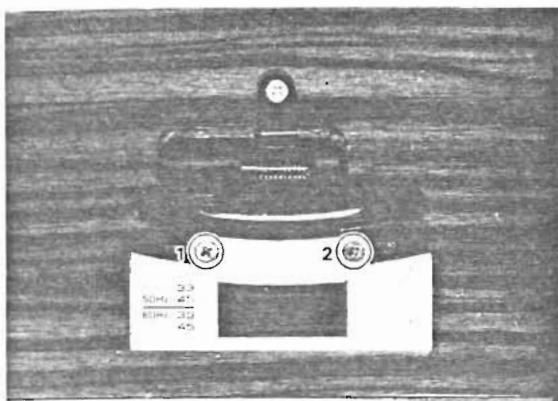

Photo 9

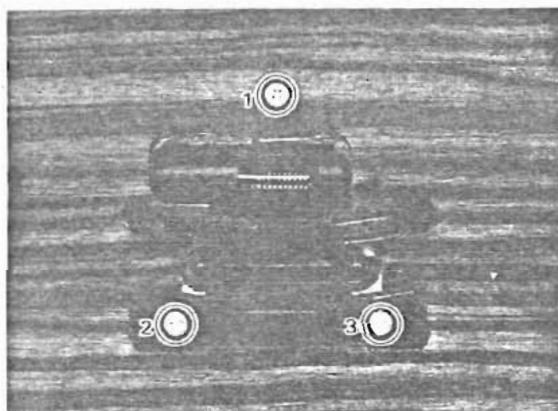

Photo 10

## ADJUSTMENTS

### 1. Circuit Board Adjustments

#### ■ Motor Servo Circuit Board (r.p.m. adjustment)

The semi-fixed variable resistors VR1 and VR2 provided on the motor servo circuit board are controls for adjusting the motor's rotational speed, VR1 being for 33-1/3 r.p.m. and VR2 for 45 r.p.m. Since they have been perfectly adjusted prior to delivery, they are not to be moved, because it will deteriorate the various characteristics, making normal operations difficult at times. However, when the rotational speed cannot be controlled by means of the speed controls located on the upper surface of the body alone, VR1 and VR2 are to be adjusted in the range shown below.

For 33 r.p.m.:  $33\frac{1}{3} \pm 3\% (\pm 1)$  r.p.m., or more

For 45 r.p.m.:  $45 \pm 3\% (\pm 1.35)$  r.p.m., or more

By the slip type count method, adjustment is possible in the following range.

For 33 r.p.m.: (2,060~1,940) or more,  
Center (2,000) or more.

For 45 r.p.m.: (2,780~2,619) or more,  
Center (2,700) or more.

The procedure is as follows. First set the speed controls "33" and "45" on the upper surface of the body to the center of the variable range. Then, adjust VR2 and VR1 in that order so as to make the specified stroboscope stop at the respective rotational speed. Adjust again, using the speed controls.

#### ■ Auto Up Circuit Board (auto up adjustment)

##### VR201 : CdS bias voltage adjustment

Connect a DC voltmeter (with input impedance of not less than  $100k\Omega$ ) between CdS and + terminals on the Auto Up Circuit Board. And turn on the SPEED SELECTOR switch (33/45). (The arm is positioned on the arm rest.)

Fully turn VR201 clockwise, then turn it back counter-clockwise until the voltmeter reads  $10 \pm 0.2V$ .

##### VR202 : Up point adjustment

After adjusting the mechanism, adjust VR202 while monitoring the output when the test record ES-1008 (NEC) is played.

1. Adjusting the return point (3mm pitch grooves on the first side of the test record.)

Fully turn VR202 clockwise, then descend the

cartridge onto the outside (count of 10 or less) of the 3mm pitch grooves of the test record. After that, turn VR202 counter-clockwise so that the arm automatically ascends at count of 15 to 21. If this adjustment cannot be achieved at one time, repeat it for complete adjustment.

2. Confirming the non-action of the arm (1mm pitch grooves on the second side of the test record).

Confirm that the arm does not automatically ascend at count of 21 or more after the cartridge is lowered on the outside (count of 10 or less) of the 1mm pitch grooves of the test record.

If the arm automatically ascends, make readjustment according to Item "Adjusting the return point".

### 2. Mechanism Adjustment

#### (Positioning of the sub-arm assembly)

When the sub-arm assembly is removed for replacement of the arm, etc., the following adjustment will be required thereafter.

#### Rough adjustment (Attaching the sub-arm assembly)

With the tonearm locked on the arm rest, tighten the set screws so that the distance between the lamp holder and sub-arm is 22 mm as illustrated below.

Here, previously set the sub-arm near the center of the adjustable range by means of the fine adjustment screw. Tighten the set screw 1 first and tighten the set screw 2 after turning the sub-arm A clockwise, using a hexagonal wrench for M3 (1.5 mm dia.)

#### Fine adjustment (Setting the end grooves position)

This fine adjustment is made while monitoring the voltage between CdS and + terminals on the Auto Up Circuit Board.

After setting VR201 (see "Circuit Board Adjustment"), move the tonearm so that stylus tip is positioned at a distance of 53.2 mm from the center shaft. (That is, the final groove on a template attached. Then, after having fully turned the fine adjustment screw for sub-arm assembly clockwise, rotate it counter-clockwise so that the voltage between CdS and + terminals becomes  $5.0 \pm 0.1V$ . Use a voltmeter with input impedance of  $100 k\Omega$  or more.)

# OUTLINE OF CIRCUITS

## ■ Non-contact Photo-electric Detection Auto Stop

The YP-D8 employs a photo-electric detection auto stop mechanism that detects the end groove of the record, lifts the arm and simultaneously turns off the power.

In the end groove detection mechanism, a shutter interlocked with the arm is inserted between LED and CdS. This shutter serves to block light between LED and CdS. At this time, the speed of the shutter is detected to actuate electric circuits which operate the cueing lever through a solenoid plunger.

Thus, this non-contact photo-electric detection system poses no load to the arm and has no adverse effect on tracking ability. Shown below is block diagram of the non-contact photo-electric detection system.

### [Start]

When the switch 33 or 45 is pressed, a micro-switch turns on the primary side of the power transformer, and current flows to the circuits.

When the power supply circuit is turned on, current momentarily flows into C204 On the Auto Up Circuit Board to actuate a flip-flop circuit which holds TR206 in ON condition and TR205 in OFF condition.

### [Detection Circuit]

When the stylus tip approaches the end of the record, the shutter interlocked with the arm (sub-arm) inserts between LED and CdS to change the amount of light which is radiated to CdS. Therefore, the resistance value of CdS increases. When the stylus tip traces the inside grooves with rough pitches (4 to 9 mm : JIS) after the end of play, the resistance of CdS changes rapidly. The resistance of CdS determines the base voltage of TR201, changes in the resistance appear at the

emitter of TR201 (Emitter follower) and are transmitted to the gate of FET201 through C202. C202 and R206 consistute a differentiation circuit. This means the higher the change speed, the shorter the rising time and the higher the trigger wave height. Thus, the end of the record can be detected by means of the inside rough pitch grooves.

### [Discriminating Circuit]

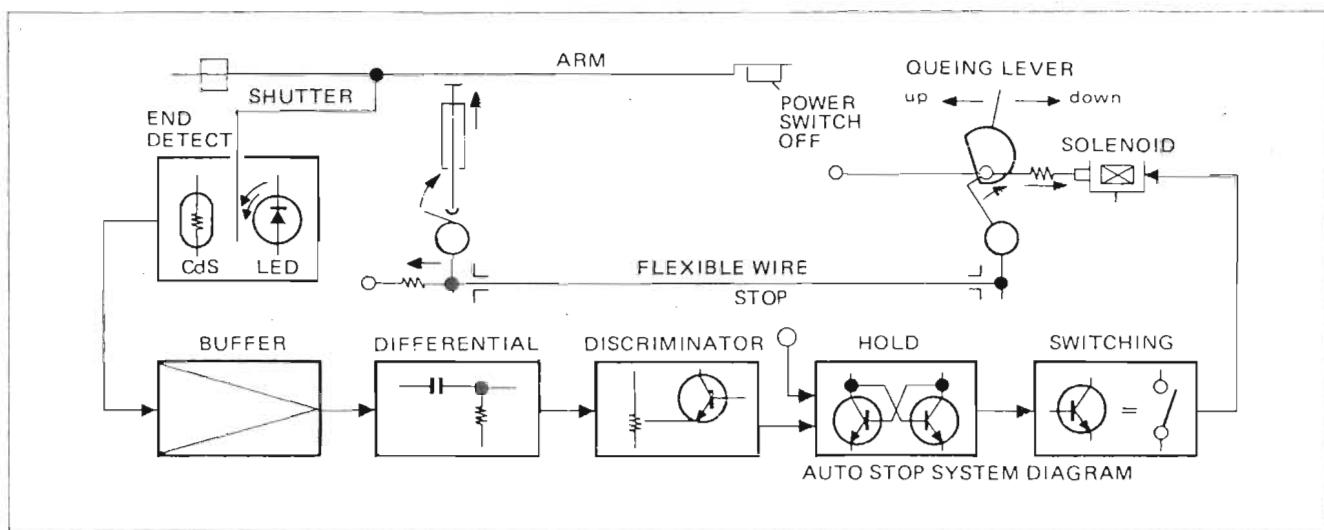

VR202 (see Item "ADJUSTMENT") delivers the bias voltage to the emitter of TR203 to discriminate whether the waveform of currents from the detection circuit is caused by rough pitch grooves or not. This discriminating circuit actuates when groove pitch is 3 mm or more, and prevents erroneous operation due to eccentricity of the record (loose fit between the center shaft and record hole). Only the waveform above the Zener voltage of the inverse-connected D205 can pass the discriminating circuit.

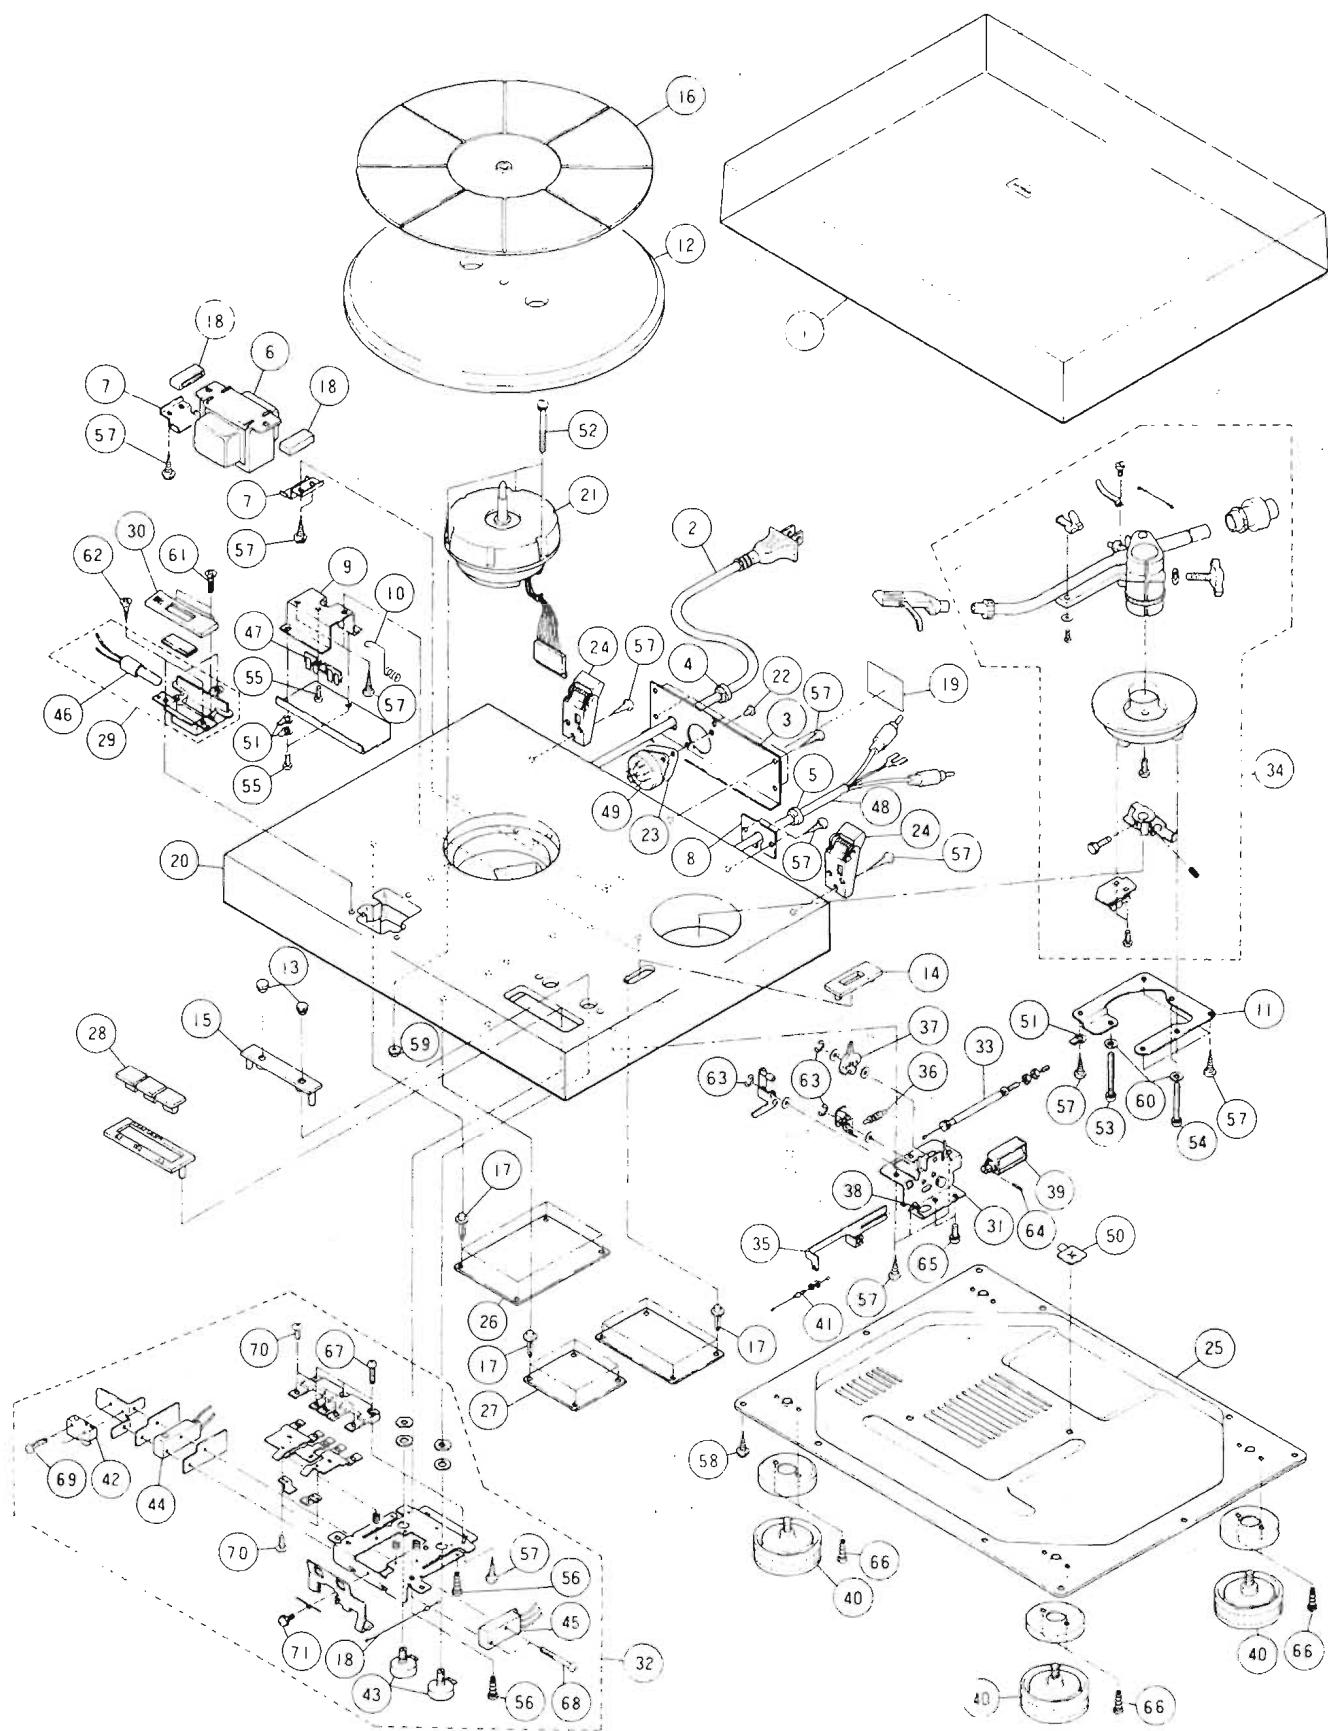

### [Hold Circuit]

This hold circuit holds TR206 in ON condition and TR205 in OFF condition when the power is turned on. When the pulse that passes D205 is transmitted to the base of TR205, the hold circuit is inverted.

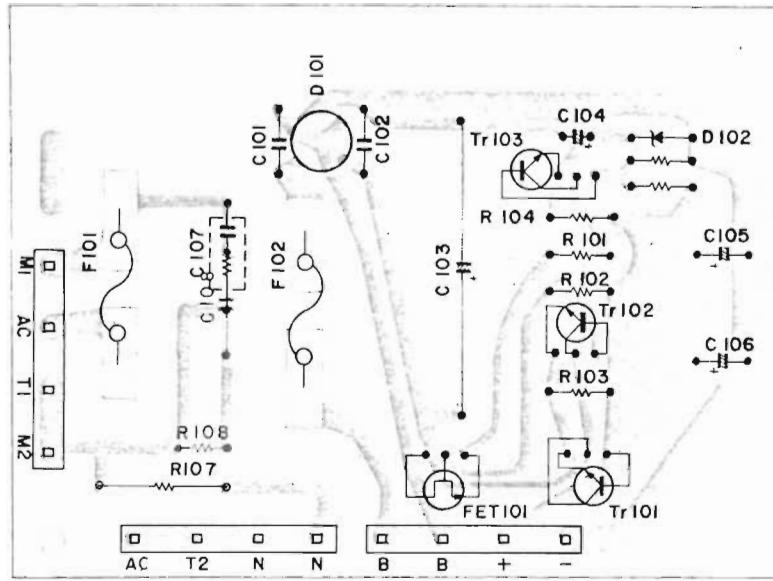

### [Switching Circuit]

At the moment when TR206 is turned off, the rising portion of the voltage passes through D209, which turns on TR207 and TR208. As a result, the solenoid plunger is actuated to operate the cueing lever. Thus lifting of the arm is completed and turns off the power switch interlocked with the solenoid plunger. Now the circuitry is completely shut off. (Refer to the attached schematic diagram.)
